EFFECTS OF ACCESS TO MICROCREDIT ON THE GROWTH OF WOMEN-OWNED SMALL AND MEDIUM ENTERPRISES IN THE CENTRAL BUSINESS DISTRICT OF KISUMU: THE CASE OF KENYA WOMEN FINANCE TRUST

Clemencia Osa Ouma, University of Nairobi, Kenya
Charles M. Rambo, University of Nairobi, Kenya

Microcredit is a crucial tool for economic empowerment of women. In Kenya, the microcredit industry has supported more than 3 million small and medium enterprises for close to 30 years. Kenya Women Finance Trust is a leading microcredit institution dealing exclusively with financing needs of women. However, whether the services provided by the institution have spurred growth among women-owned enterprises remains undocumented. The objective of this study was to assess the effect of access to microcredit services on the growth of women-owned enterprises within the Central Business District of Kisumu City. To accomplish this, we sourced primary data from 190 women entrepreneurs. The study found that access to microcredit significantly associated with sales, net profit, number of paid workers and liabilities. Thus, access to microcredit had positive effects on the growth of women-owned enterprises. In addition, Kenya Women Finance Trust's lending policies were not responsive to financing needs of women and to changes in the business environment. This undermined the potential of funded enterprises to achieve sustainable growth. The study recommends the need to review the financial institution's lending policies, increase the amount of microcredit funds and encourage other actors to finance women-owned enterprises.

JEL: O16

KEYWORDS: Access, Microcredit, Small and Medium Enterprises, Women-Owned, Central Business District

INTRODUCTION

Microcredit provides an opportunity for low income-earners, including women to improve their economic and social status. Besides economic empowerment, microcredit carries with it numerous other benefits for women, including better control of their reproductive health as well as reduced vulnerability to domestic violence. Better incomes make women less vulnerable to gender-based violence perpetuated by their partners (Goetz & Sen, 1994; Mayoux, 1998a). In most countries, commercial banks have not effectively addressed the financial needs of low income-earners, due to stringent baseline requirements. In addition, commercial banks perceive low income-earners as not being credit-worthy due to lack of assets, which they may use as collateral against credit facilities (World Bank, 2009). In this regard, credit facilities provided by Micro-Finance Institutions (MFIs) plays an important role by filling the gap for financial services among low income-earners, majority of who include women.

The origin of microcredit is traceable to the 14th Century, when the Franciscan monks founded the community-oriented pawnshops (World Bank, 2009). A study conducted by the World Bank (1999) indicated that about 25 million people worldwide were using microcredit to finance their business activities, with women forming up to 90% of beneficiaries. By 2005, up to 113 million borrowers had benefited from microcredit services and by 2010, microcredit industry addressed the financing needs of up to 150 million low income-earners, especially in developing countries (World Bank, 2009). In Kenya, the microcredit industry is a relatively new phenomenon, with a few agencies starting about 25 years ago.

Due to rapid development in Kenya's economic landscape, the agencies eventually graduated into vibrant institutions in the 1990s (Hospes, Musinga & Ong'ayo, 2002). Between 1992 and 1994, the Government was intensively involved in implementing the Structural Adjustment Programmes (SAPs). In this regard, the aim of economic liberalization was to restore macro-economic stability and spur private sector investments. To counter the potential negative impact of liberalization, microcredit industry emerged as one of the areas requiring donor support.

By 2001, about 1.3 million SMEs were operational in the country and provided job opportunities to about 2.4 million people; and accounted for about 70% of economic activities (Hospes et al., 2002). By 2008, SMEs created employment for about 75% of the national workforce and contributed up to about 22% of the national Gross Domestic Product (GDP). In Kisumu town, the role of SMEs as regards employment creation needs no amplification. By 2008, the sector engaged more than 40% of the district's labour force (Columbia University, 2007; NCAPD, 2008). Kenya Women Finance Trust (KWFT) is one of the institutions that have shaped the microcredit industry in the country by extending microcredit facilities to women-owned SMEs (Odhiambo, 1985; Hospes et al., 2002; Republic of Kenya, 2008). Established in 1982, KWFT has an elaborate national network of 9 regional offices, supported by 77 sub-regional offices. KWFT empowers women by providing accessible and affordable financial services.

Microcredit facilities are important for the growth and expansion of Small and Medium Enterprises (SMEs) and for their subsequent role in the national economy (Atieno, 2009). The growth and expansion of SMEs requires sustained investment in working capital. However, at low levels of income, the accumulation of such capital may be difficult. Under such circumstances, microcredit facilities may help small-scale entrepreneurs improve their incomes and accumulate own capital (Hossain, 1988; Atieno, 2001). KWFT have exclusively served the financing needs of women-owned SMEs; however, whether the microcredit services provided by the institution has spurred growth in the performance of women-owned SMEs, especially within the Central Business District (CBD) of Kisumu City remains unclear and undocumented. Against this background information, this study determined the effect of microcredit services provided by the KWFT on the growth of women owned SMEs within the CBD of Kisumu City. The resultant information is useful for development agencies, as well as scholars in microfinance, entrepreneurship as well as gender and development.

DATA AND METHODOLOGY

The study population consisted of women-owned SMEs operating within the CBD of Kisumu City. We sourced primary data from 190 women SME owners who had received microcredit from KWFT and stayed in business for at least three years. We also sourced secondary data through a review of KWFT registers and reports, as well as relevant empirical and policy literature. We used stratified random and purposive sampling procedures to obtain samples of SMEs and women entrepreneurs, whom were engaged in interviews between May and June 2010. Furthermore, we applied the Statistical Package for Social Sciences (SPSS) package to generate frequency distributions, percentages and cross-tabulations. The analysis of qualitative data involved organization into thematic areas, description and thematic analysis. The following publications support the methodology that we applied in this study: Best & Khan, 2004; Kothari, 2004; Bryman & Cramer, 1997; Mugenda & Mugenda, 1999; Nachmias & Nachmias, 1999.

RESULTS AND DISCUSSIONS

The study covered a total of 190 women entrepreneurs, each representing and providing information about their enterprises. All the participants reported having received microcredit from Kenya Women Finance Trust (KWFT) to support their businesses. Of the 190 participants, the majority, [110 (57.9%)] had received microcredit from KWFT trust only once; 66 (34.7%) participants had been funded twice, 11 (5.8%) had received microcredit thrice, while 3 (1.6%) had been funded more than thrice. In addition,

table 1 indicates that the SMEs represented in the study were involved in various lines of business, including hairdressing, clothing boutique, tailoring, food selling and retailing, among others.

Table 1: The Type of Business for SMEs Participating in the Study

CATEGORY OF SMES	FREQUENCY	PERCENT
Hairdressing	13	6.8
Clothing boutiques	49	25.8
Tailoring	51	26.8
Food selling	17	8.9
Hair dressing /clothing boutiques	12	6.3
Tailoring/clothing boutiques	14	7.4
Retailing	26	13.7
Others	8	4.2
Total	190	100.0

Table 1 presents the type of business activities carried out by the small and medium enterprises involved in the study. As reflected in the frequency distributions, most business ventures dealt in tailoring activities, clothing boutiques and retailing business. The category lumped as 'others' included hardware shops, bookshops and dry-cleaning outlets.

Moreover, table 1 shows that some SMEs were involved in more than one business activity. In this regard, 12 (6.3%) respondents stated that they were involved in both hairdressing and clothing boutiques, while 14 (7.4%) respondents operated tailoring and clothing boutiques. The table also reveals a preference towards certain business lines such as clothing boutiques and tailoring shops among women. We measured access to microcredit in terms of the number of times one had obtained credit from KWFT, and the growth of SMEs in terms of change in sales volume, net profits, number of paid workers as well as the trend of liabilities before and after obtaining credit. As indicated in table 2, 140 (73.7%) respondents felt that their enterprises were very inactive in terms of sales before receiving microcredit; however, after credit, up to 160 (84.2%) participants were convinced that their SMEs became more active - an indication that performance in terms of sales improved for more than 80% of the SMEs that received microcredit from KWFT.

Table 2: Business Performance in Terms of Sales Before and after Credit

SALES	BEFORE CREDIT		AFTER CREDIT	
	Frequency	Percent	Frequency	Percent
Very active	11	5.8	29	15.3
Active	32	16.8	160	84.2
Inactive	7	3.7	0	0.0
Very inactive	140	73.7	1	0.5
Total	190	100.0	190	100.0

This table indicates the opinion of women business owners regarding the activeness of their firms in terms of sales before accessing microcredit and after accessing microcredit from Kenya Women Finance Trust. The results suggest that a significant majority of women entrepreneurs (84%) believed that their firms became more active after accessing microcredit than before [$n=190$; $\chi^2=7.34$; 3df; $p=0.05$ (critical value $\chi^2=3.16$)].

The results yielded a computed chi square value of 7.34 with 5 degrees of freedom. The results were statistically significant within 5% error margin, leading to the rejection of the null hypothesis stating that *there is no statistical association between access to microcredit from KWFT and the growth of SMEs in terms of sales* because it contradicted empirical evidence. This implies that there was some significant association between access to microcredit and the growth of women-owned SMEs. Hence, about 85% of the SMEs were likely to experience higher growth after accessing microcredit than before. Through improved sales, SMEs were in a better position to improve revenues and accumulate capital resources for reinvestments. In conclusion, access to microcredit facilities is likely to have a positive effect on the growth of SMEs in terms of sales. We requested participants to indicate if there was any change in net profits, looking at the period before and after receiving microcredit from KWFT. The results presented in table 3 below shows that the majority, [152 (80.0%)] participants were of the view that their SMEs

registered dismal performance in terms of net profits before accessing microcredit from KWFT. After funding, up to 166 (87.4%) participants indicated that there was a positive change in net profits.

Table 3: Performance Before and After Access to Credit in Terms of Profits

CHANGE IN PROFIT	BEFORE CREDIT		AFTER CREDIT	
	Frequency	Percent	Frequency	Percent
Profit increased	18	9.5	166	87.4
No change in profit	20	10.5	17	8.9
Profit decreased	152	80.0	7	3.7
Total	190	100.0	190	100.0

This table presents women business owners' opinion regarding change in net profits before accessing microcredit and after accessing microcredit from Kenya Women Finance Trust. The results suggest that a significant majority of women entrepreneurs (87%) believed that net profits changed positively after accessing microcredit than before [$n=190$; $\chi^2=13.144$; 2 df; $p=0.05$; (critical $\chi^2=5.991$)].

The results obtained a computed chi square value of 13.0, with 6 degrees of freedom, which was statistically significant within 5% error margin. This led to the rejection of the null hypothesis stating that *there is no statistical association between access to microcredit and the growth of SMEs in terms of net profits* because it was inconsistent with actual data. The results suggested up to 95% chance that access to microcredit provided by KWFT was statistically associated with the growth of women-owned SMEs.

We requested participants to state the number of paid workers they had before and after receiving microcredit from KWFT. The results showed that up to 141 (74.2%) SMEs had between 1 and 9 paid workers, 41 (21.6%) had between 10 and 19 workers, while 8 (4.2%) had 20 workers or more. More still, table 4 presents the results obtained from the bivariate analysis regarding change in the number of paid workers between the pre-credit and post-credit periods. The results suggest that there was a general increment in the number of paid workers.

Table 4: Variation in the Number of Paid Workers

NUMBER OF PAID WORKERS	BEFORE CREDIT		AFTER CREDIT	
	Frequency	Percent	Frequency	Percent
1 to 9 workers	128	67.4	135	71.1
10-19 workers	54	28.4	40	21.1
20 workers+	8	4.2	15	7.9
Total	190	100.0	190	100.0

The table shows women business owners' opinion regarding change in the number of paid workers before accessing microcredit and after accessing microcredit from Kenya Women Finance Trust. The results suggest that there was a general increment in the number of paid worker [$n=190$; $\chi^2=16.22$; df=2; $p=0.05$; (critical $\chi^2=5.991$)].

The analysis obtained a computed chi square value of 16.22, with 3 degrees of freedom. This was statistically significant within 5% error margin, leading to rejection of the third null hypothesis, which stated that *there is no significant association between access to microcredit and the growth of SMEs in terms of number of paid workers*. The results implied up to 95% chance that access to microcredit provided by KWFT was associated with growth of women-owned SMEs in terms of number of paid workers. This suggests that most SMEs experienced increased performance after receiving microcredit, which necessitated the number of paid workers to go up. In conclusion, access to microcredit is likely to spur SME growth, which in turn is likely to create more employment opportunities.

The level of indebtedness is yet another indicator of whether an SME is growing or not. We further asked participants to state if there was any change in the trend of liabilities, during the period before and after obtaining funding from KWFT. As indicated in table 5, liabilities were increasing for majority of participants [164 (86.3%)] before accessing microcredit. However, this trend changed for the majority, [163 (85.8%)] who indicated that their liabilities were decreasing after accessing microcredit from KWFT.

Table 5: Liability Status Before and After Credit in Terms of Liabilities

CHANGE IN LIABILITIES	BEFORE CREDIT		AFTER CREDIT	
	Frequency	Percent	Frequency	Percent
Liabilities increasing	164	86.3	19	10.0
No change in liabilities	12	6.3	8	4.2
Liabilities decreasing	14	7.4	163	85.8
Total	190	100.0	190	100.0

This table presents the perceptions of women business owners' opinion regarding change in liability status before accessing microcredit and after accessing microcredit from Kenya Women Finance Trust. The results show that for most participants (86%), liability was decreasing after accessing microcredit from the financial institution [n=190; $\chi^2=9.02$; 2 df; p= 0.05; (critical $\chi^2= 5.991$)].

In addition, the results obtained a computed chi square value of 9.02 with 3 degrees of freedom, which prompted rejection of the null hypothesis stating that *there is no statistical association between access to microcredit and the growth of women-owned SMEs in terms of the level of liabilities*. This suggests up to 95% chance that access to microcredit provided by KWFT significantly associated with the growth of women-owned SMEs in terms of liability status.

CONCLUSIONS

Access to microcredit remains instrumental for the growth of women-owned SMEs. The key indicators of growth considered in this study included sales volume, net profits, the number of paid workers, and the trend of liabilities before and after receiving microcredit. The study found that access to microcredit significantly associated with all these indicators of growth. The results suggested up to 95% chance that SMEs experienced higher sales and better profits after accessing credit from KWFT. This enabled SMEs to hire more paid workers to support increasing production and to reverse liability trends. In conclusion, adjusting lending policies to be consistent with the actual financing needs of women, and business environment is likely to strengthen the role of KWFT, as a leading pro-women microcredit institution in the country.

ACKNOWLEDGEMENT

We acknowledge the support of our research assistants, including Tom Odhiambo and Isaiah Mwangi, who supported data collection and processing. We remain indebted to all women entrepreneurs for committing their time to provide the information. To all those supported in other ways, we thank you.

ROLE OF CORPORATE GOVERNANCE IN THE FAMILY BUSINESS

Graziella Sicoli, University of Calabria, Italy

ABSTRACT

Problems of governance, associated with the Public Company, have also emerged in other types of businesses, for example in family firms. What takes place in family firms, albeit with different degrees of intensity, is an overlap, rather than the separation, of ownership and governance. In the start-up phase all the distinctive traits of entrepreneurship converge in the figure of the businessman; depending on certain affective, psychological, financial and/or professional factors, this can lead to a blurring of the distinction between the rules and needs of the family on the one hand, and those of the business on the other. In small scale family firms, the system of governance is not a significant issue because, besides not being formalised explicitly, it often represents a synthesis or in some cases a compromise between the values of the family and those of the business. As the business grows, however, a process of delegation away from the family may occur, which causes a gradual erosion of the centrality of the entrepreneur, as well as of his ability to deal with internal conflicts. In the absence of an absolute leader, the relationship between corporate and family governance, may degenerate into inter-familial conflicts, with knock-on implications for the management of the business. In such cases, the family council can intervene to reconcile the interests of actors who are, at one and the same time, the owners, controllers, and managers.

KEYWORDS: governance, family business, performance

JEL: F0; F13; F23

INTRODUCTION

Governance is a topic of great relevance and currency and one that continues to attract growing interdisciplinary interest; considered as a fundamental driving force for business, governance also represents a valid instrument for the pursuit of positive business performance. Contributions in the literature stress the importance of governance as a useful instrument for a company policy which manages to express and achieve the harmonic functioning of the organisation. The expression *corporate governance* nonetheless continues to be an ambiguous one, without a fixed meaning; this has largely contributed to increasing its indeterminateness. The word *governance* expresses the mechanisms through which relations between the various subjects involved in a company's activity – among these, the shareholders, administrators, executives, investors, and other financial agents who might enter into contact with it – are regulated. The aim of *corporate governance* is to limit the possibility of opportunistic behaviour within company relations. This is in order to avoid problems of agency which may relate to, under different perspectives, either an agent (the manager) and several principals (shareholders, creditors, employees, suppliers, clients, etc.), or one principal (the entrepreneur) and several agents (managers, investors, employees, etc.). A good system of corporate governance can thus ensure an improvement in the quality of life of the firm.

Problems of corporate governance in the context of the diffused shareholding Public Company and thus characteristic of the Anglo-Saxon world, have gradually also arisen in other contexts and types of business, for example in the family firm. What often happens in the family firm, albeit with different degrees of intensity, is the overlapping of ownership and governance, rather than their separation (Denis D., Sarin A., 2000). This points to a cultural delay and implies two distinct consequences, both of which have precise implications for the model of governance. On the one hand, it can alter the balance of power

within the family entourage, either because of the number of members, or because some of them do not possess adequate skills and knowledge to take on managerial roles. On the other hand, the process of the development and growth of the family firm, alongside which often occurs a broadening of the management team, may result in the entry into the firm of non-owner managers, who work alongside the family members, without replacing them. In this latter case, a gradual separation may arise between the owners and that part of the management which is actively involved in the running of the firm and thus its future. The two categories become critical variables for the continuity of the family firm and as such they must be adequately managed through careful planning of governance structures with the aim of achieving an effective balance keeping the family and the business united, and ensuring the peaceful and productive coexistence of the two institutions.

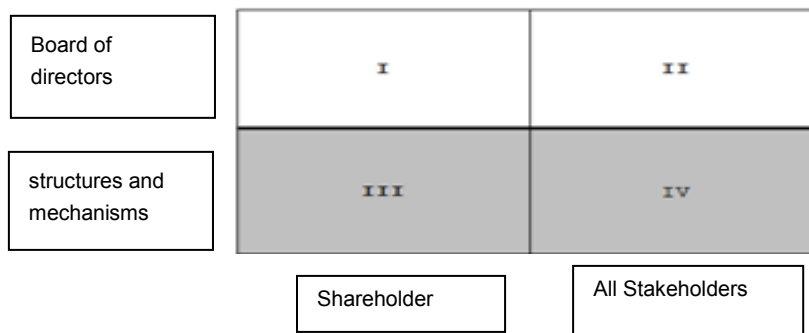

LITERATURE REVIEW

In an article from 1937, Coase uses the concept of governance to refer to those coordinating mechanisms internal to the firm which reduce market originated transaction costs (Coase, 1937). Later, in 1979, Williamson takes up the term governance in his theory of transaction costs, to describe alternative forms of financial organisation to the market and hierarchy. In his theory, governance designates the coordination modalities of those individual and organisational actions, different from hierarchies and the market, through which the construction of the social order is achieved (Williamson, 1979).

According to Rhodes' classification (Rhodes, 1996), on the other hand, the concept of governance assumes two further meanings which may be defined as "Minimal Status" and "Corporate Governance". The term "corporate governance" was used for the first time by Eells (Eells, 1960) to indicate "the structure and the functioning of company policy" and, thus, the governance of the businesses. Shleifer and Vishny (Shleifer, Vishny, 1997), speak of corporate governance as of a complex system of rules aimed at guaranteeing adequate returns on the capital supplied by the investors. In such a system we find those mechanisms directed to the regulation of agency relations between the top, the executive, and the bottom, often wide and fractioned, of holders of ownership rights. Zingales (Zingales, 1998), uses the term corporate governance as a synonym for the exercise of authority, direction and control.

Monks and Minow (Monks, Minow, 2004), represent corporate governance as the whole of the relations between the board of directors, the owners and the managers. Daily, Dalton e Cannella (Daily, Dalton, Cannella, 2003) conceive of corporate governance as the determination of the different uses for which organisational resources are deployed and the resolution of conflicts between the various participants in the organisation. For Huse, (Huse, 2006), on the other hand, corporate governance is defined as the interaction between the coalitions of internal actors, external actors and the members of the board of director, aimed at creating value. In the literature, the concept of corporate governance is often linked to that of *outsider* and *insider*, defining it precisely as the complex of rules through which investors (*outsiders*) protect themselves against the risk of expropriation from those who control the firm which, depending on the case in question, may be the majority shareholder or the management (*insiders*). Despite the numerous contributions to the literature, there continues to be no agreed and shared definition of corporate governance. Authors interested in the topic have adopted definitions which differ both in the extension and variety of stakeholders considered in the governance process (shareholders, managers, employees, the State, consumers, investors, etc.), and for the breadth and variety of corporate bodies or mechanisms considered responsible for governing the firm (the board of directors, the managers, the board of statutory auditors, etc.). Combining, on the one hand, the "interests involved in the process of corporate governance" and, on the other, the 'structures and mechanisms of corporate governance' we obtain a matrix where we place the most commonly used definitions of corporate governance (Figure 1).

Figure n. 1: Different definition of governance

Interests considered in the process of corporate governance

In Quadrant I are studies which predominantly take into account the shareholders' perspective and leave the responsibility of financial governance to the board of directors. The Board of Directors (BoD) thus becomes the main body in the structure of governance, and scholars' attention focuses on its composition in terms of numbers, degree of independence, and ability to carry out a controlling function to safeguard shareholders from potentially opportunistic behaviours by the management.

In Quadrant II we find those who recognise the importance of a plurality of stakeholders to be taken into account in performing the function of business governance and who at the same time, consider the *board of directors* as the only governing body of the firm. This *multi-agency approach* broadens the responsibilities of the BoD which has as its *principal* the owners-shareholders, but also a broader range of actors. In Quadrant III we find definitions of corporate governance which contemplate the protection exclusively of the owners' interests through a great number of bodies and mechanisms, internal and external to the firm. In this case, corporate governance must seek to guarantee and safeguard the suppliers of risk capital (shareholders), and make sure the managers maximise *shareholder value* through a more institutional structure which is more varied and more complex than the simple board of directors.

In Quadrant IV, an extended definition of corporate governance is given, which does not consider exclusively the interests of one class of subjects (the shareholders-investors), but places them, rather than in a position of total supremacy, on a privileged plane relative to other actors who nonetheless play a role in the growth of the firm. Further, the protection of diverse interests is not the exclusive prerogative of the board of directors or other formal bodies, but it is obtained through a complex web of relations between the institutional environment and characteristics specific to the firm.

Governance And Family Firms

The dichotomy between family and non-family firms is particularly evident most of all in terms of models of corporate governance. Once again, the differentiating factor is the family, sometimes drastically described as an element of interference, and other times, seen as the driving factor of success. Corporate governance is influenced by the capitalistic system of the country in which the family firm is located and it presents particular aspects which derive from the coexistence of the two institutions, the "business", on the one hand, and the "family", on the other, guided by two contrasting logics "rationality", and "sentiment", respectively (Ward, 1997). Contrary to what is often thought, government structures of family firms are often more complex than those of other types of business; further, there exists no valid and fixed model of corporate governance per se which may allow us to identify them. In fact, even a simple search for common traits between the governing structures of family firms turns out to be

particularly complicated for two reasons:

1) the arbitrariness in identifying a firm as a family firm, due to the lack of an unambiguous definition of *family firm*;

2) differences arising from the multiplicity of “guises” in which this typology can manifest itself: quoted family firm, totalitarian control based family firm, multiple-ownership family firm, first generation family firm or subsequent generations family firm.

The corporate governance model adopted by *family firms* is closely tied to the influence of the owner family and often represents a synthesis and sometimes even a compromise, between family values and business roles (Anderson, Jack, Drakopoulou-Dod, 2005). Only by focusing attention on the family and the firm at the same time does it become possible to draw out the lines of an adequate system of governance which can allow the two institutions to interact positively despite their different aims, values and organisational structures. The family is primarily concerned with the sustenance and wellbeing of its members; it is driven by a logic which appeals to sentiments, unity, tradition and harmony. The firm, on the other hand, has the sole aim of generating products and services through a results oriented behaviour. Its values are rationality in decision-making, the ability to adapt to changes in the market and so on. The interweaving of family problematics with those of the firm and the reciprocal influence of the two institutions (firm and family), inevitably impact on the composition of the structure of governance.

For example, in business contexts characterised by forms of absolute control, the overlapping between the family and the firm is greatest; in other words the family hierarchy is transferred onto the firm, meaning that the firm is not seen as an autonomous and external financial entity, but as a family “affair” and as such, one to be managed by members of the family only. The most likely situation in this case, and certainly the most realistic one too, is one in which the system of governance coincides with the entrepreneur himself. The latter often opts for systems of governance which tend not to be made explicit, and for a distribution of responsibility and power amongst family members only. In this case, it is rare to find an instituted board of directors or, where there is one, it is in most cases lacking in effective power and its presence is imputable simply to a mere bureaucratic function of a formal nature. On the other hand, in a medium to big scale firm, governance is generally based on complex organisational structures in agreement with an adequate system of norms (laws, Codes of Self Discipline).

Governance Models In Family Firms

In family firms, as for the other typologies of firms, there exists no one model of governance which is absolutely valid in every context, and even within the same business context, the structure of governance is not fixed but may change over time (Zocchi, 2008). Depending on the specific situation and timeframe considered, very different types of institutional structures can prevail (Solomon, 2007). However, we can note today a convergence towards a common model. Alongside the classical financial framework based on firm controlling rights, the literature has found two different interpretational frameworks: the *outsider system* and the *insider system*. Such models are conducive to the Anglo-Saxon experience and to the German-Japanese experience, respectively.

The *outsider system*, also defined *market oriented*, refers to a model in which the capital market represents the most efficient regulating mechanism for the potential conflict of interests between shareholders and manager. Businesses operating on this model are public companies. These are characterised by an extremely widespread distribution of capital, by a *shareholder* interest oriented decision-making process, by an efficient capital market and by the possibility of a conflict of interest between shareholders and managers. The main problem arising from such a conflict is the potential presence of agency costs, that is the costs of information and controls necessary to guaranteeing that the behaviour of the (strong) management keeps in line with the aims of the (weak) shareholders. In the *outsider system* model, shareholders can exit from the business at any time through the sale of the share in

their possession. Further, they are protected by a *common law* system characteristic of Anglo-Saxon countries where invigilating bodies establish stringent conditions that the firms are obliged to comply with, or else their market quotation will suffer. The system of corporate governance which follows from this is centred, mainly, on a shareholders vs. managers dialectic and on the role of the market as the external conflict regulator between interests that have a tendency to diverge.

At the opposite extreme we have the *insider system* model, typical of those situations which constantly seek compromises between the various stakeholders involved in the productive activity of the business. Precisely for this reason it is also defined as *relationship based*. It is commonly found in countries such as Japan and Germany and is characterised by a not very efficient capital market and by the presence of numerous financial intermediaries within the firms. Firms operating in such an environment are characterised by the presence of concentrated shareholding and, for this reason, they are defined as low-contestability, closed-capital firms. In the *insider system* model, the decision-making process mainly takes into consideration the interests of *stakeholders* over those of the *shareholders*.

Putting together, on the one hand, the business structure and on the other, its stability and variability, it is possible to classify the different models of corporate governance. If we consider the composition of the firm structure, we have cases in which the shareholding is unified, and cases in which on the other hand it is spread across a plurality of often heterogeneous subjects, and no single actor retains a sufficient number of shares to exercise control. Examining this first aspect, we may distinguish companies with capital concentrated into the hands of one individual or one family, from companies whose the capital is divided between several subjects, who may be savers, institutional investors, employees, and so on.

As regards the stability or variability of the shareholding structure, we can distinguish two different situations: one is characterised by stable shareholding, at least as regards the part relative to the control of the firm, the other characterised by unstable shareholding, subject to frequent changes due to the sale and purchase of shares. Crossing the two variables analysed above we obtain three different models of corporate governance:

Diffused ownership firm: (unstable and divided shareholding): characteristic of Anglophone countries, it recalls the scheme of the *outsider system* and it is distinguished by the distribution of share capital over a wide number of savers. Also defined *public company*, it is characterised by the separation of ownership and control of the firm; the first belonging to share owning partners, the second to administrators who provide corporate governance. It follows is that the identification between shareholders and the firm is limited, the main objectives are short term and aimed at immediate profit. In Italy this type of firm is not common; one of the main causes for this being the presence of numerous family firms, both large and small scale, which are particularly “attached” to traditional forms of activity, thereby impeding the take-off of the “public company”.

Closed ownership firm: (unified and stable shareholding): typical of those countries which have so-called domestic capitalism, it is well suited to small scale economic situations. Also defined as “family firm”, because guided by an entrepreneur who decides and establishes its fate, it is distinguished from the *public company* by the concentration of shares in the hands of a few subjects, who, in the majority of cases, are tied to one another by kinship and family ties. Further, in this type of firm thanks to the passion, entrepreneurial spirit and the involvement of the major shareholder, entrepreneur and owner, who devotes his whole life to the firm, which he conceives of as his own creature, we find:

- Rapidity in decision-making;
- Little bureaucratic organisation;

- Sudden changes of direction;
- Emotional involvement with the employees.

However, alongside its evident advantages, the closed ownership family firm is still subject to certain risks and limits. In fact, the firm is financially very weak because its opportunities for growth are connected to the financial position of the owner alone, which may be insufficient for certain types of investment. As a consequence, if this is indeed the case, this model does not contribute to creating value. In fact, because of the lack of capital, the entrepreneur is often forced to forsake opportunities for growth and development or, alternatively, he is either obliged to resort to higher levels of indebtedness or of further conferment of his own capital, which may involve running the risk of losing control of the firm with the entry of external subjects. Moreover, in closed ownership family firms, unlike the *public company*, there is a lack of high quality managers who possess specific professional skills and competencies. This happens because the limited opportunity for growth impedes the professional development of these subjects. As a consequence, the results obtained, inextricable from the skills of the major shareholder entrepreneur and owner, or majority partner, are achieved in the short and medium term, but they may be invalidated in the long term, due to the problems of succession; on account of this experts in the sector consider such a model to be fragile.

Restricted ownership firm: (stable and divided up shareholding): this characterises the majority of German and Japanese firms. Its presence, however, can be found in other contexts too; for example, certain large French firms. This model is characterised by a particularly complex firm structure which includes a wide range of institutional investors who are different from both the shareholders and the managers. As regards its profile, like the *public company*, it is formed by a clearly defined business group which, similarly to the family firm, and differently from the public company, remains relatively stable over time. In this model of *corporate governance*, the stable part of the capital is possessed by a restricted number of shareholders, banks, and other investors who effectively control the business. The remaining shares are made available on the market to a wide number of small savers who regard the firm as a financially profitable investment opportunity. In a restricted ownership firm, the fact that no one shareholder alone occupies a position of absolute majority, the possibility that personal interests dominate business decisions is obviated. In fact, this is the main characteristic distinguishing this model from the two previously described. Thus each investor, independently of their personal situation, looks to deploy their capital with the stability of the firm in mind; what counts ultimately is the survival of the business over time. The three types of ownership structure all present specific problems which it is good to be aware of in order to run the firm, efficiently both in periods of stability and, most importantly, in periods of transition. In the latter case, an analysis of the structure of corporate governance can ensure the timely planning of firm-family relations, with particular attention to the means of transmission from one generation to the next and with an eye to both the past and the future. A correct structuring of such relations is seen herein as the necessary condition for the continuity both of the family firm and of the family itself.

Governing Bodies of Family Firms

Generally, in small scale family firms, problems of financial governance are less relevant. The concentrated ownership structure and the overlapping of ownership and control, limit the possibility that those who have control may expropriate the shareholders who are not directly involved in the management of the firm. The structure of governance is thus both simple and informal and it presents itself as follows: a Board of Directors (BoD), or a sole administrator. The BoD is made up of a limited number of people, usually coinciding with those who supply risk capital and with other people who are connected to the family by family ties. In large scale family firms, it often occurs that the majority shareholder or shareholders, even if not directly involved in the management of the firm, nonetheless

have both the ability and see it in their interest to control the operation of the management which finds itself obliged to make decisions guided not by economic rationality, but rather by the needs of the controlling family. The sole presence of family members on the BoD may not be a good thing, as often those board members who have ownership of the capital do not necessarily have the managerial skills to use it wisely. The entrepreneur, who lacks the ability to deal with particular business situations (moments of crisis, growth processes, organisational changes, generational turnover of management), needs to have alongside him trustworthy people with specific skills, who know the firm's business well and can contribute actively to taking the most delicate decisions, thereby guaranteeing a stable and durable equilibrium. Outsiders involved in the management of the firm are too often linked to the family by long standing ties of collaboration and/or friendship. If this on the one hand makes more formal the behaviour of the family partners and leads to a concrete functioning of the governing bodies, on the other hand it makes difficult reaching a shared vision through which the firm can be lead.

This can be attributed to the presence of the different cultures of the family partners and of third parties external to the family clan. In any case, entry into the family firm of outsider directors, that is, external administrators, who are not linked to the firm and the family by personal ties, guarantees the good functioning and effectiveness of the BoD of the family firm. This is thanks mainly to the contribution that the outsider directors bring both in terms of skills and experience in the context of decisional processes, both in terms of a more detached vision of family problems. In such a context, and upon the condition that this is appropriately structured, the BoD can become a useful governing instrument of the family firm system. To avoid contrasts, a good BoD must be made up in large part by non-executive and independent administrators, who must take on role of real support to the CEO (President and/or Managing Director).

Other bodies may be constituted in a non official manner. A good example is the family council (consiglio di famiglia) which is usually composed both of partners and non-partners and meets each time it is necessary to discuss and/or solve problems regarding the owner family and relations between the family and the business. The family council manages tensions and potential family conflicts, it chooses the family members who may become a part of the Board of Administrators, it informs the family members of the business performance, and enables all actions necessary for the safeguard and development of the estates both of the firm and of the family and potentially even those of individual family members. The family council acts as a support for the formation of a responsible estate (proprietà), allows a gradual rapprochement of the family members to the firm and it contributes to strengthening the links between family partners and future partners. Among its main tasks, one of the functions of the family council is that of acting as the real interface with the Board of Directors, exchanging with it information and reports on business performance and constructively dialoguing with it on the definition of the most appropriate strategies and policies for the firm.

CONCLUSION

The new competitive challenges and the necessity of improving relations with stakeholders, force family firms to invest in the system of governance. This means the establishment, alongside the entrepreneur, of a Board of Directors which will carry out a much more active role in the planning, control and relations with stakeholders; in particular the presence on the board of external members (Independent Administrators) becomes extremely important. If it is true that a good system of governance is not in and of itself a sufficient condition for the survival of the family firm, in the sense that corporate governance per se cannot guarantee a performance superior to the competition, an effective system of governance does increase the chances that successful strategic decisions be elaborated, planned and implemented. In other words, a necessary requirement common to family firms, is the introduction of an effective structure of governance which may redefine the roles and contributions that the various subjects bring to the firm, with particular reference to the roles of members of the family itself.

In a firm characterised by a lack of clear and defining rules, the adoption of a suitable model of governance can lead to significant modifications which guarantee greater transparency, careful business planning, and awareness of the need for growth. The codification of behaviours avoids the confusion that may arise from an unclear separation between the needs of the family and the business, namely the making of decisions which favour the former at the expense of the latter, business-focused, needs.

A good system of corporate governance also allows family firms to overcome problems related to generational turnover more easily. In fact, the existence of adequate governing bodies represents a guarantee that the business can look to the future irrespective of its founder. Furthermore, to grow and develop, every family firm must be able to attract private capital, and in order to do so make the transition from family management to family control, leaving the management to professionals external to the family group, but nonetheless maintaining the majority of the ownership rights. This process is made easier the more the family business provides itself with a system of governance which is both transparent and effective, able to guarantee the mediation between the diverging interests of owners and managers.

CREATIVE INDUSTRY: AN OVERVIEW OF THE STATE OF MICHOACÁN, MÉXICO

Rubén Molina Martínez, Universidad Michoacana de San Nicolás de Hidalgo.
M. A. Lexlie Ileri Rangel Vázquez, Universidad Michoacana de San Nicolás de Hidalgo

ABSTRACT

Creativity refers to the formulation of new ideas and the application of these ideas to produce original works of art, cultural products, functional creations, scientific inventions and technological innovations. Creativity is found in all societies and countries large or small, advanced or developing. The creativity, is observed in the way it promotes economic growth, contributes to entrepreneurship, fosters innovation, and enhances productivity. Despite the importance of the creative industries, the studies related in Michoacán are quite scarce. The aim of this paper is to provide an overview of the creative industries in Michoacán, México.

JEL CLASSIFICATION: L8,L89,Z10.

KEYWORDS: Creative Industries, Third Sector, Productivity.

INTRODUCTION

The creative industry offers unique opportunities for economic growth and human development. In the same way, it can foster the development of trade and employment generation, investment opportunities for entrepreneurs, in particular for small and medium enterprises, powering all sectors of society. Studies related to the creative industries in Michoacán are scarce. The aim of this paper is to provide an introductory overview of the creative industry in Michoacán. This paper has focused on basic theoretical aspects starting with the definition, classification and methodology of creative industries given by The United Nations Conference on Trade and Development UNCTAD, ending with the analysis of the current state of the creative industries in México and Michoacán.

Creativity, Creative Economy And Creative Industries.

Creativity refers to the formulation of new ideas and the application of these ideas to produce original works of art, cultural products, functional creations, scientific inventions and technological innovations.

The creative economy is an evolving concept based on creative assets, it can foster income generation, job creation and export earnings while promoting social inclusion, cultural diversity and human development according to UNCTAD (2008). Howkins (2007), says creativity is not necessarily an economic activity, but can be, when the results of the creative process is an idea with economic implications or a marketable product. The Creative Economy is therefore, a holistic concept dealing with complex interactions between culture, economics and technology in the contemporary globalized world that is dominated by symbols, texts, sounds and images, and the scope of the creative economy is determined. UNCTAD proposes for the creative industries this definition, classification and methodological tool based on statistics and a classification of trade goods and services of the creative industries.

Definition: Cycles of creation, production and distribution of goods and services that use creativity and intellectual capital as primary inputs.

Classification

Creative Industries.			
Heritage	Arts	Media	Functional Creations
- <i>Cultural sites.</i> Archaeological sites, museums, libraries, exhibitions, etc. - <i>Traditional cultural expressions.</i> Art crafts, festivals and celebrations.	- <i>Visual arts.</i> Paintings, sculptures, photography and antiques. - <i>Performing arts.</i> Live music, theatre, dance, opera, circus, puppetry, etc.	- <i>Publishing and printed media.</i> Books, press and other Publications. - <i>Audiovisual.</i> Film, televisión, radio, other broadcasting. - <i>Desing.</i> Interior, Graphics, fashion, jewellery and toys. - <i>New media.</i> Software, video games, digitized creative content.	- <i>Creative services.</i> Architectural, advertising, creative R&D, cultural & recreacional.

Source: Self elaboration using as reference the classification of creative industries UNCTAD (2010)

According to this classification, the creative industries comprise four large groups, taking into account their distinct characteristics. These groups, which are heritage, arts, media and functional creations, are described below:

- **Heritage.** Cultural heritage is identified as the origin of all forms of arts and the soul of cultural and creative industries. It is the starting point of this classification. It is heritage that brings together cultural aspects from the historical, anthropological, ethnic, aesthetic and societal viewpoints, influences creativity and is the origin of a number of heritage goods and services as well as cultural activities.
- **Arts.** This group includes creative industries based purely on art and culture. Artwork is inspired by heritage, identity values and symbolic meaning.
- **Media.** This group produces creative content with the purpose of communicating with large audiences.
- **Functional creations.** This group comprises more demand-driven and services-oriented industries creating goods and services with functional purposes.

METHODOLOGY

UNCTAD presents a methodological tool based on statistics and a classification of trade goods and services of the creative industries. This methodology helps the countries with the organization of their framework for cultural statistics. It is important to recognize that there is a considerable gap in the availability of statistics relating to the creative industrie due to the differences in the taxonomies and categories used for collection and analysis and in the faster economic change that has occurred the last century, particularly with respect to areas based on technological change. It is for these reasons that the creative economy is invisible when one looks at national statistical tables. This is a problem shared for many countries.

The UNCTAD classification emphasizes the undiscovered creativity of the southern countries by providing elements to identify potentialities. This methodology helps classifying the creative industries of several countries and influences the policy approaches that countries take to creative industries.

Methodological tool based on statistics and a classification of trade goods and services of the creative industries.			
Heritage	Arts	Media	Functional Creations
I. Art Crafts Art crafts, Celebration Paperware Yarn	II. Performing arts. Music (CD, tape) Printed music Musical instrument	IV. Publishing and printed media. Books Newspaper Other printed material Printing machinery	VI. Design. Architecture Fashion Interior Glassware Jewellery Toys
	III. Visual arts. Antiques Paintings Sculpture Photography	V. Audiovisual. Film Audio-visuals Post-production equipment Broadcasting equipment	VII. New media. Recorded media Video games Computer equipment

Creative Industries In México And Michoacán.

According to research conducted in the web sites of national and state government, there are not enough elements to affirm that México or Michoacán state are using the UNCTAD classification and methodology. However in Michoacán exists The Cultural Development Law. The Law's 5th Article, paragraph XVII states that the government should promote with relevant bodies the recognition of micro, small and medium enterprises and cultural creative industries, so that they can be subject to mechanisms of economic development and fiscal stimulus. It could not be found any information in the government web sites about programs which may promote what the law states. Despite the above, the tertiary economic sector in Michoacán (trade, tourism and services, where creative industries are focused) contributes in a greater percentage in the net income gross and employs 62% of the total economically active population, hence the importance of paying special attention and recognition of the creative industries in the state.

CONCLUSION

Despite the benefits that brings the creative industry and despite the efforts of organizations such as UNCTAD to recognize and classify the creative industry, México and Michoacán have not applied any sort of methodology to identify and separate the production data from creative industry from other industries and especially to identify the cost of production and the cost of creativity in the net value of the products and services offered in the creative industry. There could not be found any government support to develop the creative industry in the official web sites.

MERCANTILISM, GLOBALIZATION, UNETHICAL PRACTICES, CORRUPTION: A CASE STUDY OF THE RELATIONSHIP BETWEEN THE ENGLISH EAST INDIA COMPANY AND THE MONARCHY IN THE CONTEXT OF COLLABORATIONS IN THE SLAVE TRADE AND OTHER COMMERCIAL ACTIVITIES IN THE SEVENTEENTH CENTURY

Alan Parkinson, University College London
Lynsie Chew, University College London

ABSTRACT

This paper examines the nature and operation of the relationship between the English East India Company (EIC) and the English Monarchy in the seventeenth century, a relationship based on bribery and corruption in the pursuit of mutually beneficial financial interests. Its focus is the acquisition of rights to participate in commodity imports and exports in general, and specifically the slave trade through the links between the EIC and the Royal African Company, a slaving company owned by the Stuart Royal family. A particular feature is the pivotal role of Sir Josiah Child, prominent in EIC governance, in forging relationships with the Monarchy for personal gain, both financial and political. This involved off-balance sheet financing and shrewd management of the resources of sailing ships, assets being worked to capacity to provide payback and gain. Such activities occurred under the guise of mercantilism – free trade, in an early form of globalization. The study reveals that many features of the reality of modern-day globalization and financial pressures and temptations existed four hundred years ago. The methodology involves research of primary and secondary sources. It goes beyond traditional research primarily concerned with the study of a company's history and financial and trading-related facts and figures, by examining selected aspects of relationships between, and consequences for, the particular parties involved in joint ventures. This extends the scope of the paper across the boundaries of national studies into comparative, regional and transnational history, connecting with social studies in the broader sense.

KEY WORDS: joint ventures; management history; slave trade; globalization; mercantilism

INTRODUCTION AND CONTEXT

The seventeenth century witnessed a growth in trade and economic prosperity which saw England emerge from its status as a commercial and industrial minnow to the richest country in Europe in the early eighteenth century (Allen, 2004). (Note: *England* is used in this paper as the term for the *British State* which was subject to change during the period studied). This emergence is all the more remarkable given the trade crises of 1614-17, 1621-24, and 1640-42, and the disruptions caused by the conflicts of the Civil Wars in the 1640s. The early part of the century saw sporadic growth, interspersed by periods of trade surges, with the immediate post-Restoration period witnessing a remarkable positive change in the economic prosperity of England. Of significant influence in this change in fortunes was the nature and scale of activities of the English East India Company (EIC); in particular its global activities, its involvement in the slave trade, and its relationship with the monarchy. This paper tells the story of those aspects, and focuses in particular on the role of Sir Josiah Child as a governing member of EIC. The EIC mirrored the changes in the economic landscape. By the latter half of the seventeenth century the

Company had grown to be the pre-eminent corporation in England, reaping vast profits, distributing substantial dividends to shareholders, acting as a major creditor and benefactor to the monarchy, and controlling the trade channels with the East Indies, whilst having vested interests in trading channels with Africa and the American colonies (Stern, 2009; Lawson, 1993).

The EIC and Mercantilism

During the period 1660-1688, the EIC's trade was conducted within a framework of the theory of Mercantilism (Mun, 1664). This theory espoused the notion that government control of foreign trade was essential to ensure a favourable balance of payments. It reflected a widely-held view that all the wealth of the world was limited and a nation could only grow its economic position by gaining from other nations. The accepted mechanisms for implementing mercantilism included protectionism, tariffs, monopoly of markets, exclusive trade with colonies, restrictions on the export of gold and silver bullion, and the prohibition of goods being transported by foreign ships. Mercantilism created an environment which, as will be demonstrated later, enabled both England and the EIC to prosper. Despite eighteenth century criticisms of the theory, it was not until the latter half of the nineteenth century that the British Empire abandoned it and embraced free trade.

Established on New Year's Eve 1600, the EIC was originally titled *The Governor and Company of Merchants of London Trading into the East Indies*. It adopted a governance structure now commonplace in the twenty-first century corporation with a Court of Directors (the Board) reporting to a Court of Proprietors (shareholders). Its charter from Elizabeth 1, renewed on an indefinite basis by James 1 in 1609, gave permission to trade for spices, silks and related items (Gardner, 1972).

The company obtained footholds in India in the Mughal Empire, and a fort (factory) was built in Surat in 1612. Further locations were gained in parts of what is now Malaysia and Indonesia. Profits were variable as the Company discovered that traditional English products of wool and broadcloth were not wanted by Asian traders. This led ultimately to the use of gold and silver bullion being traded for cottons, calicoes and peppers, in addition to silks and spices. The first steps towards a form of globalization had been taken. Competition with Dutch and Portuguese rivals remained fierce, including a massacre by the Dutch of English traders at Amboina in Indonesia in 1623. This prompted the Company to focus on the mainland of India. A major fort was established at Madras in 1640, and by 1647 it had 23 factories in India. The immediate post-Civil Wars era saw the EIC's fortunes suffer. This was due partially to the depression afflicting a post-war ravaged nation, and the negative attitude of Oliver Cromwell to the Company. The restoration of Charles II saw an upturn in the fortunes of the Company, due in part to the lobbying of powerful groups of interested parties, and in part to the perennial need of the King for additional sources of revenues. New Charters and Navigation Acts reflecting forms of protectionism saw exponential increases in the fortunes of the Company.

The marriage of Charles to Catherine of Braganza brought with it the ceding of Bombay (now Mumbai) where the Company already had a factory, and the rights to trade in a number of Portuguese locations around south-east Asia. The intertwined financial, political and religious challenges facing Charles in the mid to late 1670s and early 1680s saw the King seeking new and ever changing allegiances and alliances, and the fortunes of the Company swayed with the King's movements. The accession of his brother James II, formerly the Duke of York, brought with it a trade climate providing more certainty to the Company; its recent expansion into political governance and power in India achieved solid foundations, and profits flowed with greater strength. The EIC embarked on a number of monopolistic abuses, and a number of its Officers became involved in corruption, bribery and fraud. The return of Charles II in 1660 heralded opportunities which the company took full advantage of, with consequential benefits for the company itself, Charles, and subsequently James II, and England as a nation. It assumed a pro-active and pre-eminent role within a set of collaborative lobbying ventures unifying parties interested in trade expansion.

Perhaps more significantly it employed financial mechanisms to influence Charles on a more personal level. Both resulted in the acquisition of further trading rights and a protected monopolistic position.

Liaisons With Royalty And Resultant Trade Dominance

The immediate pre-Restoration period saw an injection of £370,000 of additional capital, placing the EIC in a strong financial position but a competitive trading environment, compounded by Dutch trading strength reinforced by aggression, limited opportunities for trade expansion (Wilson, 1968). This was a situation shared with English merchants in general, and individually and collectively they began lobbying Charles for action upon his return (Ogg, 1972). Charles proved remarkably amenable to such lobbying, partially due to a need for political international positioning, and partially for financial reasons, reasons due in no small way to both of Parliament's failure to provide an adequate annual grant settlement, and the King's extravagant lifestyle (Sherman, 1976).

The situation facing English traders and merchants in 1660 had three core fronts: i) Dutch rivalry, aggression and dominance; ii) hostile actions against English ships by a number of European nations, and particularly so in the Caribbean; and iii) English colonists buying goods and supplies direct from rival European nations (Sherman *ibid*). The continuing advocacy of mercantilism engendered deep rooted worries. The belief that the world's wealth was limited and that one nation prospered only at the expense of others led to vociferous demands for protective action. These demands reflected concerns within the Stuart royal family itself given its significant interests and investments in the slave and fur trades. Petitions were submitted with energy and urgency to the King. (Illustratively, evidence of petitions may be located in Great Britain. Public Records Office. Colonial Office. Board of Trade, Commercial. Entry Books, Vo. 1, C.O. 389/1, fols. 31-33, 44-51, 54-56, 58-64).

The Earl of Clarendon, Charles Chief Adviser, comments: *(he) manifested a very great desire to improve the general traffik and trade of the kingdom, and upon all occasions conferred with the most active merchants upon it, and offered all that he could contribute to the advancement thereof* (Tourneisen, 1798). Charles enacted this desire by establishing, in November 1660, a new Council of Trade to advise himself and his Privy Council on matters concerning the regulation of trade. The four month period during which the Council was formulated and implemented reflects the significance Charles II placed upon trade matters. This was followed in the following month by a new Navigation Act, allowing only English and colonial ships to carry key goods. It added the proviso that specified articles such as cotton, sugar, wool, indigo and tobacco could only be consumed within the empire, thus promoting self-sufficiency and reducing England's reliance on foreign imports.

This Act did not restrict the rights of colonials to import from elsewhere other than England and/or export to non-empire countries (Jensen, 1962). Subsequent merchant lobbying led to the passing of the Navigation Act of 1663 (referred to as the Staple Act), requiring all supplies for the colonies to be transported through English ports, benefiting English traders and merchants. From England's national perspective it had the additional benefit of preventing colonials from using lower-cost Dutch ships, thus damaging the Dutch economy (Bulut, 2003). Also in 1663, the Government sanctioned the export of bullion and foreign currency, thus enabling traders to use more desirable tools of exchange in regions where traditional English goods were not in demand (Sherman *ibid* 332). The prospects for the English economy were improving. The transition from 'also ran' in 1660 to prominence by 1700 had its roots in this initial reaction by Charles II, followed by series of further government policy decisions. Many of the decisions focussed on anti-Dutch commercial and foreign policy, seeking to undermine the fierce competition. The initiatives of 1660 required further concerted efforts on the part of lobbyists to influence policy, and the Company was pre-eminent in this group, seeking to ensure it obtained concessions favouring itself (Sherman *ibid* 332).

Alliances in partnership, factions in co-factions

Lobbying by the Company was not new. Throughout the seventeenth century, before and after Charles II, the company had sponsored pamphlets outlining the challenges it faced, suggesting responses, and the benefits to the nation of a more prosperous Company (illustratively, Roberts, 1641; Robinson, 1641; Child, 1693). The Company's management and supporters recognised that its position in 1660 was tenuous and if it were to survive – let alone prosper, it needed government help. The requisite help was forthcoming, facilitating not just survival but generating significant profits. By 1672, the incoming Governor of the Company, Sir John Banks, found himself overseeing the activities of the '*richest and most powerful mercantile corporation in England*' (Coleman, 1963: 58). This position resulted from the successful implementation of two deliberate, well designed strategies: the gaining of representation on government councils and of seats in Parliament and, and the making of loans and financial gifts to the King (Sherman *ibid*: 335). The former ensured direct representation and influence on commercial policy decisions; the latter took advantage of the King's perennial avarice for money, and enabled personal influence to secure concessions. As a consequence, the improvement in the EIC's prosperity and the direction and content of English trade and foreign policy marched side by side. EIC representation on the newly formed Council of Trade and its derivative sub-committees was, to say the least, voluminous, despite the King's original intentions for its composition to reflect a cross-section of England's trading and merchant communities (Letters from the King and Council, IX, 1660-1664. Item 5, fol. 4a and b).

The Council comprised sixty-three members, including fourteen who were appointed in their capacity as peers and for cosmetic purposes and played little part in the formulation of policy (Sherman *ibid*: 339). Of the remaining forty-nine active members, the Company had representation through eight of its current employees (including both its Governor and Deputy-Governor), augmented by a further twenty-one members who had a range of commercial and financial ties with the Company. Of those twenty-one, two had been EIC officers in the 1650s and four more became officers by 1663 (Henning, 1983). Thus over 50% of the Council had EIC affiliations and over 25% had either been or were Company officers. It is perhaps not surprising that seven major petitions and/or remonstrances were made in the first month of the Council's existence and granted (Sainsbury 1922:32), providing trade protection and contributing towards enhanced profitability. The representation on the Council aided the degree of influence, but laws were passed by Parliament. It thus assumes significance that thirteen of the EIC-connected Council members were also MPs in the Parliament.

As the decade progressed, the close ties, inter and intra, between the Council, Parliament and the Company continued and, indeed, strengthened. The composition of the forty-six Council members in 1668 was made up of twenty-one peers – there, as before for political and cosmetic reasons, and twenty-five lay members. Of those twenty-five, sixteen were linked with the Company thus holding a considerable degree of influence over the policies formulated and agreed by the Council. Statistically, the Company was represented in one way or another by 41% of the entire Council, and by 64% of the more active members (Sherman *ibid*: 341).

In light of the foregoing, there should be little surprise that the Company prospered as it did in during the 1660s. As referred to earlier, however, connections and allies were also needed in Parliament. Computer analyses of records (Sherman *ibid*: 342). reveal that between 1660 and 1663, at any one time between 19% and 23% of its officers sat as MPs in the House of Commons. The volume of representation was harnessed by key political allies and supporters of the Company, allies and supporters with, invariably, financial interest. Upon his return, Parliament had voted Charles 50% of all indirect excises and he used a variety of allies to collect and, where necessary apply those taxes, known as 'farming' (O'Brien, 2002: 33-37). This was of great value to Charles and he relied upon the fidelity of his 'tax farmers'. Key amongst those were Sir John Shaw and Sir George Downing; and both happened to have financial and commercial interest in the Company. Shaw faced problems with the Dutch concerning his African trade

and backed Company moves against the Dutch, also reflecting a role he played as a tax farmer on behalf of the Company.

Downing was virulently anti-Dutch and was England's trade representative at The Hague. This influential position proved to be to the Company's advantage when he was given the right to also represent and, indeed, act with power of attorney for the EIC there. As with other Company-related MPs, Shaw and Downing sat on a number of key Parliamentary committees, including those associated very specifically with the wool trade and the Navigation acts (Sherman *ibid*: 341). Indeed, the 1660 Navigation Act emerged from the deliberations of a committee of which 27% were 'Company men'. In the immediate post-Restoration period, the Company had found ways of ensuring its aims were reflected in emerging trade commercial policy; the Company was well represented and its needs and wishes well attended to, an outcome doubtlessly linked to the financial gifts and loans made by the Company to the king or his acolytes. The return of Charles witnessed contentious discussions with Parliament concerning the Royal finances. Many MPs at the time of the Restoration were fearful that a generous financial provision would result in an independent monarchy, accompanied by a standing army, with echoes of the King's father's activities and consequences in the 1640s (Coward, 2003: 286). The sum calculated for the annual needs of the monarch was £1,200,000, but that full sum was never paid (Chandaman, 1975: 196-202).

This excluded the sum of £550,000 that Charles had paid in settlement of his exile period debts, and debts originally owed by his father. The final settlement fell short by £425,000 and Parliament granted Charles excise duties on alcohol for life, but it was barely £100,000. By the end of 1660, the monarchy had debts of £925,000 and received £300,000 less than the specified £1,200,000. This was compounded by Charles' decision to maintain a standing army garrison at Tangier – significantly not in England, at an annual cost of £140,000 (Childs, 1976: 47). Charles was unable to raise money through taxation without Parliament's approval, action that was not feasible, and with annual income challenges the notion of long term credit loans was, in the main, not tenable. Charles was thus in a position which, to say the least, made him financially vulnerable and enthusiastic to participate in arrangements which might alleviate that vulnerability. Contextually, Parliament's stance accentuated Charles' subsequent propensity to enter into questionable financial arrangements, whilst, paradoxically, also serving to weaken its financial hold over him (Miller, 1982: 4).

Charles obtained loans and gifts from many sources, not least from the EIC. The Company's lobbying paid dividends, in more ways than the obvious: the Company's Charter was renewed in 1663. Between 1660 and 1688, the Company experienced an economic boom, at least on the surface. Between the Restoration and 1688, the Company, usually with the explicit backing of the monarchy, complete a total of 404 voyages to the East Indies (Furbur, 1997: 91). The cargoes included the traditional cloths of cotton and silk, but the entrepreneurial endeavours of Company officers now included expansion into coffee and tea, and saltpetre. The established bases at Surat and Madras, the new port of Bombay, new liaisons with Bengal, all contributed to record levels of trade. 1664 saw imports into England of two hundred and fifty thousand bales of cloth, imports which contributed to the fashionable clothing styles favoured by the Restoration court and the tastes of those following the Royal fashion agenda. By 1684, cloth imports totalled in excess of one and three quarters of a million bales, again contributing significantly to the clothing industry in England and to the balance of trade through re-exports to the new colonies and European countries.

The Company's reliance on cloth trade was emphasised by this level of activity amounting to 83% of its total trade. 1680s witnessed a new high in the Company's share price of £300. (The share price had been £65 in 1664, had grown to £245 in 1680.) Dividends also surged. In the 1670s, dividends averaged 20% of profits, but in 1680 reached a then high of 50%, with this level repeated again in each 1682, 1689, and 1691. Between 1657 and the late 1680s, shareholders received returns in cash dividends alone totalling 840% of their investments. Following Charles' sanction of bullion exports, the Company continued to

export increasing amounts as trade grew. Between 1681 and 1685, the Company's bullion exports exceeded 240 tonnes of silver. Many of the bullion export critics were silenced, as these exports were shown to stimulate the economy of India, through employment, output, and exports to England, and re-exports from England to elsewhere.

The death of Charles and the accession of James saw Royal patronage not only maintained but, through both marriage and financial arrangements, increase. The backing by James of the EIC Governor, Josiah Child, saw an aggressive expansion in India. The figures quoted above represent peaks, highs, and are, in mathematical terms, absolute rather than relative. They hide the reality of the troughs experienced from time to time through depressions and wars, and the challenges to the Company and the Nation. One such trough occurred during the Second Anglo-Dutch War in 1667. The first had been in 1663 but had not lasted long enough to have a serious impact on the Company's activities. Then, trade imports and exports ground almost to a halt. In 1672, Charles used what he perceived as his Royal prerogative to suspend his interest payments due on loans, causing consternation amongst his many creditors, including the EIC as a corporation, and merchants and gentry who required income to maintain their lifestyles. Immediately afterwards, the effects of the on-going Franco-Dutch war were felt, with concern about what would happen to imports and exports in a volatile European climate. Such concern is evidenced by a communication from the Directors in London to the Officers in Madras: *'Europe being so filled with all sorts of goods from your parts and you so full of Europe commodities, we would have you forebears to provide any of the said commodities. (Danvers and Foster, 1902).* The surge in bullion exports in the early 1680s is at odds with the reality of trade. Further communications between London and India suggest that it was move by the Company not to finance extra trade necessarily, but, rather to manage interest rates in India through differential values in exchange rates. (Danvers and Foster *ibid*).

There was a decline, although temporary, in activity in 1683. This was caused by a credit crisis in the City of London and panic amongst creditors to many companies. The EIC held large sums of short-term loans from the public and was forced to repay them. The sense of anger and concern expressed against many companies – but particularly the EIC given its propensity to continue to export large quantities of bullion, forced the Directors to suspend bullion exports until all immediate debts had been paid. Thus, the figures quoted earlier hide what was, in reality, a turbulent passage over time. More turbulence was to churn the not always so calm waters, following the transition from James to William and Mary in the Glorious Revolution of 1688.

Peaks And Troughs: The Role Of Sir Josiah Childs And The Atlantic Slave Trade

Josiah Child was pivotal in the increase in the fortunes of the Company, blending strategic skills with opportunism. He had a history of entrepreneurship. He supplied food as a victualler to the Navy under first Oliver Cromwell and then Charles II, and grew very rich. He was instrumental in founding the Royal African Company, helping it to acquire its Charter for monopoly of the slave trade. He used his ever increasing wealth to acquire shareholdings in the EIC. Between 1671 and 1679 his stock increased from 2% to him becoming the largest shareholder. Throughout the 1680s he was either Governor or Deputy Governor. When not holding these offices, his shareholding ensured his wishes were heard, and acted upon. He was a fierce advocate of the Company's expansionist policies and published his views on trade and business models.

His presence in the London Stock Exchange was formidable; he bought and sold shares for other as well as himself. Daniel Defoe (Defoe, 1700 reprinted 2000: 243) articulated the view that he was well versed in the art of misrepresentation of facts with a view to manipulating the share price of the EIC: *'there are those who tell us, letters had been order'd by private management to be written from the East Indies with an account of the loss of ships which have been arrived there, and the arrival of ships lost; of war with the Great Mogul, when they have been in perfect tranquillity, and of peace with the Great Mogul when he*

has come down against the factory of Bengal with 100,000 men, just as it was thought proper to call those rumours for raising and falling of the stock and when it was for this purpose to buy cheap and sell dear.' Child's views on the generation of profit focussed on monopoly as the primary source of amassing wealth both for the individual and for the nation. He also embraced the notion of profit from the slave trade: not just in the East Indies but also within the Atlantic triangular route. It was through this mechanism, and his close links with James, Duke of York (later James II) as head of the Royal African Company (RAC) The notions of the slave trade heading from Africa west across the Atlantic, and trading companies heading east to India and China is well established in the psyche of the generalist reader of history. Harms (2002: 92) makes a specific and telling, point:

'While many are aware of the 'triangular' slave trade between Europe, Africa, and the Americas in the 18th century, few people realize that Asian-European trade was also instrumental in sustaining the exchange of human slaves. For example, French ships taking European goods to Asia returned with cowry shells and Indian textiles valued by West Africans. On the African coast, traders exchanged these Asian products for slaves who, in turn, were sent to France's New World colonies. The circle was completed when sugar and other goods from the Americas were loaded on board and shipped back to France. The Asian-European trading relationship, as a fundamental step in the African slave trade, thus played a crucial role in the development of an integrated global economy in the early modern era'.

Bringing matters to a more localised arena, Murphy (1999) use the English East India Company as a focus of a significant dimension to Harms' point:

'Although the (English) East India Company was not itself engaged in the transatlantic slave trade, the link was very close and highly profitable.'

The Atlantic slave trade was in fact, and without being revealed in the accounts, a vital contributor to the financial strength of the English East India Trading Company. The mechanism for this subterfuge involved a close relationship between that Company and the Royal African Company. Kitson (1999) records the RAC's roots in the foundation of a slaving company by the Stuart Royal family in 1660, under the direction of James, Duke of York, Charles II's brother and the future James II. It was granted a monopoly under Royal Charter. Slaves had either the initials 'RAC' or 'DY' (*Duke of York*) branded on their chests. Between 1672 and 1689 it transported between 90-100,000 slaves from West Africa to the Caribbean – and East India Trading Company ships were utilised on many journeys.

The link was Sir Josiah Child, a founding member of the RAC. In 1671, he became a shareholder in the EIC and by 1679 he was the largest EIC shareholder (Robins, 2006). Between 1674 and 1699, the year of his death, he was an EIC Board member; indeed, he was either governor (chairman) or deputy-governor throughout the 1680s. The duality of the two positions was realized through the awarding of contracts by the RAC to the EIC for the carriage of cargoes, including those other than textiles: slaves. Davies (1999) reports that, as a consequence, the ports of Liverpool and Bristol in particular were to see the comings and goings of EIC ships to and fro across the Atlantic with the transportation of slaves from West Africa. The 'at a distance' involvement – acting as a third party carrier across the Atlantic - was not the sole engagement of the East India Trading Company.

A more 'hands on' engagement was also undertaken. Logan (1956) reports that whilst much research has taken place into the transport westwards from Africa to the Caribbean, transportation the other way, across the Indian Ocean to Asia, has received less attention. A significant number of slaves were transferred from Africa into Asia, particularly into India and south-west Asia. The East India Trading Company was a pro-active participant: *'Among the companies to engage in this traffic to the East, the British East India Company took an auspicious part. Thus while another English company, the Royal African, was busily transporting slaves westward into the then new lands of North America and the West*

Indies, the East India Company was similarly occupied, although on a smaller scale, with shipping Madagascar slaves to India and the East Indies’.

Unlike the trade to the New World, where enslaved labour worked on sugar and cotton plantations, other motives were behind the transportation of the slaves from Madagascar. This ‘hands on’ engagement was connected with the establishment in 1686 by the East India Trading Company of a factory, York Fort, at Benkulen on Sumatra. The Company had originally transferred its England-based employees to York Fort but had become alarmed by the ill health suffered and deaths taking place due to the unfavourable climate and conditions. So alarmed was the company that correspondence between London and Benkulen referred to ‘*Englishmen being sent to their everlasting homes*’ if sent to that ‘*fever infested island*’ (Logan *ibid*). One option was to abandon York Fort but it was Company policy to retain a foothold on Sumatra to counter the activities of the Dutch.

Thus, the slaves were to be sent as direct replacements for English employees, English employees however, did more than work in the factory. Logan (*ibid*) identifies slaves being used in a victory of pragmatism over ideology, as armed quasi-soldiers, rather than chattels within the factory. Logan’s examination of ship records and slave documentation at Your Fort indicates that some of the slaves on Sumatra had been transferred not from Madagascar but from Fort St. George, the company’s location near Madras in India. This suggests that the Company may already have been involved in slaving from an earlier period.

The English East India Company was not alone in either the collaboration with the slave ships of other companies or its own activities. Harms (*ibid*) reports of the involvement of the French East India Company in the slave trade, emphasising its key role in forming what he terms ‘*a vital link in the trading system that connected the continents and formed the backbone of the global network of commerce*’. As with the role of the East India Trading Company related earlier as a key cog in the slave trade, Harms contends that the popular view of slave trade routes being connected in a triangular fashion, linking the circuit of Africa, Europe and the Americas, is understandable but a fallacy; in fact it formed ‘*an essential bridge between Europe’s New World trade and its Asia trade*’.

THIS PAPER IN REVIEW

The thrust of this paper has sought to show that trade, commerce and business in the seventeenth century reflected many of the characteristics witnessed in the twenty first century. The scale of West-East trade was tantamount to a form of globalization, contained within a framework of mercantilism, ensuring protectionism and tariffs worked to the advantage of the English Monarchy and the EIC shareholders. Where this involved co-operation and partnership, this was acceptable if profit was the result. Trading parties co-operated with each other on partnership terms, but also competed. The drivers of the necessities of survival and profit resulted in pragmatic collaboration, sometimes corruption, ensuring that money arrived in the pockets of the few, usually, particularly in the case of slaves and the colonies, at the expense of the many. This paper provides a foundation for further study in the area of archive documentation tracing and tracking the flows of profit and cash.

EFFECTS OF MONETARY POLICY RATE ON INTEREST RATES IN NIGERIA

Ikechukwu Kelilume, Lagos Business School

ABSTRACT

Monetary policy rate has remained a major potent monetary policy tool used by monetary authorities in setting targets and direction of other rates and in driving the movement of other macroeconomic aggregates in both developed and developing countries. In Nigeria however, the Central Bank has kept monetary policy rate stable at 12 percent between October 2011 and September 2012 but stability in MPR is hardly reflected in the movement short term and long term interest rates. The aim of this study is to use the multivariate Vector Autoregressive Model (VAR) to analyze the effects of MPR on other rates in Nigeria. The study makes use of monthly data from M1:2007 to M9: 2012 to evaluate the cause effect relationships between MPR and short term and long term rates in Nigeria. The choice of the scope of the study lies in examining the response of interest rates to monetary policy shock since the 2007-2008 global economic crises. Result obtained from this study will be used to track the relative effectiveness of monetary policy in an emerging market where money market instrument is not fully developed.

JEL: E4, E43, E52

KEYWORD: Monetary Policy, Monetary Policy Rates, Interest Rates.

INTRODUCTION

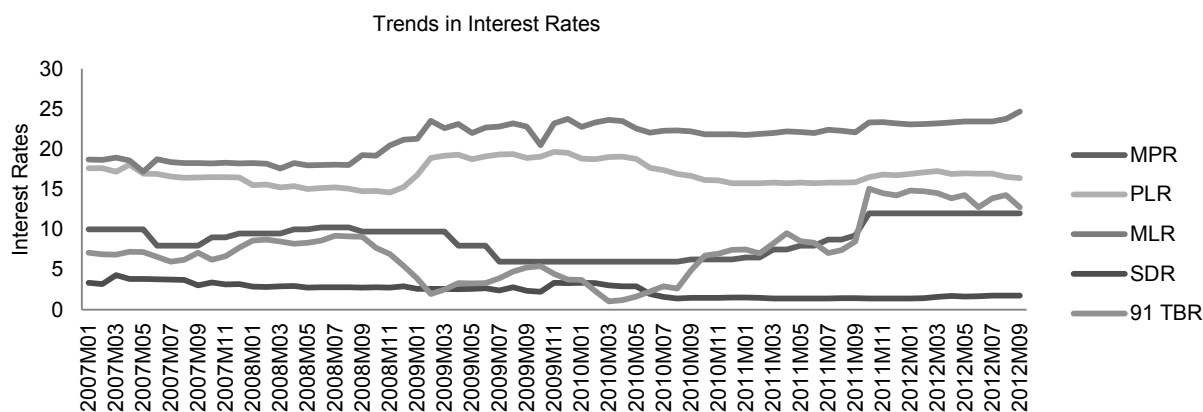

Two major policy instruments used by monetary authorities to influence the level and availability of credit in most developed and emerging market economies is fiscal policy and monetary policy. Of particular interest to the monetary authorities in developing economies is the issue of how monetary policy impacts on some selected macroeconomic target variables which inter alia, includes money supply, equilibrium money stock, interest rates, investment, savings and the level of Gross National Product (GDP). Although, the relative effectiveness of monetary policy in developing countries and emerging market economies has been less successful because of the unsophisticated nature of the money market in most of the economies. There is however, an increasing need to track the sensitivity of interest rates to changes in monetary policy target instrument-the monetary policy rates (MPR). Two decades ago, the empirical literature was heralded with conflicting views on the direction of causation on the monetary transmission mechanism. While prevailing theory such as the term structure of interest rate provides little guide to policy makers as to the size and persistence of the effects of monetary policy rates on short term and long term yields, the expectation hypothesis does not appear to do better in providing the linkage between monetary policy instrument and short term and long term interest rates.

The transmission of monetary policy action is often effected through interest change. Being a cost for borrowing and a reward for lending, the interest rate is an important economic variable which need to be guided so as to achieve economic stability. In a bid to ensure price and financial stability, the Central Bank of Nigeria (CBN) Monetary Policy Committee (MPC) adopted the Monetary Policy Rate (MPR) in place of Minimum Rediscount Rate (MRR) to controls the movement of market interest rate by benchmarking it against the MPR. Generally, a tight monetary policy tends to increase interest rate which impacts the economy by increasing the cost of borrowing and by so doing cut back on investment and the general price level. The reverse situation applies to an easy monetary policy but this may not be the actual behaviour of interest rate in practices. In the wake of the 2007-2008 global financial crises, the CBN reduced the MPR in an attempt to avert the global uncertainty of recession. The puzzle in the

response of market interest rate to monetary policy actions as shown in the trend in figure 1 has left economic analyst with the profound question of the effectiveness of monetary policy in tracking other rates and target variables in Nigeria. To this end, this paper is designed to test the linkage between MPR and other market interest rate in Nigeria over the period 2007 to 2012. The choice of these periods is unique as it marks the period in which monetary authorities carried out several monetary policy actions to check economic recession and contagion from the external economic environment.

Following the introduction section, the rest of the paper will be structured into four sections. Section two reviews the empirical literature while section three deals with the methodology and data. In section four we present the empirical analysis while section five concludes the paper.

Figure 1: Monetary Policy Rate and Interest Rates Movement in Nigeria

The figure shows monthly data of interest rate movement in Nigeria during the period 2007M1-2012M9. The fourth line from the top-right of the chart is the monetary policy rate. Between M1:2007 and M4:2009 MPR was a lot stable averaging 5 per cent. Until M10:2011 there was a misalignment between MPR and all other rates. Of particular interest is the savings deposit rate which has remained very low since 2007. All rates however, showed a stable movement between 2011 and 2012 when MPR was fixed at 12 per cent.

LITERATURE REVIEW

The process in which bank interest rates respond to changes in monetary policy rates is often referred to in the literature as interest rate pass-through process. This process is simply the rate or process at which official interest rate is transmitted to other interest rates (Rehman 2009; Kovanen, 2011). Generally, a weak and incomplete interest rate pass-through is an indication of an unhealthy financial system (Aydim, 2007) and the failure of monetary policy to stabilize macroeconomic shocks (Marotta, 2009).

There has been renewed interest in the issues of interest rate pass-through especially with regards to the link between monetary policy rate and short term and long term interest rate. Early studies on the subject matter includes; Cottarelli and Kourelis (1994); Heinemann and Schuler (2002); Mojon (2000); Toolsema, Strum and de Haan (2001); Donnay and Degryse (2001); Petro, McDermott and Tripe (2001); Weth (2002); and De Bondt (2005). The more recent studies on interest rate pass-through include; Hofmann and Mizen (2004); Sander and Kleimeier (2004); Ghartey (2005); Sorensen and Werner (2006); Sorensen and Werner (2006); Liu, Margaritis and Tourani-Red (2008) Chen, (2009); Banerejee, Bystrov and Mizen (2010); Cas, Carrion-Menendez and Frantischek (2011) and Tia, Sek and Har (2012).

The conventional model for analyzing the effects of monetary policy rate on market rates is the Monti-Klein model (Monti 1971, Klein 1971). The Monti-Klein framework assumes that if markets are perfectly competitive then the interest rate pass-through will be full symmetrical and swift in response to monetary policy rate. The model assumes the absence of information asymmetry, switching cost and imperfect competition in financial markets and by so doing making the full pass-through a long run

phenomenon while deviations from long run equilibrium occurs only in the short run. Although, the reality in most markets is that perfect market condition hardly exists as markets generally exist under conditions of imperfect market situations, high switching and menu cost and absence of perfect information. This notwithstanding, some studies have found the Monti-Klein model to be realistic and true in its assumptions. These studies which reflected changes in monetary policy rates in asymmetric and non-linear adjustment includes; Hofmann and Mizen (2004), and Fuertes and Heffernan (2009).

Almost all the studies in the empirical literature on the interest rate pass-through is centered on the investigation of the degree and speed of adjustment of banking rates to changes in money market rates however, with some degree of variability in terms of short term and long term adjustment of market rates to monetary policy rates. While some of the study concluded in their empirical analysis that interest rate pass-through is weak and incomplete (Kwapil and Scharler 2006; Aydim, 2007; Marotta, 2009; Kovanen 2011), others found interest rate pass-through to be weak in the short run but fully complete in the long run (Weth 2002). Yet, few studies found interest rate pass-through to be fully complete in the short (Crespo-Cuaresma, Egert, and Reininger 2004). Four major theories however exist in the literature to explain the inflexibility in interest rate in the short run. These theories include; the agency cost theory (Stiglitz and Weiss, 1981), the adjustment costs (Cottarelli and Kourelis, 1994), the switching costs (Klemperer, 1987) and the risk sharing cost (Fried and Howitt, 1980).

The more recent studies of interest rate pass-through have considered the impact of future money market rate on current retail rate setting with the central focus on the search for market efficiency (Bernoth and von Hagen, 2004). In the study conducted by Sander and Kleimeier (2006), it was found that there exists a greater response to anticipated monetary policy changes measures by interest rate features than to unanticipated changes. Other recent studies have gone beyond estimating the degree and speed of adjustment of market interest rates in relation to changes in monetary policy rates to examining the degree and variability of interest rate pass-through across countries and regions (Weth 2002; De Bondt 2005; Sorensen and Werner 2006; Sander and Kleimeier 2006; Banerjee, et al 2010; Cas. et al 2011). These studies shows the degree of interest rate pass-through differ across regions and across countries with common monetary union. Some studies have found the monetary transmission mechanism to be quick and efficient while other found the effect of monetary policy rate on market rates to be inconclusive.

The recent study carried out by Aziakpono, Wilson and Manuel (2007) and Aziakpono and Wilson (2010) attest to this fact. While Aziakpono, Wilson and Manuel (2007), found market interest rates to respond quickly to monetary policy rate, the study conducted by Aziakpono and Wilson (2010) found that commercial Banks lending rates are more rigid in response to positive shocks in monetary policy official rate in South Africa. In Nigeria, the Central Bank (CBN) Monetary Policy Council (MPC) which derives its legal backing from the various statutes of the bank (CBN Act 1958; Decree No. 3 1997; CBN Act 2007), adopted a new anchor for monetary policy action on December 11, 2006 with the ultimate goal of achieving stability in the domestic currency, prices and ultimate economic stability through interest rates stability around a benchmark called MPR. At inception, MPR was fixed at 10 per cent with a 600 basis point making a lower band of 7% and an upper band of 13% based on the current and expected inflation. Since inception, the MPR has been changed about fourteen times most of which was positive and are usually done in anticipation of a raise in the general price level. Adjustment of MPR by MPC has ranged from a decrease of 20% in the wake of the 2007-2008 global economic crisis to an approximately 30% increase in the period between the third quarter 2011 and the fourth quarter of 2011.

As shown in figure 2 (see Appendix 1) monetary policy rate (MPR) has remained constant between the third quarter of 2011 and the third quarter of 2012. Although at various periods of the change in MPR, market interest rates exhibited changes in different direction without correspondingly tracking changes in MPR. This according to Romer and Romer (2000) represents a puzzle to policy planners. Given that the

relative effectiveness of MPR in tracking other market rates has not been extensively studied in Nigeria, we explore this linkage for Nigeria.

DATA AND METHODOLOGY

Data Source

The data used for this study is monthly time series observations sources from the Central Bank of Nigeria Statistical Bulletin covering the periods 2007:M1 to 2012:M9. The choice of this period is unique given that it tracks the monetary policy action of the Central Bank in the wake of the global financial crisis of 2007-2008. The major variables used in the model include monetary policy rate (MPR), savings deposit rate (SDR), interbank rates (IBR), prime lending rate (PLR), maximum lending rate (MLR) and 91 day Treasury bill rate (TBR).

Theoretical Framework And Model Specification

The theoretical base for explaining the linkage between monetary policy rate and short term and long term and long term interest rates is the marginal cost pricing model also referred to as the monetary policy approach (de Bondt, 2005). Following the Monti-Klein framework (Monti 1971; Klein 1971) which assumes the existence a perfectly competitive market devoid of asymmetric information, transaction cost and menu cost, we assume price is equal to marginal cost. Under this condition, the derivative of price with respect to marginal cost will be unity. If this assumption of perfect competition is relaxed however, the derivative of price with respect to marginal cost becomes less than unity. Applying this framework to the relationship between money market rate and retail rates of interest we develop a simple model where;

$$BRR = f(MPR) \quad (3.1)$$

Where, BRR is bank retail rates which are in the form of short term interest rates (savings deposit rate (SDR), interbank rates (IBR), prime lending rate (PLR), maximum lending rate (MLR) and long term interest rates in the 91 day Treasury bill rate (TBR). MPR is the monetary policy rate usually set by the monetary policy council (MPC) in Nigeria.

In simple linear estimation form we can express equation (3.1) as;

$$SDR_t = \alpha_0 + \alpha_1 MPR_t + U_t \quad (3.2)$$

$$IBR_t = \beta_0 + \beta_1 MPR_t + U_t \quad (3.3)$$

$$PLR_t = \delta_0 + \delta_1 MPR_t + U_t \quad (3.4)$$

$$MLR_t = \phi_0 + \phi_1 MPR_t + U_t \quad (3.5)$$

$$TBR_t = \lambda_0 + \lambda_1 MPR_t + U_t \quad (3.6)$$

Where; MPR, monetary policy rate is assumed a proxy for marginal cost price. Parameters $\alpha_1, \beta_1, \delta_1, \phi_1$ and λ_1 are the coefficient of the pass-through rates, while the parameters $\alpha_0, \beta_0, \delta_0, \phi_0$ and λ_0 are the constant terms. If the coefficient of the pass-through rate is unity, the

transmission of monetary policy rate to other market rates is said to be complete and efficient. However, if the coefficient of the pass through rate is such that it lies between zero and unity, the monetary transmission mechanism is said to be incomplete and inefficient.

To establish the direction of casualty and interdependence between monetary policy rate and other retail rates, we adopt the Vector Autoregressive (VAR) methodology. This methodology is explained in a simplified form if we assume a $n \times 1$ vector composed of banking retail rates (Y), we can explain the VAR as a model that relates current values of Y_t to past values of Y_t and a $n \times 1$ vector of innovation U_t . This can be expressed simply as;

$$Y_t = \alpha + \phi_1 Y_{t-1} + \dots + \phi_p Y_{t-p} + U_t \quad (3.7)$$

Where; α is a $n \times 1$ vector and ϕ_j 's are $n \times n$ matrices. U_t is a $n \times 1$ vector of serially uncorrelated random variables with zero mean and a covariance matrix Ω . The VAR model can be expressed explicitly as;

$$BRR_t = \alpha_1 + \sum_{t=1}^n \alpha_{11} BRR_{t-1} + \sum_{t=1}^n \alpha_{12} MPR_{t-1} + U_t \quad (3.8)$$

$$MPR_t = \alpha_2 + \sum_{t=1}^n \alpha_{21} MPR_{t-1} + \sum_{t=1}^n \alpha_{22} BRR_{t-1} + V_t \quad (3.9)$$

Where; BRR is banking or market rates of interest in the form of savings deposit rate, interbank rates, prime lending rate, maximum lending rate and the 91 day Treasury bill rate. MPR is the monetary policy rate while U_t and V_t are the uncorrelated error term.

To estimate the impulse response and variance decomposition of monetary policy rate and market rates, we assume that the innovations $U_t = (U_t \text{ and } V_t)$ are functions of some fundamental shocks ϵ_t : such that;

$$U_t = \psi \cdot \epsilon_t \quad (3.10)$$

Where; $\epsilon_t \sim iidN(0, \Omega)$. These fundamental shocks represent unanticipated deviations of the Central Bank from its monetary policy rule usually termed as monetary policy shocks. To estimate the matrix ψ^* in equation 3.10, we assume that ψ^* is the lower triangle in the 2×2 matrix in equation 3.11.

$$\begin{bmatrix} U_{1,t} \\ U_{2,t} \end{bmatrix} = \begin{bmatrix} \psi & 0 \\ \psi & \psi \end{bmatrix} \begin{bmatrix} \epsilon_{1,t} \\ \epsilon_{2,t} \end{bmatrix} \quad (3.11)$$

From the ordering in equation 3.11, the innovation, $Y_{1,t}, U_{1,t}$ are not affected by the shocks $\epsilon_{2,t}$ but innovation $U_{2,t}$ is affected by the shock $\epsilon_{2,t}$. We can interpret one of the ϵ_t 's as monetary policy shock and we are interested in finding out how this monetary policy shocks affects other retail rates of interest.

To establish the transmission mechanism between monetary policy rates and short term and long term interest rates, we use the Granger causality test. Usually, the null hypothesis is rejected if the observed F-Statistics exceeds the critical F-values at the usual 1 percent, 5 percent or 10 percent levels of significance.

EMPIRICAL ANALYSIS

The result of the effects of monetary policy rate (MPR) on interest rates in Nigeria is summarized in Table 1 and 2. While Table 1, shows the result of the model without considering the stationarity properties of the variables, Table 2, shows the result of the regression estimate with a consideration of the unit root properties of the variables. Both results reported in Table 1 and 2 compares the results between the response of short term rates (savings deposit rate, interbank lending rate, prime lending rate and maximum lending rate) and long term rate (91 days Treasury bill rates) to changes in monetary policy rates. In Table 3, we report the results of the interdependency between monetary policy rate and short term and long term interest rates using the granger causality test. The result from Table 1 shows an interesting pattern of the link between monetary policy rate and retail interest rates in Nigeria. While the interest rate pass-through from monetary policy rate to savings deposit rate, prime lending rate and maximum lending rates were incomplete and failing the test of significance on the basis of the traditional t-test, the interest rate pass-through from monetary policy rate into interbank rates and long term interest rates (Treasury bill rate) were complete and significant on the basis of the traditional t-test.

Table 1: Estimated Result at their Levels

	SHORT TERM MARKET RATES				LONG TERM MARKET RATES
	(1, SDR)	(2, IBR)	(3, PLR)	(4,MLR)	(5, TBR)
C	2.7953	-2.5071	19.1434	22.1692	-5.1494
	(6.5497)***	(-1.4294)	(28.1112)***	(19.8234)	(-4.3143)***
MPR	-0.0424	1.4258	-0.2528	-0.1045	1.4342
	(-0.8969)	(7.3256)***	(-3.3459)**	(-0.8427)	(10.8289)***
R-squared (R ²)	0.0118	0.4447	0.1434	0.0104	0.6363
Adj. R-squared	-0.0028	0.4365	0.1303	-0.0042	0.6309
F-statistic	0.8044	53.66***	11.1950***	0.7101	117.2651***
Durbin-Watson	0.1194	0.7357	0.1555	0.1148	0.2489

The table reports results for the regression estimate over the sample periods 2007:M1-2012:M9. The models reported includes: $SDR_t = \alpha_0 + \alpha_1 MPR_t + U_t$; $IBR_t = \alpha_0 + \alpha_1 MPR_t + U_t$; $PLR_t = \alpha_0 + \alpha_1 MPR_t + U_t$; $MLR_t = \alpha_0 + \alpha_1 MPR_t + U_t$; and $TBR_t = \alpha_0 + \alpha_1 MPR_t + U_t$; where the dependent variables are savings deposit rate, interbank rate, prime lending rate, maximum lending rate and treasury bill rate. The explanatory variable in all five equations is monetary policy rate (MPR). The figures in parenthesis are the t-statistics and the symbol ***, ** and * indicates significant at the 1, 5 and 10 percent respectively.

The result shows that interbank rates and Treasury bill rate increases substantially with an increase in monetary policy rate, with both variables passing the test of significance at the 1 per cent level and having a relatively high adjusted R² (coefficient of determination) value of 0.43 and 0.63 for interbank rate and Treasury bill rates respectively. The result of the unit root test reported in Table 3 however, shows the variables were all not stationary at their individual level hence the need for differencing of the variables reported in Table 1.

Table 2: Unit Root Test for the Variables

Augmented Dickey-Fuller Test				
Variables	Levels	Status	First Difference	Status
MPR	-0.8654	I(0)	-7.8611	I(1)
SDR	-2.7481	I(0)	-9.7377	I(1)
IBR	-2.8392	I(0)	-9.0248	I(1)
PLR	-2.3235	I(0)	-6.0145	I(1)
MLR	-2.5526	I(0)	-10.78482	I(1)
TBR	-1.4153	I(0)	-6.6138	I(1)

The table shows the result of the Augmented Dickey-Fuller (ADF) set of unit root test at the levels of the individual variables and at their first difference with I(0) indicating integrated of order 0 and I(1) indicating integrated of order 1.

Table 3 shows the result of the regression estimate after first differencing. From the result reported in Table 2, all the variables became stationary after first differencing. The result obtained after first differencing appears to be similar with the result reported in Table 1. With the exception of the low R², monetary policy rate had a positive impact on interbank rate and Treasury bill rate. However, the pass

through of monetary policy rate was only complete in relation to interbank rate where the coefficient of interbank rate was positive and greater than unity.

Table 3: Estimated Result at their First Difference

	SHORT TERM MARKET RATES				LONG TERM MARKET RATES
C	(1, SDR)	(2, IBR)	(3, PLR)	(4,MLR)	(5, TBR)
	- 0.0244	0.0111	-0.0206	0.0893	-0.0608
	(-0.7151)	(0.0312)	(-0.3483)	(1.0058)	(0.4597)
D(MPR)	0.0426	1.1075	0.0670	-0.0520	0.7577
	(0.7177)	(1.7998)**	(0.6521)	(-0.3383)	(3.3051)***
R-squared (R ²)	0.0077	0.0467	0.0064	0.0017	0.1420
Adj. R-squared	-0.0072	0.0323	- 0.0086	-0.0133	0.1290
F-statistic	0.5150	3.2392**	0.4252	0.1144	10.9239***
Durbin-Watson	2.3454	2.3270	1.4638	2.5543	1.6885

The table reports result for differenced regression estimate over the sample periods 2007:M1-2012:M9. The models reported includes: $d(SDR_t) = \alpha_0 + \alpha_1 d(MPR_t) + U_{it}$; $d(IBR_t) = \alpha_0 + \alpha_1 d(MPR_t) + U_{it}$; $d(PLR_t) = \alpha_0 + \alpha_1 d(MPR_t) + U_{it}$; $d(MLR_t) = \alpha_0 + \alpha_1 d(MPR_t) + U_{it}$ and $d(TBR_t) = \alpha_0 + \alpha_1 d(MPR_t) + U_{it}$; where the dependent variables are savings deposit rate, interbank rate, prime lending rate, maximum lending rate and treasury bill rate respectively. The explanatory variable in all five equations is monetary policy rate (MPR). The figures in parenthesis are the t-statistics and the symbol ***, ** and * indicates significant at the 1, 5 and 10 percent respectively.

Both results give an idea of the relative effectiveness of monetary policy in tracking other rates in Nigeria. An interesting finding of the study is that savings deposit rate does not respond to changes in monetary policy rate while the rate of adjustment of Treasury bill rate to monetary policy rate is weak as indicated by the difference series. Both results show the response of interbank rate to monetary policy rate to be strong and positive which has strong implication for investment in Nigeria.

Table 4: Mac-Kinnon Critical Value for Rejecting the Null Hypothesis of Unit root

Augmented Dickey-Fuller Test Criteria		
Critical Values	ADF at Levels	ADF at First Difference
1%	-4.0987	-4.1009
5%	-3.4772	-3.4783
10%	-3.1661	-3.1667

The table shows the Mac-Kinnon critical value for rejecting the null hypothesis of unit root in the model. We reject the null hypothesis of no unit root if the critical Mac-Kinnon value greater than the observed ADF tau statistics at the 1, 5 and 10 percent levels respectively.

In Table 5, we report the test of the interdependencies between the variables and the response time of retail interest rate to changes in monetary policy rate. The result indicates that monetary policy granger causes only interbank rates with the effect almost immediately. Also of interest to us is the fact that there appears to be a bi-directional relationship between monetary policy rate and interbank rate. This is indicated by the high and significant F-statistics values of 12.6 and 4.8 respectively with the values passing the test of significance at the 1 percent level. Other notable findings from the granger casualty test shows that savings deposit rate, prime lending rate and Treasury bill rate granger causes monetary policy rate and not the other way round.

CONCLUSION

This study set out to analyse the effect of monetary policy rate on interest rates in Nigeria over the sampling periods 2007-2012. The study utilized monthly time series data obtained from the Central bank of Nigerian Statistical Bulletin over the period (2007:M1-2012:M9). The choice of this period is remarkable as it marked the period of the change of the Central Bank from the use of minimum rediscount rates (MRR) to monetary policy rate (MPR) as the benchmark rate of interest for the country. The period is also unique as it coincided with period in which the Central Banks of most countries responded to the 2007-2008 global financial crises with substantial use of monetary policy tools.

Table 3: Granger Causality Test

Augmented Dickey-Fuller Test Criteria			
Direction of Causality		Lag Length	F-Statistics
$\Delta\text{MPR} \rightarrow \Delta\text{SDR}$		1	0.5107
$\Delta\text{SDR} \rightarrow \Delta\text{MPR}$		1	5.0734***
$\Delta\text{MPR} \rightarrow \Delta\text{IBR}$		1	12.6264***
$\Delta\text{IBR} \rightarrow \Delta\text{MPR}$		1	4.8351***
$\Delta\text{MPR} \rightarrow \Delta\text{PLR}$		2	0.0278
$\Delta\text{PLR} \rightarrow \Delta\text{MPR}$		2	5.0295***
$\Delta\text{MPR} \rightarrow \Delta\text{MLR}$		1	0.8077
$\Delta\text{MLR} \rightarrow \Delta\text{MPR}$		1	0.0203
$\Delta\text{MPR} \rightarrow \Delta\text{TBR}$		1	0.1758
$\Delta\text{TBR} \rightarrow \Delta\text{MPR}$		1	7.8407***

The table shows the granger casualty of interdependencies between monetary policy rate and retail interest rate. The symbol Δ represents change in the one variable in response to change in the other variable in the model. In the table, monetary policy exhibits a unidirectional relationship with interbank rate with the shock taking place immediately. The *** indicates significance at the 1 per cent level.

The major findings of this study is that the pass-through of monetary policy rate into short term and long term retail interest rates in Nigeria is sticky. The only evidence of the effectiveness of monetary policy can be seen only in the relationship between monetary policy rate and interbank rates. The low pass-through rate evident in the study could be easily explained by the presence of high menu and transaction cost and imperfect financial market condition. The weak link between monetary policy rate and savings deposit rate can be explained with the low savings incentives. Overall, the study reveals that the continuous use of monetary policy rate (MPR) by the Central Bank of Nigeria as the benchmark rate for tracking the movement of other market rates of interest and maintaining economic stability is suspect and calls for an immediate review. Monetary policy changes through variation in MPR or stability in MPR as has been the case between 2011:M9- 2012:M9 (see Appendix 1.) has produced contradictory result in all the retail market rates with the exception of Treasury bill rate which seems to track movement in monetary policy rate as clearly visible in the trend in figure 1. This result is in line with the earlier findings of Salami and Kelikume (2012) that continuous use of monetary policy tools to maintain price stability is not likely to yield the desired medium to long-term monetary policy goals.

Limitations

The major limitation of this study is the short time span of 2007-2012. Although this problem was successfully addressed with monthly time series data it would have been useful if we compare the interest rate pass through using annual and quarterly time series data over a longer period. Another limitation is that the study did not track the performance of monetary policy in the era of minimum rediscount rates. A comparison of the effectiveness of monetary policy in the era of minimum rediscount rates and monetary policy rate would have thrown more light into the effects of monetary policy rate on other market rates in Nigeria. These limitations notwithstanding, the study generally shows a weak interest rate pass-through in Nigeria.

Appendix 1

OBS	MPR	QUARTERLY CHANGE	DIRECTION OF CHANGE
2007 Q1	10		
2007 Q2	8	-20	Decrease
2007 Q3	8	0	Constant
2007 Q4	9.5	18.75	Increase
2008 Q1	9.5	0	Constant
2008 Q2	10.25	7.89	Increase
2008 Q3	9.75	-4.87	Decrease
2008 Q4	9.75	0	Constant
2009 Q1	9.75	0	Constant
2009 Q2	8	-17.94	Decrease
2009 Q3	6	-25	Decrease
2009 Q4	6	0	Constant
2010 Q1	6	0	Constant
2010 Q2	6	0	Constant
2010 Q3	6.25	4.16	Increase
2010 Q4	6.25	0	Constant
2011 Q1	7.5	20	Increase
2011 Q2	8	6.66	Increase
2011 Q3	9.25	15.62	Increase
2011 Q4	12	29.72	Increase
2012 Q1	12	0	Constant
2012 Q2	12	0	Constant
2012 Q3	12	0	Constant

The table shows the Central Bank of Nigeria Monetary Policy Rate (MPR) over the sample period of the observation. From the observation, monetary policy rate have been relatively stable over the sample period but this stability is hardly reflected in the movement of other rates as shown in figure 1.

GAAP VS. IFRS TREATMENT OF LEASES AND THE IMPACT ON FINANCIAL RATIOS

Peter Harris, New York Institute of Technology

William Stahlin, Stevens Institute of Technology

Liz Washington Arnold, The Citadel, The Military College of South Carolina

Katherine Kinkela, New York Institute of Technology

ABSTRACT

As of January 1, 2011 most of the world financial market economies are using International Reporting Standards (IFRS) as the required framework for financial statements. A non-comprehensive listing includes the European Union Countries, Canada, Australia and New Zealand. In the United States, US Generally Accepted Accounting Principles (GAAP) is still required but adoption of IFRS has support of many accounting firms and professional organizations and is under consideration by the SEC. This case study focuses on differences in the treatment of leases and the impact of these differences on financial statements and selected financial ratios. Students take GAAP financial statements and prepare an IFRS based balance sheet and income statement. The need to understand both GAAP and IFRS rules regarding leases is required to adequately address this case study. This case study is suitable for use at both the undergraduate and graduate levels. It could be used in an Intermediate Accounting II, Accounting Theory, Financial Statement Analysis or an International Accounting class, as well as an Investment Finance course.

KEYWORDS: US GAAP, IFRS, Capital Lease, Operating Lease, Financing Lease, Ratios.

Background

ACE Corp, a publically traded NASDAQ company (symbol ACE), is a manufacturer of electrical automobiles. Its main headquarters is based in Detroit, Michigan and the company has been operating since 1996. The company sells their electrical automobiles to auto manufacturers as well as the retail market on a worldwide basis. Its major clientele is Ford, General Motors and Toyota and has captured about 10 percent of the world market of the electrical automobile sales. Its stock sells at 25 US Dollars per share, and its 52 week price range is between 19.75 and 27.15 US Dollars, with a market cap of 10.6 billion dollars.

Their financial statements presented below for the year ending December 31, 2011 has been prepared using GAAP. The controller would like to see the effect of IFRS treatment of leases on the financial statements, and you have been assigned this task. In particular, the controller would like to see the impact GAAP and IFRS differences have on balance sheet, income statement and selected financial ratios. The company would like to adapt IFRS by as early as next year as it is considering a new stock issue in the Tokyo Stock Exchange, which requires IFRS compliance.

ACE Corp
Balance Sheet (in 000's)
12/31/2011

ASSETS		LIABILITIES AND SHAREHOLDERS EQUITY	
Current Assets		Current liabilities	
Cash	\$33,000	Accounts payable	\$20,000
Accounts receivable	25,000	Accrued expenses	15,000
Investments	10,000	Taxes payable	<u>5,000</u>
Inventory (FIFO)	<u>50,000</u>	Total current liabilities	\$40,000
Total current assets	\$118,000

Net Income	\$10,500

ADDITIONAL INFORMATION

Ace entered into a lease on January 1, 2011 with the following terms:

- Ace leased specialized machinery manufactured by the lessor, Bell Corp., which will enable Ace to manufacture their electric cars in a much more efficient manner. This machinery does not have a resale market and was made specifically for ACE to meet its specifications.
- The lease term is for 3 years with a minimum lease payment of \$10,000. Payment is due on December 31 of each year, with the first payment due on December 31, 2011. At the end of year 3, Ace has the option of leasing the equipment for one additional year for \$2,500. At the end of the lease term, ownership reverts back to lessor. There is no option to buy the equipment.
- The lessee will pay all executor costs.

- The estimated useful life of the lease is 49 months (4 and 1/12 years.)
- The fair market value of the equipment is \$30,000.
- The implicit rate of Bell Corp. is 6 percent, and this is known to the lessee, Ace.
- The incremental borrowing rate of Ace is 7 percent.

REQUIRED

- 1- Differentiate between an operating lease and a capital/ financing Lease for GAAP financial reporting purposes.
- 2- Under GAAP, has this been treated as a capital lease / financing Lease for Ace or an operating lease?
- 3- Under IFRS, should this lease be classified as an operating or a financing lease?
- 4- Describe the different reporting results between GAAP and IFRS and make the necessary adjusting entries to conform the financial statements to IFRS compliance for Year 1.
- 5- Prepare an income statement under IFRS for year 1. Assume that the net income remains the same under IFRS as it does for GAAP and any difference is reconciled in the tax expense and tax payable accounts.
- 6- Prepare balance sheet under IFRS for Year 1.
- 7- Compute the following ratios for Year 1, under both IFRS and GAAP reported totals:
Current Ratio
Quick Ratio
Cash Ratio
Times Interest Earned
Debt to Capital Ratio
Debt to Shareholder Equity Ratio
- 8- Comment on your findings in 7 above.

INSTRUCTOR NOTES

Case Overview

This case focuses on GAAP and IFRS differences in the treatment of leases and the grounds for classification as an operating or capital lease. It is designed to have students conduct research on GAAP and IFRS pronouncements. They are asked to compare and contrast the differences in the treatment of leases under the two frameworks. It also requires students to prepare the adjusting entries for the IFRS conversion. They will prepare IFRS statements, and compute and compare financial ratios for both GAAP and IFRS statements. Finally, they will discuss the status of IFRS adoption and the impact of its adoption in the US.

Case Learning Objectives

The case is designed to have students identify reporting issues and apply U.S. and international authoritative accounting literature by researching the FASB Accounting Standards Codification and the International Financial Reporting Standards (IFRS).

The specific learning objectives are for the student to:

- a) Identify differences in GAAP and IFRS treatment of leases:
- b) Prepare adjusting entries to convert GAAP based financial statements to IFRS income statement and balance sheet and
- c) Prepare an IFRS income statement and balance sheet

Suitable Classes for This Case

Since this case requires research into GAAP and IFRS pronouncements, it is most appropriate for students who have completed or are currently enrolled in intermediate financial accounting II. It can be used at the graduate or undergraduate levels in a variety of additional financial reporting courses including accounting theory, international accounting, and financial statement analysis, as well as an investment finance course.

Suggested Teaching Approach

The case may be offered as an individual case study or as a group project. For more advanced accounting students, this case may be offered as an individual project. It could have a weight of 10-15 % of the final course grade.

For less advanced students, the case may be offered as a collaborative group project. This would enable students to demonstrate and develop team working skills. The case presents an opportunity to discuss the status of IFRS implementation in the US and the impact IFRS had on JAL Corp. The in-class review of the solution and case discussion can be completed as part of a 50 minute class.

In grading the case write-ups, instructors should evaluate the identification of relevant issues, proper accounting for the IFRS conversion and computation of the ratios including the computational accuracy of numbers, quality and depth of research as evidenced by proper citations of the literature. We suggest that the instructor explain the basis for grading at the outset.

Pointers for Classroom Discussion

After the review of the IFRS statements, the instructor may wish to discuss the impact of IFRS. Suggested questions to ask the class could be: What impact will IFRS have on AXE Corp.'s income statement and balance sheet? What are the benefits of adopting IFRS? What are the disadvantages of IFRS? You may wish to have students research the current status in the US of IFRS adoption.

SUGGESTED SOLUTION

Q 1 Differentiate between an operating lease and a Capital/ Financing Lease for financial reporting purposes.

An operating lease is treated as a rent expense and recorded on the income statement. An operating lease is an off balance sheet transaction and is preferred by companies because it lowers the liabilities and the debt ratio. A capital lease –per GAAP, termed as a financing lease under IFRS, is treated as a purchase of a Property, Plant and Equipment and capitalized as such on the Balance Sheet. The minimum lease payments required on the lease are recorded as a liability on the Balance Sheet at the present value. The discount rate is the lessee's incremental borrowing or the implicit rate of the lease, if it is lower and known by the lessee. The liability is separated into its current and long term components which affects the current ratio.

Pointers for Classroom Discussion

Discuss the differences US GAAP based bright line rules, versus principles based IFRS requirements for distinguishing between operating versus capital/financing leases ?

Q2. Under US GAAP, has this lease been treated as a capital lease / financing lease for Ace or an operating lease?

Under GAAP, if the lessee meets one of the four tests listed below, the lease is treated as a capital lease; otherwise it is an operating lease.

Test 1: Economic Life Test: The lease term is equal to or greater than 75% of the economic life of the asset. In this case, the lease term is 3 years divided by the economic life of 4.1 years, yields 73%. Test 1 not met.

Test 2: Transfer of Ownership Test: If at the end of the lease term, ownership transfers to lessee, then this test is satisfied. Test 2 is not met in this case as there is no transfer of ownership at the end of year 3.

Test 3: Bargain Purchase Option: If the lessee has the option to purchase the lease at a bargain purchase price, then this test is satisfied. In this case, there is no bargain purchase option, so test 3 is not met.

Test 4: Economic Recovery Test: If the Present Value of the Minimum Lease payments is 90 percent or greater than the fair market value of the asset.

In this case, the present value of the Minimum Lease Obligation is \$26,730. This divided by the fair market value of the leased asset of \$30,000 is 89 percent; just shy of the 90% requirement. Test 4 is not met.

Minimum Lease

Assuming a Capital/ Financing lease

Year	Payment	Interest 6%	Principal	Obligation-Payable
1	\$10,000	1,604	8,396	26,730
2	\$10,000	1,100	8,900	18,334
3	\$10,000	566	9,434	9434
	\$30,000	3,270	26730	0

Since none of the 4 tests is met, the lease is treated as an operating lease to the AXE Corp. under US GAAP. Note should be made that AXE just missed some of these tests by fractional amounts.

Pointers for Classroom Discussion

Discuss why a corporation has an incentive for making a lease classification as operating rather than capital?

Q3. Under IFRS, should this lease be classified as an operating lease or a financing lease?

Under IFRS, this lease is clearly a financing/capital lease as the criteria of lease type is based on principles, and not rules. Under IFRS, if the lessee assumes the economic benefit and risks of the leased asset, and the facts of the situation are such that the lease resembles a financing lease, then it is treated as a financing lease. The fact that the lessee has a fourth year rental option at a very significant discount, coupled that this machine is specialized in nature for ACE's use, and many of the tests under GAAP are nearly met which are an indicator of a financing classification rather than operating lease. The lessor manufactured this equipment to ACE's specifications and in effect transferred the risk to AXE upon the inception of the lease. Further, ACE was able to circumvent the capital lease rules under GAAP by making estimates work to its advantage.

Q4. Describe the different reporting results between GAAP and IFRS and make the necessary adjusting entries to conform the financial statements to IFRS compliance for Year 1.

In each of the three years of the lease, GAAP treats the operating lease payment of \$10,000 as rent expense on the income statement and is not recorded on the balance sheet.

A: Year of lease Inception:

Under IFRS, the financing/ capital lease is treated as a purchase of property, plant and equipment and capitalized on the balance sheet as such in the amount of \$26,730. Additionally, the Minimum Lease obligation is shown on the balance sheet as a liability in the amount of \$18,334 (\$26,730 less the year 1 payment of \$8,396). Of this amount, \$8,900 is classified as a current liability and \$9,434 is classified as a long term liability. On the income statement, depreciation expense is \$8,910 (26,730 divided by the lease term of 3 years) and interest expense is \$1,604, for a total of \$10,514.

B: Subsequent to Year of Inception-years 2 and 3 of lease payments:

IFRS: The \$10,000 lease payment is treated as an interest expense as calculated above; \$1,100 in year 2 and \$566 in year 3 in addition to a depreciation expense of \$8,910. Over the 3 year period, the total expense will be the same at \$30,000 under both methods of reporting (operating v. capital/financing.)

ADJUSTING ENTRIES YEAR 1 TO CONFORM TO IFRS

1-Dr. Leased Asset-Financing Lease 26,730
Cr. Minimum Lease Obligation-Financing Lease 26,730

To record capitalization of the lease

2-Dr. Depreciation Expense 8,910
Cr. Accumulated Depreciation 8,910

To record depreciation expense on the capitalized lease

3-Dr. Interest Expense 1,604
Dr. Minimum Lease Obligation-Financing Lease 8,396
Cr. Rent expense/Selling and Administrative expense 10,000

To adjust lease from operating to capital/financing

4-Dr. Minimum Lease Obligation-Financing lease 18,334
Cr. Minimum Lease Obligation-Financing lease -Current liability 8,900
Cr. Minimum Lease Obligation-Financing lease -Long Term Liability 9,434

To correctly classify the Minimum Lease Obligation to its liability term components

5- Dr. Selling and Administrative Expense 15,000
Cr.- Extraordinary Item 15,000

To reclassify extraordinary item as an operating expense

This is calculated by the extraordinary loss, shown net of taxes of 10,500 divided by 1 less the tax rate of 30 percent, or .7, which yields a before tax loss of 15,000.

Pointers for Classroom Discussion

There is no prompt for this reclassification. Students must demonstrate critical thinking by identifying that IFRS does not allow for the use of an extraordinary item.

It is important to point out that we should not be so focused on one issue (lease treatment) that we overlook other issues that should be apparent.

Also note that the reclassification of the extraordinary loss is shown before tax (10,500+ 4,500)

6- Dr. Tax Payable 514
Cr. Tax Expense 514

To reconcile a net income total of \$10,500; an amount equal to the GAAP reported total.

Pointers for Classroom Discussion

Show that under capital/financing lease treatment, the expense will be greater in the early year(s) , resulting in lower income, and lower in the latter year(s), showing a higher income. In the entire term of the lease, each method will yield identical expense totals. Use of the amortization schedule will illustrate this clearly.

Q 5. Prepare an Income Statement under IFRS for year 1. Assume that the net income remains the same under IFRS as it does for GAAP and any difference is reconciled in the tax expense and tax payable accounts.

ACE Corp
Income Statement (in 000's)
For the year ended 12/31/2011

Sales	\$250,000
Cost of goods sold	<u>175,000</u>
Gross profit	\$ 75,000
Selling and administrative expenses	
(Exclusive of amortization & depreciation) less (3) 10,000 =	<u>36,000</u>
Earnings before interest, taxes, depreciation and amortization	\$ 39,000
Amortization and depreciation expense 10,000 + (2)8,910 =	<u>18,910</u>
Earnings before interest and taxes	20,090
Interest expense 4,000 + (3)1,604 =	<u>5,604</u>
Income before tax	\$14,486
Tax expense 4,500-(6)514 =	<u>3,986</u>
Net Income	<u>10,500</u>

Q6. Prepare Balance Sheet under IFRS for Year 1.

ASSETS		LIABILITIES AND SHAREHOLDERS EQUITY	
Current Assets		Current liabilities	
Cash	\$33,000	Accounts payable	\$20,000
Accounts receivable	25,000	Accrued expenses	15,000
Investments	10,000	Taxes payable 5,000-(6) 514	<u>4,486</u>
Inventory (FIFO)	<u>50,000</u>	Minimum lease obligation	8,900
Total current assets	\$118,000	Total current liabilities	\$48,386
Property, plant and equipment		Noncurrent liabilities	
Assets (cost)	100,000	Bonds payable	50,000
Leased Assets (1) 26,730		Minimum Lease obligation (4)	\$9,434
Less: Accumulated Depreciation (30,000 + 8,910)	<u>(38,910)</u>	Total Liabilities	<u>\$107,820</u>
Net	\$ 87,820	Shareholders' equity	
Intangible Assets		Common stock (\$1 par)	\$50,000
Trademark	5,000	Retained earnings	<u>60,000</u>
Goodwill	7,000	Total shareholders' Equity	110,000
	<u>\$12,000</u>		
Total assets	\$217,820	Total liabilities and Shareholders' equity	\$217,820

Part 7: Ratio Calculations:

	GAAP	IFRS
Current Ratio=current assets/current liabilities 118,000/40,000 118,000/48,316	2.95	2.44
Quick Ratio=current assets-inventory/current liabilities 18,000-50,000/40,000 118,000-50,000/48,316	1.70	1.41
Cash Ratio=cash/current liabilities 33,000/40,000 33,000/48,316	.825	.683
Times Interest Earned =EBIT/ Interest Expense 34,000/4,000 20,090/5,604	8.5	3.58
Debt to Capital Ratio=Total Liabilities/Total Assets 90,000/200,000 107,820/217,820	.45	.4950
Debt to Shareholder Equity Ratio=Liabilities/Shareholder' Equity 90,000/110,000 107,820/110,000	.8181	.98

Part 8: Comments

The ratios clearly indicate that IFRS rules result in more conservative ratio results with respect to the current and long term creditor when compared to US GAAP. Every liquidity ratios is lower under IFRS and the differences are significant. Similarly, all long term ratios are also more conservative when compared to US GAAP. The implications here is that IFRS will have far greater negative implications on bond covenant agreements as well as other long and short term creditor legally binding agreements than US GAAP.

CONCLUSION

IFRS is the future of worldwide financial reporting and should be included as a major part of any accounting and/or business curriculum in the US, as well as the rest of the world. This case illustrates a situation where a Balance Sheet and Income Statement is prepared using GAAP as a basis and converting to IFRS for comparison purposes, with the focus being from the creditor point of view. In this case study IFRS rules are discussed, and key Lease accounting similarities and differences between GAAP and IFRS are addressed and its implications on the corporation's creditors.

EARLY AFTERMARKET DIVERGENCE OF OPINION AND MISPRICING OF FIXED PRICE IPOs ON BURSA MALAYSIA

Cheedradevi Narayanasamy, Graduate School of Business, National University of Malaysia

ABSTRACT

Mispricing of initial public offerings (IPO) in finance literatures refers to the deviation of IPOs offer price from its aftermarket price. Miller (1977) argue that divergence of opinion provide alternative explanation for IPO mispricing where high divergence of investors' opinion (DOP) is associated with overvaluation in the early aftermarket. The current study investigates whether divergence of investor opinion influences the decline of Malaysian IPOs first day return reported in some of the Malaysian studies, where low divergence of opinion is assumed as an indication that IPOs are fairly price, while high divergence of opinion as an indication that the IPOs are either overvalued or undervalued. The study incorporates a sample of 267 fixed-priced IPOs for study period of 2004 to 2011. It uses market adjusted initial return (MAIR) in measuring mispricing, while DOP is measured using the volatility of excess return as suggested by Gao et al. (2006) and Jerwartowski and Lizinska (2012).

JEL: G12, G14, G24

INTRODUCTION

The recent headwind faced by global market, has attracted institutional and foreign investors to invest in Asian securities, especially in initial public offerings (IPOs). Bursa Malaysia is of no exception to this, in fact the local market is seen as an IPO oasis. Despite the overwhelming response from investors, the high quality IPOs trade between 3 to 10% above offer price, while other IPOs trade below offer price in the immediate aftermarket. This statement poses a question on whether Malaysian IPOs are fairly price or are they subject to mispricing. Past studies associate the low level of Malaysian IPOs initial return to liberalization of pricing mechanism and other regulatory changes that took effect after 1997 (Yong & Isa 2003). However, despite the liberalization of pricing mechanism a large number of IPOs in Malaysia remain as fixed price IPOs, thus, the current study infers that the low level of initial return is not solely due to liberalization of pricing mechanism rather it is due to changes in investors' expectation. There is a possibility that the restructuring of listing board (2009), changes in equity guidelines and disclosure requirements (2008) influence the aftermarket investor's expectation.

The early evidence of mispricing in international market come from studies of Ibbotson & Jaffe (1975), Ibbotson (1975), Ritter (1984), Beatty & Ritter (1986) that show on average IPO initial return is 15% in US. Subsequent studies conducted by Miller & Reilly (1987), Ritter (1991), Rajan & Serves (1997) for study period of 1970-1990 indicate that initial return ranges between 9% -14%. Most of the studies document that asymmetric information and risk composition explain early market mispricing (see Beatty & Ritter 1986). Recent study by Loughran & Ritter (2004) reveal that changes in issuers' objective function provide a better explanation for cross sectional variation in mispricing from 1999-2000.

The early evidence of pricing inaccuracy in Malaysian IPO comes from Dawson (1987)'s. His findings reveal that the average market adjusted initial return was 166% for 21 IPOs over a study period of 1978 to 1983. Subsequent studies show that mispricing (or market adjusted initial return) has gradually dropped for example Loughran *et al.* (1994) reveal that initial return for 1980-1991 has reduced to 80.3%. Paudyal *et al.* (1998) show that average adjusted return is 62% for period 1984-1995, and Annuar and Shamsheer (1998) show that average market adjusted initial return is 135% for period 1980 - 1994. The variation of initial return is explained by regulatory interference, oversubscription ratio, market volatility, allotment of shares, underwriter reputation, ex-ante risk, and signaling theory. Recent study by Moshirian *et al.* (2010)

document that despite the gradual reduction in underpricing, Malaysian IPO's average initial return ranks as the third in Asia next to China and Korea (61.8% within the study period of 1991 - 2004) but exceed the developed Asian countries such as Hong Kong, Japan and Singapore. The review of literatures reveals that there is no empirical evidence on the effect of DOP on IPO mispricing on Bursa Malaysia. Moreover, studies related to DOP in developed nations are rather sparse, and it primarily focuses on book built IPOs. These studies document high DOP is associated with overvaluation in the early trading and lower long run return (see Miller 1977; Houge *et al.* 2001; Diether *et al.* 2002; Gao *et al.* 2006; Jewartowski & Lizinska 2012). Although most of the studies provide evidence that DOP explains early market mispricing and poor long run performance, there is a need to examine the influence of DOP on IPO undervaluation for fixed priced IPOs in emerging market.

The current study finds that DOP not only results in overvaluation (unintended underpricing) as posit by (Miller 1977) and Houge et al (2001) but it also attributes to undervaluation of Bursa Malaysia between 2004 to 2011 (see table 1, 2, 3 and 4 in full paper or pp slides). Both undervalued and overvalued IPOs are sensitive to the IPOs risk composition. The findings also show that issuers are interested in current proceeds and that they give less emphasis on future price movement unlike developed nation as proposed by Loughran and Ritter (2004). The results across sub periods show that IPOs issued between 2004 to 2005 and 2011 to 2010 are sensitive to DOP, indicating that some IPOs experience unintended underpricing, while others experience undervaluation. IPOs issues between 2006-2007 and 2008-2009 are possibly fairly priced as there is insignificant influence of DOP on MAIR.

ADDING MARKOWITZ AND SHARPE TO THE INVESTMENTS PROJECT

Lynda S. Livingston, University of Puget Sound

ABSTRACT

Introductory investments courses revolve around Harry Markowitz's modern portfolio theory and William Sharpe's Capital Asset Pricing Model. Nonetheless, the textbook versions of these seminal contributions tend to obscure their economic insights, focusing instead on their mathematical consequences. In this paper, we suggest simple additions to the basic portfolio spreadsheet project that will distinguish the economics (e.g., the market portfolio is efficient) from its necessary consequences (e.g., the beta-expected return relationship is linear). We also show that it is important to use Excel's MMULT function, not Solver, to find efficient portfolios.

JEL: G10, G11

KEYWORDS: Portfolio Theory, CAPM, Investments Pedagogy

INTRODUCTION

An investments course without Harry Markowitz and William Sharpe is unthinkable. Markowitz's (1952) modern portfolio theory and Sharpe's (1964) Capital Asset Pricing Model (CAPM) are the bedrock upon which investments courses are built. Nonetheless, a student does not actually see the concepts as the authors originally presented them; unless she takes one of the few doctoral-level classical papers courses, she sees instead only a textbook distillation. This distillation obscures important detail—in particular, it muddles the distinctions between the authors' (Nobel-prize-winning) economic insights and their purely mathematical consequences.

In this paper, we show how a few simple spreadsheet-based tweaks to a traditional investments project can highlight these critical distinctions. Excel's matrix multiplication functions allow students to identify mean-variance efficient portfolios easily. With those portfolios in hand, they can replicate Markowitz's graphs that show efficient portfolios lying on a line (not on a parabola!), and they can verify Roll's (1977) critique of tests of the CAPM—the observation that it is always possible to derive a linear beta/return relationship *ex post*. Students who have worked through these sorts of exercises will have a much deeper understanding of modern portfolio theory.

Project Additions From Markowitz

The problem with the traditional textbook presentation of the efficient set is that it plots portfolio expected return against portfolio standard deviation—that is, it depicts portfolios in $(\sigma_p, E(R_p))$ space, in which the minimum-variance set traces out a nice, bullet-shaped curve. As nice as the graph looks, this presentation obscures the true drivers of both expected return and variance: the portfolios' asset weights. Variance does not determine expected return; instead, both are determined by the chosen weights.

The most important graph for students is Markowitz's Figure 2, in which he illustrates the determination of the efficient set for a portfolio of three assets. In this figure, he identifies efficient portfolios in $(\text{weight}_1, \text{weight}_2)$ space, where weight_i is the proportion of portfolio funds invested in asset i . In this space, Markowitz identifies portfolios offering the same level of expected return and the same level of variance. The former he calls "isomeans"; these plot as lines, the slope of which depends upon the

expected returns of the various assets. “Isovariances,” on the other hand, form a set of concentric ellipses (assuming no pair is perfectly positively correlated), whose center is the global minimum-variance portfolio. Efficient portfolios maximize expected return for any given level of variance; these portfolios are the tangencies between an isovariance ellipse and an isomean. These tangencies trace out a line in $(\text{weight}_1, \text{weight}_2)$ space. Students accustomed to seeing efficient portfolios lying on a parabola may be surprised by this. They may also be surprised at the ease with which they can now find the efficient set of risky assets. Given two points from Markowitz’s linear efficient-set relationship, they can generate the others simply as other points on that line.

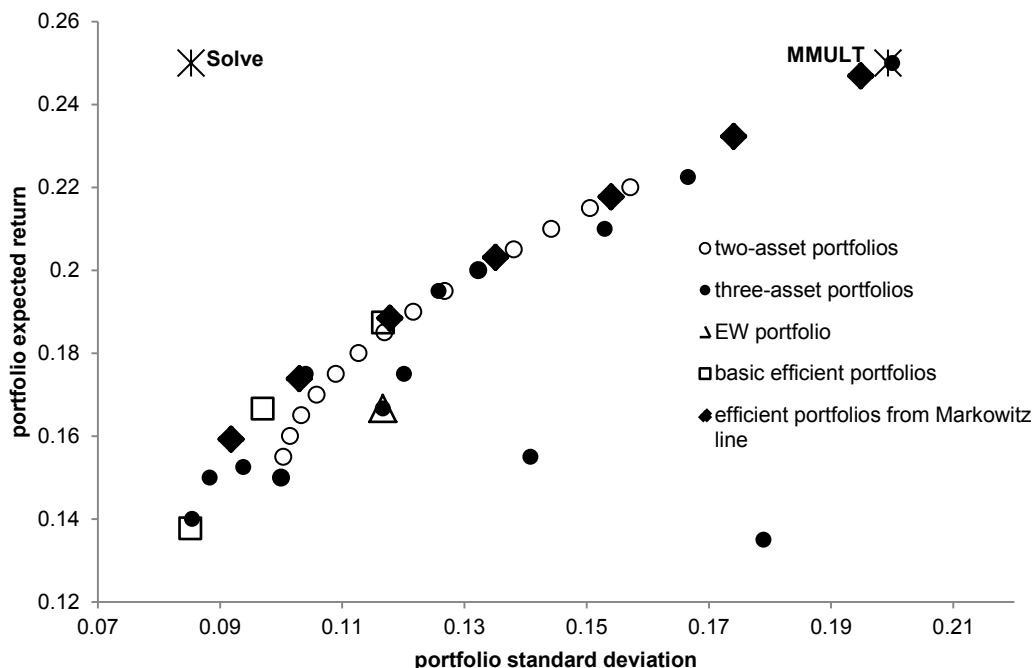

Figure 1 illustrates the steps I ask my students to follow to generate their efficient set. First, they plot two-asset portfolios against various three-asset portfolios. (Note that the equally weighted [EW] three-asset portfolio is shown as a triangle.) Students can see that their two-asset portfolios fall on a perfect parabola, but that the three-asset portfolios do not behave as nicely. Moreover, while some three-asset portfolios dominate some two-asset portfolios, not all do.

Next, they add three efficient three-asset portfolios. By adding these, students learn that the efficient frontier is still bullet-shaped, but that it has moved to the left (in the preferred direction, to lower standard deviations). They find the efficient portfolios using both Excel’s Solver optimizer and its matrix multiplication “MMULT” function. Our point in asking students to find several efficient portfolios is to show them that these portfolios will lie on a line in $(\text{weight}_1, \text{weight}_2)$ space.

This is Markowitz’s linear efficient set. (Of course, for this to work, students must have truly efficient portfolios. The portfolios found using MMULT lie on a line in weight space; they therefore are efficient. However, portfolios found using Solver do not lie on a line; Solver’s results, while close approximations, therefore are not efficient. Given the problems with Solver, students should use MMULT to complete the generation of the efficient set.) With their efficient portfolios in hand, students can now verify Markowitz’s efficient set. Using MMULT, students can quickly generate several efficient portfolios. Plotting those in $(\text{weight}_1, \text{weight}_2)$ space, they will find that they lie on a line ($R^2 = 1$), just as Markowitz said they would. Next, they should use that line to generate additional portfolio weighting schemes. These new portfolios must also be efficient. Finally, they should plot these new portfolios in the standard $(\sigma_p, E(R_p))$ space—where they will fall on a perfect parabola, just as the two-asset portfolios did.

This is the big payoff: making the link between what they know (the parabola) and what Markowitz described (the line). Looking beyond the parabola to Markowitz’s line makes students focus on what defines an efficient portfolio of specific assets: the weights chosen. The weights determine expected return and variance; variance does not determine expected return. The optimal weighting scheme for a given level of variance—the one that maximizes expected return—can be identified in $(\text{weight}_1, \text{weight}_2)$ space as the tangency between the given isovariance ellipse and the highest attainable isomean line. This tangency will lie on a line with all of the other efficient portfolios. We have just shown how a simple application of MMULT can help students find that line, and thus to find a simple way to identify other efficient portfolios.

Figure 1: Results of Exploration of Markowitz's Efficient Set

This figure presents the results of the sequential derivation of Markowitz's efficient frontier. We start with random two- and three-asset portfolios. We then add the global minimum-variance portfolio and the efficient portfolios that match the equally weighted three-asset portfolio on return and variance. Next, we add the results from a test of Excel's Solver optimizer and its MMULT function; note that the Solver solution lies outside the minimum-variance set. Finally, we add three-asset portfolios generated using the linear weight relationship described by Markowitz, and show that those portfolios lie on the parabolic frontier in the $(\sigma_p, E(R_p))$ space above.

Project Additions From Sharpe

Students often leave their basic finance courses thinking that the Capital Asset Pricing Model (CAPM) is the equation for the Security Market Line: $E(R_i) = r_f + \beta_i[E(R_M) - r_f]$ (where β_i is the systematic risk of asset i , r_f is the return on the riskless asset, and $E(R_M)$ is the expected return on the market benchmark). However—given unlimited borrowing or lending at a risk-free rate, homogeneous expectations, and no market frictions, among other assumptions—the economic insight of the CAPM is that *the market portfolio is efficient*. If the benchmark is efficient, the relationship between beta and expected return *must* be linear. "...[W]e may arbitrarily select *any* one of the efficient combinations, then measure the predicted responsiveness of *every* asset's rate of return to that of the combination selected; and these coefficients will be related to the expected rates of return of the assets in exactly the manner pictured"—a line (Sharpe, 1964; emphasis original).

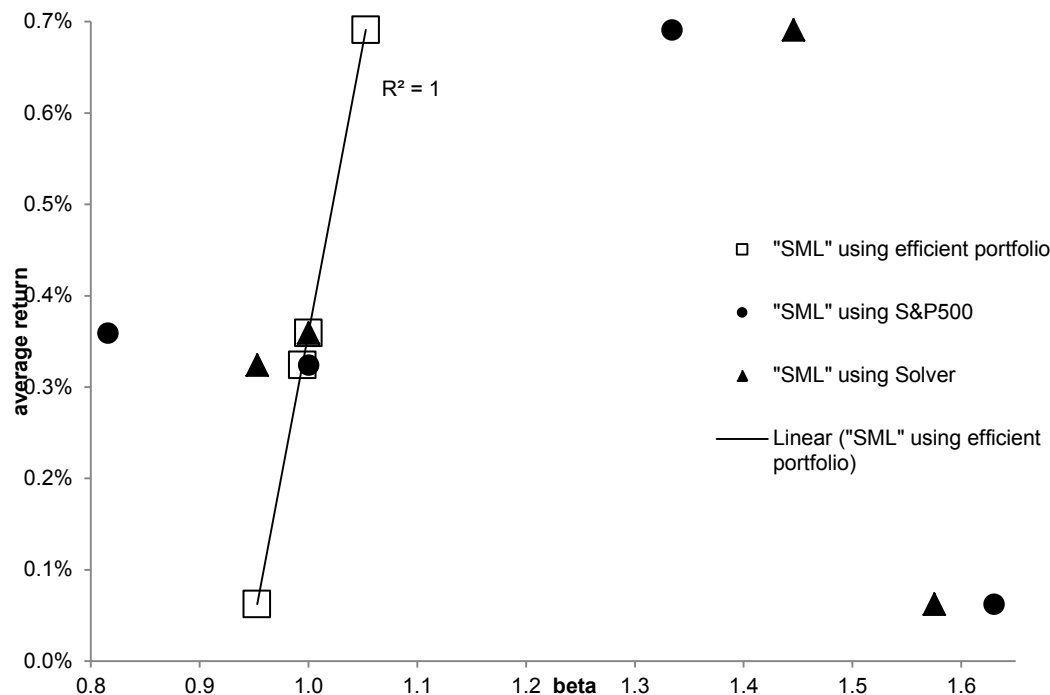

Using Excel, students can easily prove that beta/return linearity is a consequence of the efficiency of the "market." We present the results from a simple exercise in Figure 2. We started with price data for three assets, Harley Davidson stock (HOG), Ford stock (F), and the S&P 500 market index. We then found the daily returns, averages, sample standard deviations, and covariances. Doing these sorts of calculations is standard for basic investments spreadsheet projects.

Given the covariances, we used Excel's MMULT function to solve for the efficient portfolio that has the same expected return as the equally weighted portfolio. We used these weights to create an ex post

efficient portfolio, P. Finally, we calculated “betas” using both the S&P500 and efficient portfolio P as benchmarks. We repeated this process using Solver to identify the efficient portfolio.

The beta/return relationships based on the S&P500 and Solver’s “efficient” portfolio are decidedly nonlinear. Early empirical results like this seemed inconsistent with the CAPM. However, as Roll (1977) argued, the CAPM is an ex ante model, and testing the beta/return relationship using an arbitrary benchmark using ex post data could not be expected to result in the linearity implied by the theory. On the other hand, if it is linearity that we want, we can always find it—as long as we are careful to choose a benchmark that we know is efficient. Since P was efficient, using it as the benchmark did lead to a linear beta/return relationship—a perfect one, just as is implied by the mathematics of “efficiency.”

Figure 2: A Test of the Linearity of the Security Market Line

This figure demonstrates the equivalence between an efficient benchmark and a linear return/beta relationship. Using ex post data, inefficient benchmarks (here, both the S&P500 and the portfolio identified by Solver) give return/beta relationships that are nonlinear. However, an efficient benchmark—always available ex post—will lead to a linear relationship, as demonstrated by the trendline.

CONCLUSIONS

Using a spreadsheet project in investments courses has become almost a given. However, while these projects harness the power of Excel to perform basic calculations on real data, they have not yet exploited it to explore the theoretical underpinnings of portfolio theory. In this paper, we show several straightforward investments applications of Excel’s matrix multiplication functions (following Arnold, 2002). Students will not only learn a valuable Excel tool (and the potential problems with its Solver optimizer), but will also become much more familiar with portfolio mathematics.

Markowitz’s (1952) figures look daunting, but students—once they get past their fear—find them extremely helpful. Being able to recreate the graphs in Excel demystifies them. Using MMULT allows students to identify efficient portfolios, which is more than half the battle. Given a few efficient weighting schemes, students can verify that the optimal portfolios—the tangencies between the isomean lines and the isovariances ellipses—lie along a line in (weight₁, weight₂) space. This is surprising for

students, who are accustomed to the traditional parabolic representation. Using the linear relationship they find, they can work back to that parabola by finding more efficient portfolios from the line, then replotting them in $(\sigma_p, E(R_p))$ space. This is the big payoff: linking Markowitz's line directly to the traditional parabola. We can also use Excel to work through some issues with the Capital Asset Pricing Model. Most importantly, we can demonstrate part of Roll's critique of the CAPM: that the linearity of the beta/return relationship does not prove Sharpe's theory, but is simply a mathematical consequence of the efficiency of the benchmark portfolio. Students can prove this by using MMULT to identify an ex-post efficient portfolio from data they choose on their own, then using that portfolio as the benchmark for beta calculations. Their beta/return relationship *will* be linear—just as Roll said. Students will then be in a much better position to distinguish the ex ante nature of the economic contribution of the CAPM—that the market portfolio is efficient—from the ex post consequence of efficiency, and they will be better able to evaluate the empirical tests of the CAPM. They will also become immune from the error of equating the SML equation with the CAPM theory.

WHY THE LAST IN FIRST IN INVENTORY METHODS (LIFO) SHOULD BE SAVED?

Peter Harris, New York Institute of Technology

Liz Washington Arnold, The Citadel

William Stahlin, Stevens Institute of Technology

ABSTRACT

The Last in First out Method (LIFO) is presently under severe scrutiny from the financial community which may soon culminate in its repeal as an acceptable accounting method. There are pressures from the SEC in conjunction with the International Financial Accounting Standards Board (IFRS) to standardize accounting standards worldwide. In addition, there is political pressure imposed by the US Obama administration to raise additional revenues. Both groups strongly oppose LIFO, raising a strong possibility that its complete elimination as an accounting method will occur by as early as 2014. This paper will address the reasons defending LIFO as an acceptable accounting method.

INTRODUCTION

LIFO can be defended on economic, taxation, accounting reporting and political grounds as this paper explores. The second part addresses the current and future state of LIFO. Part 3 discusses the defenses of LIFO which include the following aspects: First, from an accounting theory perspective, it satisfies the principles of matching and the income statement economic reality of LIFO presentation. Second, from the perspective of the US government, tax loopholes are many and LIFO is but one small example. If the US government eliminates these many tax loopholes at the expense of lowering the tax rates, as indicated, the result will be a tax neutral revenue situation which does nothing to help the deficit. Third and lastly, IFRS and US GAAP are in the process of convergence, which is far different than having identical accounting standards. Differences between the two entities in financial reporting will remain in effect after 2014. The result is that the need to eliminate LIFO is not necessary from taxation, political or financial reporting position.

DEFENSES OF LIFO

LIFO can be defended on present accounting theory, taxation principles as well as political issues as discussed next.

Accounting Theory: LIFO satisfies many present underlying US GAAP principles including; the matching principle which results in an income statement economic reality presentation. LIFO's greatest defense is that the Income Statement represents economic reality as it matches current inventory cost with current revenue, making the Income Statement correct. The matching principle is adhered to by LIFO use. However, the matching principle will only apply if there is a build-up of inventory reserves. If there is a liquidation of inventory, then matching will not occur as there will be predated, older inventory matched to current revenue.

However, even if this liquidation were to occur, the SEC and US GAAP require disclosure of the effect on earnings resulting from this liquidation. As such, matching is restored and current cost is matched with current revenue, ensuring an Income Statement reality presentation.

TAX LOOPHOLES: The US Tax code has a series of tax loopholes initiated by special interest groups. Eliminating these loopholes is seen as a political impossibility and only then will LIFO's repeal have

credence. Even if all these loopholes are indeed eliminated, the result will be a reduction in tax rates resulting in a tax neutral situation which does not help in political goals, such as deficit reduction for the US government. Further, the elimination of LIFO will result in roughly a \$30 Billion reduction in the deficit. This is calculated by the additional revenue generated by non LIFO use, known as the LIFO Reserve of \$80 according to Compustat times a 35 percent corporate tax rate. This is greatly much lower than the government's calculation. Further, a tax collection of \$30 billion compared to a US Deficit of \$15 Trillion has a most insignificant impact on deficit reduction.

IFRS CONVERGANCE: IFRS and US GAAP are in the process of convergence, which is far different than having identical accounting standards. Differences between the two entities in financial reporting will remain in effect well after 2014 and these differences will be many. As an example, differences will exist in the area of consolidation as a joint task group has acknowledged differences in US GAAP and IFRS well beyond 2014. LIFO is presently used by roughly 5 percent of US Companies, so this inventory difference should in no way impact convergence. LIFO is a tax benefit; US phenomena and differences in financial reporting will result as a result of cultural reasons. Exact financial reporting is not in the radar screen between the US and the rest of the world, so LIFO repeal should not impact convergence.

CONCLUSION

LIFO can be defended on many aspects including accounting theoretical frameworks, taxation aspects and political aspects as it relates to worldwide financial reporting convergence. This paper explored these defenses. The limitation of this paper is the ultimate repeal of LIFO, which although not presently likely, is possible. Further research should focus on the argument against LIFO as well as other defenses of LIFO.

MODELING AND FORECASTING INFLATION WITH ARIMA AND VAR: THE CASE OF NIGERIA

Ikechukwu Kelilume, Lagos Business School
Adedoyin Salami, Lagos Business School

ABSTRACT

A major concern of entrepreneurs and monetary authorities in Nigeria in the past decades has remained the issue of successful prediction of the movement of the general price level with some level of certainty. The result of which will guarantee successful planning on the part of monetary authorities and continued profit drive on the part of entrepreneurs and investors. The aim of this study is to use a univariate time series in the form of Autoregressive Integrated Moving Average (ARIMA) model developed by Box and Jenkins and multivariate time series model in the form of Vector Autoregressive model (VAR) to forecast inflation for Nigeria. Our focus is to use change in monthly CPI data obtained from the National Bureau of Statistics over the period 2003 to 2012 to predict the movement of the general price level. Based on different diagnostic and evaluation criteria, the best forecasting model for predicting inflation in Nigeria will be selected. The significance of the study is that result obtained will enable policy makers and businesses to track the performance and stability of key macroeconomic indicators using the forecasted inflation values.

JEL: E3 E17, E31

KEYWORD: Modeling Inflation, Forecasting, ARIMA, VAR

INTRODUCTION

Maintaining a reasonable degree of price stability and ensuring an adequate expansion of credit to foster steady and sustainable economic growth have been the primary goals of monetary policy. A challenging problematic macroeconomic economic issue confronting nation states and monetary authorities today is the issue of tracking and predicting the movement in the general price level. Nigeria like most developing countries has had significant gaps between policy formulation, policy implementation and policy target. In most cases, policy goals lags behind targets and are often times unattainable due mainly to the prevalence of policy inconsistencies driven by the inability of the monetary authorities to predict inflation and its real determinants. Inflation apart from being a major monetary policy performance indicator is a useful indicator in informing the public about the likely trends in the movement of leading and lagging macroeconomic indicators the knowledge of which drives inflationary expectation and therefore serve as a nominal anchor for bargaining process and fixed contracts (Moser, Rumler and Scharler, 2004). Generally, a clear understanding of inflation forecasting technique is crucial for the success of monetary policy in tracking the movement of macroeconomic aggregates and in maintaining stability and sustainability in economic growth.

The paper compares Vector Autoregressive (VAR) model and Autoregressive Integrated Moving Average (ARIMA) model for forecasting the rate of change of the Nigerian Consumer Price Index (CPI). The main attraction to VAR modeling is that it has a natural basis for testing conditional predictability unlike the ARIMA model which is poor in predicting turning points but is relatively robust in generating short term forecast. Thus most empirical analysis on forecasting has focused on the use of VAR while ARIMA is used as a benchmark forecasting tool. The forecasts of the models with the highest predictive accuracy are then evaluated using a range of criteria that characterize optimal forecasts.

Following the introductory section, the rest of the paper is organized as follows: Section 2 summarizes the theoretical and empirical literature. Section 3 describes the models, methods and sources of data. Section 4 compares the forecasting performance of the models and evaluates the resulting models with the highest predictive accuracy. Section 5 concludes the paper.

LITERATURE

The central role of monetary policy in developed, emerging and developing economies has remained the maintenance of price stability and the ensuring of adequate expansion of credit to foster economic growth and development. Generally, economists across the various economic divide differ in their analysis of the root causes of inflation and in the way and manner inflationary spiral should be managed and controlled. While the monetarists hold the strong view that sustained growth in money supply not matched by corresponding growth in output will cause inflation at the long run (Milton Friedman 1956, 1960, 1971), the structuralist economist explain the long run inflationary trend in developing countries in terms of structural rigidities, market imperfection and social tensions such as relative elasticity of food supply, foreign exchange constraints, protective measures, rise in demand for food, fall in export earnings, hoarding, import substitution, industrialization and presence of political instability (Thirwell, 1974; and Aghevei and Khan 1977).

Given the monetarists view and the structuralist view on the root causes of inflation, it is becoming increasingly difficult to forecast inflation in not only the developed economies but also in the OECD countries and in particular in emerging and developing economies. In the empirical studies conducted by Olga, Kamps and Nadine (2009), and Stock and Watson (2008), they found that, over the longer term (3-year), forecasting horizon, and monetary indicators contain useful information for predicting inflation in most New Member States (NMS) countries of the European Union (EU). Models of inflation forecast and accuracy has evolved in several studies ranging from extrapolation to econometric modeling. The early study of inflation forecast by Landsman and Damodaran (1989) in which the univariate autoregressive integrated moving average method was used drew the conclusion that, ARIMA parameter estimator improves the forecast accuracy of the model because of its lower mean squared percentage error.

Although, inflation forecasting with autoregressive integrated moving average method (ARIMA) compares favorably with other forecasting models such as the vector autoregressive method (VAR), and the Bayesian VAR, it has been shown that ARIMA performs poorly forecasting turning points and yields poor forecast values when applied to volatile and high frequency data (Meyler, Kenny and Quinn (1998). In the study carried out by Ho and Xie (1998), using the ARIMA framework, they concluded that ARIMA model is a viable alternative that gives satisfactory results in terms of its predictive performance. According to Wayne (1998), the use of the vector autoregressive model in forecasting exhibits significant degree of predictive accuracy when compared with other forecasting models. This same conclusion was reached by Meyler et al (1998). Applying the Bayesian VAR approach forecasting, they found the VAR approach improves forecasting performance.

Black, Corrigan and Dowd (2000), comparing an AR (1) with the Mean Absolute Percentage Errors (MAPEs) of different models adding one variable at a time, found the money supply variable to improve the forecast values of inflation significantly, while the study by Jacobson, Jansson, Vredin and Warne (2001) shows that VAR model with long-run restrictions is useful for both forecasting inflation and for analyzing other issues that are central to the conduct of monetary policy. Using a VAR model, Gottschalk and Moore (2001) assessed the link between monetary policy instruments and inflation in Poland. The result showed that although exchange rate was found to be effective with respect to output and prices, direct linkage between interest rate and inflation do not appear to be very strong. Toshitaka (2001), found mark-up relationship in estimating and forecasting inflation;

excess money supply and the output gap were of importance in determining long run equilibrium correlation model of inflation.

Other studies on inflation forecasting in different region produced mixed results. The study by Fritzer, Moser and Scharler (2002), found VAR models to outperform ARIMA in terms of forecasting accuracy while Bokhari and Feridun (2006), indicate that VAR models do not perform better than the ARIMA model. Espasa, Poncela and Senra (2002), concludes that ARIMA models outperformed the VECM and dynamic factor models while Hubrich K. (2003), found that VAR models outperformed the autoregressive forecasting models. The study by Alnaa and Ahiakpor, (2005) followed the same pattern as other models proving the VAR modeling technique to be highly efficient in its predictive ability. But, the study by Binner, Bissoondeal, Elger, Gazely and Mullineux (2005) drew a different conclusion. Using Neural Networks (NN) forecasting model-a nonlinear forecasting approach, they found the VAR and ARIMA modeling technique to be statistically less superior to the Neural Network model.

Recent studies by Clausen and Clausen (2010), using the Phillips curves showed that model forecasting based on ex post output gaps generally improve the accuracy of inflation forecasts compared to an AR (1) forecast model. The literature is rich in the support of the forecasting strength of ARIMA modeling technique in forecasting (Hill and Fildes, 1984; Libert, 1983; Poulos, Kvanli, and Pavur, 1987; Texter and Ord, 1989). Although, recent studies in Nigeria, has shown the VAR modeling technique to be highly useful in predicting short run forecast (Adebisi, Adenuga, Abeng, Omanukwe and Ononugbo 2010, Uko and Nkoro 2012), there is however need to revisit the forecasting ability of both ARIMA and VAR model in Nigeria.

METHODOLOGY

The study intends to forecast core inflation in Nigeria with the aid of a univariate time series model in the form of Autoregressive Integrated Moving Average (ARIMA) model developed by Box and Jenkins and a multivariate time series Vector Autoregressive model (VAR). The choice of both models is linked to recent forecasting success in both ARIMA and VAR modeling. Our objective is to establish the best forecasting model in tracking price movement in Nigeria.

Data

The data used in this study is sourced from the Central Bank of Nigeria Statistical Bulletin and the National Bureau of Statistics. The frequency of the data is monthly and the period covered is 2003:01 to 2012:06. The variable used is the rate of change in the consumer's price index, broad money supply (M2) and our focus is to forecast core inflation. The INF and M2 data gathered was estimated and analyzed with E-views 7 estimation software.

Model Inflation with ARIMA

Modeling and forecasting inflation with the Box-Jenkins methodology requires the following systematic steps. The first step is the data collection and examination stage, the second step is the identification of the data, while the third step is the estimation of the model. The fourth and fifth step is the diagnostic checks and forecasting stage respectively.

Data Collection and Examination

ARIMA entails the use of Box-Jenkins methodology which requires that the sample data be at least more than 50 observations (Meyler et al 1998) and even when sample observations is greater than 50 there is need to examine the data for the existence of structural breaks which if present in the data will necessitate only the examination of a sub-section of the data or the need to introduce a dummy variable but in this case the data was stationary at levels as shown by Figure 1 and 2, this can easily be verified in the augmented Dickey-Fuller test of unit root with 5 per cent level of significance reported in Table 1 below.

Figure 1: Autocorrelation Function

Figure 2: Partial Autocorrelation Function

Note: Figure 1 and 2 is the Autocorrelation and Partial Autocorrelation functions showing that the core inflation series is stationary at levels and that it is an Autoregressive Moving Average (ARMA) process. This is seen in the pattern.

Table 1: Unit Root Test on Core Inflation with Intercept and a Linear Trend

	T-Statistics	Prob.	Status
Augmented Dickey-Fuller test Statistics	-3.459039**	0.0490	I(0)
Test Critical Values :			
1% level	-4.042042		
5% level	-3.450436		
10% level	-3.150549		

Note: The table is the result of the Augmented Dickey-Fuller (ADF) which indicates that the core inflation series is integrated or stationary at levels. ** indicates significance at 5 per cent level.

Identification

The estimation of univariate time series variable with autoregressive integrated moving average method ARIMA (p,d,q), requires identification of the appropriate value of p, d and q. Where p denotes the number of autoregressive term, d is the number of times the series has to be differenced to obtain an I(0) series and q is the number of moving average term. The chief tool of identification is the plot of the autocorrelation function (ACF), the partial autocorrelation function (PACF), the correlograms and the augmented Dickey and the Fuller (1971, 1981) test for unit roots.

From Figure 1 and 2, it can be seen that the series is stationary this can easily be verified in the augmented Dickey-Fuller test of unit root reported in Table 1 above.

Having obtained the order of integration (d), our next step is to obtain the ARMA pattern in the inflation series by considering the autocorrelation function (ACF), the partial autocorrelation function (PACF) and

the associated correlograms. This process involves using the Box-Jenkins methodology where the ACF and the PACF plots are used to predict p and q in the ARMA model. The selection of p and q is usually based on the following characteristics of the ACF and the PACF plots. If data is purely AR (p), then ACF will decline steadily and PACF will cut off suddenly after p lags but if data is purely an MA (q), ACF will cut off suddenly after q lags and PACF will decline steadily. An ARMA (p, q) model usually exhibits a complex pattern in the ACF and PACF function.

From the plot of the autocorrelation function and the partial autocorrelation function reported in figure 1 and 2, we got a clear pattern to help predict p and q . The criteria used in this case are;

$$BIC = \text{Log}\left(\frac{rss}{n}\right) + \left(\text{Log}(n) * \frac{k}{n}\right) \quad (1)$$

$$HQC = \text{Log}\left(\frac{rss}{n}\right) + \left(2 * \text{Log}(\text{Log}(n)) * \frac{k}{n}\right) \quad (2)$$

$$AIC = \text{Log}\left(\frac{rss}{n}\right) + \left(2 * \frac{k}{n}\right) \quad (3)$$

Where, SC = Schwarz criterion, HQC = Hannan-Quinn criterion and AIC = Akaike information criterion, K = the number of coefficient estimated, rss = residual sum of squares and n = the number of observations. With the aid of the correlogram and the partial correlogram reported in Figure 1 and 2, we obtained the identified model which is seen clearly in the plot of the ACF and the PACF function reported in figure 1 and 2.

The tentatively identified ARMA (p, q) model is specified as follows;

$$CINFL = \delta + \alpha_1 CINFL_{t-1} + \alpha_{12} CINFL_{t-12} + \alpha_{14} CINFL_{t-14} + \beta_1 U_{t-1} + \beta_2 U_{t-2} + \beta_{12} U_{t-12} + \beta_{14} U_{t-14} \quad (4)$$

Where; CINFL is inflation series at levels;

α_1, α_{12} and α_{14} are the coefficients of the AR (p) process while $\beta_1, \beta_2, \beta_{12}$ and β_{14} are the coefficients of the MA(q) process. AR (p) is autoregressive process while MA (q) is moving average process.

After the successful identification of the ARMA (p, q) process, we estimate the model with EVIEW 7 estimation software. The result of the ARMA process is reported in Table 2.

The selection of the ARMA (p, q) model in equation (4) is based on the ACF and the PACF function reported in Figure 1 and 2. Since the core inflation variable was stationary at levels as shown in the unit root test reported in Table 2, there was no need to difference the variable. The graph of the correlogram reported in Figure 1 and 2 reveals some interesting pattern. First, both the ACF function (Figure 1) and the PACF function (Figure 2) exhibits some form of exponential decay. The spikes from the graph shows the ACF to be statistically significant at lags 1, 2, and 14 while for the PACF, lags 1, 2, 12 and 14 appeared to be statistically different from zero.

We therefore proceed to estimating the ARMA (p, q) process with the result reported in table 2. Thereafter, we proceed to checking the reasonable fit of model to data. This is done by simply obtaining the ACF and the PACF from the residual of the regression estimate reported in table 2.

Diagnostic Checks

The model diagnostic check entails examining the graphical analysis of the plot of the residuals of the estimated model and the plot of the autocorrelogram of the residuals to verify whether the residuals of the

estimated models are purely random. This is seen clearly in figure 3 where the residual of the autocorrelation function at various the lags hover around zero with the exception of lags 2, 9 and 15 while in figure 4 the residual of the partial autocorrelation function at various lags hover around zero with the exception of lags 2, 15 and 23. The estimated ARMA (p, q) model can therefore be accepted as a purely random walk hence there is need to look for another ARIMA model.

Table 2: Estimated ARMA (p, q) Coefficient

Variables	Coefficient	Std. Error	T-Statistic	Prob.
C	10.2102	1.0247	9.9637	0.0000
AR (1)	0.9709	0.0154	62.9968***	0.0000
AR (12)	-0.2555	0.0389	-6.5681***	0.0000
AR (14)	0.1892	0.0385	4.9124***	0.0000
MA (1)	0.8045	0.0750	10.7272***	0.0000
MA (2)	0.2108	0.0571	3.6923***	0.0004
MA (12)	-0.0764	0.0301	-2.5338***	0.0130
MA (14)	0.4434	0.0428	10.3454***	0.0000
R-squared	0.995995	Adjusted R-squared	0.995691	
F-statistic	3268.825***	Durbin-Watson	1.783613	

Note: The table shows that 99 per cent of the systematic variation in core inflation is explained by it lag. The *** indicates that AR, MA and F-statistics are significant at the 1% level while the Durbin-Watson shows the absence of serial correlation.

Figure 3: Residual Autocorrelation Function Figure 4: Residual Partial Autocorrelation Function

Note: Figure 3 and 4 is the Autocorrelation and partial autocorrelation function of the residual showing that the residual is a random walk.

Forecasting

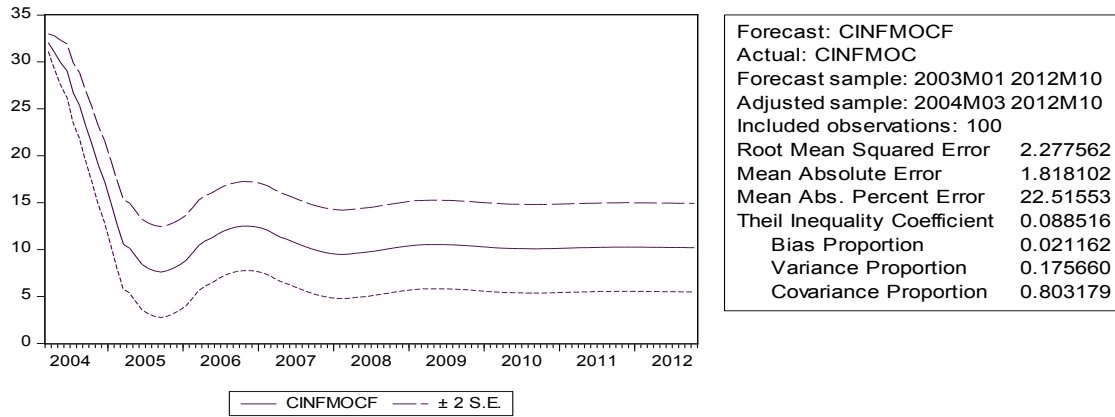

We however, proceed to forecasting core inflation with the ARMA (p, q) model with the forecast shown in figure 5 below.

Modeling Inflation with VAR

The seminal work by Sims (1980) brought succor to the modeling of multivariate autoregressive models with the use of unrestricted vector autoregressive model (VAR). Conventionally, in VAR modeling technique, we consider several endogenous variables together with each endogenous variable explained by its lagged values and the lagged values of all other endogenous variables in the model. In VAR estimation and forecasting, unit root test is not necessary because of the loss of information, observation (Sims 1980). In modeling and forecasting inflation with VAR, we used a univariate autoregressive framework, in which the model is specified describing the interdependence of money supply (broad money supply) and core inflation. In its simplest form, we express the set of n variables collected in the $n \times 1$ vector Y_t on their own lags and those of the other variables in the model. The model can be expressed as;

$$Y_t = \alpha + \beta_{1i} Y_{t-1} + \beta_{2i} Y_{t-2} + \dots + \beta_{pi} Y_{t-p} + u_t \quad (5)$$

Figure 5: ARIMA Forecast

Note: The figure shows an historical simulation and forecast of core inflation. The second line is the forecast while the other two lines are the bound for standard error of forecast.

The coefficient matrix β_{li} are the $n \times n$ matrix (made up of the inflation and money supply variables) and u_t is an $n \times 1$ vector of serially uncorrelated random error which is assumed to have a multivariate normal distribution $u_t \sim iidN(0, \sum_u)$.

Assuming Y_t is an $n \times 1$ column vector composed of all the variables in our study, the VAR model simply relates current values of Y_t to past values of Y_t and an $n \times 1$ vector of innovations U_t . This can be written precisely as follows;

$$y_{1t} = \beta_1 + \beta_{11}y_{1t-1} + \beta_{12}y_{2t-1} + \alpha_{11}y_{1t-2} + \alpha_{12}y_{2t-2} + \epsilon_{1t} \quad (6)$$

$$y_{2t} = \alpha_1 + \beta_{21}y_{1t-1} + \beta_{22}y_{2t-1} + \alpha_{21}y_{1t-2} + \alpha_{22}y_{2t-2} + \epsilon_{2t} \quad (7)$$

The VAR equation can be written more compactly as;

$$y_t = \alpha + \beta_1 y_{t-1} + \beta_2 y_{t-2} + u_t \quad (8)$$

Where α is an $n \times 1$ vector and β_j 's are $n \times n$ metrics.

To determine the appropriate lag length, we will employ the Akaike information criterion (AIC) and Schwarz criterion (SC). This is determined precisely with the aid of E-view 7 estimating software shown in Table 3 below.

Table 3: VAR Lag Order Selection Criteria

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-2063.813	0.0000	0.0000	39.72717	39.77802	39.74777
1	-1607.289	886.7099	0.0000	31.02479	31.17735	31.08660
2	-1527.079	152.7067	0.0000	29.55922*	29.81349*	29.66223*
3	-1524.693	4.452163	0.0000	29.59024	29.94622	29.73446
4	-1522.818	3.424672	0.0000	29.63112	30.08880	29.81654
5	-1521.029	3.199879	0.0000	29.67363	30.23302	29.90026

	[-18.3353]***	[0.5601]
M2(-1)		0.9273
	0.0000	[9.5022]
M2(-2)		0.0740
	[-0.0000]	[0.7550]
R ²	0.9941	0.9947
Adjusted- R ²	0.9939	0.9945
F-statistics	4495.88***	4963.39***
Durbin-Watson Stat	2.0591	2.0292

Note: CINF is the core inflation series and M2 is the broad money supply, while numbers in brackets are the lag length, numbers in parenthesis are the T-statistics. ** and *** indicate 5 and 1 per cent level of statistical significance respectively.

RESULTS ANALYSIS

The ARIMA and VAR model results shows a good fit as shown by the Adjusted R-squared. While current inflation is explained by over 99 percent systematic variation in the independent variables in the ARIMA model, the VAR model also showed a very predictive power given the value of its coefficient of determination and adjusted coefficient of determination values of 0.9941 and 0.9939 respectively. The F-statistics for both models show an overall significant at the 1 per cent level. While the AR and MA's were all significant at the 1 per cent level in the ARIMA model, the VAR model only lag inflation was significant at the 1 per cent level while all the lags of money supply was not significant in determining variation in inflation. The Durbin-Watson statistic shows the absence of serial autocorrelation. Since our aim is to predict and forecast inflation and compare the forecast values of the ARIMA with that obtained from the VAR model, we generated the forecast values directly using the Eview 7 estimating software.

Table 5: Forecast Comparism of the VAR and ARIMA Model

Months	Actual CINF	ARIMA Forecast	VAR Forecast
2012M05	12.40	10.2350	12.1971
2012M06	12.70	10.2276	12.1026
2012M07	13.00	10.2199	11.9291
2012M08	13.3	10.2123	11.6896
2012M09	13.5	10.2053	11.3971
2012M10	-	10.1992	11.064

Table 5 show a comparison of the ARIMA and VAR forecast with actual core inflation published by the Central Bank of Nigeria. The forecast result shows the VAR forecast to be closer to the actual inflation values. CINF is core inflation.

Conclusion

Current inflation in Nigeria which is put at 11.3 per cent in September 2012 (All Item Consumers Price Index) is expected to increase in the last quarter of 2012 following severe flooding and the washing away of farm lands in the earlier part of the year. Predicting price movement under periods of volatile food price increase has been made much more difficult. This study attempted forecasting inflation in Nigeria using monthly data over the periods 2003:01 to 2012:06. Two methods which have been used increasingly in the literature in forecasting inflation—the Vector Autoregressive Method (VAR) and the Autoregressive Integrated Moving Average Method (ARIMA) was used for this study with the sole objective of comparing both forecasting methods to obtain the best for Nigeria. While the ARIMA model was a univariate time series model, the VAR model was a multivariate model that incorporates the interdependency amongst several endogenous variables. The result of our estimate from both ARIMA and VAR model tracks actual inflation values for the period 2012: 06 to 2012 09. However, the VAR model had the least error in terms of the minimum square error and is the closest approximate to current inflation in Nigeria. The study forecasted core inflation using VAR for the month of 2012:10 to be 11.06 percent.

Limitation

A major limitation of this study is that it focused on two major forecast tools—the VAR method and the ARIMA method and neglected the use of neural network analysis. In addition to this limitation is the fact that only one variable was used as a measure of inflation—the core inflation. Subsequent studies on inflation forecasting in Nigeria will attempt to forecast inflation across a wider spectrum of inflation measures.

THE DEFENSES OF THE LAST IN FIRST IN INVENTORY METHOD

Peter Harris, New York Institute of Technology
Katherine Kinkela, New York Institute of Technology

ABSTRACT

The Last in First out Method (LIFO) is presently under severe scrutiny from the financial community which may soon culminate in its repeal as an acceptable accounting method. There are pressures from the SEC in conjunction with the International Financial Accounting Standards Board (IFRS) to standardize accounting standards worldwide. In addition, there is political pressure imposed by the US administration to raise additional revenues. Both groups strongly oppose LIFO, raising a strong possibility that's its complete elimination. This paper will address the reasons defending LIFO as an acceptable accounting method strictly from a financial reporting perspective.

INTRODUCTION

LIFO can be defended from a financial accounting reporting standpoint as this paper explores. Further, IFRS introduces several limitations and criticisms not evident in LIFO, further defending LIFO's position as an acceptable accounting method. This paper examines the defenses of LIFO. The second part discusses the current and future state of LIFO. First, from an accounting theory perspective, it satisfies the principles of matching, and the income statement economic reality of LIFO presentation. Additionally, a correct Balance Sheet amount can also be derived by use of the LIFO by utilizing the required LIFO Reserve disclosure. It also adheres to the historical cost and conservatism principles. Second, from the perspective IFRS, there is a deviation from historical cost, which allows for estimation of values, resulting in the possibility of earnings management by the use of the Lower of Cost or Market rule.

DEFENSES OF LIFO

LIFO can be defended on present accounting theory, which can transform LIFO use to correct income statement financial reporting totals, as discussed next. It can also be defended that LIFO reserve disclosure can most accurately transform the Inventory balance sheet value to the most current cost presentation. Lastly, IFRS suffers in many areas of financial reporting, including the deviation from historical cost which leads to earnings management possibilities, not found in LIFO.

1-Accounting Theory:

A) LIFO satisfies many present underlying US GAAP principles including; the matching principle which results in as income statement economically reality presentation. LIFO's greatest defense is that the Income Statement represents economic reality as it matches current inventory cost with current revenue, making the Income statement correct. The matching principal is adhered to by LIFO use.

B) Balance Sheet Correcting Inventory total by use of the LIFO Reserve amount: Since LIFO expenses its most recent inventory acquisitions to cost, the ending inventory balance presentation is composed of the oldest inventory purchases, making the balance sheet potentially and practically very inaccurate. From a non-tax aspect, this is the most viable argument against LIFO. The saving grace however, is that LIFO use can depict a true, current inventory valuation by use of the required IFO Reserve disclosure. The LIFO Reserve is simply the difference between the LIFO and FIFO inventory value. A FIFO, balance sheet friendly total can easily be calculated by adding the LIFO Reserve .

C) Conservatism: LIFO presents the most conservative financial position of a company. In an age of inflating earnings, LIFO is a relief in this regard and adheres to the principles of US GAAP.

D) Historical Cost: Further, the goal of reliability is met by LIFO use as historical cost valuation is followed. This is consistent with US GAAP methodology.

2-IFRS Limitation Both, US GAAP and IFRS allow for the Lower of Cost or Market for the valuation of inventories. This can be coupled with the FIFO or Weighted Average Method of inventory accounting. Under US GAAP, LCM cannot be used if LIFO is the chosen accounting method. IFRS rules allow for losses to be reversed if market value increases. US GAAP does not allow reversal of losses under any circumstance.

The potential negative implications under IFRS are as follows:

1-A deviation from historical cost: By allowing the LCM, subjective values can be imposed in the valuation of non LIFO inventory, leading to earnings management and potential income manipulation practices.

2-Earnings management potential as losses are allowed to be reversed in a future period: This can be quite problematic and companies can easily create “income” simply by reversing inventory losses; assuming an increase in market values by controllable in house valuations. This is too easy and the results of earnings management are thus controllable within the company.

Use of LIFO will prevent the above limitations, as LIFO use is objectively based and disallows the LCM rule, which may become very problematic in financial reporting under IFRS. Under US GAAP, if a company uses LIFO, it is precluded from using LCM and in effect retains the historical cost principle, preventing potential earnings shenanigans.

CONCLUSION

LIFO can be defended on many aspects of accounting theoretical frameworks, including the matching principle, historical cost principle, conservatism, reliability and relevance. Under LIFO, the income statement depicts a correct economic picture of a company’s operations. The ability to present a correct Balance Sheet amount by use of the required LIFO Reserve amount is also easily possible, making the Balance Sheet economically relevant. Additionally, IFRS suffers from several key theoretical perspectives, such as the deviation from historical cost, reversal of previous year’s inventory losses, consequently allowing for the possibility of practicing earnings management techniques, not evident in LIFO.

RELATIONSHIP BETWEEN ENVIRONMENTAL REPORTING IN CORPORATE ANNUAL REPORTS & CORPORATE PROFITABILITY IN BANGLADESH

Anup Kumar Saha, Jagannath University, Bangladesh

Shahnag Akter, Jagannath University, Bangladesh

ABSTRACT

This exploratory study is designed to investigate the extent and nature of environmental reporting in corporate annual reports by the listed companies of Bangladesh. Specifically, this study examines the relationship between environmental disclosure in corporate annual reports and corporate profitability in Bangladesh. In order to do this, a disclosure index has been developed and utilized to measure the extent of disclosure made by companies in corporate annual reports. The study shows that corporate environmental reporting in Bangladesh is still in its infancy as the level of environmental disclosures on corporate annual reports is very low and the nature of disclosure is in quantitative. This study reports that there is positive relationship between environmental reporting and corporate profitability.

KEYWORDS: Environmental accounting, Environmental Disclosure, Environment costs, Corporate Annual Reports, Corporate profitability, Disclosure Index.

INTRODUCTION

All countries of the world are now concerned about the protection and development of the environment as environment is changing rapidly and becoming unsuitable for living. Specially, the developing countries (like Bangladesh) are experiencing the worst natural disaster. Business concerns are hold responsible for such changes in environment to a large extent as their activities exert adverse impact on the environment. “Environmental accounting”- sometimes referred to as “green accounting”, “resource accounting” or “integrated economic and environmental accounting” has emerged during the last two decades in response to this issue. Review of available literatures and corporate practices reveal that a range of different perception and conception of environmental accounting has been developed.

However, recently there has been a movement towards a common understanding of the term Environmental accounting. Disclosure of environmental information in corporate annual reports began in the 1970s and it had sharply expanded in the 1990s (Kukobo *et al*, 2002). Over the last twenty years, corporate environmental reporting has become an issue of interest for researchers. Most of the corporate environmental reporting studies conducted so far have been in the context of developed countries such as Western Europe, the USA and Australia (see, for example, Choi, 1998; Adams *et al.*, 1995 and 1998; Kisenyi and Gray, 1998; Tsang, 1998; Ernst and Ernst, 1978; Gray *et al.*, 1987, 1995a and 1995b; Savage, 1994; Guthrie and Parker, 1990; Mathews, 1997; Roberts, 1990). Very few studies are available on the corporate environmental reporting practices in the developing countries. All of these studies were carried out in the context of newly industrialized countries such as Malaysia and Singapore and the African countries such as South Africa, Nigeria and Uganda. However, there is a lack of specific studies regarding Corporate Social and Environmental Disclosures both in developed and developing countries.

The concept of environmental reporting is relatively new in Bangladesh. Before 90’s there is no evidence that public limited companies listed with Dhaka Stock Exchange (DSE) disclosed environmental information in their annual reports. In Bangladesh, there are very few studies available on environmental reporting and all of these studies have focused on environmental disclosure through corporate annual reports (see, for example, Belal, 1997 and 1999; Imam, 1999 and 2000; Hossain, 2002; Bala and Yusuf,

2003; Shil and Iqbal, 2005). Most of prior studies have mainly shown the extent of environmental disclosure through corporate annual reports. Thus an attempt has been made in this study to find out the relationship between environmental disclosures on corporate annual reports and corporate profitability of 20 companies for the year 2009- 2010. By measuring correlation between them, it has also been tried to find out whether there exist any association between them or not.

Objectives Of The Study

This study is conducted for achieving the following objectives:

- a) Obtain an overview on the present status of environmental reporting practices by the listed companies in Bangladesh.
- b) Review corporate Annual Reports to identify environmental disclosures, their type and depth of disclosure.
- c) Identify whether the environmental disclosures in the Annual Report relate to the corporate profitability.
- d) Assess the nature and degree of relationship between environmental reporting and corporate profitability.
- e) Assess whether the environmental information disclosed in the Annual Report meets the requirements of the users of environmental information in the Annual Reports.
- f) Develop awareness of the companies about environmental disclosure in corporate annual reports.

Rationale Of The Study

Protection of environment is the burning question for today's world. All countries are now concerned about the environment because day-by-day environment is losing its balance and becoming unsuitable for living. Businesses are often held responsible for this. Findings of the study will help to know how much companies is concerned towards environmental protection & development and how they are performing their duties and responsibilities towards environment. Thus this study is expected to help the government to formulate the rules, regulations and guidelines for protecting environment from harmful activities of companies. The users of the environmental information disclosed in the corporate annual reports are expected to be benefited by this study in making correct decision. Finally findings of this study are expected to provide insight to how companies can better demonstrate a link between environmental disclosure/performance and financial performance which include:

- Encourage more companies to undertake environmental performance
- Promote the reputation of firms and encourage investments.

LITERATURE REVIEW

Corporate environmental reporting has been mainly a phenomenon of developed countries and consequently, most corporate environmental reporting studies were confined to the developed countries (Belal, 2000). A handful of studies concentrated on the newly industrialized countries such as Korea, Hong Kong, Malaysia and Singapore and African countries such as South Africa, Nigeria and Uganda (Belal, 2000). In addition, a majority of such studies has primarily focused on the extent of environmental disclosure in corporate annual reports for a developing country. This section sheds light on studies (in the international context as well as in the context of Bangladesh) on corporate environmental reporting through corporate annual reports. In addition, attempts have been made in this section to illuminate the status of environmental reporting in Bangladesh.

Status of Environmental Reporting in Bangladesh

Bangladesh is experiencing a fast degradation of environment. Some examples of this degradation are Dhaka's terrible air pollution, the 'clinically dead' river Buriganga and widespread arsenic pollution in the underground water (Belal, 2000). The Government of Bangladesh started paying attention to the environmental management of Bangladesh since the 1990s and in order to improve the environmental condition, the Bangladesh Environmental Protection Act, 1995 was passed. At present, corporate environmental reporting is not mandatory in Bangladesh. A very few companies in Bangladesh are making efforts to provide environmental information on a voluntary basis, which are mostly qualitative in nature. But under the Bangladesh Environmental Protection Act, 1995, companies may be asked to disclose environmental information as and when required (Belal, 2000). The only mandatory environmental disclosure requirement in Bangladesh is the disclosure of expenditures on energy use. Under Schedule-XI, Part-II of the Companies Act 1994 and under Schedule, Part-II of the Securities and Exchange Rules, 1987, the total amount spent on the use of energy is to be shown in notes to the financial statements under a separate head of expenditure.

Prior International Researches

In Hong Kong, Ho *et al.* (1994) studied 182 companies and found that only 9 out of these 182 companies (4.9 percent) disclosed environmental information in their annual reports for the year 1991. In Korea, the study of Choi (1998) reveals that out of 770 listed companies 64 companies disclosed environmental information in their audited semi-annual financial statements for the year 1997. Tsang (1998) conducted a longitudinal study of social and environmental reporting practices by the banking, food and beverages and hotel industries over a ten-year period from 1986 to 1995. The researcher found that 17 (52 percent) out of 33 listed companies made social and environmental disclosure in their annual reports. The study observed a steady increase in social and environmental disclosures during the late 1980s and then a stable pattern since 1993. In a study of 22 large MNCs in Nigeria, Disu and Gray (1998) noted that all companies included in the survey made some mandatory disclosures such as charitable donations, employment data, pensions, employee consultation, employment of the disabled, health and safety and corporate governance. The samples also made some voluntary disclosure predominantly in the area of employee reporting. In another study of only four companies of Uganda, Kisenyi and Gray (1998) observed that none of them made any environmental disclosure, all of them made employee related disclosure and two of them gave information on customers and community involvement. They tentatively conclude that "social and environmental disclosure in Uganda is scarce, low grade and of little importance" (Kisenyi and Gray, 1998, p. 18).

Savage (1994) studied 115 South African companies and found that approximately 63 percent companies had made environmental disclosures in their annual reports and the length of disclosure made by the number of pages had been 0.5. Profitability as well as corporate financial performance was used by a number of researchers as an explanatory variable for differences in disclosure level. However, the relationship between corporate financial performance and corporate social and environmental disclosure is arguably one of the most controversial issues yet to be solved (Choi, 1998). The results of different studies measuring the relationship between corporate financial performance and corporate social and environmental disclosure show mixed results. Among these researchers found a positive association between profitability and the extent of corporate social and environmental disclosure (Waddock and Graves, 1997) whereas Cowen *et al.* (1987) found no association between the variables. Again, the results Belkaoui and Kirkpik (1989) tend to be more intriguing. They showed a significantly pair-wise correlation, yet an insignificant negative regression co-efficient for return on assets and corporate social and environmental disclosure. There are researchers those used log of profits and among these researchers, Roberts (1992) has found a positive relationship between profitability level of a company and corporate social and environmental disclosure. However, Patten (1992) fails to find any significant positive relationship between profitability and corporate social and environmental disclosure. In addition,

Roberts (1992), Ng (1985) and Davey (1982) found that the size of the company did not significantly explain an association with the level of corporate social and environmental disclosure and its variability.

Prior Researches in Bangladesh

Very few studies on environmental reporting have been undertaken in the context of Bangladesh. All of these studies focused on environmental disclosure through corporate annual reports. Belal (1999) surveyed annual reports of 30 companies of Bangladesh of which 28 were listed and 2 were unlisted. He found that 90 percent of the companies under study made some environmental disclosure. Imam (2000) analyzed annual reports of 34 companies listed with the stock exchanges of Bangladesh for the year of 1996-97 and found that only 22.5 percent of the sample companies provided environmental information in their annual reports. Hossain (2002) conducted a survey of annual reports of 150 non-financial companies (listed on the Dhaka Stock Exchange) for the year of 1998-99. The study reveals that only 5 percent of the companies under study disclosed environmental information in the Directors' Report or in the Chairman's Report of their annual reports and not a single company disseminated any quantitative information as to the environmental items. An interesting finding of this study is that subsidiaries of multinational companies did not disclose environmental information.

Bala and Yusuf (2003) analyzed the annual reports of 249 public limited companies (listed on the Dhaka Stock Exchange) for the year of 2001. They report that only 26 (10.4 percent of the total) companies disclosed environmental information in the Directors' Report or in the Chairman's Statement or elsewhere in their annual reports. The information disclosed was qualitative in nature and companies did not follow any specific or standard reporting format. Shil and Iqbal (2005) surveyed 121 manufacturing companies listed on the Dhaka Stock Exchange (DSE). They reported that only 13 companies (11 percent of 121 companies) disclosed environmental information in their annual reports. All companies disclosed qualitative information in the Directors' Report. They developed a simple hypothesis to test whether there is any relationship of environmental disclosure with profitability and found that there is no relationship of environmental disclosure with the profitability.

Rahman and Muttakin (2005) surveyed 125 manufacturing companies listed on the Chittagong Stock Exchange (CSE) as on May 7, 2005. They analyzed the annual reports of these 125 companies for the year 2003/2004. The researchers found that only 5 companies (4 percent of 125 companies) disclosed environmental information in their annual reports. The information was descriptive in nature; no quantification thereof was made. They also report that the disclosure of environmental information was done in different places of the annual report and there was no standard environmental reporting framework. Bose (2006) analyzed 5 years' annual reports of 11 Petrobangla companies for examining their environmental reporting status. He found that in 1998-1999 and 1999-2000, only 45.45% and in 2000-01, 63.63% and in 2001-02 and 2002-03, only 81.81% of Petrobangla companies disclosed environmental information in their annual reports. The nature of information disclosed was qualitative and descriptive; the reporting companies did not attempt to quantify the environmental information. In addition, companies provided only positive information and ignored negative information. This study also shows that most of the Petrobangla companies provided information only on protection of the environment, pollution control, planting of trees and other matters. They did not provide any information regarding waste generation, conservation of energy, water wastage, recycling of waste and noise nuisance. Environmental information was disclosed either in the Chairman's Statement or Director's Report.

Hossain, Islam and Andrew (2006) surveyed 107 non-financial companies (listed on the Dhaka Stock Exchange) for the year 2002-2003. The study shows that on average 8.33% of Bangladeshi companies disclose social and environmental information in their corporate annual reports. These disclosures were voluntary in nature and largely qualitative. The study reported the results of multiple linear regressions to

test the association between a number of corporate attributes and the extent of social and environmental disclosure in company annual reports for a developing country, Bangladesh. The results showed that corporate environmental disclosure levels are associated with some company characteristics. For Bangladesh, the variables those were found to be positively significant in determining disclosure levels are the nature of the company (INDUSTRY), presence of debentures in the corporate annual reports (DEBENTURE), and the net profit margin (NPMARGIN). Specifically, in Bangladesh, they found that manufacturing companies with higher profitability and those that had issued debentures tended to disclose more social and environmental information.

Most of prior studies in the context of Bangladesh have mainly concentrated on the extent of environmental disclosure through corporate annual reports but they did not give much attention on the relationship of the environmental disclosure with several corporate attributes (such as age, size, efficiency, profitability, multi nationality, industry type etc). Thus this study has been tried to find out the relationship between the environmental reporting on corporate annual reports and profitability of listed companies in Dhaka stock Exchange.

METHODOLOGY OF THE STUDY

The study is mainly based on secondary sources of information. The reason is that in our country the use of environmental accounting and reporting is rare and in most of the cases, the concept is vague. The environmental accounting practices followed by some developed countries have been studied to develop an idea of its applicability in our countries. To collect the data of the study, various published textbooks, related journals, reports, seminar papers, magazines and research works have been analyzed. Literatures were collected from the said sources and the internet. In addition, the annual reports published by our companies have been analyzed to collect information regarding the current status of environmental accounting practices & its disclosure and profitability of the companies.

Sample Selection

As the study is related to the environment, only manufacturing companies that are listed on the Dhaka Stock Exchange have been taken into account. The reason is that such companies have adverse impact on the environment. Although almost all of the companies (manufacturing and non-manufacturing) through their activities directly or indirectly affect the environment, the manufacturing companies are directly & seriously polluting environment by their production process, types of material used, disposal of wastages etc. In the study, 20 manufacturing companies of the following categories have been selected-

- i. Pharmaceutical & chemicals industries.
- ii. Food & allied industries.
- iii. Cement industries.
- iv. Ceramic industries.
- v. Textiles & Clothing industries.

A list of companies included in this study has been shown in Appendix A. The sample covers the annual reports of the said 20 companies for the year 2009 or 2010. Data for evaluating environmental information were extracted from corporate annual reports of the sample listed companies.

Information Items Included in the Environmental Disclosure Index

Disclosure Index Approach has been used to provide an evaluation of the environmental disclosure in corporate annual reports. The major task of the present study is to develop a suitable disclosure index comprising items of environmental information that are expected to be disclosed in corporate annual

report from the view point of Bangladesh. But there is a problem as to the measurement of corporate environmental disclosure. There is no generally accepted theory to predict user information needs and there is an absence of an appropriate generally accepted model for the selection of the items of environmental information to be included in a disclosure index. The items of environmental information included in the disclosure were selected from the study of Wiseman (1992), Porwal and Sharma (1991), and Singh, and Ahuja (1983). The list of this environmental disclosure information can be found as Appendix B. The disclosure index constructed for this study included 15 items, which were used in environmental index formulations.

Scoring in the Environmental Disclosure Index

There are various approaches available to develop a scoring scheme to determine the disclosure level of corporate annual reports from the works of other researchers. Among the those approaches, unweighted disclosure index approach has been used to measure the extent of disclosure of environmental information where an item scores one if disclosed and zero if not disclosed. An unweighted environmental index is the ratio of the value of the number of items a company discloses divided by total value that it could disclose. Under an unweighted environmental disclosure index, all items of information in the index are considered equally important to the average user. In the unweighted environmental disclosure index, disclosure of individual items has been treated as a dichotomous variable. Here, the only consideration is whether or not a company discloses an item of environmental information in its corporate annual report. If a company discloses an item of environmental information in its annual report, it will be awarded '1' and if not it will be awarded '0'. The disclosure model for the unweighted environmental disclosure thus measures the total disclosure (TD) score for a company as additive as follows:

$$TD = \sum_{i=1}^{15} di$$

Where,

TD = Total Disclosure

di = 1 if the item is reported and 0 if the item is not reported

i = 1, 2, 3,.....15

Correlation Analysis

The relationship between environmental disclosure and corporate profitability is arguably one of the most controversial issues yet to be solved. The results of different studies measuring such relationship show mixed results. Some researchers found a positive association between environmental disclosure and profitability whereas others found no association between the variables. In the present study, net profit margin has been used as the measures of profitability and to examine the relationship between the environmental disclosure in corporate annual reports and corporate profitability (net profit margin), Karl Pearson's correlation coefficient (*r*) has been computed.

HYPOTHESIS

In this study, a simple hypothesis has been developed to test whether there is a positive relationship of environmental disclosure with profitability (net profit margin). Our hypotheses are as follows:

H₀: Companies with environmental disclosure have not higher net profit margin than companies without environmental disclosure.

Ha: Companies with environmental disclosure have higher net profit margin than companies without environmental disclosure. To test the hypotheses, *t*-test has been used in this study due to the size of sample, nature of variables and available information.

ANALYSIS AND FINDINGS

The analysis and findings of the study are presented in this section. At first, the nature and extent of the corporate environmental disclosure has been analyzed and discussed. Secondly, the discussion on analysis of correlation co-efficient has been made and finally hypotheses testing, results and interpretation are presented. The *t*-test has been used to test the hypotheses of the study.

Disclosure Levels by the Sample Companies in Bangladesh

Of the 20 sample companies, 9 companies (45 percent) disclosed environmental information on their annual reports. Out of these 9 companies, 4 (44.44 percent) companies belong to Pharmaceutical sector, 3 (33.33 percent) companies from Cement sector and 1 (11.11 percent) company from each of the two sectors such as Textiles & Clothing and Food & Allied sectors, disclosed environmental information on their annual reports. **Table-1** provides the sector-wise distribution of 9 companies.

Table-1: The Sector-Wise Distribution of the Companies

No.	Name of Company	Sector
1	Aramit Limited.	Cement
2	Beximco Pharmaceuticals Ltd.	Pharmaceuticals & Chemicals
3	British American Tobacco Bangladesh Co. Ltd.	Foods & Allied
4	Confidence Cement Ltd.	Cement
5	Heidelberg Cement Bangladesh Ltd.	Cement
6	Malek Spinning Mills Ltd.	Textiles & Clothing
7	Orion Infusion Limited.	Pharmaceuticals & Chemicals
8	Square Pharmaceuticals Ltd.	Pharmaceuticals & Chemicals
9	The IBN SINA Pharmaceutical Industry Ltd.	Pharmaceuticals & Chemicals

The score received by all individual sample companies for disclosing their environmental information in corporate annual reports has been made in Appendix C. A summary descriptive statistics of disclosure score (DS) for the sample companies are provided in **Table 2**. The mean of the DS for 9 companies was 2.33 points, which indicates a very low level of corporate environmental disclosure by different listed manufacturing companies of Bangladesh. The standard deviation for 9 companies was 1.33 and their DS was ranged from 1 point to 5 points, indicating a medium variation in the disclosure level of corporate environmental information on corporate annual reports.

Table 2: Descriptive Statistics of Disclosure Score

No. of Observations	9
Mean	2.33
Standard Deviation	1.33
Maximum	5
Minimum	1
Range	4

Nearly 47 percent of the items included in the EDI were not disclosed by any of the reporting companies. Table 3 presents both disclosed and non-disclosed items of environmental information. Not a single company disclosed quantitative facts such as expenditure incurred or targets set and achieved. According to Table 3, all the companies have disclosed “environmental policies or company concern for the environment” on their annual reports (100%). Not a single company disclosed about water discharge or solid waste disposal information on the corporate annual reports. Out of 9 companies, 4 (44.44%) made

disclosure on their annual reports of how they controlled pollution of industrial process. Around 22.22 percent companies have disclosed on their annual reports whether they have air emission information or conserved natural resources. Approximately 11.11 percent companies have reported whether they have installed effluent treatment plant or financed for pollution control equipment or have forestation programs. An interesting finding of the study is that only 1 of the 9 companies obtained ISO 14001 certification.

Table 3: Disclosure and Non-disclosure of Items of Environmental Information by Sample Companies

Item No.	Items of Environmental Information	Disclosures (No. of Companies out of 9)	Percentage of Disclosures
1	Financing for pollution control equipment or facilities.	1.00	11.11
2	Air emission information.	2.00	22.22
3	Water discharge information.	0.00	0.00
4	Solid waste disposal information.	0.00	0.00
5	Environmental policies or company concern for the environment.	9.00	100.00
6	Conservation of natural resources.	2.00	22.22
7	Recycling plant of waste products.	0.00	0.00
8	Installation of effluent treatment plant.	1.00	11.11
9	Land reclamation and forestation programs.	1.00	11.11
10	Pollution control of industrial process.	4.00	44.44
11	Past and current expenditure for pollution control equipment and facilities	0.00	0.00
12	Past and current operating costs of pollution control equipment and facilities	0.00	0.00
13	Future estimates of expenditures for pollution control equipment and facilities	0.00	0.00
14	Research on new methods of production to reduce environmental pollution.	0.00	0.00
15	Obtaining certification for Environmental Management Systems/ISO 14001.	1.00	11.11

Sample Companies With Their Disclosure Score & Net Profit Margin

The main focus of this study is to find out the relationship between the environmental reporting on corporate annual reports and corporate profitability. **Table 4** presents all individual sample companies with their disclosure score & net profit margin. According to table 4, companies without disclosure have insignificant net profit or net loss. On the contrary, none of the companies which have disclosed environmental information have suffered from net loss. Almost all of the companies with environmental disclosure have enjoyed higher net profit margin than companies without environmental disclosure.

To summarize, it can be said that companies with environmental disclosure have higher profit than companies without environmental disclosure. There are a lot of statistically significant tools to justify the relationship between corporate environmental reporting and profitability. In this study, the coefficient of correlation and hypothesis testing have been used.

Correlation Analysis, Results and Interpretation

Of the several mathematical methods of measuring correlation, the Karl Pearson's coefficient of correlation is most widely used in practice. It is used universally for describing the degree and direction of relationship between two variables. In this study, Karl Pearson's coefficient of correlation has been used to determine the degree and direction of relationship between the environmental disclosure in corporate annual reports and corporate profitability (net profit margin). The result of the correlation is 0.45 which indicates that there is moderate degree of positive correlation between the environmental disclosure and net profit margin. That's the direction of relationship between environmental disclosure and net profit margin is positive (i.e. if one variable increases, other will also increase & vice versa) and the degree of relationship is moderate level.

Table 4: List of Sample Companies with their Disclosure score & Net profit margin

No.	Name of companies	Disclosure Score	Net profit Margin
1	Heidelberg Cement Bangladesh Ltd.	5	12.00%
2	Beximco Pharmaceuticals Ltd.	3	16.20%
3	British American Tobacco Bangladesh Co. Ltd.	3	11.77%
4	Orion Infusion Ltd.	3	5.58%
5	The IBN SINA Pharmaceuticals Industry Ltd.	3	3.74%
6	Square Pharmaceuticals Ltd.	1	18.80%
7	Aramit Cement Ltd.	1	14.55%
8	Confidence Cement Ltd.	1	14.02%
9	Malek Spinning Mills Ltd.	1	7.89%
10	Square Textiles Ltd.	0	6.71%
11	Reckitt Benckiser(Bangladesh) Ltd.	0	6.16%
12	Fu-Wang Foods Ltd.	0	4.97%
13	Beximco Synthetics Ltd.	0	1.47%
14	Fu-Wang Ceramic Industry Ltd.	0	0.82%
15	Tallu Spinning Mills Ltd.	0	0.67%
16	Monno Ceramic Industries Ltd.	0	0.47%
17	Apex Foods Ltd.	0	0.39%
18	Monno fabrics Ltd.	0	-26.22%
19	Lafarge Surma Cement Ltd.	0	-28.97%
20	Zeal-Bangla Sugar Mills Ltd.	0	-29.59%
	TOTAL-----	21	41.43

Hypothesis Testing, Results and Interpretation

In this study, the *t*-test has been used to test the hypothesis whether companies with environmental disclosure have higher net profit margin than companies without environmental disclosures. As H_a is one-sided, one tailed test has been applied for determining the rejection region at 5 percent level of significance which comes to as under, using table of *t*-distribution for 18 degree of freedom:

R: $t > 1.734$ The computed value of *t* is 3.372 which fall in the rejection region and thus the null hypothesis (H_0) is rejected and alternative hypothesis is accepted. So it can be concluded that companies with environmental disclosure have higher net profit margin than companies without environmental disclosures. In the study, it has been observed that among 9 companies (which have disclosed environmental information) all have net profit during the surveyed financial year. On the contrary, among the rest 11 companies (which have not disclosed environmental information) 3 companies have shown net loss and 4 companies have showed very little net profit (less than 1%).

SUMMARY, CONCLUSION AND RECOMMENDATIONS

Though corporate environmental reporting is not mandatory at present in Bangladesh, out of 20 sample companies 9 companies have disclosed environmental information voluntarily in their annual reports. That means 45% companies have disclosed environment related information. But the study also shows that on average only 2.33% of environmental information have been disclosed by the sample companies in their corporate annual reports and no company has disclosed quantitative information which is very disappointing as compared with the developed and some developing countries. Thus it can be concluded that environmental reporting in Bangladesh is still in its infancy and is in need of further development. This paper has reported the results of correlation-coefficient and a simple hypothesis test (*t*-test) to show the association between corporate profitability and the extent of environmental disclosure in corporate annual reports for Bangladesh. The result of correlation-coefficient shows that there is a moderate degree of positive correlation between them and the *t*-test result represents companies with environmental reporting have higher net profit margin than companies with environmental reporting. In order to improve the situation of environmental reporting in Bangladesh, following recommendations have been offered and they are as follows:

- Companies have been found to disclose only qualitative information about their environmental activities. They should also provide quantitative environmental information such as the amount of fines for noncompliance, the amount spent on tree plantation, the quantity of energy saved, the quantity of CO2 emitted etc.
- Companies have provided only positive information about their environmental activities. They should also provide negative information so that the information has decision-usefulness for information consumers.
- It has been found that there are inadequate laws, rules and guidelines on corporate environmental reporting and disclosure. Laws, rules and guidelines are needed to be developed.

This study considers the annual reports for a single year. Further research can be undertaken to measure the extent of environmental disclosure longitudinally to determine whether quality of disclosure has improved over time. Such a study would provide additional insights on corporate disclosure practices in Bangladesh. This study does not concentrate on any particular industry type. Further research can be undertaken based on particular industry type (e.g., the pharmaceutical industry and textile industries in Bangladesh). This study concentrates only on the relationship between environmental reporting and profitability. Further research can be undertaken based on relationship between environmental reporting and severe corporate attributes (such as age, size, efficiency, profitability, multi nationality, industry type etc). It should be noted that the number of environmental disclosure items was limited to 15 items and the results may be different if the numbers of environmental information were increased or another set of environmental disclosure items was examined. It should also be noted that the number of sample companies was limited to 20 companies and the results may be different if the number of sample companies was more. As always, much more research is needed if we are to contribute to more environmentally responsible corporate practices in all corners of the world.

THE CURRENT AND FUTURE STATES OF LIFO AND AVAILABLE TAX OPPORTUNITIES

Peter Harris, New York Institute of Technology
William Stahlin, Stevens Institute of Technology
Liz Washington Arnold, The Citadel

ABSTRACT

The Last in First out Method (LIFO) is presently under severe scrutiny from the financial community, which may soon culminate in its repeal as an acceptable accounting method. There are pressures from the International Financial Accounting Standards Board to standardize accounting standards worldwide. In addition, there is political pressure imposed by US Congress to raise additional revenues. Both groups strongly oppose LIFO, raising the possibility of its complete elimination as an acceptable accounting method. However, adverse economic and political events in 2011 and again in 2012 have greatly renewed the lifeline of LIFO indefinitely. In the unlikely case of its ultimate repeal, the author presents some tax opportunities available in this transition period.

KEYWORDS: LIFO, LIFO Reserve, IFRS, US GAAP, FIFO.

INTRODUCTION

At present, LIFO faces a possibility of its elimination by the year 2015, as political forces coming from the International Financial Accounting Standards Board, the world financial community and the US administration strongly oppose this method. The International Financial Reporting Standards (IFRS) prohibits LIFO as an acceptable accounting method, and the Obama administration proposed in its 2010 budget to repeal LIFO altogether in the future. However, given new developments against Senator Rangel, LIFO's biggest critic and the renewed worldwide recession, as well as an unprecedented report by the SEC, which avoided a critical due date of convergence, LIFO's repeal is now very unlikely. This paper will examine the current and future states of LIFO and available tax opportunism assuming the unlikely repeal of LIFO.

CURRENT STATE OF LIFO

LIFO was facing pressures from both: the International Reporting Standards Board in cooperation with the SEC and the U.S. Congress for its possible complete elimination by the year 2014. On June, 18, 2008 the SEC issued a press release stating that the world's securities regulators are uniting to increase their oversight of international accounting standards. There are plans set forth by the SEC and the IFRS to standardize accounting standards, on a worldwide basis with a target date set for periods ending after December 31, 2014. Under IFRS rules, LIFO is not a permitted acceptable accounting method. IFRS is balance sheet oriented and on this basis, disallows LIFO as an inventory method. The use of LIFO disrupts the theoretical foundation of the IFRS. More importantly is the current tax position on LIFO. The Obama Administration has proposed in its 2010 budget to repeal LIFO altogether in an attempt to generate greater tax revenues.

Recently in 2010, Senator Rangel, the biggest political critic of LIFO was brought up on a number of ethical violations. This in effect has pushed LIFO repeal backwards and has at best delayed its possible repeal. Additionally, the economic crisis has resumed unexpectedly in 2011 as the pale state of the economy was announced, which was contrary to the belief that it was in a recovery stage. Most significantly in 2012 the SEC announced that it has no target date if any for IFRS convergence in the US

and expressed major constraints if plans for convergence were to continue. Clearly, the SEC is in no rush and non-enthusiastic about convergence, which is not likely to happen anytime in the intermediate future. These developments have put LIFO repeal on the backburner and the result is that the political pressures against LIFO have eased in a significant manner and the likelihood of its eventual repeal now is very unlikely

THE FUTURE OF LIFO

There are four possibilities of LIFO going forward, and illustrated as follows:

Case	Financial Reporting Purposes	Tax Purposes
1	Yes	Yes
2	No	Yes
3	Yes	No
4	No	No

In case 1, LIFO would continue as present. Although dual resistance from IFRS and Congress exist, recent developments and charges against senator Rangel coupled with the continued weakness in the worldwide economy makes the status quo a reality. Although the continued use of LIFO will greatly and potentially hinder the goal of uniform financial reporting going forward, the ultimate goal here has moved to convergence and not uniformity, adding to the real probability of continued LIFO use in the USA. Compromises between US GAAP and IFRS in our opinion will be the norm rather than the exception going forward; commonly called endorsement of IFRS into US GAAP.

In case 2, allowing LIFO for tax purposes and not for financial reporting purchases represents the best of both world, as a company report the highest income for financial reporting purposes and pay the least amount of tax. The scenario would effectively eliminate the LIFO conformity requirement. The likelihood of this happening is most unlikely and not feasible.

In case 3, the worst of both worlds for a company; that is, the lowest income for financial reporting and the highest tax payment. This scenario is also not feasible.

Case 4 represents the complete elimination of LIFO. This will only occur if LIFO is eliminated at the tax level. If so, then it will be eliminated for financial reporting purposes, as the advantage for business purposes would not exist. Given the SEC's non commitment to IFRS adaption in the US, the spiraling US deficit which now exceeds 16 trillion Dollars, LIFO is safe and unlikely that any repeal will occur in the future. In addition, the continuing worldwide economic problems, LIFO at this time is just a footnote for the US regulators, similar to the second term of then President Bush, which leads us to predict that this issue will not be addressed well beyond the 2012 election. Our prediction then is a status quo on LIFO at this time and in the near foreseeable future.

TAX PLANNING OPPORTUNITIES AVAILABLE FOR THE CURRENT USERS OF LIFO

Assuming the repeal of LIFO, which seems very unlikely, what are some of the tax planning opportunities available to taxpayers to help ease in this transition?

Extended Payment Adjustment Period: Under current tax rules, if a taxpayer changes its accounting period from LIFO to another acceptable method, and it results in a higher inventory value, the difference in additional tax is payable over a period of four years. Under the current Obama Administration's 2010 Budget Proposal, which would eliminate LIFO, the difference would be spread to taxable income and payable over eight years. Consequently, the termination of LIFO would be mitigated as the resulting extra tax would be payable to the tax authorities over an eight year period.

CONCLUSION

Given the worldwide continued recession, political concerns, spiraling US Deficit and most importantly, the SEC's non commitment to US IFRS compliance, LIFO is insulated from the possibility of repeal in the indefinite future. In the authors' opinion, the status quo of LIFO in the US will continue.

ABSTRACT

It is well known that Mathematical Programming techniques are well-developed and with widespread application. It would be useful for researchers and practitioners in the information systems field to have a categorization that would show the types of problems that have been solved using these techniques. This paper provides this categorization

INTRODUCTION

Application of business, financial and economic problems to mathematical programming is of ongoing interest. Users include insurance companies, mutual funds, farmers and shipping companies. Mathematical programming is used when an optimization decision has constraints that limit decisions. For example, a business may use mathematical programming to allocate scarce resources in an optimal way, an insurance company may be required to keep a small percentage of its assets in treasuries and another percentage in fixed income securities and a farmer's crops may require a minimum amount of fertilizer. Much research has been conducted to make the solving of linear programs more efficient [7, 8, 20, 21, 25]. Applications of these optimization problems extend over many fields. For example, in the fields of economics and finance, linear programming may be applied to production problems, shipping problems, asset allocation, crop growing, allocation of sewage, mortgage backed securities portfolios other similar problems [1, 2, 3, 4, 5, 6, 10, 11, 13, 14, 15, 16, 17, 18, 19, 22, 26, 27, 28].

We have written papers on the topics that encompass this research: mathematical programming, asset allocation models, the sub-prime mortgage problem and even applying linear programming to parallel computers [23, 24, 25]. It is well known that Mathematical Programming techniques are well-developed and with widespread application. It would be useful for researchers and practitioners in the information systems field to have a categorization that would show the types of problems that have been solved using these techniques. This paper provides this categorization.

BACKGROUND

Linear Programming (LP) has been said to be one of the ten most important discoveries of the last century [9, 12]. Many fields including the fields of micro-economics and finance have been impacted directly as both private business and governments have made use of Linear Programming. Its use in the production and allocation of resources cannot be underestimated.

Linear programming formulation

Figure 1 Where c_j , a_{ij} and b_j , are coefficients and x_j are the variables to be solved for $j=1..n$ and $i=1..m$.
Definition: A constraint is a row of a linear program that restricts the variables to values that would not violate the expression. Definition: A feasible solution x is a set of x_j , $j=1..n$ that satisfy the constraints.

Definition: An optimal solution x is a set of $x_j, j=1..n$ that both satisfy the constraints and maximize the function in figure 1.

A standard LP formulation is of the form

Maximize	c_1x_1	$+c_2x_2$	$+c_3x_3$...	$+c_nx_n$		
Subject to constraints	$a_{1,1}x_1$	$+a_{1,2}x_2$	$+a_{1,3}x_3$...	$+a_{1,n}x_n$	\leq	b_1
	$a_{2,1}x_1$	$+a_{2,2}x_2$	$+a_{2,3}x_3$...	$+a_{2,n}x_n$	\leq	b_2

	$a_{m,1}x_1$	$+a_{m,2}x_2$	$+a_{m,3}x_3$...	$+a_{m,n}x_n$	\leq	b_m
					$x_j \geq 0$	$(j=1,2, \dots, n)$	

OR

$$\begin{aligned} & \text{Maximize } \sum_{j=1..n} c_j x_j \\ & \text{subject to } \sum_{j=1..n} a_{ij} x_j \leq b_i \text{ for all } i \quad (i=1, \dots, m) \\ & \quad \quad \quad x_j \geq 0 \text{ for all } j \quad (j=1, \dots, n) \end{aligned}$$

General Production Problem

Suppose a manufacturer manufactures j products where each product yields a known profit. Suppose further that there are i resources necessary in the production of all the products and there is a known limit on the amounts of each resource. The problem to be solved is: how many of each of the products should be produced to maximize profit.

Production Example

Suppose a furniture company manufactures two items: wooden chairs and beds. The company employs workers skilled in carpentry, painting and upholstery. Suppose that the number of hours of skilled labor and profit per item are as defined in table 1.

Table 1: Production Example Coefficients

	Chair	Bed	Available labor
Carpentry	6	3	48
Painting	1	1	6
Upholstery	2	6	36
Profit	\$80	\$70	

Constraints and Optimization Coefficients for the Production example

Table 1 From the table one notes that 6 hours of carpentry work are needed per chair and 3 hours are needed per bed. There is a maximum of 48 carpentry work hours available. Interpretation of the other rows is analogous. We know too, that for each chair and bed manufactured one will earn \$80 and \$70 respectively.

Linear Program for Production Example

This may be described as the LP problem:

Maximize	$80x_1$	$+ 70x_2$		
Subject to constraints	$6x_1$	$+3x_2$	\leq	48
	x_1	$+x_2$	\leq	6
	$2x_1$	$+6x_2$	\leq	36
	$x_1, x_2 \geq 0$			

Economic Interpretation

The economic interpretation is straightforward. We wish to determine the number of chairs (x_1) and beds (x_2) to manufacture per day to enable maximization of profits without exceeding available resources. The company is constrained by the number of work-hours per skill to which it has access. We examine table 1 on a row by row basis. We wish to know how many chairs (x_1) and beds (x_2) to produce in order to maximize the profit $80x_1 + 70x_2$. We must be careful not to violate the constraints designated by the rows:

$$(9 \text{ carpenter-hours})x_1 + (3 \text{ carpenter-hours})x_2 \leq 48$$

$$(1 \text{ painting-hour})x_1 + (1 \text{ painting-hour})x_2 \leq 6$$

$$(2 \text{ upholstery-hours})x_1 + (9 \text{ upholstery-hours})x_2 \leq 36$$

CONCLUSION

Mathematical Programs which in Linear and nonlinear Programs can be an important tool for information system professional to help businesses, organizations grow. As already indicated, in addition to production problems, optimization techniques are used to solve shipping problems, asset allocation, crop growing, allocation of sewage, mortgage backed securities portfolios and many others. Linear programs also occur frequently in such other important applications as wavelet decomposition, digital filter design, text categorization, image processing and relaxations of scheduling problems. We presented in this abstract a simple example, but the number of real applications is vast. In this research we are categorizing and analyzing these applications so that practitioners can use this categorization as a guide to applying proper optimization techniques to their own problems.

CHAIN COORDINATORS' LEADERSHIP STYLES AND COORDINATION EFFECTIVENESS: SELECTED AGRI-FOOD CHAINS OF UK IMPORTERS

Pervaiz Akhtar, Massey University
Norman Marr, Massey University
Elena Garnevska, Massey University

ABSTRACT

The application of suitable leadership styles and consideration of certain dimensions (operational and social outcomes) are pivotal tools for chain coordinators (CEOs, managing directors and head of departments) to achieve coordination success. The linkages are scrutinized by applying structural equation modeling to the data collected from UK's selected agri-food supply chains (dairy, meat, apples, onions and wine). The findings suggest that chain coordinators' participative leadership style is significantly correlated with the effectiveness of supply chain coordination (operational, social and financial performance). Moreover, operational (service and product quality) and social (satisfaction with/trust in supply chain partners) outcomes are found to be important determinants of financial performance. This empirical investigation enhances the understanding of chain coordinators and thus contributes to determine best practices for modern agri-food supply chains.

Keywords Chain coordinators, leadership styles, agri-food chains, UK, SEM

Paper type Research paper

INTRODUCTION

Leadership styles consist of complex social processes rooted in chain coordinators' ways of leading and directing (Gallos and Heifandetz, 2008). Two commonly used leadership styles, namely participative and directive, are often employed to oversee the performance or operation of a person or group of people. The former encourages the participation from team members and shares decision power with work colleagues. The latter applies command-and-control rule that replicates directive practices (Akhtar et al., 2011).

Researchers (Mehta et al., 2003; Akhtar et al., 2011) have recognized a significant links between leadership styles and performance. The sharing of decision making power and participation from subordinates seem to be an essential component of modern agri-food supply chain performance. For example, Pfeffer (1998) stated that a firm reduced 38% defect rates by using participative approach, as a consequence, it increased productivity by 20% (Pfeffer, 1998). In support, Mehta et al., (2003) and Akhtar et al. (2011) believed that outcomes can be more effective when a participative leadership styles is used rather than directive leadership practices.

A participative leadership style also assists chain coordinators (CEOs, managing directors, head of departments – supply chain/marketing/channel/chain mangers) to achieve the effectiveness of coordination (Akhtar et al., 2012a). Chain coordinators are defined as the major decision makers who lead, direct and control chain activities (Akhtar et al., 2012a; Akhtar et al., 2012b). Their job is rooted with a complex business activities and the implementation of a suitable leadership style can have remarkable impact on the coordination effectiveness of selected agri-food chains i.e., dairy, meat, apples, onions and wine (Akhtar et al., 2012a).

The coordination effectiveness is defined as a synthesis of operational performance (service and product quality), social performance (satisfaction with and trust in supply chain partners) and financial

performance (profit, sales and market share). The contribution of a particular leadership style to the individual components of the effectiveness of coordination has been highlighted in a number studies (Mehta, 2003; Kruglanski et al., 2007; Akhtar et al., 2011).

However, despite the stronger evidence reported in the literature in the favor of participative leadership approach, it is still not clear which leadership styles is more appropriate in certain chains such as selected agri-food chains (dairy, meat, apples, onions and wine) of UK importers (Akhtar et al., 2012a). Although studies such as Akhtar et al. (2012a; 2012b) identified chain coordinators, they did not systematically investigate the impact of leadership styles on the effectiveness of coordination and the linkages between the dimensions (operational, social and financial). Thus, by testing the proposed theoretical models, this study answers two questions:

Question 1: Which leadership style (participative or directive) is highly significant in selected agri-food chains?

Question 2: How are the dimensions of coordination effectiveness related?

This article is organized in five sections. Following the introduction, the second section presents research hypotheses and two conceptual models. The third section outlines the data collection procedure and the exploratory statistical analysis. Section four describes the main results. This article is concluded by section five which concisely discusses the findings and managerial implications.

Theoretical Background And Hypotheses

A participative leadership style focuses on the empowerment of team members. It has been a vital part of the coordinators' tool-kit to handle modern agri-food supply chains. On the other hand, a directive leadership style is closely associated with hierarchical management system and clearly gives directions about the duties and rights of subordinates (Kruglanski et al., 2007). The effectiveness of supply chain coordination depends on the adoption of a suitable leadership that fastens front line workforce, board level and trade unions into a connected unit (Jung et al., 2003). A study conducted by Mehta (2003) in USA, Finland and Poland clearly showed a positive relationship between workers' decision-making participation and performance. Leadership that emphasizes the participation of employees and treat them fairly provides maximum coordination effectiveness. A significant positive relationship was found between the leadership style and effects on the shop floor behavior.

The study which included multiple industries such as food, retail, logistics service, IT, automotive and pharmacy was conducted in the Netherlands (Leeuw and Berg, 2011). The key benefits and the higher levels of trust in and satisfaction with supply chain partners are associated with the participation from team members rather than traditionally designed teams (Akhtar et al., 2012). The effective coordination outcomes such as good relationships, high service quality, increased market share and growth in sales are the results of satisfied and trusted chain partners. An increase in these outcomes means that they can be motivated for the growth of their businesses and it totally depends on fair and equitable dealing and rational leadership practices (DeConinck, 2010). From the above discussion, the following hypotheses are proposed:

- H1: Chain coordinators' participative leadership style is significantly correlated with the effectiveness of supply chain coordination.
- H2: Chain coordinators' directive leadership style is significantly correlated with the effectiveness of supply chain coordination.

The dimensions of coordination effective consist of operational performance (relative service and product quality), social performance (satisfaction with and trust in supply chain partners) and financial performance (relative profit, sales and market share). The linkages between these dimensions have also

been partly highlighted in a number of studies. For example, an empirical study of over 200 US manufacturing firms stated a significant positive relationship between service quality and financial performance (Lado et al. 2011). Moreover, researchers (Aramyan et al., 2007) suggested that factors related to service and product quality (delivery on time, order flexibility and fulfilling 100% orders without defective products) are the key operational outcomes that increase profit, sales and market share (Chen and Paulraj, 2004; Aramyan et al., 2007). In support, Akhtar et al. (2011) also provided evidence that service quality significantly affect financial performance. The above discussion directs towards the following hypotheses.

H3: Operational performance significantly influences financial performance.

H4: Social performance significantly influences financial performance.

In summary, the conceptual models shown in Figures 1 and 2 depict the factors and their interrelationships which are argued above. The leadership styles are the determinants of the effectiveness of supply chain coordination. Moreover, it is assumed that the operational and social outcomes are significantly correlated with financial performance.

Figure 1: Leadership style model

Figure 2: Dimensions of effective coordination

1. Data collection and analysis method

3.1 Sample procedure: The UK importers of agri-food products (dairy, meat, apples, onions and wine) listed in the KOMPASS database were selected. Five-point Likert scales (strongly disagree = 1 and strongly agree = 5) were employed to facilitate chain coordinators to state their degree of agreement or disagreement. After developing the questionnaire it was tested on identified chain coordinators. A total of 675 questionnaires were sent to chain coordinators in September 2012. After excluding the unusable responses (eight), 112 questionnaires yielded a response rate of 17%. A number of efforts were made to increase the response rate and finally enough sample size was achieved to apply structural equation modeling.

3.2 Measures: Each construct consists of three measures (items) except of product quality and satisfaction – each was assessed using four items. *Participation and directive leadership styles* were assessed by the items taken from a study conducted by Mehta et al. (2003). *The effectiveness of supply chain coordination*, the dependent variable, was measured by five constructs – service quality, product quality, financial performance, trust and satisfaction. The items for these constructs were adopted from the previous studies (Cullen et al., 1995; Amoaka-Gyampah, 2003; Batt, 2003; Acquaaah, 2007; Aramyan et al., 2007; Akhtar et al., 2012a).

3.3 Data analysis: The statistical tests showed that the data met the distributional assumptions (means/medians comparisons; skewness and kurtosis within the suggested limits). The (exploratory) factors were extracted by using recommended eigenvalues ≥ 1 . The scree plots were also observed to select the factors. During the process, one item for product quality (item4) was deleted because it had low loadings on its intended construct. Moreover, Cronbach α values were larger than the recommended value of 0.7 and thus confirmed the reliability (Kline, 2011).

A two-stage approach was used to perform SEM. The first stage assessed the measurement models and the second stage estimated hypothesized relationships. The measurement models were tested for validity. The loadings, construct reliability and average variance extracted were more than satisfactory. Additionally, the correlation between the respective constructs did not exceeded threshold value of 0.85 which means the items assessed different constructs. Moreover, discriminant validity was also checked by estimating whether the average variance explained (AVE) for each pair of constructs was greater than the square of the correlation between the constructs. Thus, the measurement satisfied validity criteria (Aggelidis and Chatzoglou, 2008; Kline, 2011). Also, parceling (averaging item scores for a respective factor) strategy was used to reduce the number of indicators and achieve the main purpose of this study

(investigating the structural relationships between the constructs rather than the relationships between the measurement items).

SEM Results

The structural results estimated for leadership model are shown in Figure 3 which provides the standardized coefficients and R^2 values. It can be seen that *CCs' participative leadership style* ($\beta = 0.62$; $p = 0.00$) is an important determinant for the effectiveness of supply chain coordination. Moreover, both variables (participative and directive leadership styles) explain 38% of the variance in the effectiveness of supply chain coordination.

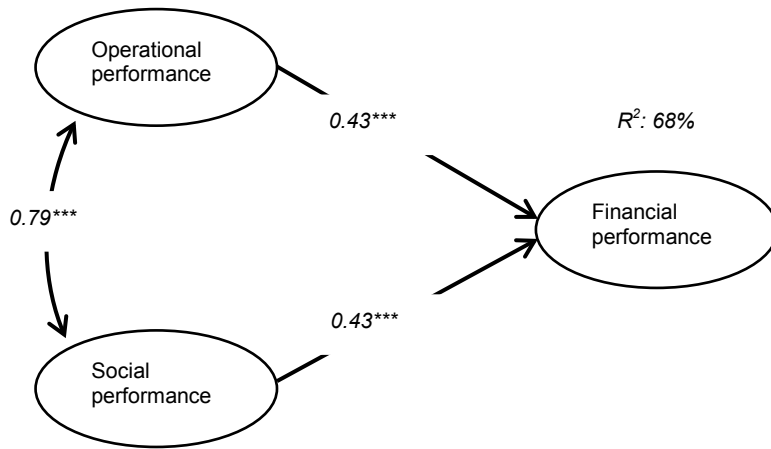

Figure 3: SEM results for leadership styles

*** statistically significant at $p < 0.01$; $n = 112$

Figure 4 shows the linkages between the dimensions of coordination effectiveness. *Operational* (service and product quality) and *social* (trust in and satisfaction with chain partners) outcomes seem equally important for financial performance ($\beta = 0.43$ and $p = 0.00$) and together explain 68% of variance in the financial performance with a strong bivariate correlation ($\beta = 0.79$, $p = 0.00$).

Figure 4: SEM results dimensions of coordination effectiveness

*** statistically significant at $p < 0.01$; $n = 112$

The results are also supported by the models' fit measures which are given in Table 1. Turning to the research questions and hypotheses, a summary of the hypotheses that answer the research questions is provided in Table 2. Hypotheses 1 and 2 resulted that leadership style (participative or directive) is highly significant. Hypotheses 3 and 4 address question two and concluded that operational and social performances significantly influence financial performance.

Table 1: Suggested and resulted fit indexes

Fit indices	Suggested values	Leadership model
χ^2	–	61.53
Degree of freedom (df)	–	59
χ^2/df	< 5	1.04
P value	> 0.05	0.39
Comparative fit index (CFI)	> 0.95	0.99
Incremental fit index (IFI)	> 0.95	0.99
Tucker Lewis fit index (TLI)	> 0.95	0.99
Root mean square error of approximation (RMSEA)	< 0.06	0.02

Table 2: Hypotheses and questions summary

Hypotheses	Supported(yes/no)	Questions
1: Chain coordinators' participative leadership style is significantly correlated with the effectiveness of supply chain coordination.	Yes	1: Which leadership style (participative or directive) is highly significant in selected chains?
2: Chain coordinators' directive leadership style is significantly correlated with the effectiveness of supply chain coordination.	No	
3: Operational performance significantly influences financial performance.	Yes	2: Question 2: How are the dimensions of coordination effectiveness related?
4: Social performance significantly influences financial performance.	Yes	

CONCLUSION AND MANAGERIAL IMPLICATIONS

This research investigated the impact of chain coordinators' leadership styles on coordination effectiveness and the linkages between the dimensions. The findings support other studies which

suggested that participative leaderships style is more effective than directive leadership approach (DeConinck, 2010; Leeuw and Berg, 2011; Akhtar et al., 2012a). Participative leadership style seems to be the future of modern agri-food supply chains where workforce is more knowledgeable. The results also suggest that the concepts of operational and social performance are becoming more important to achieve financial objectives. Thus, financial and non-financial outcomes simultaneously work together and that is a message that chain coordinator should consider to achieve the effectiveness of performance dimensions.

ABSTRACT

In this case study we implement a tool for performance measurement and performance prediction in collaboration, namely the Value Network Scorecard, using value network mapping. Generally, the aim of collaboration is to get benefits and to absorb value from other participants. Furthermore, the need of collaboration starts from the multitude of challenges and the aim of solving them efficiently. The case study starts from identifying challenges in elderly care and then trying to find solutions to solve the challenges efficiently. Efficiency means here creating value to other participants. In order to create value, must be identified which collaboration participant has the best capabilities to perform specific tasks while finding solutions to solve the challenges. The task of performance measurement uses the value network mapping, which helps in assigning and defining roles for the participants in collaboration process. The data was gathered through a workshop with key representatives from public, private and third sectors involved in welfare services delivery for elderly. Understanding how Value Network Scorecard can be applied in practice will help the managers to improve collaboration, to create new value in network, to assign roles for every collaboration participant and to follow easily the performance of duties.

KEYWORDS: performance measurement, performance prediction, value network, cross-sector collaboration, elderly care

INTRODUCTION

Collaboration and partnerships have become crucially important in order to succeed in the today's dynamic environment (Camarinha-Matos and Afsarmanesh 2006). Social domain faces with many different kinds of challenges that cannot be solved by a single organization. Collaboration with people from different domains which have different kind of expertise it is very important (Alter and Hage 1993; Zuckerman et al. 1995). People and organizations must be motivated to get involved and to be fully committed in collaboration process (Hansen 2009). Being aware of the benefits they could get from collaboration could be a good motivator factor in that sense. Acquiring benefits, as well as offering value to other network participants represents the value network: the amount of value that is created in the network to all its participants during the collaboration process.

Elderly care has become one of the biggest challenges in modern society. In the developed countries, the amount of aged population has increased continuously, while the amount of active population has decreased (Selsky and Parker 2005). In Finland the situation is even more challenging. According to Statistics of Finland (2009), the proportion of the Finnish population aged over 65 years is currently 17% of the whole population. It is estimated that by 2030 the aged population will rise up to 27%. The Finnish government strategy is to provide welfare services to elderly people, so that they can live as long as possible in their own homes, because enhanced services in specialized rest homes are much more costly (Bakker et al 2003). As in any other social domain that faces challenges, collaboration with organizations from different sectors is crucial in order to be able to solve the multitude of challenges in this area.

In order to collaborate efficiently there is a need to manage collaboration in a powerful way. While managing collaboration, besides strategy and planning, performance measurement is one of the important issues of management (Varamäki et al, 2008). Powerful performance measurement tools have to be used in that sense (Yeniyurt, 2003). Different kind of tools for performance measurement have been developed over the years, but still a lot of gaps exist in the performance measurement systems: they lack the ability to predict and explain future performance, they do not consider intangible assets, neither measure the value created (Yeniyurt, 2003; Hatry, 2010). The Value Network Scorecard, is a tool for performance measurement that overcomes these gaps. It measures and predicts the performance, evaluating how new value can be created in collaboration process.

In this article we show how Value Network Scorecard can be used in practice. We exemplify step by step how performance can be measured and predicted in collaboration, using a case study in cross-sector collaboration for elderly care in Finland. In the next section we present a theoretical background for the topic, explaining in detail the elements of Value Network Scorecard. Section three consists of explanations related to data and the methods used in this study. Fourth section illustrates how to use Value Network Scorecard in practice and finally, the discussions and conclusions are outlined.

THEORETICAL BACKGROUND

Performance Measurement And Value Network

Performance measurement is the process that helps organizations to establish criteria for determining the quality and outcomes of their activities, based on organization's vision or its goals (Kaplan and Norton, 1996; Gates, 1999; Forza and Salvador, 2000). It's about creating an effective and simple tool that allows organizations to follow whether the objectives are met. Performance measurement development starts by defining the vision and strategic goals (Kaplan and Norton, 2001). For a business organization the most important goal is turning a profit, but for public and third sector organizations the key objectives may be difficult to define. When organizations from different sectors of activities (e.g. public, private and third sectors) collaborate, determining the common goal and objectives may be quite a challenging task (Bryson et al., 2006). Furthermore, designing a performance measurement tool for collaboration is a more complicated task, because it involves a lot of complex issues.

Measuring complex issues in a simple and effective way is also challenging. When defining the performance measurement Moullin (2003) adopted a little different approach, arguing that performance measurement is evaluating how well organizations are managed and also, what is the value the organization delivers to its customers and stakeholders. Starting from this idea The Value Network Scorecard is a performance measurement tool that evaluates what value can be created in collaboration process to customers, as well as to all collaboration (network) participants, or with the other words, how the value network can be enhanced during the collaboration process. To understand the idea of Value Network Scorecard (which will be described in the next chapter) the concept of value network is shortly introduced. According to Allee (2002) value network is a web of relationships between individuals or organizations that generate tangible and intangible value through their complex dynamic exchanges. The value network can be illustrated easily using a map (Allee, 2006) where can be seen what is the value exchange between network participants (Fig.1).

When drawing the map, the participants in the collaborative network are indicated with ovals and with arrows are indicated the value-attributes (see Fig.1). For value there are used two different types of lines in the map: dotted lines indicate intangible value-attributes (e.g., knowledge, experience) and dash lines tangible value-attributes, respectively (e.g., goods, services, money).

The direction of the arrow indicates to whom network participant is generated a certain value and the starting point of the arrow indicates which network participant generates the specific value. In the rectangle is labeled the value. In the picture with the example of value network map (Fig.1) "Value 1" is

an intangible value offered by “*Organization 2*” to “*Organization 1*”. More concretely it means that during the collaboration process “*Organization 2*” offers (generates) some value (e.g., knowledge about customer needs) to “*Organization 1*”. Alternatively, “*Organization 1*” offers “*Value 3*” to “*Organization 2*”. Value-attributes can be simply associated to benefits. Therefore during collaboration process network participants get benefits from other participant. This is the glue of collaboration. Without getting any benefits, the motivation to collaborate will be very low, or inexistent. In the next section we’ll see how these two concepts (value network and performance measurement) are linked together.

Figure 1: Value network map overview (based on Allee, 2006)

Value Network Scorecard: A Tool For Performance Measurement And Performance Prediction

Following we describe in details what the main components of Value Network Scorecard are. Value Network Scorecard is a tool for performance measurement and performance prediction developed by our team. It was designed to measure the performance of collaboration and it is a value network approach. The measurement and the prediction of performance have as the core concept the value network. The main idea is how collaboration should be managed in order to create value to all network participants. Going back to performance measurement in collaboration, it has been seen that the designing of performance measurement tool starts from the vision and the goals of collaboration (Bryson et al., 2006). When organizations engage in collaboration, any of them aims to fulfill the own goals, but the same time a common goal should bring them together. These two different types of goals should be embedded in the vision of collaboration, at the strategic level (Jap 1999; Hansen 2009). Usually the common goal that encourage organization to engage in collaboration process is solving specific challenges; and every organization’s own goals are different kind of benefits they want to acquire from collaboration, so absorbing value from others, in other words. Therefore at the strategic level managers should have in their mind that the collaboration should be organized so, that as much value as possible will be created to all participants during collaboration process. The performance measurement is about predicting how value network can be enhanced, while trying to solve the challenges that brought them together. Figure 2 is an overview of performance measurement idea for collaboration, which it was described earlier. The strategic thinking of Value Network Scorecard is behind this picture.

The outcomes of collaboration can be easily observed from the value network map: the solved challenges, as a common benefit to all participants, as well as different value-tributes to every network participant, as individual benefits. In the value network map are predicted the outcomes of collaboration, as the target outcomes. This is done in the beginning of performance measurement process. There is expressed the glue of value between all collaboration participants that will result as outcome of collaboration. The Value Network Scorecard is adjusted from the Balance Scorecard (Kaplan and Norton, 2001) for the network

perspective of organization. While Balance Scorecard is a financial approach in performance measurement, Value Network Scorecard focuses on network efficiency, measuring and predicting the value creation in the network (to network participants, as well as to customers).

Figure 2: Translating the vision and strategy of collaboration from theory to practice

In the Figure 3 there are presented in detail all the components of Value Network Scorecard. Similarly to Balanced Scorecard (Kaplan and Norton 1996), but in a little different manner, Value Network Scorecard offers managers four different perspectives related to: customers, collaboration process, network efficiency and innovation. Therefore the network will operate efficiently if it is able to solve challenges related to customers as well as overcoming challenges related to collaboration process. In order to create new value in the network, innovation and learning is needed when assigning the roles and the responsibilities. The distribution of roles and responsibilities should be done in the best possible way, by identifying first the partner's assets and resources and then analyzing who is the right partner to solve a specific challenge. Some partner would need to put forward little effort in solving a specific challenge if it possesses the right resources/assets. This way new value can be created to other partners if a big encountered challenge was solved with minimum efforts by others. Value network can be enhanced continuously, when new challenges appear, if the distribution of roles is done in the best possible way. The assets of the partners can be converted into value to others, that way. In the performance measurement process of Value Network Scorecard, mapping the value network is a very important part, that needs skills and *specific steps* that should be followed. We recommend the following steps:

- (1) *Identifying challenges in the activity of the network;*
- (2) *Identifying participants' assets and resources (intangible and tangible assets);*
- (3) *Establishing roles for participants, according to their assets, in order to solve the challenges;*
- (4) *Converting the assets into value in order to enhance the value network (codifying the data).*
- (5) *Adding the value-attributes into value network map*

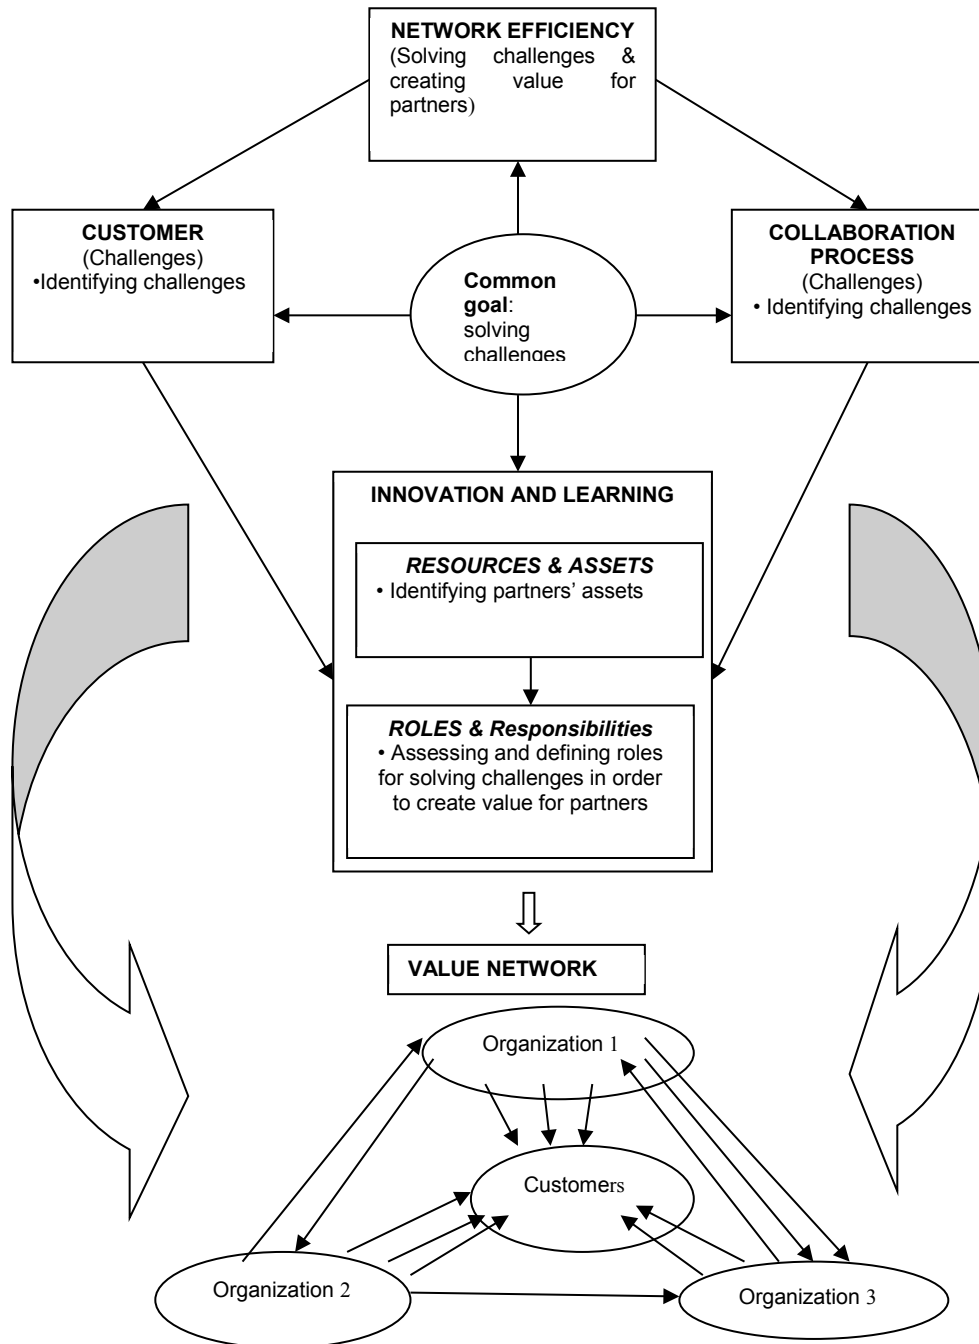

In the following we'll exemplify, step by step, how Value Network Scorecard can be used in practice. First we will describe the data and methodology we use and after that a concrete example, using a case study, will be used in this regard.

DATA AND METHODOLOGY

The implementation of Value Network Scorecard was realized through a case study: the collaboration between public, private and third sector in providing welfare services for elderly in Finland. The public sector has the responsibility to provide welfare services for elderly in Finland. The finish government strategy is to provide welfare services to elderly people, so that they can live as long as possible in their

own homes, because enhanced services in specialized rest homes are much more costly (Bakker et al 2003). Welfare services are provided through public procurements from private and third sectors' organizations or they are provided by the public sector itself, depending on its own resources in specific areas. Due to the limitation of resources and the big amount of challenges that exists in elderly care domain, an effective collaboration that must be strategically managed, is required. Performance measurement is a very important part of strategic management in that respect.

Figure 3: Value Network Scorecard

Performance measurement with Value Network Scorecard starts with the mapping of value network. The first step in value network mapping is to *identify the challenges* in the activity of network. A workshop with experts from all three sectors was carried out, aiming to identify the challenges. Furthermore, during the same workshop session were *identified the strength* and resources of every sector (intangible and tangible assets); the second step of value network mapping was fulfilled the same time. Three persons from every sector participated in the workshop session. The participants were selected from managerial staff of every sector, which has wide experience in the delivery of welfare services for elderly. From the public sector were selected top managers and from the private and third sectors were selected manager directors. All of them were involved in collaborative projects for elderly services delivery and the challenges from that domain were well known by all of them.

In order to identify the challenges and every sector's assets, Think Tank software was chosen as a working tool during the workshop session. Think Tank software supports the coordination of strategic planners, offering group intelligence and real-time decision support. It allows a quick brainstorming anonymously, encouraging everyone to participate actively to expose their opinions. In the beginning of the workshop session we had a short list with challenges collected from the source documents related to welfare services in Finland and participants were asked to complete the list with other challenges which they encountered in their collaborative activity. Similarly, a ready short list with every sector's assets was given to them to be completed during the workshop session. In the end of workshop session we got a long list with different types of challenges from the collaborative activity in elderly services delivery. The challenges were divided into (a) *customer related challenges* and (b) *challenges related to the collaboration process*, as they are identifies in different groups in the Value Network Scorecard (Fig.3). Even so, in order to map the value network, we needed to divide the challenges in smaller specific groups to be easier to fit them in smaller maps. After the second step, of identifying the sector's assets (strengths) and resources, as a result of this task we got a table with three columns, where are specified the strengths and resources, by sector. Going further to the next steps that must be followed for value network mapping, *establishing roles in the network* and *converting the assets into value-attributes* have to be done. For these steps another workshop session is required. To be able to demonstrate the applicability of Value Network in practice through this publication, the tasks from these steps were conducted by the research team involved in this project (three researchers). When the tasks were performed, the results were validated (with small modifications) by an expert in the domain of elderly services delivery (a top manager from the public sector) who participated earlier in the workshop session.

In order to perform these tasks for value network mapping purpose, every single challenge should be analyzed carefully. First pondering what kind of abilities are needed to solve specific challenge, then identifying which network participant has the main abilities (assets), or resources, to solve that specific challenge efficiently. Efficiency in this case means to create value for other network participants. Then the assets are converted into value, by analyzing how a specific asset of a participant can be converted into value to other network participant. Finally all the *value-attributes are added in the value network map*, one by one. Trying to find solutions to solve all the challenges in an efficiently way, new value will be created for all network participants, enhancing the value network that way. The value network map obtained through the Value Network Scorecard tool is then used in performance measurement of collaboration, where can be easily observed the goals that are set for the collaboration process. From the value network map can be easily observed also what is the predicted performance for the collaborative network, what new value can be created for all participants if all the challenges will be solved as it was planned. In the following section we show how to use the Value Network Scorecard in practice.

RESULTS: USING VALUE NETWORK SCORECARD IN PRACTICE

In this section we exemplify how we implement performance measurement in collaboration using Value Network Scorecard. To understand better, we'll exemplify step by step how Value Network Scorecard can be used in practice, following the five steps described in the section Value Network Scorecard. *(1) Identifying challenges in the activity of the network* As we explained earlier, the first step in predicting and measuring performance using this tool is to identify the challenges from the activity of the network:

(a) customer related challenges and (b) challenges related to the collaboration process. As we already mentioned, the list of identified challenges was very long and we divided them into small groups. *Customer related challenges* were divided in three groups:

(1) the availability of services, (2) the quality of services and (3) the prices of services and the financial support for the clients. The challenges related to the collaboration process were divided into two groups: *(1) the management of service system and (2) the integration of service system.* The list of the challenges related to the management of service system was the longest one. For the scope of this paper we take for the exemplification only one group of customer related challenges, those related to the quality of services. The list of challenges belonging to this group is much shorter than the others and it is easier to understand the exemplification through a simpler example. Following is the list of the challenges related to the quality of services (customer-related challenges).

- Personalization of services*, to meet the customer needs is required. The needs of people are usually very different from a person to another, according to their health situation, or the own habits. For example in the current service system the most catering services are provided by the public sector. In order to organize the time schedule efficiently, the breakfast is provided to everyone during the same time period, daily between 8 and 9 a.m. This schedule it is not suitable to all people, because their daily rhythm is quite different from a person to another. Some of them awake up early in the morning, at 5 a clock; some others may awake up at 10 a clock. The catering services should be personalized, according to everyone's needs.

- More time spend with the customers is needed.* Due to the limitation of personnel resources, the public sector's personnel seem to be always in a hurry. They perform quickly their task and usually they don't have time to discuss with the customers. If the time it wouldn't be so limited, the personnel could give more attention the elderly, discussing about their needs, which would be very valuable information for service enhancement. But the most important is that the customers would be much more satisfied and their quality of life could be enhanced significantly that way, because most of them are lonely people.

- More activities for the elderly are required:* In elderly home care usually the basic daily needs are covered, but there are not so many other activities organized for them during the whole day. Furthermore during the evenings and weekends much less activities are organized for elderly people. In some communities the third sector's organizations (e.g., the church or non-profit organizations) arrange different kind of activities for elderly, but they are not enough and in some municipalities (or places) they are inexistent.

- Service quality comparison:* provided by different suppliers is difficult to be made by the old people, because there are no specific criteria in that direction. They do not know what exactly a service should include. The services quality is very irregular, depending on the service supplier. Service standard regulations are needed in that sense.

- Self-determination of clients:* for service delivery it is not always meat. Even if this principle should be complied when providing services to elderly people. In some situations if the elderly doesn't have any

relatives who can help in determining the need of services, the authorities decide on behalf of the clients. The elderly are not always satisfied about the decisions done by authorities.

(1) *Identifying participants' assets and resources (intangible and tangible assets)* The strengths and the resources of the network participants were identified during the workshop session, where nine persons participated, representatives of every sector. The results are included in the Table1, below.

Table 1: The strengths and resources, by sector

Public sector's assets	Private sector's assets	Third sector's assets
Certainty of activity	Innovativeness	Timetable flexibility
Certainty of service delivery	Customer-oriented services	Regional know-how
Nearness of services to customers	Collaborative capacity	Human resources
Democratic service supply	Advanced welfare services	Customer-oriented services
Responsibility to organize services (quality control)	High educational level and technology know-how	Church is expert in spiritual needs and crisis situations
Financing/funding opportunities	Flexibility of open times	Light organization structure
Taxing power	Effectiveness of action	Free labor (volunteers)
Continuity of activity	Financing know-how	Special know-how
Legitimacy know-how, law regulation, law making	Transparency of earnings and expenses	Big collective facilities (of non-governmental organizations)
Wide collaboration network	Individuality/quality of services	Big collective spaces
Opportunity to govern the cost of the process	Well defined core tasks	The pioneer role in many concepts development
The ethic of public services	-	Ideology is value based
Variety of know-how	-	-

(1) *Establishing roles for participants, according to their assets, in order to solve the challenges* At this step every challenge should be taken separately for analyses. Representatives of every participant organization ponder together, during a workshop session, how the challenges could be solve in the most efficient way. Should be also analyzed which network participant has the best capabilities or resources to solve the specific challenge with minimum effort, creating that way value to other network participants, as well as to customers. The network participants' roles and responsibilities are defined during this session. For the purpose of this paper, this task was performed by the research team. Following, *every challenge is analyzed individually* and the results are explained.

• *Personalization of services* In order to find solutions to solve a challenge, first must be identified the participant who has the more suitable resources or capabilities to solve it. Looking in the table where are listed the assets of every participant, it was decided that private and third sectors have the best capabilities to solve this challenge. Private sector has the assets of providing advanced welfare services to elderly and it is effective in its activity. Third sector's asset is that it provides customer oriented services to elderly, according to their needs. Another important asset of third sector is its special know-how. The elderly people are usually very confident to the personnel of third sector organizations (church, voluntary or non-profit organizations). That's why third sector knows much better than the other sectors the needs of elderly people. By an effective collaboration together with private and third sectors, public sector could organize and provide personalized services to elderly, according to their special needs. The private and third sectors could offer consultancy to the public sector, which is responsible for services providing to elderly. Furthermore in many situations, depending on the area every sector operates and the customer needs, personalized services could be provided by third or private sectors. According to these analyses and decisions made by the participants of the analysis session (in our case the research team), the *roles* of providing personalized services are attributed to the private and third sectors, depending on the areas where they operate. Additionally, the private and third sectors play the role of consultants for the public sector. By doing so, new value is created to customers by private and third sectors, offering them personalized services. The same way private and third sectors create new value to the public sector, offering consultancy to it, but they can offer consultancy to one another, because every organization owns

different kind of knowledge that may be valuable knowledge for everyone. Alternatively private and third sectors could fulfill the public sector's needs by helping it to provide customer oriented services and also advanced welfare services.

More time spend with the customers is needed: Due to the limitation of this paper we'll explain shortly about the analysis of the next challenges. When looking into the table with sectors' strength and resources, analyzing this data, it was decide that the private and third sectors have capabilities and resources to solve this challenge. With private sector's assets "Quality of services" and "Flexibility of open times", and alternatively the third sector's assets "Ideology/empathy value-based", "Flexibility of timetables" and "Human resources" this challenge could be solved. So the private and third sectors have the roles of providing high quality services to the special segment of elderly people who requires more attention and also to provide them homogeneity of service delivery during the whole day. Especially the third sector human resources (voluntary workers) may be a huge help in this case, because there are no needs for qualified personnel to be able to discuss with elderly people.

More activities for the elderly are required: Similarly to the earlier explanations, the role of solving this challenge could be attributed to the third sector, based on their assets "Human resources" and "Ideology/empathy value-based". Recreational services could be provided by the third sector through the voluntary workers if the collaboration is well managed and organized.

Service quality comparison: Public sector has the capability of solving this challenge through its asset of "Law regulation". Service quality standards could be created by the public sector through law regulations. These would help either private and third sectors in comparing the service quality when competing for services and also could help customers by being knowledgeable about what kind of tasks or activities the services should include.

Self-determination of clients: Looking and analyzing the data from the table with sectors' assets, it was decided that the role to solve this challenge to be attributed to the third sector. By putting third sector's assets into action ("Regional know-how", "Ideology/empathy value-base" and "Human resources") elderly people who have no relatives, could be helped by third sector's personnel (e.g., voluntary workers, church) to determine the need and the planning of services.

(1) Converting the assets into value in order to enhance the value network (codifying the data). After all the challenges were analyzed and the attribution of roles was defined, the data got at the previous step should be codified, in order to be able to introduce all the information into value network map. The codified data is in the Table 2, bellow. The table is organized into three columns and every challenge's analysis is on the same raw. The most important data is in the third column ("*Converting asset into value*"). There can be seen what new value-attributes can be created in the network while trying to solve specific challenge. With the bold characters are labeled the value-attributes and under it is specified who offers the value and to whom is offered. For example the first value-attribute in the table ("*Advanced welfare services*") is created (offered) by private sector to the public sector (Private->Public).

(5) Adding the value-attributes into value network map: This is the final step in value network mapping. The map will be drawn based on the data from the third column of Table 2. All the participants in the network are identified from the table and they will be putted on the map using the ovals (in our case public, private and third sector, plus the customers). After that all the value-attributes are introduced on the map, one by one, using the arrows. With dashed lines are represented intangible value-attributes and with continue lines are represented tangible value-attributes. From the table can be observed who offers the value to whose (indicating what the direction of the arrow on the map is). With rectangles are labeled the value-attributes. Because we have a lot of information in the table 2, it would be difficult to fit all the information on the same map. To get a clear map, we decided to put all the information on two different

pictures: on the first map (Figure 4) to illustrate only the value network between network participants and on the second map (Figure 5) to illustrate the new value created to the customers through collaboration. We used Microsoft Word to draw the maps. With a better drawing tool could be obtained a single picture of the entire value network, which would be a more illustrative picture.

Table 2: Converting assets into value to solve challenges related to the *quality of services*

Challenge	Asset to respond to challenge (Whose sector asset) Roles assessment	
<i>Personalization of services</i>	Advanced welfare services (Private) Effective activity (Private) Customer oriented services (Private, Third) Special know-how (Third)	Advanced welfare services Private->Public Customer oriented services Private->Public Third->Public Service organization consultancy Third->Public Third->Private Private->Public Private->Third Personalized services Private->Customers Third->Customers
<i>Too short time spend with the clients</i>	Quality of services (Private) Ideology /empathy value-based (Third) Flexibility of open times (Private) Flexibility of timetable (Third) Human resources (Third)	Service quality Private->Public Third->Public High quality services Private->Customers Third->Customers Homogeneity of service delivery during the hole day Private->Public Third->Public Wide range of services Private->Customers Third->Customers
<i>More activities for the elderly are required</i>	Ideology /empathy value-based (Third) Human resources (Third)	Recreational services Third->Public Recreational services Third->Customers
<i>Difficulty in comparing service quality</i>	Law regulation (Public)	Service quality standards Public->Private Public->Third Public->Customers
<i>Self-determination of clients for service delivery is not meat</i>	Regional know-how (Third) Ideological/empathy value-based (Third) Human resources (Third)	Consultancy in individualized service planning Third->Public Third->Private Self-determination of service planning Third->Customers

Figure 4: Value network map (*part 1*): flow of value between network participants resulted while trying to solve challenges related to the quality of services through collaboration

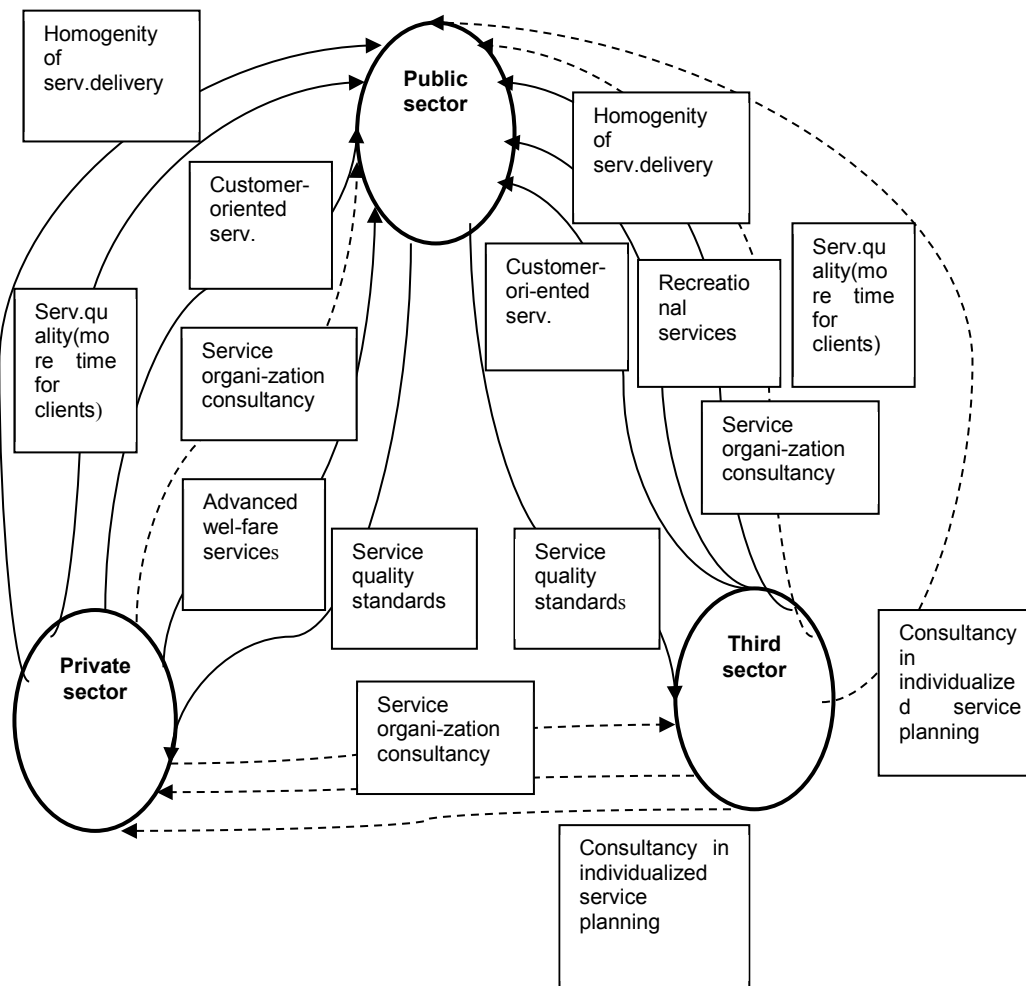

Figure 5: Value Network map (*part 2*): new value created for customers while trying to solve challenges related to the quality of services through collaboration

DISCUSSION AND CONCLUSIONS

In this paper it was illustrated how to use Value Network Scorecard in practice, through a case study example. Value Network Scorecard is a tool for performance measurement and performance prediction that can be used in collaborative networks. Following the logic of Balanced Scorecard, Value Network Scorecard jumps to a higher level of organization, the network level. Instead of traditional way in performance measuring, when the aim is measure and improve the financial results, Value Network Scorecard aims to create new value for all network participants, while trying to solve the challenge in the collaboration process. The main task in performance measurement and performance prediction, using this tool, is to map the value network. From the value network map can be easily seen what new value can be created during collaboration process, or more exactly what is the value network potential.

If the collaboration process is well managed, the value network potential is huge, as can be seen from the value network map (Figure 4 and 5). Based on value network analysis, the roles in the network can be easily assigned. In our example, looking and analyzing the map, can be observed that private and third sectors may have important roles in enhancing the quality of services in elderly care if the collaboration process is well managed. They are able to create new value to customers, by providing them with high quality services that could fulfill the gaps in the current service system.

Furthermore private and third sectors can create new value for the public sector, providing consultancy to it, regarding the enhancement of quality of services. Additionally, indirectly the same value that private and third sectors create to customer they create it to the public sector as well, because public sector is responsible for services providing. Without the collaboration between all three sectors, the enhancement of service quality would be not possible, due to the limitation of resources. Using Value Network Scorecard for performance measurement of collaboration every network participant can get great benefits from collaborative activities, in a way or another. New value can be created to all participants only if the collaboration process is well managed. Value Network Scorecard is a tool that helps managers in performing this task. In performance measurement and performance prediction with Value Network Scorecard, value network mapping is just a first big step. In order to follow if the goals are fulfilled in the future, as it was predicted with Value Network Scorecard, new actions should be planned. There have to be specified exactly how every single goal should be met. What actions are required in order to create the value predicted in the Value Network Scorecard. This is a topic for the future research in that scope.

PATENTS AND TAXES DON'T MIX

Sara Linton, Roosevelt University

ABSTRACT

An unusual (and misguided) interpretation of a 1998 Federal Court of Appeals case led to the US Patent Office issuing hundreds of patents relating to tax matters. Numerous logical and policy arguments can be made that this is a gross misapplication of the Patent Law whose effects are 100% negative. The Supreme Court reviewed a related matter in 2010 but did its decision did not change the Patent Office's position on the issue. It continued to issue patents for tax strategies. Fortunately, the matter was resolved legislatively very recently by the America Invests Act. This piece examines the history of this issue and several other matters. It describes why the nature of tax law, including the confidentiality of tax returns, makes it impossible for patent examiners to perform their investigations properly. It also explains why issuing such patents was harmful to not only taxpayers but also the legal and accounting communities.

INTRODUCTION

“Patents should be tolerated only if they serve the public good.” (Kieff, et.al. 2008) The United States Constitution specifically authorizes patents. Among the powers granted to Congress is “...To promote the progress of Science (sic) and useful arts, by securing for limited times to Authors (sic) and Inventors (sic), the exclusive right to their respective Writing (sic) and Discoveries (sic).” (Constitution for the United States of America, 1787). Thus, the rationale for issuing patents is to encourage innovation. However, in the case of tax strategy patents, the result would be precisely the opposite.

Legal Issues

“Whoever invents or discovers any new or useful process, machine, manufacture or composition of matter, or any new or useful improvement thereof, may obtain a patent thereof, subject to the conditions and requirements of this title.” 35 USC 101. The next two statutes, 35 USC 102 and 103, set out some rules on what may or may not be patentable. In addition, due to the common law nature of the United States legal system, a number of courts have further limited the scope of patentability. The case which opened the Pandora's box of permitting tax strategy patents was *State Street Bank and Trust Co. v. Signature Financial Group, Inc.*, 927 F.Supp 502, 308 U.S.P.Q.2d 1530 (D. Mass 1996), rev'd, 149 F.3d 1368, 47 U.S.P.Q.2d 1596 (Fed. Cir. 1998). This decision will hereinafter referred to as *State Street II*. *State Street II* held U.S. Patent No. 5,193,056 for “Data Processing System for Hub and Spoke Financial Services Configuration”. *State Street* attempted, but failed, to negotiate a license to use the patented system. Then *State Street* filed an action for declaratory judgment asserting several issues including invalidity of the patent. The trial court granted summary judgment on patent invalidity, citing the court created “business methods” exception and the “mathematical algorithm doctrine” exception.

In *State Street II*, the court takes special note of the word “any” in 35 USC 101, interpreting it as proof that the Congress did not intend for any restrictions to be placed on patentability, aside from those enumerated in the statutes. The court goes on to deal with the two exceptions to patentability, which were relied upon by the District Court in granting summary judgment on the invalidity of the patent. It first cites *Diamond v. Diehr*, 450 US 175 at 185 (1981), in which the US Supreme Court specified three categories, which are ineligible for patents: “laws of nature, natural phenomena, and abstract ideas”. It is the last of these on which the “mathematical algorithm” exception is based. The Court stated that mathematical algorithms are not patentable if they are merely abstract ideas.

A subsequent Court of Appeals decision held that if the algorithms were applied practically, leading to “a useful, concrete and tangible result” that they were no longer merely abstract ideas and the mathematical algorithm exception would not apply. In re Alappat, 33 F.3d 1526 at 1544, 31 U.S.P.Q.2d at 1557 (Fed. Cir. 1994). Along with further analysis, this is the basis on which State Street II reverses the trial court's holding that the mathematical algorithm exception invalidates the patent.

The “business method” exception, based upon the conclusion that allowing patents for such matters would facilitate monopolies, had become firmly established in the first half of the twentieth century. Hotel Security Checking Co. v. Lorraine Co., 160 F.2d 467 (2d Cir.1908), Loew's Drive In Theatres v. Park-In Theatres, 174 F.2d 547 (1st Cir. 1949). State Street II took very sharp aim at the business method exception, stating, “We take this opportunity to lay this ill- conceived exception to rest. Since the 1952 Patent Act, business methods have been, and should have been, subject to the same legal requirements for patentability as applied to any other process or method.” Following State Street II, patent applications for all sorts of business methods, including tax strategies, began flooding the Patent and Trademark Office. For a number of years, the American Institute of Public Accountants and a number of other tax related organizations issued countless statements, letters, and articles explaining why tax strategy patents are ill conceived and urging ending the practice of issuing such patents. (American Institute of Certified Public Accountants 2012)

On February 17, 2007, Senators Obama, Levin and Coleman introduced the Stop Tax Haven Abuse Act, which included language prohibiting patent protection for anything “designed to minimize, avoid, defer, or otherwise affect the liability for Federal, State., local, or foreign tax”. (Senate Bill 681 2007) In 2010, the US Supreme Court had an opportunity to revisit this issue in Bilski v. Kappos, 561 U.S. ____ (2010) but failed to do so. As of September 2011, over 150 tax strategy patents had been issued while applications for more than 160 were pending. (American Institute of Certified Public Accountants 2011)

Incapacity Of The Patent Office To Properly Evaluate Tax Strategy Patent Applications

Patents may be issued if the subject matter must be novel and non-obvious “to a person having ordinary skills in the art to which said subject matter pertains.” 35 USC 102(a) and 103(a). Whether an application meets those standards is determined by patent examiners. However, these examiners are generally engineers, and certainly not tax lawyers or accountants. There are at least two reasons why the examiners are unable to properly assess “prior art” in the area. First, they lack the ability to perform complex tax research. And patent examiners are generally legally prohibited from consulting others outside the Patent and Trademark Office. Second, and more importantly, the confidentiality of tax returns makes it literally impossible to determine whether anyone has used a particular tax strategy. In addition, with all of these limitations, examiners spend between 15 and 20 hours per application. (Aprill 2007) (American Bar Association, 2007).

Policy Issues

“...tax strategy patents have no value apart from the acts of Congress. These patents, which involve applications of the laws of Congress, are thus fundamentally different from the patents for which our patent system was designed – patents that involve applications [of] technology and the laws of nature.” (Aprill 2007) (Schwartz 2007).

One commentator notes that, contrary to the intent of the patent laws, strategies on tax patents would actually discourage improvements in the “art”. She wrote

“Historically, the dissemination of tax planning ideas has been open and widespread. Tax practitioners currently share information and ideas with each

other freely. There is an astonishing array and number of meetings, conferences, conventions and listservs where tax planning ideas are shared. Although the patent system is designed to encourage the dissemination and discussion of ideas and information, many tax practitioners are concerned that the spread of tax strategy patents will have the opposite effect, namely, that those with new ideas or the beginnings of ideas will hesitate to enter into discussions with others. If patents become an important part of the tax landscape, the atmosphere could become more secretive and less cooperative. The tax system as a whole will suffer if, in order to protect their patentable intellectual property, tax professionals are no longer willing to disclose, evaluate and criticize each other's insights regarding how to comply with the tax system. (Aprill 2007)

Another commentator addresses a more fundamental issue: whether tax planning is something that should be encouraged. He points out that tax planning is “deadweight to society” because it results in a number of undesirable effects: distortions in taxpayer behavior, out of pocket costs in terms of attorney fees and the expense of the transaction, and possible government costs of enforcement. (Hellwig 2007) Hellwig also enumerates two reasons why tax planning should be discouraged. He first offers a scenario in which a taxpayer may, by completing a simple task, reduce her/his tax liability by 10%. Since the commission of the task is relatively simple, all taxpayers avail themselves of the opportunity. Ultimately, the government would respond by raising tax rates to maintain the same level of revenue. Thus, the tax strategy is rendered useless. (Hellwig 2007)

Next, Hellwig considers a situation which is more representative of reality, in which only some taxpayers exercise the tax saving option. One group of taxpayers will receive a financial benefit. Then a greater burden is placed on those taxpayers who did not make this choice. He suggests that the perception of unfairness by the latter group may lead them to reduced compliance. (Hellwig 2007) Others have reached similar conclusions. “Patented loopholes will make the tax system more complex. Greater complexity means greater frustration for taxpayers. Taxpayers will consider the U.S. tax system more unfair and arbitrary. This is dangerous because the U.S. tax system relies on voluntary compliance. (Drennan 2007)

The End Of An Era

In 2011, S. 23, also known as the America Invents Act, made its way through the legislative process. It contained explicit language prohibiting the issue of patents on tax strategies. The original version passed the Senate on March 8, 2011. The House passed its own version on June 23, which was adopted by the Senate on September 8. President Barack Obama signed the bill into law on September 16, 2011.

A COMPREHENSIVE CASE STUDY: US GAAP CONVERSION TO IFRS

Peter Harris, New York Institute of Technology
William Stahlin, New York Institute of Technology
Liz Washington Arnold, New York Institute of Technology
Katherine Kinkela, New York Institute of Technology

ABSTRACT

International Reporting Standards (IFRS) has become the required framework for most of the world financial markets effective on January 1, 2011. The United States is in a transformation stage, and it is expected that IFRS will be in place by as early as 2014. As such, it is important to introduce IFRS accounting rules in the college curriculum and make it a major component of accounting classes. At present, the CPA Uniform CPA exam is testing IFRS and its testing content is increasing with each current test. Additionally, the CFA exam tests IFRS exclusively and has eliminated US GAAP from its curriculum, basing its action on the fact that the CFA examination is a global based exam. This case study takes a US GAAP prepared Income Statement and balance Sheet, and based on the facts of the case, requires students to prepare an IFRS Based Statement. This case study is most suitable for a second offered Intermediary Accounting and a Financial Statement Analysis class, as well as an Accounting Theory and Accounting Capstone class and it recommended for graduate level of study. A solid understanding of both; US GAAP and IFRS rules is required to adequately address this comprehensive case study.

KEYWORDS: US GAAP, IFRS, LIFO, Fair Market Value Accounting, Asset Impairment, Asset Revaluation.

Company Background

JAL Corp, a publically traded NASDAQ company (symbol JAL), is a manufacturer of prescription drugs. Its main headquarters is based in Miami, Florida and the company has been operating since 1981. The company sells its products to the retail market on a worldwide basis. Its major clientele is Wal-Mart. Its stock sells at 45 US Dollars per share, and its 52 week price range is between 37.75 and 67.85 US Dollars, with a market cap of 10.2 billion dollars.

Their financial statements presented below for the Year Ending December 31, 2011 have been prepared using US GAAP. JAL's controller, Mercedes, would like to begin to see the effects of using IFRS on the Income Statement and balance Sheet and has been assigned this task. The company would like to adapt IFRS by as early as next year as it is considering a new stock issue in the Costa Rica, which requires IFRS compliance.

Net Income	14,400

ADDITIONAL INFORMATION

- 1- AXE Corp. uses the LIFO method to account for its inventory. The LIFO reserve was \$5,000 at the beginning of the year and \$7,000 as of year-end.
- 2- Management has established that the Fair market value of Property, Plant and Equipment as of 1/1/2011 is \$86,000, resulting in a \$5,000 increase above Book Value.
- 3- Upon review , management has established the following Fair Market Values for the presented assets as of 12/31/2011:

Goodwill	7,000
Trade name	6,000
- 4- In 2010, there was a Goodwill impairment accounted for in the amount of \$2,000, thereby reducing the carrying value from \$7,000 to \$5,000.
- 5- In 2008, there was a Trade name impairment of \$1,000.
- 6- Property, plant and equipment are depreciated over a 10 year period using the straight line depreciated method. There is no salvage value. Amortizable Intangible assets are amortized over a 5 year period, using the straight line method. The half year convention is applied for all assets placed in service during the year. No salvage value is expected.
- 7- Investments include Available for Sale Securities (AFS) with a Fair market Value of \$20,000 as of 12/31/2011. The beginning of year value was \$15,000. \$ 3,000 of this gain was due to exchange rate currency gains.
- 8- There are long term contingencies of \$3,000 stemming from civil lawsuits. Legal council considers the payout slightly “more likely than not”, but not highly probable. Also legal counsel considers in an independent case where the company is a plaintiff, the recovery of \$10,000 in a punitive damage case. Both cases are expected to settle in a time frame of greater than one year.
- 9- The extraordinary loss was due to an earthquake damage which is considered unusual and infrequent.
- 10- The Bonds payable are convertible and have a maturity date of December 31, 2020. There is an assigned value of 10 percent associated with the conversion feature as calculated by independent consultants using the Black-Sholes model of valuation.
- 11- In 2011, the company spent \$2,000 on internally feasible Development Costs, which relates to their pipeline of pharmaceutical drugs.
- 12- The effective tax rate for JAL is 25 percent.

REQUIRED

For each scenario above (1 to 12):

- 1- Identify the similarities and differences between the Income Statement effects of US GAAP and IFRS.
- 2- Record the differences above in journal entry form to conform to IFRS rules.
- 3- Prepare an IFRS Income Statement for the 2011 calendar year, and,
- 4- Prepare an IFRS Balance Sheet for the 2011 calendar year.

SOLUTIONS

Parts 1 and 2 Solutions:

- 1- LIFO is not permitted under IFRS. As such, FIFO has to be used. The difference between the LIFO and FIFO Cost of Goods Sold is the difference between the beginning of the year and year-end differential in the LIFO Reserve. In this case, the difference will result in a decrease in Cost of Goods sold by virtue of a greater Inventory total under FIFO in the amount of \$ 2,000 (\$7,000 less \$5,000) (1A). Additionally, there will be another increase in FIFO inventory to reflect the extra reserve of \$5,000 (1B), bringing a total increase in inventory of \$7,000. There will be a Deferred Tax addition created, which will equal the \$5,000 times the tax rate of 25 percent. As such , the journal entries will be :

1A-Dr. Inventory 2,000

Cr. Cost of Goods Sold 2,000
 1B- Dr. Inventory 5,000
 Cr. Deferred Income Tax 1,250
 Cr. Retained Earnings 3,750

- 2- IFRS allows for Asset Revaluation for Property, Plant and Equipment and Intangible Assets. Both US GAAP and IFRS allow for asset impairment, which is tested on an annual basis. IFRS allows for an asset reversal of impaired assets for all tangible and intangible long term assets; excluding Goodwill. US GAAP allows for impairment, but once lowered, no reversal of impairment is allowed. In no circumstance may Property, Plant and Equipment assets or Intangible assets be written above its book value under US GAAP.

Resulting Accounting Treatment: US GAAP

The impairment loss for tangible and Intangible Assets is recorded on the income Statement and results in a lower carrying value on the Balance Sheet.

Resulting Accounting Treatment: IFRS

The loss is treated similar to US GAAP.

Write-up of tangible and intangible assets is recorded as comprehensive income and not on the Income Statement. Finally, reversal of losses, up to the amount of the impairment, is recorded as a reduction in loss-a gain- in the Income Statement, and any excess is recorded as part of comprehensive income. Goodwill may not be reversed, under both US GAAP and IFRS once impairment has occurred. So the accounting for Goodwill is consistent between both accounting bodies.

On 1/1/2011, the Property, Plant and Equipment assets were increased by \$5,000 above Book Value. For IFRS purposes, this results in an increase of depreciation expense of \$500 (\$5,000 divided by a 10 year useful life using the straight line depreciation method). The Adjusting entry then is:

2A-- Dr. Depreciation Expense 500
 Cr. Accumulated Depreciation 500
 2B- Dr. Property, Plant and Equipment 5,000
 Cr. Shareholders' Equity – Surplus (Deficit)(Comprehensive Income) 5,000

The trademark had an estimated fair market value of \$7,000 as of year-end. US GAAP does not allow for reversals of previous recorded impairments. Under IFRS, the previous impairment loss incurred in 2008 of \$1,000 will be reversed to the Income Statement, as a reduction to loss-in effect, a gain, and any excess over that in recorded as Comprehensive Income (not on the Income Statement: but on the Balance Sheet – Shareholders' Equity-Surplus (Deficit) account). The adjusting entry is:

3- Dr. Trade name 2,000
 Cr. Reversal of Impairment Loss- Trademark – Income Statement 1,000
 Cr. Shareholders' Equity –Surplus (Deficit) (Comprehensive Income) 1,000

- 3- Finally, there is no adjustment for Goodwill as both US GAAP and IFRS have similar treatment for this Intangible Asset. Also note that Trademarks and Goodwill are not amortizable Intangible Assets due to their indefinite useful life.

4- Available For Sale Securities (AFS)

Both US GAAP and IFRS treat AFS securities similar in that they are reported at Fair Market Value at the Balance Sheet date. Any income or loss is part of comprehensive income (not Income Statement). The

only difference however is that IFRS treats the foreign currency exchange gain or loss as an income (loss) item, which is reported in the Income Statement.

As such, \$3,000 of the increase in the AFS value, which relates to currency gain, is part of non-operating income. As such, the adjusting entry is:

- 4- Dr. Shareholders' Equity- Surplus (Deficit) (Comprehensive Income) 3,000
Cr. Currency Exchange Rate Gain 3,000
- 5- US GAAP and IFRS record a contingency loss when the loss is deemed to be probable. This definition of probable differs between the two groups. US GAAP defines probable as "likely", whereas IFRS defines probable as "more likely than not". The result is that IFRS is more conservative in recognizing contingency losses. In this situation, the loss is recorded for IFRS only.
- 6- Neither US GAAP nor IFRS realize contingency gains until the date of occurrence. As such, no contingency gain is realized here. The adjusting entry then is:
 - 5-Dr. Contingency loss 3,000
Cr. Contingency Liability payable 3,000
- 7- Extraordinary Items- US GAAP v. IFRS

IFRS disallows extraordinary gains (losses), and as such is not existent. Consequently, this item needs to be part of the non-operating income (loss) schedule of the Income Statement. The gross amount of the loss in this case, is the net of tax loss of \$3,000, divides by .75 (1 less 25 percent tax rate) , resulting in a loss from hurricane –before taxes of 4,000.

We reclassify this loss from Extraordinary to non-operating income (loss).

- 8- IFRS requires that option related securities reflect an equities' portion amount, which equals its underlying value. In this case, 10 percent of the convertible feature has been assigned an options price, and as a result is classified as Shareholder's equity under IFRS. As such, \$6,000 of the \$60,000 convertible Bonds is re-classified as Equity, while the \$54,000 remains as Long –Term Debt. In addition, 10 percent of the interest has to be reclassified as a Dividend payment to reflect the above adjustment. The two adjusting entries as such , are:

Value of Derivatives in Stock/Equity Securities

- 6- Dr. Bonds Payable 6,000
Cr. Common Stock or Paid In Capital 6,000

Reclassifying Debt interest payments as Equity. Interest Payments = $5\% \times 60,000 = 3,000$.

Total Interest Payment of \$3,000 @10% reclassification to Dividend payment = \$300

- 7-Dr. Retained Earnings- Dividends Paid 300
Cr. Interest Expense 300

- 9- IFRS allows for the capitalization of internally Development Costs; if deemed economically feasible and traceable. US GAAP expenses all Development costs.

As such, two adjusting entries are required; the first is to capitalize Development Costs as an Intangible Asset on the Balance Sheet and the second, to amortize this asset over a 5 year period using a half year convention, straight line method. This will equal \$20,000 divided by 5 years, which equals \$4,000 and then dividing by 2 to reflect the half year convention, equaling \$2,000. The Adjusting Entries are:

8A: Dr. Development Costs 2,000
 Cr. Development Expense-Part of Operating Expense

8B: Dr. Amortization Expense 200
 Cr. Accumulated Amortization 200

AXE Corp.

Income Statement (in 000's)

US GAAP to IFRS Reconciliation

1/1/2011-12/31/2011

	IFRS	
	US GAAP	ADJUSTMENTS
INCOME FROM CONTINUING OPERATIONS		
IFRS		
Sales	350,000	350,000
Cost of Goods Sold	275,000 (1A)(2,000)	273,000
Gross profit	75,000	77,000
Selling and Administrative Expenses (Exclusive of Amortization and Depreciation)	35,800 (8A)(2,000)	33,800
Earnings before Interest, taxes, depreciation and Amortization	39,200	43,200
	(2A) 500	
Amortization and Depreciation Expense	13,000 (8B) 200	13,700
Earnings before Interest and Taxes	26,200	29,500
Interest Expense	3,000 (7) (300)	2,700
Income before Non-Operating Income and Taxes	23,200	26,800
Non-Operating Income (Loss)		
1- Reversal of trade name Impairment loss	(3) 1,000	1,000
2- Exchange rate gain on AFS	(4) 3,000	3,000
3- Contingent losses	(5) (3,000)	(3,000)
4- Hurricane loss	(6) (4,000)	(4,000)
	(3,000) (3,000)	
Income before Tax		
Tax Expense (25 %)	5,800	
Earnings from continuing operations	17,400	23,800
Tax Expense (25%)		5,950
EXTRAORDINARY ITEM		
Net loss from Earthquake (net of 1,000 taxes)	(3,000)	N/A For IFRS
Net Income	14,400	17,850
Less: Dividends Paid		0 (7) (300)
(300)		
Addition to Retained Earnings	14,400 (9)1,575	17,550
ADJUSTING ENTRY (9)		
Dr. Income Summary		4,600
Cr. Income Tax Payable- Current		1,150
Cr. Retained Earnings	3,450	

To record difference in income between US GAAP and IFRS of 17,850 -14,400, or a net income difference of 3,450. The before tax amount income is 4,600 or 3,450 divided by 1 less the tax rate of 25 percent (.75). The tax expense on this difference is 1,150 (4,600 times 25% tax rate), and also represents a current liability tax payable account. Retained Earnings is increased due to the increased net income total.

Note that the \$300 in Dividend payment was recorded as a decrease in Retained Earnings in adjusting entry number 7.

Part 3 Solution: IFRS Prepared Income Statement

IFRS Prepared Income Statement

1/1/2011-12/31/2011

(In 000's)

INCOME FROM CONTINUING OPERATIONS

Sales	350,000
Cost of Goods Sold	<u>273,000</u>
Gross profit	77,000
Selling and Administrative Expenses	<u>47,500</u>
(Includes of Amortization and Depreciation expense of \$13,700)	
Operating Income	29,500
Non- Operating Income (Loss):	
1- Reversal of trademark Impairment loss	1,000
2- Exchange rate gain on AFS	3,000
3- Contingent losses	(3,000)
4- Hurricane loss	<u>(4,000)</u>
	<u>(3,000)</u>
Earnings before Interest and Taxes	26,500
Interest Expense	<u>2,700</u>
Income before tax	23,800
Tax Expense (25 %)	<u>5,950</u>
Net Income	<u>17,850</u>

Solution 4: Balance Sheet-US GAAP -IFRS Reconciliation

Balance Sheet (in 000's)

As of 12/31/2011

CONCLUSION

IFRS is the future of worldwide financial reporting and should be included as a major part of any accounting and/or business curriculum in the US, as well as the rest of the world. This case illustrates a situation where an Income Statement and Balance Sheet is prepared using US GAAP as a basis, and converting to IFRS for comparison purposes. In this case study IFRS rules are discussed, and key Income Statement and Balance Sheet similarities and differences between US GAAP and IFRS are addressed. We will follow up with other similar case studies which focus on an IFRS prepared Cash Flow Statement from a US GAAP prepared Financial Statement.

AN EMPIRICAL ANALYSIS OF CORPORATE FINANCIAL CONDITION AFTER ACCOUNTING MALFEASANCE

Liz Washington Arnold, The Citadel
Peter Harris, New York Institute of Technology

ABSTRACT

This study examines corporate survival/recovery after corporate accounting malfeasance from an exploratory and empirical perspective utilizing 100 companies known to have committed corporate malfeasance from a previous study and the related matching non-malfeasance companies to whom they were compared in that study to see if the survival/recovery for the malfeasance companies fared any different than the non-malfeasance companies. This study will examine the current status of the companies relative to where they were during the time of the announce malfeasance from a bankruptcy, merger, market value (stock price increase or decrease) or accounting value (book value) change perspective, including whether there have been subsequent announced malfeasance for any of the companies in the previous study.

The research contributes to contemporary accounting literature by providing survival/recovery information for companies with announced malfeasance.

EARTH WALL CONSTRUCTION: THE WAY OUT FOR AFFORDABLE AND SUSTAINABLE HOUSING DEVELOPMENT

Amao Funmilayo, Ladoke Akintola University of Technology

ABSTRACT

Nowadays all around the globe, people, communities, and counties are committing themselves to appropriate technologies, discovering that they can use native talent, resources, and financing to solve their own problems. The issue of Affordable and Sustainable housing development for the low income workers is still an illusion in Nigeria today. This arises as a result of financial and technological incapability. Therefore, the paper examines the suitability and potential of the use of local constructional materials to addressing housing affordability in the country. The secondary data used for this paper is gotten from detailed Literature review from relevant published journals, books and seminar papers. The paper examines evaluation of the existing program of housing delivery and the paper found out that the issue of Affordable Housing provision in Nigeria did not yield much result due to high cost of provision. The paper conclude by recommending the use of Earth as a local building material for Housing construction in order to reduce the cost of housing and make Sustainable Housing Provision a reality in Nigeria especially for the poor. The conclusion is that we cannot be importing materials from other nations but rather evolve workable models based on our locally available materials.

JEL: E01

KEYWORDS: Housing, Affordable housing, housing delivery, Earth, Sustainable Housing provision.

INTRODUCTION

The United Nations estimates that Nigeria's population in 2005 stands at 141 million, and predicted that it would reach 289 million by 2050 (Encarta, 2007). The United States Census Bureau projects that population of Nigeria will reach 264 million by 2050. Nigeria will then be the 8th most populous country in the world (Encarta, 2007). Rapid growth in population creates demand pressure towards shelter and efficient supply and distribution of basic utilities and services for the city dwellers, In most of our urban centers the problem of housing is not only restricted to quantity but to the poor quality of available housing units .

Need for Affordable Housing

Nigeria is perhaps the fastest urbanizing country in the African continent. One of the most important challenges facing the country is the provision of affordable housing. As more and more Nigerians make towns and cities their homes, the resulting social, economic, environmental and political challenges need to be urgently addressed (Raji, 2008). A recent study of housing situation in Nigeria put existing housing stock at 23 per 1000 inhabitant. Housing deficit is put at 15 million houses (Mabogunje, 2007) while N12 trillion will be required to finance the deficit. This is about 4 times the annual national budget of Nigeria (FHA, 2007).

Current Housing Delivery Approach

In 2003, the federal government also established the Federal Ministry of Housing and Urban Development, and Proposed a Housing Reform, in view of the fact that there were not many affordable houses in Nigeria. There was an illusion that houses were available. But most of them were high-priced. Mabogunje, 2004 opined that a number of other legislation needs to be amended substantially to bring their provisions in line with the new housing regime. The period 2003 – 2004 witness a Housing policy that recognized the private sector on the driving seat of housing delivery in the country, the key features of this policy include the placement of the private sector in a crucial position, for the delivery of affordable houses, on a sustainable basis; assignment to government of the responsibility for the development of primary infrastructure for new estate development.

Affordable Housing Scheme: There are several affordable housing schemes that are either fully funded by government or in partnership with the government under the Public Private Partnership (PPP) scheme. In some cases selected developers were given some kind of concession by government with the aim of providing affordable housing for instance, in the Federal Capital Territory. Such efforts were further complemented with the Private Finance Initiative (PFI). Jibrin (2009) further argued that while the quality of the existing stock is also under a heavy scrutiny in term design and desired functions including acceptable livable neighborhood, 87% of the existing stocks are backlogs which are stocks that do not meet the minimum quality requirement.

Site and Services Scheme: The pressure for this came from the international lending community and in particular the World Bank. Given the rising figures of ‘spontaneous or squatter settlements’, in cities all over the third world, in the face of tight planning control, regular demolitions, and high-cost construction programs, the World Bank argued for a new approach to urban development which incorporated various forms of aided self-help (World Bank, 2005). The two ‘packages’ which received the most support were sites and services scheme, and upgrading schemes.

LITERATURE REVIEW

Earth

Earth is the oldest most widely used building material in the world today. It is an appropriate, abundant, inexpensive, eco-friendly, and energy-efficient technology. Buildings with raw earth as well as stabilized earth avoid deforestation and pollution, and can achieve low energy costs throughout their existence: during their manufacturing and construction process as well as during their use as homes, offices, communities etc., and ultimately in their recycling back to the earth. The type of earth materials available locally will of course vary depending upon the conditions in the area of the building site. In many areas, indigenous stone is available from the local region, such as limestone, granite, and sandstone. The use of locally available and indigenous earth materials has several advantages in terms of sustainability like:

- Reduction of energy costs related to transportation.
- Reduction of material costs due to reduced transportation costs.
- Support of local businesses and resource bases.

Care must be taken to ensure that non-renewable earth materials are not over-extracted. Ecological balance within the region needs to be maintained while efficiently utilizing its resources. Both brick and stone materials are aesthetically pleasing, durable, and low maintenance. Exterior walls weather well, eliminating the need for constant refinishing and sealing. Interior use of brick and stone can also provide excellent thermal mass, or be used to provide radiant heat.

Mud Wall: Mud is the natural building material that is absolutely different from wood, rock, and cement or metal. Owing to durability and recycling ease, mud can be formed for our shelters and it can be reformed back to nature, to be simple soil on earth. Moreover, mud is harmonized with all environments and good for being a passive air-conditioning system. Thus living in mud-house is comfortable year round. Frugality and reuse in mud- house construction can create tremendous saving in environmental impact, energy use and capital expenditure. Mud from earth or soil is one of the most widely used traditional building materials throughout the world. All mud-house constructions use just simple local materials, mainly are soil and water, added up with paddy husky or rice straw or local fiber weed.

Construction Techniques

Basically, there are roughly eight types of mud-house construction techniques:

Rammed Earth: Damp earth lay between formwork and mould and compacted by ramming; wall baring system.

Adobe: Sun-dried brick [soil, water and local fiber materials] bonded with clay mortar; wall baring system.

Cob: Fresh lumps of mud [soil, water and local fiber materials] stacked on each other; wall baring system.

Wattle and Daub: Woven work of sticks intertwined with twigs or bamboo covered with mud; framework system.

Cordwood or Stone: Left over materials like slender shoot of a tree or tiny stone bonded with mud [soil, sand and paddy husk]; wall-baring system.

Earthen Bag: Stacking the sags of damp earth hooked up with thorn or barbed wire; wall baring system.

Straw-bale: Plastering the bundle of hay with mud; the structure can be both skeleton and wall baring system.

Advantages:

Environmental Impact

- To save natural resources
 - Using neither cement nor rock (Save our mountains)
 - Using just a little wood (Save our forests)
- To save building materials
 - Main materials are soil and water, mixed to be mud

Energy use

- To save energy
 - Cool in summer (Inside building temperature is about 24°C to 26°C)
 - Warm in winter (Automatic temperature control by passive cooling system)

The advantages of earth construction are multiple and complementary and are reviews as follows: -

- Appropriate use of material considerably reduces construction cost (Zami & Lee et al, 2007) and hence stimulates the economy. Earth construction allows appreciable economies to avoid excessive expenditure of energy.
- Earth is easy to work with using simple tools and less skill. So, it encourages and facilitates self-help and community participation in house building (Kateregga, 1983).
- The higher the ratio of non-manufactured local materials the lower the ratio of man-made energy. Earth is nature's product; it requires no energy to produce, it saves man-made energy, it is labour intensive, and it is in plentiful supply and enduring. Contrary to popular belief, earth provides the natural comforts of balanced temperatures, humidity and noise control (Alphonse et al, 1985).
- Earth has such a low rate of thermal conductivity; warmth takes almost 12 hours to work its way through a 300mm thick wall (Cassell, 1993). The sun's warmth will actually be reaching the interior of the house during the cold hours of the night, yet the walls insulate the interior from summer temperatures (Kateregga et al, 1983).
- According to Cassell (1993), besides insulating and storing heat, rammed earth also allows more air exchange than does any comparable material. A rammed earth house breathes without suffering any significant heat loss. This is especially important today because the interior of houses are 5 to 7 times more polluted than the outside.
- Earth is a good noise absorbent which is a desirable quality in house design (Kateregga, 1983)
- The thick walls also provide a feeling of security which goes beyond their warmth and strength. Moreover, putting metal grills on window and door openings can make a house fortress. The compression strength of rammed earth is higher than that of a concrete wall of similar thickness (Houben & Guillaud, 1989) thus making a rammed earth building nearly as durable as a bomb shelter.
- A rammed earth wall is about 40 percent cheaper to build than a standard stud wall, including labor (Cassell, 1993). Rammed earth is not just an economy construction technique it results in some of the most pleasant, comfortable, and energy- efficient buildings available at any price (Zami & Lee, 2007). Using tinted stucco, the pise builder can finish his house in almost any color or architectural style (Houben & Guillaud, 1989).
- Since this natural material can be used locally with reduced transport costs (Kateregga et al, 1983) and without secondary industrial transformation.
- Earth building can be seen as a means of creating employment (Zami & Lee, 2007).
- Earth is very good in fire resistance (Alphonse et al, 1985).

According to Cassell (1993), the two historical disadvantages to rammed earth has been water damage and labor intensity. Labor intensity has been solved by the use of gasoline and pneumatic powered tamping devices (Beyond 2000). Kateregga (1983) listed the following weaknesses of earth (unstabilised) in building construction: -

- Its poor and very low load bearing capacity makes it unsuitable for supporting heavy roofs from large span building.
- It has a very high moisture (water) absorption ratio which also contributes to its
- Structural failure.
- Earth has a low binding strength for its particles and this contributes to its low compression strength.
- Earth has a very high shrinkage/ swelling ratio resulting in major structural cracks when exposed to different weather conditions

It has a low resistance to wear and tear, less durable and calling for frequent repairs and maintenance when used in building construction works. Also, according to Dunlap (1993), a significant problem associated with the construction of earthen buildings is the lack of standard criteria to evaluate the finished product.

TYPES OF EARTH WALL FINISHES

Natural Plasters: Plaster is used as front-line defense for moisture intrusion into the structure, and is employed to help control moisture within wall assemblies. Plaster helps to protect walls from premature wear and abrasion. Natural plastering is a truly ancient form of building, found in civilizations throughout history. Since some of the earliest habitations, humans have been covering their walls, for decoration and performance, first with earth, then with lime and gypsum. These three substances — lime, gypsum and clay — are the basic materials known as natural plasters; these stand in contrast to cement-based stuccos, which are far more common in the modern industrialized world due to their speed of set and ease of uniform mass production.

Mud Plaster: Mud plaster is usually applied in two coats for both exterior and interior surfaces. The addition of straw is recommended in the mud plaster mix. This will help to reinforce the plaster, allowing for thicker coats and surface levelling. In addition, this will decrease the tendency for cracking of the plaster as it dries. High clay content soils in mud plaster may tend to result in a poor bond of the plaster to the wall. The finish coat is made of screened, fine materials. This layer is applied as thinly as possible while achieving full coverage. Plaster can be towelled or floated to achieve a variety of textures, and reapplied as many times as necessary to achieve the desired affect or to make repairs. When dry, the mud plaster surface will take a hard, firm set similar in hardness and texture to conventional plaster. The same stabilizers used in the preparation of the structural soil mix may be used to stabilize the plaster. Thorough mixing of the plaster mix is necessary to avoid an uneven finish.

Cement Plastered Finish

An earth wall is made using soil mixed with water and some cement. These rooms are very comfortable to stay in during the hot weather. The earth walls do not absorb heat. After the earth wall is constructed, it is usually very rough. The wall may be finished using various methods. The wall can be plastered with cement or lime. This allows for other decorative finishes like paint. It is prepared in the form of mortar with cement, sand and water in proper proportions and applied on masonry manually to achieve a smooth finish or sand faced finish. Traditional cement stucco may be used on walls for a low-maintenance finish. While this may seem desirable, cement stucco also has disadvantages in that it has a different expansion coefficient than the wall material. This may eventually lead to separation from the wall, and may conceal structural erosion problems which may result from leaky pipes or roofs. Stucco netting is recommended to accommodate any settling and cracking of the stucco. Exterior stucco walls should not be painted with traditional exterior paints, which will increase moisture impermeability. A final colored coat of stucco or texture finishes may be used decoratively.

Pebbles Finish: This is a very simple and attractive finish obtained by pasting small pebbles on the walls with cement mortar as an adhesive. Pebbles finish is usually preferred for exterior facade. It is also commonly used to give nice flowing effect to the waterfalls that are created especially designed for Hotel Interiors or as a part of Exterior Landscaping.

Flakes Finish: It is a special material used to enhance the elevation treatment of the building. It is majorly used for the exterior facade. It has also been used for the interiors but to a very small extent. Application of flakes finish is avoided in the interiors because chipping off of flakes is a trouble. The flakes are applied with a trowel on walls over a coat of adhesive.

Coral Finish: Coral finish is similar to Plaster of Paris Finish and Gypsum Plaster Finish. Coral is the name of a type of plastering material. It gives a rough edgy finish.

Canfor Finish: Canfor finish is also known as faux finish. This material is used for the interiors of residences. It adds a unique aesthetic appeal to the place. It comes in 6mm thickness and in different designs. This finish is chosen when a false finish is to be given. It gives a stone wall or brick wall effect.

Tile Cladding: Different tiles, for example, granite, marble, glazed tiles or vitrified tiles are used for tile cladding. Tiles are available in a variety of colors and shapes. The selection of tiles depends on the place where it is to be applied i.e. interior facade or exterior facade. Tile Cladding

Sand Textured Finish: Sand Textured finish is used to give fine texture to the wall. This wall finish is not very commonly used because of its grains coming out.

Sand Textured Finish

Textured Wall Coating: Decorative or textured concrete products are a type of wall coating material which decorates any wall surface and replicates a realistic brick wall or natural stone by texturing the wall. Wall textures can be used on a new wall or to renovate an old wall. Wall coating material can be applied on wood, concrete or stone surfaces. It is widely used today because of its quality of keeping the wall durable and elegant in spite of being subject to harsh weather conditions.

Venetian Plaster Wall Finishes: Evolving since 7500 B.C., Venetian Plaster's ingredients have evolved from lime, sand and marble dust to synthetic "Venetian plaster" often consisting of acrylic based plaster and water based waxes. Luckily, though hard to find, authentic Venetian Plaster is still available today. It has been a timeless wall finish that looks magnificent and improves as it ages.

Tiled Wall Finishes: Usually tiled wall finishes appear in bathrooms. Tiled walls are effective against moisture created from the shower. Fortunately there are sealants that are effective against moisture, making a plaster wall finish a possibility in bathrooms.

METHODOLOGY

In order to reach the above mentioned objectives, the study included secondary data. The secondary data involved available census data, official documents, the national housing policy and other relevant secondary data were obtained from existing literature, on books, journals and housing market.

RESULTS AND DISCUSSION

Evaluation Of Benefits Of Using Earth Materials For Construction

Healthy and Environmentally Friendly: Earth wall construction are non-toxic, non-polluting and 'breathes'. This creates safer, more people-friendly buildings. It is very low in embodied energy, and extremely comfortable to live in.

Cost Effective: Unlike most types of walls, earth wall and finishes are cost effective.

Strong and Durable: Research has proved that wall with earth materials can withstand pretty much anything nature can throw at it.

Low Maintenance: Earth wall finishes are permanent and require little on-going maintenance.

Thermal Mass: The thickness and density of the material means that heat (or cold) penetration of the wall is very slow and the internal temperature of the building remains relatively stable, with the end result of it feeling warmer in winter and cooler in summer than the outside temperature e.g. natural plaster

Noise Reduction: The thickness and density of the walls mean that unwanted sounds such as traffic noise are kept out.

Fire Proof: Earth materials have very good resistance to the fire outbreak

Aesthetic: Architects are using earth wall and finishes in commercial and domestic buildings of many styles and for many functions. Variations in texture, colour and finish are possible. It is a natural product which blends beautifully with the environment and other natural building materials.

RECOMMENDATIONS

Housing is a critical component in the social and economic fabric of all nations. No country is yet satisfied that adequate housing has been delivered to the various economic groups that make up its citizenry. Thus, most nations, in one form or another continue to claim a housing problem. Building materials is believed to have constituted 55% to 65% of total cost of construction input. Indigenous building materials have potential for enhancing mass housing development, but regrettably stakeholders have not embraced them. For sustainable housing delivery, both private and public developers should shift from over dependency on imported materials to the use of local materials such as earth for wall, roofing and floor materials that are affordable and durable. An inward approach and enlightenment of the public services and professionals in the industry of the efficiency of local materials will enhance housing delivery and affordability. The establishments of small and medium size companies for the exportation, manufacturing and coordinated network distribution of building materials will greatly enhance housing delivery. In all, workable national policy framework where the duties and responsibilities of each stakeholder in housing delivery will be stipulated will assist sustainable mass housing delivery in Nigeria.

CONCLUSION

The basis of Earth as building materials is the need to reduce the environmental impact of buildings and provide affordable housing to the masses, without sacrificing comfort, health or aesthetics. To be more sustainable, natural earth wall use primarily abundantly available, renewable, reused or recycled materials. The use of rapidly renewable materials is increasingly a focus. In addition to relying on natural finishing materials, the emphasis on the architectural design is heightened. Earth wall construction involves a range of building systems and materials that place major emphasis on sustainability. Ways of achieving sustainability through natural finishes focus on durability and the use of minimally processed, plentiful or renewable resources, as well as those that, while recycled or salvaged, produce healthy living environments and maintain indoor air quality. Earth is also affordable and available and would be appropriate in the case of low cost house construction in Nigeria. The only challenge that prevents earth becoming the preferred choice of building material amongst people is the acceptability of this material. An awareness and understanding by people to environmental issues such as air pollution, deforestation, land degradation and energy conservation would help them change their attitudes and views towards earth building and finishes. The flexibility and simplicity in technology incorporated in earth building affords adaptability and easy transfer of knowledge between different stakeholders in the building industry.

Individuals and community as a whole can easily participate in building their own homes in affordable ways.

LEADERSHIP IN CONTEXT: THE MODERATING EFFECT OF FOLLOWER NEED FOR AUTONOMY ON DIRECTIVE LEADERSHIP STYLE, EMPOWERING LEADERSHIP STYLE, AND LEADER EFFECTIVENESS IN VOLUNTEER ORGANIZATIONS

Stephen Kalaluhi, Regent University School of Business and Leadership

ABSTRACT

This research paper proposed and tested a leadership framework based on the moderating effect that follower need for autonomy has on the relationship between directive leadership style, empowering leadership style, and perceived leader effectiveness. Building on Fiedler's (1967) contingency theory of leadership, this paper proposed and tested the concept that the level of a follower's need for autonomy moderated the effectiveness of a leader based on the leadership style utilized. This research study focused on directive leadership and empowering leadership in volunteer organizations to determine followership perceptions of leaders based on the leadership style chosen and the follower's level of need for autonomy. Survey data, obtained from a mid-sized volunteer organization in Southern California, supported one of the two hypotheses proposed in this research paper. In addition, an unexpected negative relationship was noted pertaining to the supported hypothesis regarding follower need for autonomy and empowering leadership style.

INTRODUCTION

The concept of leadership styles and leader effectiveness has been studied and researched in earnest for several decades (Durham, Knight, & Locke, 1997; House, 1971; Kahai, Sosik, & Avolio, 1997; Manz, 1986). However, surprisingly little has been published regarding the role that context plays in leadership effectiveness, and even less has been published on the moderating role that follower autonomy has on the relationship between leadership style and leader effectiveness in volunteer organizations. Vardiman, Houghton, and Jinkerson (2006) stated: "Effective leadership within an organization is often viewed as the foundation for organizational performance and growth. Organizations that lack strong leadership are likely to fail to meet performance expectations" (p. 93). Unlike their paying business counterparts, volunteer organizations rely heavily on individuals who are committed to the organization and will give of their time, money, and resources to ensure the volunteer organization remains successful and operating. From a leadership effectiveness perspective, leaders must learn how to effectively connect with their volunteers and build commitment at every level of the organization.

To reduce the possibility of volunteers withdrawing their time, resources, and finances from becoming a reality, leaders must effectively choose the leadership style most appropriate to the situation or context in order to maintain high levels of volunteer commitment. This leadership perspective is supported by Fiedler's (1967) contingency theory of leadership, which states that no one leadership style, behavior, or attribute is suitable for all situations, and is widely used to explain how no one leadership style is appropriate for all situations and contexts.

LITERATURE REVIEW

This research focused on two distinct leadership styles: directive leadership and empowering leadership. Surprisingly little has been published in peer-reviewed scholarly leadership journals concerning the use of

directive leadership in organizational settings. One research study conducted by Mehta, Dubinsky, and Anderson (2003) measured the effects of leadership style in a global competitive market.

Empowering leadership is described as emphasizing employees' reliance on self-influence rather than hierarchically controlled processes (Houghton & Yoho, 2005). Leaders are encouraged to use empowering leadership styles because "leaders are limited in terms of time, energy, knowledge and scope of authority. Some followers might be more highly motivated if given greater decision authority" (Yun, Cox, & Sims, 2006, p. 375). D'Intino, Goldsby, Houghton, and Neck (2007) conducted research on the effect that individual differences have on self-leadership effectiveness. Regarding the need for autonomy, D'Intino et al. stated: "The need for autonomy is the extent to which a person needs or is eager to express individual initiative in performing a job" (p. 112). The research published by D'Intino et al. referenced research conducted by Yun, Cox, and Sims (2006) and Roberts and Foti (1998) and found that individuals who scored high in need for autonomy preferred to engage in self-leadership, while those who scored low in need for autonomy were more satisfied in a structured environment.

Mehta, Dubinsky, and Anderson (2003) stated that leadership effectiveness is as vague a concept as the definition of leadership itself and even more difficult to accurately measure. Very few leadership effectiveness instruments exist, and those that do focus on leader behaviors, charisma, rhetorical skills, intelligence levels, and personality traits (Bass & Yammarino, 1988; Hazucha, 1992; Hogan, Curphy, & Hogan, 1994; Komacki, 1986; Shamir, Arthur, & House, 1994). Mehta et al. found that leadership effectiveness is measured at both the organizational level and the leader's subordinates with the impact of leadership on subordinates usually focusing on subordinates' satisfaction with their leader's leadership style (p. 28).

METHODOLOGY

Data

Participants were recruited from several volunteer organizations throughout the local area, including churches, a food bank, and a youth sporting establishment; however, only one volunteer organization provided approval for their volunteers to participate in the research. A purposive sampling technique was employed at a mid-sized church in Southern California where the sample (*N*) consisted of 87 volunteers from two separate campuses. Eighty seven questionnaires were submitted and returned, but 8 questionnaires were excluded due to being incomplete. Participation in the study was both voluntary and anonymous.

Measures

This research paper combined instruments used to measure directive leadership style, empowering leadership style, follower need for autonomy, and leader effectiveness to determine what moderating effect, if any, follower need for autonomy has on perceived leader effectiveness. A compilation of the Essential Behavioral Leadership Quality instrument (Oyinlade, 2006), the Follower Need for Autonomy instrument created by Yun, Cox, and Sims (2006), the Empowering Leadership Questionnaire created by Arnold, Arad, Rhoades, and Drasgow (2000), and the Leader Behavior Description Questionnaire created by the Personnel Research Board at Ohio State University and revised by Stogdill (1963) generated a quantitative 49-item Likert-like questionnaire designed to measure a respondent's need for autonomy, their perceived leader's style of leadership, and their leader's perceived level of leader effectiveness.

RESULTS AND DISCUSSION

In order to predict perceived leader effectiveness using directive leadership style, empowering leadership style, follower need for autonomy, controlling for age, number of times volunteered per month, tenure, and work group size, a multiple regression analysis was performed. The regression analysis model summary showed that the control variables (Table 1) in Model 1 accounted for 11% of the variance in leadership effectiveness; however, the results were not more significant than a constant. Adding directive leadership style, empowering leadership style, and follower need for autonomy to the model increased the R^2 by .59 (accounting for 59% more of the variance in leadership effectiveness). Model 2 listed all the variables and accounted for 77% of the variance in leader effectiveness. It was found that empowering leadership style significantly predicted leader effectiveness ($\beta = .68, p < .01$).

Table 1: Regression Analysis

Model	R	R Square	Adjusted R Square	SE	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.11	.01	-.06	1.01	.01	.16	4	55	.96
2	.77	.60	.55	.66	.59	25.41	3	52	.00

To test the moderating effect that follower need for autonomy had on the independent variables of directive leadership style and empowering leadership style, multiple linear regression was performed on follower need for autonomy and empowering leadership style.

Table 2: Moderation Test of FNA and ELS

Model	R	R Square	Adjusted R Square	SE	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.76	.58	.56	.65	.58	38.52	2	57	.00
2	.79	.63	.60	.62	.05	7.11	1	56	.01

The moderation was tested by creating an interaction variable (FNA * ELS) which was used in the regression testing to determine if empowering leadership style and leader effectiveness were moderated by follower need for autonomy. As Table 2 shows, the R^2 change was .05 when the interaction variable was added to the predictor and moderator variables. This change was significant, $F(1,56) = 7.11, p = .01$. This interaction showed that the presumed moderator did moderate the effect of empowering leadership style on leader effectiveness. In addition to these findings, an unexpected result was reported regarding the correlation between follower need for autonomy and empowering leadership style. Table 3 shows a negative relationship between follower need for autonomy and empowering leadership style when the multiple regression analysis was performed.

Table 3: Coefficients Table for FNA and ELS

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.13	.79		2.69	.01
	FNA	-.04	.16	-.02	-.26	.79
	ELS	1.06	.12	.76	8.78	.00
2	(Constant)	1.71	.77		2.22	.03
	FNA	.01	.15	.01	.02	.98
	ELS	1.12	.12	.80	9.58	.00
	FNA*ELS	-.28	.11	-.23	-2.67	.01

This result was counter-intuitive to what was expected, and after investigating for a possible root cause, it was determined that the eleven items from the Arnold, Arad, Rhoades, and Drasgow's (2000) Coaching scale were worded to measure empowering leadership as it related to work groups, as opposed to how it related to individuals.

CONCLUSION

The results of this study supported the hypothesis that follower need for autonomy moderates the relationship between empowering leadership style and leader effectiveness such that when follower need for autonomy was high, an empowering leadership style would be perceived as more effective. These findings were consistent with the current literature and theory outlined within this study and reinforced the research conducted by D'Intino, Goldsby, Houghton, and Neck (2007) which found that individuals who scored high in need for autonomy preferred to engage with empowering leaders.

EFFECTS OF OWNERSHIP ON HOSPITAL PERFORMANCE IN CHINA

Zhonghua (Betty) Xu, Faculty of Business Administration University of Macau
Jia Yuan, Faculty of Business Administration University of Macau

ABSTRACT

In recent years, Chinese health care has rapidly improved, especially in the areas of equity and accessibility of services. Like in many other countries, the controversy over the roles of the public and the private sectors in health service delivery, particularly in hospitals, has waged for a long period of time. Policies began to take effect in 2000 and were reinforced in 2009; such health policy reforms, for the first time, prominently called for the expansion of private investments in health-service-delivery in China. Does the performance of health service delivery systematically differ by ownership form? We have analyzed data from 148 Beijing public and private hospitals in 2004 to shed light on this important policy question. The data are unique and reliable, which originate from the Beijing Health Bureau. A data envelopment analysis (DEA) is used to evaluate the technical efficiency score for the panel of Beijing's public and private hospitals. We have found that public hospitals have a lower efficiency score in the results from a comparison of two DEA models. The role of private hospitals in medical reforms is essential. Progressive privatization and decentralization will be the panacea in Chinese hospital system reforms.

A DYNAMIC PANEL MODEL OF CAPITAL STRUCTURE AND AGENCY COST IN NIGERIAN LISTED COMPANIES

Dauda Mohammed, Bayero University

ABSTRACT

This study examines the impact of agency costs on capital structure of Nigeria listed companies for the period of 2000-2006. Using a dynamic panel model, the study shows the extent to which asset utilization helps explain the financing structure of Nigerian firms. The main finding shows an inverse relationship between capital structure and agency costs of Nigerian firms. Thus, the negative coefficient on the agency cost variable suggests that, on average, the management of Nigerian firms choose either to use retained earnings or to issue new equity offer. Studies have shown that managers have a natural tendency to be cautious about borrowing, given that they have more to lose if the firm goes into liquidation, compared to shareholders with a diversified asset portfolio. Hence, a rise in the ratio of total sales to total assets (agency cost) would mean the management team is efficient in using the company's assets to generate wealth for their shareholders.

KEYWORDS: Capital structure, agency costs

INTRODUCTION

In their paper, Modigliani and Miller (1958) showed the assumptions under which financing decisions do not affect the value of the company. They state which factors should influence financing decisions of companies. Financial theorist, for example, Sander (2007) has subdivided capital structure determinants into three layers. Layer 1 included fundamental factors such as *returns, risk, and value*. Layer 2 comprised classical theories including *tax, bankruptcy and agency costs* among others. Layer 3 included practical factors such as *legal regulation, the life cycle of a company, human psychology, market conditions, credit ratings, shareholder preferences and risk management consideration*. However, discussion in this paper will be concentrated on agency costs as it affects the financing decision of Nigerian companies. It is one of the important classical capital structure theories underpinning previous capital structure studies. Despite its numerous challenges Nigerian economy display a futuristic prosperity and growth with concomitant high return on investment. Firstly, this study contributes to the present debate on the impact of agency costs on capital structure of Nigeria listed companies. Secondly, this the first empirical analysis of capital and agency costs in Nigeria using advanced econometric models.

Brief outline of related literature

Agency costs theory popularized by Jensen and Meckling (1976) and Myers (1984) suggests the separation of ownership and control in a modern corporation may lead to array of conflicts from several sources. For instance, the separation of ownership from control in large public corporations may induce conflicts between creditors and the firm and between managers and shareholders. This may pitch the owners (principals) against the management (agents) given that managers as agents are not entitled to 100 percent of the residual claims resulting from their professional responsibilities and expertise in running the affairs of the business. They, however, bear the entire costs of these activities and, in the event of financial distress or corporate takeovers, they will be the first in the firing line. It is assumed that faced with this situation, managers of corporations may therefore put less effort into value enhancement activities in the firm through sub-optimal investments.

Conflicts may also occur between creditors and shareholders, or between shareholders and other stakeholders such as customers, suppliers, employees, and competitors. As suggested by Myers (1993), conflict between shareholders and creditors may emerge as a result of underinvestment or overinvestment practices by the firm's management. Agency literature has focused on the role of debt as a means of disciplining managers. Grosseman and Hart (1982) were the first to argue that managers could pre-commit to work hard by using debt rather than equity. Similarly, Jensen's (1986) free cash flow theory considers additional debt as beneficial since the firm attempts to improve the productivity of its assets because of additional debt acquired. Debt not only reduces the free cash flow available to manager but also provides discipline to management through the debt market.

Debt monitoring hypothesis is formalised by Harris and Raviv (1990) and Stulz (1990) and empirically demonstrated by Shleifer and Vishny (1997) provided extensive survey on the role of debt in reducing the conflict of interests between managers and shareholders. On the other hand, increased leverage also has costs. As leverage increases, the usual agency costs of debt rises, including bankruptcy cost (Jensen 1986). Myers (1977) pointed to the debt overhang problem where firms may forego good projects if they have significant debt outstanding. The reason is that for a firm facing financial distress, a large part of the returns to a good project go to bondholders. Therefore, in choosing their debt-equity level, firms should trade off between the agency costs of debt and the agency costs of equity. By appropriately allocating refinance between equity and debt, capital structure can balance the conflicts between investors and management as well as that between management and creditors.

Data

The data for our study were obtained directly from the Nigerian Stock Exchange, the Central Bank of Nigeria, and the Nigerian Securities and Exchange Commission. To check the authenticity of data, we compared it with those made available by some of the companies on their respective web sites. Further, we excluded firms with less than 8 years of continuous time series data on their total liabilities, total assets, and earnings before interest and tax between 2000 and 2006.

In this paper, we have chosen to define corporate leverage as the book value of the total liabilities (i.e., the sum of short-, medium-, and long-term debts) divided by the book value of total assets. The outcome measures the percentage of funds provided by sources other than equity finance. The use of such a broad definition is in recognition of the fact that for many firms, especially those in emerging economies like Nigeria with underdeveloped capital markets, a combination of short and medium-term finance, including bank overdrafts and trade credits form the greater part of their funding requirements. Moreover, as noted by Chen (2003), the use of such book values helps avoid the limitations of missing information on the share of company stocks issued and openly traded on the stock exchange as well as on the gains in capital value arising from a dramatic rise in asset prices. Thus, the use of the book value of total liabilities relative to total assets has since been recognized as the broadest definition of the leverage ratio as it captures all the percentage ratio of funds provided by the short- medium and long term borrowings of a firm.

Findings

Our major findings reveal that impact of agency costs theory on capital structure as found in the developed and emerging economies is relevant in Nigeria. Our result shows an inverse relationship between capital structure and agency cost i Nigeria. It indicates that companies with a higher debt to asset ratio have higher ratio of sales to assets. This is statistically significant at the conventional five percent confidence level. This finding is consistent with Jensen (1986) theory that debt can reduce the agency costs of free cash flow by reducing the cash flow available to managers. It is also consistent with previous studies including. Li and Cui (2003), Ang *et al* (2000) and Singh (2002).

Given this result and challenges of the Nigerian capital market and the economy in general, we make the following recommendations among others. *First*, the government needs to implement policies aimed at increasing the depth and efficiency of the market so as to “correctly” price shares. Such market-orientated reforms involve initiatives which will encourage a greater openness and private sector participation in the economy. Then too, policies should be introduced to automate trading on the stock exchange as well as to educate all registered asset managers on the linkages between risk and expected returns. Moreover, agency costs arising from the conflicts of interest between managers and external providers of finance can be mitigated by setting up regulatory bodies with legal powers to enforce the rights of investors. Also, an independent arbitration agency should be set up to settle disputes between firms and their employees, together with an ombudsman who deals with complaints by customers, suppliers and other companies. Furthermore, regulations that ensure that firms publish timely and accurate information in their accounts, as well as the provision of competent and trusted auditors, will help reduce the potential costs of financial distress for external investors.

Appendix Table 1: Leverage ratio of Nigerian Listed firms and its major determinants: Descriptive statistics from 2000-2006

<i>Item</i>	<i>Mean</i>	<i>Standard deviation</i>	<i>Min</i>	<i>Max</i>	<i>Correlation with the leverage ratio</i>
1. Total liability percentage of total assets (leverage ratio)					
a A Panel of ninety-four listed firms	0.38	0.20	0.02	0.0.85	1.000
b Manufacturing companies	0.38	0.19	0.02	0.83	0.03
c Firms with more than 30 percent foreign ownership	0.36	0.20	0.05	0.83	-0.05
d Firms aged 25years and above	0.36	0.19	0.07	0.80	-0.04
2. Standard deviation of earnings before interest and tax (business risk)					
a A Panel of ninety-four listed firms	0.16	0.10	0.08	1.90	0.15***
b Manufacturing companies	0.15	0.12	0.08	1.87	-0.10***
c Firms with more 30 percent foreign ownership	0.15	0.05	0.08	0.43	-0.06
d Firms aged 25 years and above	0.16	0.09	0.11	1.13	-0.01
3. Total Sales percentage of total assets (agency costs)					
a A Panel of ninety-four listed firms	1.77	1.26	0.13	6.33	-0.16***
b Manufacturing companies	1.71	1.54	0.13	5.86	-0.08**
c Firms with more 30 percent foreign ownership	1.95	1.19	0.14	5.86	0.11***
d Firms aged 25years and above	1.98	1.25	0.25	6.12	0.11***
4. Total fixed assets percentage of total assets ratios (tangibility)					
a A Panel of ninety-four listed firms	0.57	0.19	0.09	0.93	0.04
b Manufacturing companies	0.56	0.19	0.08	0.92	-0.08**
c Firms with more 30 percent foreign ownership	0.56	0.20	0.10	0.93	-0.03
d Firms aged 25 years and above	0.58	0.19	0.12	0.93	0.07*
5. Earnings before interest and tax percentage of total assets (Profitability)					
a A Panel of ninety-four listed firms	0.11	0.19	-0.82	0.88	-0.16***
b Manufacturing companies	0.13	0.21	-0.82	0.88	0.18***
c Firms with more 30 percent foreign ownership	0.17	0.19	-0.33	0.88	0.23***
d Firms aged 25 years and above	0.12	0.19	-0.59	0.88	0.05
6. Log of total sale revenues in millions of Naira (size)					
a A Panel of ninety-four listed firms	7.38	1.95	1.44	11.36	-0.06
b Manufacturing companies	7.64	1.90	1.44	11.36	0.21***
c Firms with more 30 percent foreign ownership	8.46	1.45	3.55	11.37	0.44***
d Firms aged 25 years and above	8.41	1.41	4.17	11.36	0.36***
7. Total assets annual percentage change (growth prospects)					
a A Panel of ninety-four listed firms	20.00	37.00	-72.21	214.16	-0.06
b Manufacturing companies	19.04	36.00	-572.20	214.16	0.02
c Firms with more 30 percent foreign ownership	20.31	35.04	-59.68	196.55	0.000
d Firms aged 25 years and above	18.14	30.59	-59.68	176.41	0.02

Note

- Manufacturing are firms officially classified as manufacturing by the United Nations International Standard Industrial Classification (ISIC). Foreign companies are firms having more than thirty percent overseas share ownership and
- Old companies are those that are more than twenty-five years old.
- *** Statistically significant at 1% confidence level, ** Statistically Significant at 5% confidence level, and* statistically significant at 10% confidence level.
- The numbers in bracket in column, 1 item 1 represent the numbers of our Nigerian listed firms in the manufacturing sector that have more than 30% of foreign ownership and aged 25 years old and above.

Table 2: Estimation of our capital structure Model

Mean of dependent variable	37.75%
Standard deviation of dependent variable	19.70%
Number of observations	609

	Column 1	Column 2	Column 3	Column 4
Estimation method			GMM-IV REG 2	GMM-IV REG 3
Dependent variable (y)	DLLEV			
Independent(x) variables	Mean			
DLLEVL1	0.13%		-0.146 [-5.208]	-0.078 [-2.581]
DLLEVL4	0.15%		0.047 [1.090]	0.250 [5.150]
SDEV	0.15%		1.121 [4.579]	-0.852 [-22.237]
DLACOT	0.08%		-0.271 [-5.972]	-0.241 [-4.374]
DLPRF	-0.30%		-0.095 [-5.159]	-0.208 [-37.469]
DLTAN	0.08%		0.104 [2.567]	0.066 [4.409]
GRW	19.79%		0.003 [2.027]	0.002 [0.974]
DSLS	0.11%		-0.288 [-4.574]	-0.113 [-1.139]
Marginal Impact on Leverage			1.121	9.938
Model fit and diagnostic test statistics				
Wu-Hausman (F-statistics)			3.85	3.85
Wu-Hausman- F-statistics (Prob Value)			0.001	0.001
m2 test			0.398	0.327
Wald test			0.001	0.001
Sargan test			0.87	0.87
Adj R ²			0.18	0.67

Note

1. The estimated coefficients in bold italics are significant at the conventional five percent level
2. The values are the coefficients and the figures in brackets [...] are the t-statistics unless otherwise stated
3. The instrumental sets includes the lagged values of all the right-hand side variables dated $t = 4$
4. The m2 tests are for second-order AR (2) serial correlation in the differential residuals equation under the null hypothesis of no serial correlation. The test is asymptotically distributed as $N(0, 1)$.
5. The formal Wald tests reject the null that the original idiosyncratic errors are serially uncorrelated. These are obtained using Eviews 'view-coefficients test-Wald-coefficients restriction and entering the restriction $C(1) = -0.5$ in the edit box'.
6. The Sargan test is used to test the over-identifying restriction and is asymptotically distributed as $\chi^2(p - k)$ under the null of instrument validity. (k is the number of estimated coefficients and p is the instrumental rank).
7. The Sargan tests for the three models in column, 2, 4 and 4 are not significantly different from zero. This implies that the null hypothesis that our instrumental variables are valid cannot be rejected at the conventional 5% confidence level.

Table 4: The Definitions Of Variables

<i>LLEV</i>	The total leverage ratio. This is calculated as the ratio of total liabilities to total assets
<i>DLLEV_{t-1}</i>	Percentage change in the natural logarithm of the total leverage ratio lagged one year, t-1
<i>DLLEV_{t-2}</i>	Percentage change in the natural logarithm of the total leverage ratio lagged two years, t-2
<i>DLLEV_{t-3}</i>	Percentage change in the natural logarithm of the total leverage ratio lagged three years, t-3
<i>DLLEV_{t-4}</i>	Percentage change in the natural logarithm of the total leverage ratio lagged four years, t-4
<i>SDEV</i>	The standard deviation of the ratio of earnings before depreciation, interest and tax to total assets. An increase in this variable denotes a worsening in earning volatility (i.e, business risk)
<i>SDEV_{t-1}</i>	The standard deviation of the ratio of earnings before depreciation, interest and tax to total assets lagged one year, t-1
<i>SDEV_{t-2}</i>	The standard deviation of the ratio of earnings before depreciation, interest and tax to total assets lagged two years, t-2
<i>SDEV_{t-3}</i>	The standard deviation of the ratio of earnings before depreciation, interest and tax to total assets lagged three years, t-3
<i>SDEV_{t-4}</i>	The standard deviation of the ratio of earnings before depreciation, interest and tax to total assets lagged four years, t-4
<i>SDEV²</i>	The square of the standard deviation of the ratio of earnings before depreciation, interest and tax to total assets
AGENCY COSTS	The ratio of earnings before depreciation, interest and tax (EBDIT) to total assets
PROFITABILITY	The ratio of total fixed assets to total assets
TANGIBILITY	Percent change in the natural logarithm of total assets in millions of Nigerian Naira
GROWTH	Natural logarithm of total sales revenue in millions of Nigerian Naira
SIZE

A PRINCIPLES-BASED CASE FOR TEACHING INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS)

Obeua Persons, Rider University

ABSTRACT

IFRS has been widely used around the world with more than 120 countries permit or require IFRS. Although the SEC still requires U.S. firms to follow U.S. generally accepted accounting principles (U.S. GAAP), it has allowed foreign companies to use IFRS for preparing their financial statements without reconciliation to U.S. GAAP since 2007. The Securities Exchange Commission is expected to make an announcement in the near future concerning how to incorporate IFRS into U.S. financial reporting. Consequently, U.S. accounting educators started to teach IFRS by discussing differences between IFRS and U.S. GAAP, and how to apply IFRS from a technical standpoint. However, such approach does not reflect any exercises of professional judgment needed for applying “principles-based” IFRS that requires a much greater extent of professional judgment than “rule-based” U.S. GAAP. In addition, this typical approach does not provide any explanations as to why the International Accounting Standards Board (IASB), a standard setter of IFRS, promulgated specific IFRS accounting treatments. This principles-based case emphasizes a “why” question by using the IASB Conceptual Framework for Financial Reporting to question and understand the basis for specific differences between IFRS and U.S. GAAP requirements, and to critically examine weaknesses of these requirements. The case discussion involves six accounting topics: fundamental differences between IFRS and U.S. GAAP; inventories; property, plant and equipment; intangibles; impairment of assets; and statement of cash flows. This principles-based approach should help stimulate classroom discussion, sharpen student critical thinking skill and develop professional judgment among students. Students will be much better served if we not only teach them differences between IFRS and U.S. GAAP and how to technically apply IFRS, but also help them develop an understanding of conceptual basis for the standards. This principles-based case could be used in an intermediate accounting class, and an international accounting course at both undergraduate and graduate levels.

JEL: M41

KEYWORDS: Conceptual Framework, IFRS, U.S. GAAP, critical thinking, and professional judgment

CASE MATERIALS

The following six tables describe accounting requirements of IFRS and U.S. GAAP regarding six accounting topics: fundamental differences between these two sets of standards; inventories; property, plant and equipment; intangibles; impairment of assets; and statement of cash flows. Each of these six accounting topics has two to five accounting issues that have major differences between IFRS and U.S. GAAP. For example, Inventories topic has five accounting issues: LIFO, standard cost, lower of cost or market (LCM), cost basis in LCM, and reversal of write-downs.

Table 1: Fundamental Differences

IFRS	U.S. GAAP
<ul style="list-style-type: none"> - More principles-based: Provide a conceptual basis instead of a list of detailed rules, leading to more judgments with greater emphasis on economic substance over form. - Conceptual framework is authoritative and has a very high status. IAS 8 requires preparers to use the framework in dealing with topics not yet addressed in any IFRSs or their interpretations. - Has overriding principle of fair presentation. In an extremely rare circumstance when compliance with the requirement of a standard or interpretation would be so misleading, preparers are required to depart from that requirement with extensive note disclosures. 	<ul style="list-style-type: none"> - More rules-based: More-detailed bright-line guidance and less judgments result in unintentional emphasis on form over economic substance as in the case of Enron. - Conceptual framework is not authoritative, not used in applying U.S. GAAP, and has a very low status, below industry practices. Preparers mainly rely on FASB's detailed implementation guidance. - No such overriding principle is available to preparers of financial statements. Although the overriding principle is available to an auditor via Rule 203 exception of the AICPA's <i>Code of Professional Conduct</i>, Rule 203 exception is rarely invoked in practice.

Table 2: Inventories

IFRS (IAS 2)	U.S. GAAP
<ul style="list-style-type: none"> - Allow FIFO and weighted-average. LIFO is not allowed. Standard cost and retail method are allowed if they approximate cost as defined in IAS 2. - Reported at the lower of cost or net realizable value (NRV). - The original cost always remains as the cost basis. - Write-downs to NRV must be reversed when selling price increases up to the original cost. 	<ul style="list-style-type: none"> - Allow FIFO, weighted-average, and LIFO. Do not allow standard cost. - Reported at the lower of cost or replacement cost with a ceiling (NRV) and a floor (NRV – normal profit margin) - The lower market value becomes the new cost basis. - Prohibit a reversal of write-downs to market.

Table 3: Property, Plant and Equipment (PPE)

IFRS (IAS 16)	U.S. GAAP
<ul style="list-style-type: none"> - May use either the cost model or the revaluation model to measure a PPE class, e.g., land, machinery, office equipment. - Revaluation (fair value) model at initial revaluation: Revaluation increases are credited to equity as a revaluation surplus. Revaluation decreases are recorded as an expense. - Must keep fair values up to date if a firm uses the revaluation model. - Must revalue all assets of the same class at the same time. - Each part of an item of PPE with a cost that is significant in relation to the total cost of the item shall be depreciated separately. 	<ul style="list-style-type: none"> - Require the cost model which is acquisition cost less accumulated depreciation and any accumulated impairment losses. - Prohibit the revaluation model. - Take a 'holistic view' of PPE depreciation instead of the IFRS 'component' approach.

If FV of land is appreciating and FV of office equipment is depreciating, which framework concepts are relevant for choosing the measurement model for land vs. for office equipment? Explain.

Table 4: Intangibles with a Limited Useful Life

IFRS (IAS 38)	U.S. GAAP
<ul style="list-style-type: none"> - Carry at cost less accumulated amortization (benchmark) or fair value (allowed alternative – only for intangibles with an active secondary market). - Research expenditures must be expensed as incurred. Development expenditures must be recognized as an intangible asset when meeting <u>all six</u> specific criteria about intention, financial ability, technical feasibility and commercial feasibility. - If <u>indistinguishable</u>, all R & D must be classified as research expenditures and expensed as incurred. 	<ul style="list-style-type: none"> - Carry at cost less accumulated amortization. Prohibit fair value. - Research and development expenditures must be expensed as incurred with an exception of computer software's development costs which may be recognized as an asset.

Table 5: Impairment of Assets (PPE, intangibles, investment in subsidiaries, associates and joint ventures)

IFRS (IAS 36)	U.S. GAAP
<ul style="list-style-type: none"> - An asset is impaired when its carrying amount (book value) exceeds its recoverable amount which is the greater of net selling price or value in use. - Value in use is the present value of future net cash flows expected to arise from continued use of the asset and upon its disposal. - Impairment loss is the excess of carrying amount over its recoverable amount. - Reversal of impairment loss is required in certain situations, except for goodwill. - Goodwill is tested for impairment at either the cash-generating unit (CGU) or group of CGUs which cannot be larger than a segment. 	<ul style="list-style-type: none"> - An asset is impaired when its carrying amount exceeds its future cash flows (undiscounted) expected to arise from its continued use and disposal. - Net selling price is not involved and future cash flows are not discounted to their present value. - Impairment loss is the excess of carrying amount over its fair value. - Prohibit the reversal of a previously recognized impairment loss. - Goodwill is tested for impairment at the reporting unit level which may be higher than CGU.

Table 6: Statement of Cash Flows

IFRS (IAS 7)	U.S. GAAP
<ul style="list-style-type: none"> - When using the indirect method, the reconciliation from income to operating cash flows may begin with any measure of income. - When using the direct method, the reconciliation of income to operating cash flows is not required. - Bank overdrafts may be included as a reduction in cash equivalents. - Dividends paid may be classified as an operating or a financing activity. - Dividend received and interest received may be classified as an operating or investing activity. Interest paid may be classified as an operating or financing activity. 	<ul style="list-style-type: none"> - When using the indirect method, the reconciliation from income to operating cash flows must begin with net income. - When using the direct method, an entity must also present a reconciliation of income to operating cash flows. - Bank overdrafts are to be classified as a financing activity. - Dividends paid must be classified as a financing activity. - Dividend received and interest received or paid must be classified as an operating activity.

CASE REQUIREMENTS

Per the conceptual framework specified in IASB (2010) and FASB (2010), the objective of financial reporting is to provide financial information about a reporting entity that is useful to existing and potential investors in making decisions about providing resources to the entity. Investors need information useful

for assessing: (1) the amount, timing and uncertainty of future net cash inflows to an entity, and (2) how well management discharges its responsibilities. For each accounting issues under each of the six accounting topics above, use the conceptual framework (available at <http://www.ifrs.org/IFRSs/IFRS.htm>) to discuss:

1. Qualitative characteristics of useful financial information that are the underlying principles of IFRS requirements and U.S. GAAP requirements.
2. Weaknesses of IFRS and U.S. GAAP requirements in term of these qualitative characteristics. Your discussion of these framework concepts should include:
 - a. Specific fundamental characteristic(s) along with its element(s) that contribute to decision usefulness in assessing cash flow prospects and management discharge of its responsibilities.
 - b. Specific enhancing characteristic(s) contributing to the decision usefulness.
 - c. Cost constraint, i.e., costs should be lower than benefits.

Articles by Barth (2008) and Nobes (2005) provide good examples for how to use framework concepts to identify underlying principles and weaknesses of IFRS and U.S. GAAP. Please keep in mind that the following justifications are NOT acceptable.

1. The requirement leads to better financial performance, e.g., higher earnings or assets. Such justification is for companies like Enron, WorldCom or Parmalat.
2. Better matching of expenses with revenue: Matching principle is not part of the conceptual framework. Income (expense) is recognized when an increase (a decrease) in future economic benefits related to an increase (a decrease) in an asset or a decrease (increase) in liability has arisen that can be measured reliably (IASB 2010).
3. More conservative treatment: Conservatism is not part of the conceptual framework because it contradicts with neutrality element of faithful representation.

TIME DIMENSIONAL ANALYSIS OF PUBLIC- PRIVATE HOUSING FINANCE IN NIGERIA

Oluronke Omolola Odunjo, Department of Architecture, University Of Technology

ABSTRACT

Against the background of the recognized fact that one of the objectives of Nigeria National Housing policy of 1991 was to ensure that all Nigerians own or have access to decent housing accommodation at affordable cost by the year 2000, this paper presents the 'Time Dimensional Analysis of Public-private sector involvement in Housing Finance in Nigeria' using detailed Literature review from relevant books and journal as well as personal observation. The achievements and failures of both the public and private sectors housing programs were analyzed and the paper found out that housing cost is still on the high side as Public housing finance in Nigeria did not yield much result and that housing affordability is still a mirage by the masses as housing finance has been left at the doorsteps of the private sector. The paper concludes by suggesting full involvement of the public sector in the provision of housing finance in Nigeria among others in order to make housing accessible by all.

KEYWORDS: Public sector, Private sector, Housing cost, Housing finance and Housing Affordability.

INTRODUCTION

Housing is one of the three basic necessities of human being and the most important requirement for the physical survival of man after food. It is one of the best indicators of a person's standard of living and his place in the society. Housing either in unit or multiple forms is a significant component of the physical form and the structure of the community. In other words, housing covers all socially accepted ways by which man acquires a territory, and the procedures by which he retains that territory. Also, the price paid for it and the manner in which the stock of the houses are maintained and enlarged (Aribigbola, 2000). However, in the developing countries today, the problem of Housing has become an everyday discussion in all quarters of the public and private services. It has become increasingly glaring that most of the urban population live in dehumanizing housing environment while those who have access to average housing do so at abnormal cost (Dosumu, 2002). In Nigeria, for example, housing problem is essentially an urban problem. Most authors have analyzed this from various perspectives, with most of them giving it a quantitative pre-eminence (Agbola, 2001; Agbola et al, 1992 and Onibokun, 1985). Also, they have, at different times revealed the problems associated with production. Agbola (1987) for example, recognized finance as part of housing problems but ranked land and building materials higher. Finance in this context refers to the capital provided for the construction of a dwelling; and as such, money provided to cover cost of acquiring land, procurement of building materials and labour cost (Bello, 2002).

Therefore, Agbola's submission on housing finance led to intensive research in these areas and the findings influenced government housing policies. Also, this led to the subsequent establishment of some relevant programs and Institutions like the Site and Service program as well as the National Institute for Road and Building Research meant to undertake research in the areas of housing. The drought of information and working knowledge of Housing finance operation is a major problem today in the country while Housing problems still persist and housing cost continue to be on the high side. Thus, in view of the high costs of erecting a house, a potential house owner has to either depend on his savings or borrow part or the entire cost of the project from the private sector. It is against this background therefore, that the paper examines the Time dimensional analysis of Public-Private housing finance in Nigeria. It identifies the achievements and failures of both and at the end, made recommendations towards solving housing problem in Nigeria.

METHODOLOGY

The descriptive research method was used for the study. The study area is Nigeria, located in the Western part of Africa consisting of black races. The country was purposely selected for the study because it is a developing country struggling to achieve housing sustainability. Data was collected from both secondary sources and personal observations.

Public Housing Finance In Nigeria

According to Arilese (1997); Okupe et al (2000) and Agbola (2001), the provision of Housing finance in Nigeria by the Public sector could be traced to the colonial days. During this period, the finance of housing was provided and limited to the expatriate staff and few selected indigenous senior servants working with the colonial masters in the urban centers. Further contribution was made in 1928 to curb the bubonic plague that erupted in Lagos and this led to the establishment of Lagos Executive Development Board. Also, the Nigerian Building Society (1956), formation of Housing Corporations between 1956 and 1960, National Council for Housing (1971) and Federal Mortgage Bank of Nigeria (1977). The Federal Mortgage Bank of Nigeria took off with a capital of ₦20million which was later increased to ₦150million in 1976 as well as Commercial Banks, Insurance Companies and Merchant Banks.

Prior to the formation of the National Housing Policy of 1991, the Federal Government of Nigeria interfered in the provision of Housing for Nigerians. This was done through National Development Plans (Federal Ministry of Work and Housing, 1991). First (1960-68), Second (1970-75), Third (1976-1980) and Fourth (1980-85). However, the most significant government intervention was during the third National Development Plan of 1976-1980 when the Federal Government participated directly and actively in the provision of Housing rather than leaving it to the private sector. Thus, a total sum of ₦2.6 Billion was allocated for the implementation of the Programme. (Federal Ministry of Economic Planning, 1975 and Federal Republic of Nigeria, 1981). The National Housing Policy of 1991 on its own explicitly spelt out the role of financial institutions in the provision of housing (Federal Mortgage of Nigeria, 1998; Federal Mortgage Bank of Nigeria News, 1998; Federal Republic of Nigeria, 1992). In spite of all these government interventions, the institutional housing finance system is still not well developed and equipped to mobilize and channel savings to the housing sector.

Achievements And Failures Of National Development Plans

The high hopes, noble pledges, huge sums of money and goodwill which welcomed the various public intervention program were not sufficient to prevent their failure. For example in the third plan, out of the anticipated 202,000 housing units, only about 20,950 units were actually completed, a success rate of only 13.3 percent. So colossal was the failure of each successive public housing programs that experts spared no pains at advancing reasons for their poor performance despite the fact that housing needs were estimated (Tables 1 and 2) which include the excessive and unnecessary delays in the planning, execution and construction of housing project which invariably add to housing costs, speculation and subsequently limit the number of units that can be built with the same capital; there is also the disregard for alternative avenues of housing provision other than direct construction. Site and services, core housing and the like were part of the explicitly stated housing policy objectives of the third and the fourth plans, only a handful of states experimented with them. Even where those houses were built, evidences abound to show that many remain inhabitable and thus unoccupied. The target population, taste and preferences were not articulated in the first instance before the standard; almost stereotype designs that have no relation to the immediate cultural environment were adopted. These amongst other reasons account for the colossal failure of public housing in Nigeria. It is not surprising, therefore, that the contribution of the public sector to the total stock of housing is only about the quarter. The implication of this is that Nigeria

cannot rely on the conventional methods (direct housing construction) to supply the people of this country with decent housing.

Table 1: Estimated Housing needs Nigeria (1999 – 2001)

	Urban areas	Rural areas	Total
Housing stock 1991 ('000 units)	3,373	11,848	15,221
Estimate no of households 2001	7,289	15,295	22,584
Required output 1991 – 2001 ('000)	3,916	3,447	7,363
Required annual output, 1991 – 2000	1391.6	344.7	736.3

Private Housing Finance In Nigeria

The private sector has been taking active part in the provision of housing. According to Olotuah (2005), the private sector is the major supplier of Housing in Nigeria. The organized private sector in most cases supplies the middle and upper income groups and does little in meeting the housing needs of the poor because the profits that can be made from low- income housing are relatively small. Such Private sectors include Commercial banks like the United Bank for Africa and the Union Bank, Nigeria. Insurance companies like British American insurance Company PLC, Money lenders, Cooperative societies, large scale Departmental stores, trading organizations like United African Company, SCOA etc. In Nigeria, only very few with strong financial base engage in housing provision. The major players in the private sector partnership are G. Cappa, Taylor Woodrow, Julius Berger and some indigenous contracting outfits. Recently, some large scale estate developers e.g. Aima Beach developers joined them.

The private sector is faced with a lot of difficulties in housing (Olotuah, 1997) which hampers its performance. The poor quality of housing provided by the private sector (in particular the popular sector) is symptomatic of these hurdles. Some of these are difficulties in obtaining planning and building permissions, lack of access to urban services and infrastructure as well as inadequate finance. In order for private sector to operate optimally, these bottlenecks have to be removed decisively. Also, improvement in the economic climate of the country is imperative for greater private sector involvement in Housing. However, the Private housing finance system is characterized with high interest rates compared to the Public housing finance system while there is also the problem of short period of loan repayment. The advantage of usage include easy accessibility to finance, regular availability and the amount of finance that has no relationship with income

Sustainability In Housing Provision In Nigeria

The general goal of Sustainable development is to meet the essential needs of the world's poor while ensuring that future generations have an adequate resource base to meet theirs. It is thus geared towards meeting the needs of the present generation without compromising the ability of future ones to meet their own needs (WCED, 1987). Achieving sustainability in Housing requires major societal changes,

restructuring of institutions and management approaches. It requires the appropriate political will based on the conviction of responsibility of government to its citizens and the need to create a humane and decent environment for dignified living. In order to realize sustainable housing provision, the housing needs of the Nigerian population have to be put into proper focus and a coordinated program to achieve this should be thoroughly worked out. Sustainable housing provision is thus contingent on a number of underlying factors. These are Policy formulation and decision making, Policy execution and monitoring and social acceptability and economic feasibility. Also, the task of providing adequate and affordable housing for the urban poor could be tackled by the increased use of alternative building materials such as laterite bricks/ stabilized bricks, cement- fibre roofing materials and bamboo.

These materials have been shown to have lower cost advantages over conventional building materials. The efforts of the Nigerian Building and Road Research Institute (NBRRI) and some local companies in Nigeria have yielded suitable equipment such as VS Cinva ram press, a multipurpose brick making equipment as well as interlocking brick press and should be encouraged. The lack of willpower and general acceptance has been the bane of the use of alternative building materials in Nigeria. Government could set the right examples by building prototype houses using indigenous approach for mass housing schemes

CONCLUSION

This paper has shown that there is problem with Housing in Nigeria. The cost of Housing is on the high side as the provision of finance is largely on the side of the private sector. Therefore,, government should take active part in order to increase the housing stock in the country as well as making housing a reality for all in order to achieve Sustainable development.

CORPORATE PHILANTHROPIC DISASTER RESPONSE AND REGIONAL ECONOMIC DEVELOPMENT: EVIDENCE FROM CHINA

Xiaodong Qiu, Beijing Jiaotong University

Ran Zhang, Peking University

Jigao Zhu, University of International Business and Economics

ABSTRACT

This paper examines whether the likelihood, speed, and amount of firm charitable giving in response to catastrophic events are related to the regional economic development that the donating firm located. Based on the data of Chinese firms' response to the 2008 Sichuan earthquake, we find that the extent of corporate contributions for firms in more developed areas following this disaster is more than that for firms in less developed areas. Firms in more developed areas are also more likely and more quickly to respond in this disaster. We contribute this to the more competitive environment that firms in more developed areas face and firms view catastrophic donation as a differentiation strategy. This study thus provides evidence suggesting that even in the wake of catastrophic events, corporate philanthropic giving is strategic. The results also reveal that firm size, profitability, geography, cash resource available, leverage, and ownership type affect firms' philanthropic disaster response behavior in the largest emerging market, China.

JEL: G11; G12

KEYWORDS: catastrophic events, corporate philanthropy, corporate social responsibility, regional economic development

INTRODUCTION

Recent catastrophic events, such as the 9/11 New York terrorist attacks in 2001, the South Asian tsunami in December 2004, Hurricane Katrina in the southern U.S. in August 2005, the Kashmiri earthquake in October 2005, and China's Sichuan earthquake in May 2008 were all devastating and spurred philanthropic actions by individuals, corporations, nongovernmental organizations, and government agencies. In particular, many companies responded by giving donations (e.g., cash, goods, and employee voluntary efforts) as part of their corporate social responsibility (CSR). Carroll (1979) argues that CSR has four intimately related facets — economic, legal, ethical, and philanthropic — with organizations striving to achieve all four simultaneously. On the bases of these components, a socially responsible firm “should strive to make a profit, obey the law, be ethical, and be a good corporate citizen” (Carroll, 1991, p. 43).

The present research focuses on one special class of CSR — corporate philanthropic disaster response (CPDR). Although corporate philanthropic response is not enforced as are economic and legal responsibilities, it is increasingly practiced by companies and is generally viewed as a sign of good corporate citizenship. Previous research (e.g., Chapple and Moon, 2005; Katz et al., 2001; Kolk, 2005; Muller and Whiteman, 2009; Shen, 2004; Welford, 2005; Zhang et al., 2010) suggests that companies worldwide react and respond differently to natural disasters, and their philanthropic donations can be motivated by a variety of factors, including cultural, institutional (e.g., stakeholder configurations), organizational, economic, and geographic. The motivation for corporate giving is not inherently altruistic. Corporate giving is a reaction to seismic shifts in the environmental landscape, and it represents a reactive strategy crafted to counter pressures such as stakeholder demands, threats of government intrusion into industry's freedom, and escalating public expectations (Campbell et al, 1999; Gardberg and Fombrun, 2006; Patten, 2008). In today's global business, CPDR is becoming more strategic, as has been indicated

by Brammer and Millington (2006), Saiia (2002), and Sánchez (2000). Ever-increasing global competition requires that firms establish their competitive advantage from various sources. Corporate philanthropy may help a firm establish reputation, brand recognition, and loyalty; promote itself as a “socially responsible” firm; or attract and maintain a work force (Sánchez, 2000). Dean (2003) finds that corporate donations can help the company forge a relationship with the customer and build loyalty. As in more marketized regions, firms are less affected by government intervention and have better operational environments, such as more developed factor market, and better legal environment, these firms are more market-oriented and have high awareness of market competition. Thus, we predict that firms located in more developed areas and face a more competitive market will tend to have higher likelihood of giving, to donate more quickly, and to donate larger amounts.

We posit that firms located in more developed areas are more strategically motivated and have more incentives to engage in CPDR than firms in less developed areas. We identified 703 Chinese listed firms that engaged in CPDR through outright cash donations and/or in-kind donations with the value released by the donor firm in May and June 2008. We find that the likelihood, speed, and extent of corporate contributions are positively related to firms’ regional marketization index. Furthermore, the decision to engage in CPDR and the amount of donations are positively associated with firm size, profitability, and cash available. Private firms are more likely to donate and donate more than state-owned firms. The decision to engage in CPDR is negatively correlated with firm leverage. Overall, our results suggest that CPDR decisions and the extent of donations are significantly influenced by firm’s ownership type, substantially motivated by strategic drivers, and greatly constricted by economic considerations in emerging markets such as China. This study contributes to the literature in several ways.

First, using a unique research setting provided by the Sichuan earthquake, we investigate the link between CPDR and regional development. To the best of our knowledge, this is the first empirical study explicitly addressing such an association. This investigation is important as Muller and Whiteman(2009) suggest that future research may wish to explore the contours of ‘regional corporate citizenship’ in more depth and to further examine the interplay between geography and institutions that may drive CPDR and other corporate citizenship behaviors. Second, we provide evidence of positive association between regional development and CPDR likelihood and amount. These findings are consistent with previous research in that CSR activities are driven by strategic motivation and constrained by economic considerations. Our results add to our understanding of the motivations behind CPDR and carry important implications for practice. We also find a positive relation between regional development and CPDR speed. To our best knowledge, this is the first study to directly examine how firms’ characteristics affect their donation speed. Third, we contribute to the literature on sustainability, performance, and CSR by investigating the association between corporate philanthropy (donations) and firm characteristics. Finally, while the issue of CPDR has attracted growing research interest in recent years, most empirical results are based on U.S. data, and this paper is one of the few empirical studies in emerging markets using a large research sample. This article adds to a growing number of non-U.S. studies by investigating the link between firm regional economic development and CPDR in China, the largest developing economy in the world.

The remainder of this article is organized as follows: the second section provides institutional background, the literature review, and research questions. The third section discusses data collection and methods. The fourth section presents the results, and the last section concludes, suggesting implications of the study.

Hypotheses Development

There are extant literature examines the role of political and economic institutions on firm behavior, such as financing behavior and long-run performance (Faccio, 2006; Leuz and Oberholzer-Gee, 2006), financial reporting (Ball et al., 2000; Bushman et al., 2004), and auditor choice (Wang et al., 2008). The literature on CSR suggests that firms’ CSR activities vary in different countries and are influenced by institutional environments (Chapple and Moon, 2005; Maignan and Ralston, 2002; Muller and Whiteman,

2009; Schlegelmilch and Robertson, 1995; Shen, 2004; Welford, 2005; Wokutch, 1990). For example, Maignan and Ralston(2002) find that companies in France, the Netherlands, the U.K., and the U.S hold substantially different perspectives on: (1) how important it is to be publicly perceived as socially responsible; (2) which CSR issues are more important to emphasize. Their results show that businesses in the four countries do not display the same eagerness to appear as social responsible and employ diverse means to convey social responsibility images. Comparing corporate sponsorship of charitable causes and non-profit organizations between Asia (Japan and Korea) and European countries (France, Germany, Italy, the Netherlands, the U. K.), Shen (2004) suggests that differences between the two regions that are rooted in differences in societal pressure and expectations. Further, an exploratory study of companies in countries in Europe, North America and Asia indicates that there is a link between the development of CSR and the economic development of countries (Welford, 2005). Welford (2005) also finds that many CSR policies are based on localized issues and cultural traditions at a country level.

As a special class of CSR, CPDR activities also vary across countries and institutional environments. Using the sample of Fortune Global 500 firms from North America, Europe and Asia, Muller and Whiteman (2009) explore the role of global variations in institutional contexts as sources of differences in patterns, frequency, and elements of CPDR. They find that corporate giving appears to vary systematically across regions, and there are ‘home region effect’ and ‘local presence effect’ in CPDR.

The literature indicates that firms’ CSR activities in different regions are related to differences in stakeholder configurations and expectations (Brammer and Millington, 2004; Muller and Whiteman, 2009), culture (Katz et al., 2001; Waldman et al., 2006), managerial values (Chapple and Moon, 2005; Logsdon et al., 2006; Schlegelmilch and Robertson, 1995), and governance structures (Navarro, 1988; Useem, 1988). Muller and Whiteman (2009), for instance, argue that companies that are embedded in similar networks and stakeholders configurations will tend to exhibit similarities in giving behavior, while differences will emerge across companies embedded in different types of networks and stakeholder configurations. Waldman et al. (2006) show that culture can have discernable differences in managerial perceptions and CSR activities. Maignan and Ralston (2002) also demonstrate that managers from the U.S. and the U.K. have different perspectives on the importance of CSR. Besides, governance structures, such as tax policy and capital market development, could also affect firms’ willingness and capacity to engage in CPDR (Muller and Whiteman, 2009; Navarro, 1988).

Fiscal decentralization from central to local governments since 1978 has created great heterogeneity in market and institutional quality across provinces in China (Qian and Xu, 1993; Huang, 1996; Qian and Weingast, 1997; Jin et al., 2005; Wang et al., 2008). In less marketized regions, government leaders have more incentive to influence firms to pursue political objectives, such as enhance the government leaders’ political capital and increasing their chances for promotion. (Li and Zhou, 2005; Wang et al., 2008) While in more marketized regions, firms are less affected by government intervention and have better operational environments, such as more developed factor market, and better legal environment. These firms are more market-oriented and have high awareness of market competition.

McWilliams and Siegel (2001) suggest that companies can also adopt CSR as a differentiation strategy because CSR helps a firm to build its reputation as being reliable and honest. Indeed, studies show that consumers assume the products of a reliable and honest firm will be of high quality (Brammer and Millington, 2005; Fisman et al., 2006). A survey of 463 U.S. companies found that companies taking a more businesslike approach to charity reported a better image, increased employee loyalty, and improved customer ties (Schwartz and Smart, 1995). Another survey by Walker Information Inc., a research and consulting company that tracks customer satisfaction and business ethics, found that 47 percent of consumers would be more likely to buy from a “good” company that was socially responsible (Sato, 1998). Prior literature has documented the relationship between advertising and provision of CSR. Navarro (1988) concludes that firms that spend more on advertising tend to give more to charity.

McWilliams and Siegel (2000) find that advertising is an element of a differentiation strategy, and it is positively correlated with corporate social performance. Fisman et al. (2006) find that CSR is more

prevalent in advertising-intensive (consumer-oriented) industries. Brown et al. (2006) support the theory that charitable giving enhances shareholder value, and within an industry, advertising intensity is positively related to companies' giving. As a special class of CSR, CPDR is also similar to other classes of CSR. For example, Crampton and Patten (2008) find that CPDR is constrained by similar economic concerns. We posit that firms view CPDR strategically, and firms with more market investments are more likely to give and give more in response to the Sichuan earthquake. Thus, a firm in a more developed area should have more incentives to use CSR to differentiate itself from its competitors. Accordingly, we propose the following hypothesis:

H1: There is a positive relation between CPDR and the economic development of the area that the donating firm located in.

Research Design

Sample: This paper focuses on the Chinese A-share companies contributed to the relief effort following the May 12th Sichuan earthquake. Our research on donation is based on firm self-reporting, which is consistent with previous literature (e.g., Muller and Whiteman, 2009). We hand collected data on the donation amount and the donation date from the official information disclosure website appointed by the China Securities Regulatory Commission (CSRC), companies' websites and press releases. We also systematically search information via Lexis Nexis China and Google China News (The official disclosure website for Chinese listed firms is www.cninfo.com.cn). Similar to Patten (2008), we conducted our search within a period of one month, from May 12th 2008 to June 12th 2008, as the requirement for a dated press release allows for identification of when the market knew the companies' intent to donate. In total, we identified 703 companies, about 47% of the total number of A-share companies. We measured corporate contributions as outright cash donations plus in-kind donations. The announced contributions for the donation firms ranged from 8,000 Yuan to 60,210,000 Yuan with a mean (median) of 3,086,688 (1,001,000) Yuan.

We include only firms that have no missing financial data. We also winsorize the continuous variables at the top 1% and bottom 99% to alleviate outlier problems. Our final sample includes 1,454 companies, with 670 donators and 784 non-donators. For the subsample of donation speed, we finally have 490 companies issued a dated press release announcing the donation amount from May 12th 2008 to June 12th 2008. Donation speed is defined as the time distance between the donation date and the earthquake date (May 12, 2008), and the average donation speed for the subsample is 7.13 days.

Our data on the extent of institutional development across regions in China comes from the National Economic Research Institute's marketization index (Fan et al., 2010, see Appendix A for a detailed description). The index captures the following aspects of regional market development: (1) relationship between government and markets, (2) development of non-state sector in the economy, (3) development of product markets, (4) development of factor markets, (5) development of market intermediaries and legal environment. Higher scores of the index suggest greater institutional development. This index has been widely used in the literature to measure regional institutional development. (e.g., Wang et al. (2008), Firth et al. (2009), and Li et al. (2009)) Specifically, we use the marketization index for the headquarters region of the listed firms. Table 1 shows the descriptive statistics of our sample and also the comparison of those characteristics for firms located in more marketized regions and less marketized regions with two-sample Wilcoxon rank-sum tests for differences across the two sub-samples. We find that companies located in more marketized regions are more likely to donate and donate more, which is consistent with our prediction. We also notice that, compared with companies located in less marketized regions, companies in more marketized regions have more cash in hand, and are more profitable.

Table 1: Descriptive statistics

	Mean	SD	Market Dummy=1	Market Dummy=0	t-test for the difference between observations in the Market Dummy=1 and the Market Dummy=0 groups
1. Donation dummy	0.461	0.499	0.527	0.400	4.90***
2. Donation	6.453	7.052	7.350	5.634	4.67***
3. Cash	19.203	1.583	19.495	18.936	6.86***
4. ROA	0.045	0.080	0.050	0.040	2.55**
5. Size	21.421	1.191	21.510	21.340	2.71***
6. Leverage	0.550	0.373	0.538	0.561	-1.15
N			760	694	

Variable Definitions: Market: the index, constructed by Fan et al. (2010), measures the development of market at the provincial level for year 2007. Market dummy: a dummy variable that takes the value of 1 if the firm is located in province where the score of market index is above the median and 0 otherwise. Donation dummy: a dummy variable that takes the value of 1 if the firm contributes to earthquake relief and 0 otherwise. Donation: log form of total amount of cash and in-kind donation of firms. Cash: log form of total amount of cash and cash equivalents in the 2007 annual report. ROA: net income divided by total assets in the 2007 annual report. Size: log form of total assets in the 2007 annual report. Leverage: total debt divided by total assets in the 2007 annual report.

Before considering a multivariate analysis, it is useful to examine the univariate relation between dependent variables and various independent variables. Table 2 presents Pearson correlations results. As expected, the donation dummy, measuring whether the firm contributes to earthquake relief, is positively correlated with market. The variable donation, including both cash and in-kind donations, is significantly positive with the marketization index. These results are consistent with the hypothesis that firms located in more marketized regions are more likely to donate and donate more.

In line with prior literature (e.g. Crampton and Patten, 2008; Useem, 1988; Zhang et al., 2010), the donation dummy and donation are positively related with Cash and ROA, suggesting that donation is constricted by economic concerns. We observe a positive correlation between donation dummy (donation) and size, which is consistent with the assertion that large firms are more visible to the public and they may have more incentives to donate to increase firm reputation (Brammer and Millington, 2006). Leverage is significantly negative with donation dummy and donation, indicating firms with more leverage are less likely to donate and donate less after the catastrophic event. Consistent with findings in table 1, we also find that the marketization index is positively correlated with size, ROA, and Cash.

Table 2: Variable correlations

	1	2	3	4	5	6
1. Donation dummy	1					
2. Donation	0.990***	1				
3. Cash	0.270***	0.310***	1			
4. ROA	0.102***	0.116***	0.122***	1		
5. Size	0.203***	0.256***	0.783***	0.043	1	
6. Leverage	-0.103***	-0.101***	-0.294***	-0.121***	-0.101***	1
7. Market	0.106***	0.102***	0.174***	0.081***	0.071***	-0.020

EMPIRICAL RESULTS

We then use logistic regression models to examine whether firms located in more marketized regions are more likely to involve in CPDR. Donation dummy was used as the dependent variable to capture the likelihood of firms to make donation. We use two variables, market and market dummy, to measure the level of marketization. Similar to existing literature (Adams and Hardwick, 1998; Amoto and Amoto, 2007; Brammer and Millington, 2006; Zhang et al., 2010), we also include size, ROA, cash available, leverage and industry as our control variables.

$$DonationDummy_{it} = \alpha_0 + \alpha_1 Market(MarketDummy)_{t-1} + \alpha_2 Cash_{it-1} + \alpha_3 ROA_{it-1} + \alpha_4 Size_{it-1} + \alpha_5 Leverage_{it-1} + Industries + \varepsilon_{it} \quad (1)$$

In Table 3, we present results for the equation (1). In both regressions, the coefficients of market or market dummy are positively significant (p -value < 0.05). These results are consistent with the first hypothesis that firms located in more marketized regions are more likely to donate in response to catastrophic events. The coefficients of size and cash are positively significant. These results confirm the findings of researchers such as Crampton and Patten (2008) and Seifert et al. (2003) that profitable firms and firms with more cash resources available are more likely to involve in CPDR activities. The coefficients of Size and Leverage are positive and negative respectively, but not significant in either of the two models.

Lev	-0.287	1.228	-0.285	1.234
Industries	Controlled		Controlled	

We also apply Cox (1972) proportional hazards model to test the effect of institutional development on the probability of donation conditional on time. The advantage of Cox model is that we do not need to make a priori assumptions regarding the distribution of terminal events in a study population, while the dependent variable is longitudinal and the phenomenon of interest is a discrete event. In our regression sample, the dependent time variable is the durations of donation from the earthquake date (May 12, 2008) to the donation date and each observation will be marked by “failure” if firm donates. A positive coefficient for independent variable x_i suggests that firm i is more likely to donate within a certain period (31 days in our sample) influenced by this factor (The regression results of Cox model imply that in a model with variable x_i , coefficient α_i is the increase in the log hazard ratio for a one-unit increase in variable x_i , holding the values of other variables constant. Furthermore, for variables with hazard ratios less than 1 ($\alpha_i < 0$), increasing values of the variables are associated with lower risk and longer survival times). We also control cash resources available, firm profitability, firm size, leverage, and industries in the model.

$$DonationSpeed_{it} = \alpha_0 + \alpha_1 Market(MarketDummy)_{t-1} + \alpha_2 Cash_{it-1} + \alpha_3 ROA_{it-1} + \alpha_4 Size_{it-1} + \alpha_5 Leverage_{it-1} + Industries + \varepsilon_{it} \quad (2)$$

The results including both coefficients and hazard ratio are show in Table 4. For variable market, the positive coefficient is found to be significant at the 10% in the model, which suggests that that firms that are located in more marketized regions increase the likelihood of donation within 31 days. Similar to model 1, market dummy also has a positive coefficient (significant at 5% level) and a hazard ratio bigger than 1, supporting our second hypothesis.

The coefficients of both the cash and ROA are significantly positive with correspondingly high magnitudes of the hazard ratios, suggesting that higher profitability and more cash resources increase the likelihood of donation. Leverage is the only variable whose coefficient is significantly negative and has a hazard ratio less than 1. Firms with more debt have more pressure to pay off their debt thus decrease the likelihood of donation. This finding is consistent with argument of Adams and Hardwick (1998) and Brammer and Millington (2005).

To further explore the effect of institutional environment on CPDR, we estimate ordinary least squares (OLS) regressions to test the relation between the marketization index and donation amount. Similar to equation (1), we control effects of size, profitability, leverage and industry.

$$Donation_{it} = \alpha_0 + \alpha_1 Market(MarketDummy)_{it-1} + \alpha_2 Cash_{it-1} + \alpha_3 ROA_{it-1} + \alpha_4 Size_{it-1} + \alpha_5 Leverage_{it-1} + Industries + \varepsilon_{it} \quad (3)$$

Industries	Controlled		Controlled	

Results of estimation of equation (3) are reported in Table 5. Market and market dummy are positively related to firm donation amount, with p-value at the 0.05 level and the 0.01 level, respectively. The regression results suggest that, after controlling for various factors that affect donation amount, firms located in more marketized regions donate more than firms located in less marketized regions. Thus hypothesis 3 is supported. Consistent with results in table 2, firm size is positively related to the total

donation amounts of firms. Firm profitability and cash resources available are positively correlated with firm donation amount, supporting Crampton and Patten (2008)'s argument that even in the wake of catastrophic events, corporate philanthropic giving is constrained by economic concerns. Leverage is not significant in regression models.

DISCUSSION AND CONCLUSION

The present study investigates the relationship between CPDR and regional economic development. Using data on Chinese firms' philanthropic response to the 2008 Sichuan earthquake, we find that the probability, speed, and amount of charitable giving are positively associated with the marketization index of firms' location. The findings are consistent with the strategic view of CPDR, in that managers use philanthropic giving as part of the firm's strategy. Firms are not purely altruistic when making philanthropic donations. Instead firms utilize CPDR as a marketing strategy to differentiate themselves from their competitors with the intent to establish firm reputation and create economic value for shareholders. As a result, firms with higher competition pressure are more likely to donate and donate more to differentiate themselves from their competitors.

Our paper also finds that firm size, profitability, ownership type, cash resources, and leverage are significantly associated with the CPDR decision. These results are consistent with major findings in the literature related to other natural disasters such as the South Asian tsunami, Hurricane Katrina, and the Kashmiri earthquake (Crampton and Patten, 2008; Muller and Whiteman, 2009).

Our findings offer useful implications for future research. Although the prior literature (e.g., Chapple and Moon, 2005) suggests that CSR activities are influenced by institutional environments, this perspective has not been tested previously in an emerging country. As there are important differences in cultural, institutional, legal, economic, and ethical backgrounds between developed and developing countries (Ge and Thomas, 2007; Lam, et al., 2008; Whitcomb, et al., 1998), our finding that firms in an emerging market use CPDR as a marketing strategy is an important contribution to the CPDR literature. Moreover, our finding also suggests that CPDR cannot be viewed in isolation from other corporate behavior or the economic environment. It is appropriate in future research to consider CPDR as part of both the economic and the cultural environments.

Our study also has implications for managers and governors. In view of rising natural catastrophes in recent years, corporate philanthropic disaster response is playing a growing role in helping societies recover from the disasters. Although governments and other non-profit organizations are major relief sources, corporate giving plays a major complementary role. Our results indicate that firms may not be purely altruistic when making donations, which is understandable because corporations have the objective to make profits for shareholders. Therefore the government and its regulatory bodies should consider designing mechanisms that motivate firms to make more donations and create a win-win situation for all related parties. Although this study sheds new light on CPDR, it has several limitations that may be addressed in future research. First, our research focuses only on the CPDR behavior of listed firms in China. While China is an important emerging market that provides a worthwhile research environment, our results may not generalize to other countries because institutional structure and national culture can affect firms' CSR behavior (Furrer et al., 2004). Future research could compare the strategic use of CPDR in different markets in order to better understand the roles of institutional structure and national culture. Second, data availability limited our sample to listed firms, while nonlisted firms may also donate. Examining the CPDR behavior of nonlisted firms is promising, as listed firms' donation decisions may be affected by investor sentiment in the stock market. Finally, although we show robust evidence that firms strategically use CPDR, we did not investigate the decision process and the determinants of the strategic decision. It would be a fruitful area to investigate how firms plan their CPDR strategies and their antecedent factors.

LEGISLATION OF ETHICS IN THE EARLY YEARS OF THE SECURITIES AND EXCHANGE COMMISSION

Dan G. Teed, Troy University

ABSTRACT

Enforcement action by the Securities and Exchange Commission in the years following its formation and prior to the beginning of World War II created reporting sanctions viewed as symbolic by much of corporate America. That is, powerful chief executive officers of many of America's giant publicly held corporations believed these sanctions were instituted only to placate a worried investing public and would not be enforced with rigor. These managers, therefore, believed they could either ignore the Securities and Exchange Commission pronouncements or implement them only superficially. I submit the result has been many continual challenges of authority and corporate disregard of ethical behavior throughout the remainder of the 20th century. This paper will explore the history of the early part of the 20th century to determine reasons why these symbolic pronouncements may have been perceived by the Securities and Exchange Commission as a necessity for its continued existence.

JEL: M49

KEYWORDS: Symbolism, power, ethics, fraud, acquiescence, conciliation

INTRODUCTION

Ethics may be generally thought of as actions that are in accord with right or moral conduct. The American Bar Association (ABA) equates ethical conduct in business with proper corporate responsibility and morality, which they define as “behavior by the executive officers and directors of the corporation that . . . results from the proper exercise of the fiduciary duties of care and loyalty to the corporation and its shareholders . . . [well] beyond that demanded by minimum legal standards” (ABA, 2003, p. 4). The Securities and Exchange Commission (SEC) was formed as a result of the passage of the Securities Exchange Act of 1934 (SEC, 2011). It was a direct response by the newly-elected American government to restore public confidence in the U.S. capitalistic system that had been severely eroded by the stock market crash of 1929 (the “Crash”) and the subsequent Great Depression of the 1930s. Determining how and why the SEC responded to corporate abuses of ethical behavior during its first six years of existence is the research topic of this paper. More specifically, this paper explains why the SEC functioned symbolically – enforcing the new securities laws by using symbolic pronouncements – in the face of extenuating circumstances over which it had only partial control.

I submit such symbolic solution to fraudulent corporate activity, however, not only emboldened those corporate managers bent on a disregard for ethical behavior, but also created an atmosphere of acceptable disregard throughout the remainder of the 20th century. Regulatory attempts to strengthen corporate governance, particularly in the last half of the prior millennium, finally culminated in the swift passage of the Public Company Accounting Reform and Investor Protection Act of 2002, better known as the Sarbanes-Oxley Act of 2002 (SOX). Examination of the history of the SEC's early years and of the economic situation leading to its formation is important. It points out problems that continue to exist in our capitalistic system today. Examination of the history of the American capitalistic system and of early attempts to mitigate bad corporate governance may therefore prove fruitful in examining current day problems and regulatory attempts. Indeed, parallels between the exuberance and subsequent sharp economic decline of two periods – the 1920s and the 1930s and the final decade of the 20th century and the first of the 21st century – are striking. Both periods had similar scenarios that lead to financial

difficulties. Both had extended periods of prosperity that seemed to be without an end. Both periods were characterized by a headlong participation in the market, and both were governed to a large extent with a *laissez faire* governmental attitude. This was especially true of the 1920s. Both had subsequent periods of corporate crisis that created anger and resentment; both created outcries for strong governmental oversight; and, perhaps most importantly, both postured the accounting profession in a defensive position which was only partially of its own making. Several early authors (Berle and Means, 1933, Dodd, 1932, 1935, Douglas, 1934) supported intervention into corporate governance and ethics by governmental fiat. These legal pluralists believed that the powerful corporate managers of their day were incapable of controlling their acquisitive instinct for power and could be restrained in no other way. Still others, particularly in later years (Anonymous, 1977, Kalbers and Fogarty, 1998, Levitt, 1998) point out that regulations cannot control a person or a group if those persons are determined to utilize their power in an unethical manner. The SEC was granted regulatory powers by Congress in 1934 (Merino, 2003), but Bealing et al. (1996) and Merino and Mayper (2001) both report a conciliatory stance by the SEC in dealing with the business world during its early years prior to World War II. This same conciliatory stance, however, produced symbolic pronouncements that emboldened already-powerful management of corporate giants because they understood that the SEC's pronouncements could be ignored with impunity.

Two periods must be analyzed to determine reasons for the SEC's methodology of dealing with instances of corporate fraud in its first decade of existence. The first period, from approximately the middle of the 19th century through the crash of the stock market at the end of the Roaring Twenties, elicits circumstances leading to the organization's birth. The second period, from the passage of the Securities Act of 1933 and the Securities and Exchange Act of 1934 through the 1939 examination of the McKesson & Robbins fraud, explains the organization's struggle to remain viable in the face of opposition from its opponents and, at the same time, exert its influence on the economic morass in which the United States found itself during this period.

MIDDLE 1800s TO 1933

Capitalism was present in the 19th century in the United States, but only to a limited degree. Officers of corporations were, for the most part, locally or regionally connected with corporate shareholders in their locale. Boards of directors were composed of individuals with whom these owners were acquainted. Mutual trust among owners, officers, and stockholders was generally accepted by all as part of corporate financial dealings. The last half of the 19th century witnessed significant lifestyle changes in America. A pattern of power began to emerge within the economy of the United States that created an interruption of this mutual trust and of the agrarian lifestyle in America. The pattern emanated primarily from two major sources: compacting of the nation by the "Iron Horse" and vastly increased technology in communications. Compaction of the nation resulting from the Iron Horse not only made areas of the country more accessible, but also created a need for vast amounts of capital and funding.

Local and regional funding of corporations in the manner of prior years had no ability to provide the massive amounts necessary for this growth of the nation. Funds for production of a transcontinental connection needed to come from persons and institutions throughout the nation. Technological advancements, such as the telegraph and telephone, provided access to persons and businesses previously unknown. Together, these two factors created a change in the country that would never be reversed. Corporate growth exploded, almost totally lacking the attendant accounting for organizations' financial dealings. Urbanization proliferated in America's population, with jobs made available in large city factories that created significantly different lifestyles for many who had been used to slower agrarian circumstances (Previts and Merino, 1998). Individuals with keen foresight realized that significant wealth and power could be amassed by controlling the production of items needed by the railroads, as well as controlling the railroad companies themselves. These individuals maintained control of emerging giant corporations through a device called a "voting trust" (United States House of Representatives, 1913).

Terms under such an agreement generally called for shareholders to relinquish their voting rights to a trustee. These trustees, then, elected boards of directors for the corporations and, in general, controlled operations of the company (United States House of Representatives, 1913, p. 1018-1020).

It appeared that Congressional legislation in 1913 dealing with voting trusts had restored a balance between U.S. capitalism controlled by large corporations and protection of individuals. Very quickly, however, World War I – the “War to End All Wars” – interrupted. After a period of neutrality, America joined Allied forces and assisted in the defeat of Germany. This was a period in American history when dramatic major sociological changes occurred. Giant corporations drove the American capitalistic system and produced a significant amount of war material that had been instrumental in the Allies’ victory in Europe. Businesses as a group received much of the credit for the effort that had won the war, and the general feeling was that business was no longer to be regarded as an evil. “Many people attributed the Allied victory to the creativity and ingenuity of American business people” (Previts and Merino, 1979, p. 197). “[T]he war had proven that business was ‘moral’” (Previts and Merino, 1998, p. 238), and any thoughts of legislation restricting the power of corporate managers were reduced to insignificance.

The Roaring 1920s

The decade of the 1920s in America was one of significant growth -- described as a “wave of prosperity” (Carey, 1969, p. 35), as a booming economy (Adelberg, 1975), as “the so-called Golden Age of Business” (Previts and Merino, 1998, p. 238). A desire for new items on the market existed in all parts of the country; consequently, the decade was aptly described as the “Roaring Twenties.” Victory in World War I produced a headiness in America, omnipresent from architecture to music to consumerism. Accompanying this headiness was the desire of many Americans to participate in the economic growth.

Berle and Means (1933) reported that the concept of wealth in property ownership was changing rapidly from material items – land, machinery, buildings – to ownership of passive property – stocks and bonds of the growing giant corporations. These two academicians were disturbed by their perception of the sinister direction that power within corporate America was taking in the Roaring Twenties. Their classic work, *The Modern Corporation and Private Property*, highlighted unchecked power accorded to managers of corporate giants and the accompanying dangers to the U.S. economy.

The power placed in the hands of managers of giant corporations, these authors asserted, threatened the foundation of the capitalistic system because it had been used in any number of cases without regard for what was best for stakeholders of the corporation. Power was accomplished through the use of handpicked, subservient boards (Berle and Means, 1933, p. 86) and the use of proxy certificates. Through the use of the proxy, corporate managers possessed power that was virtually unchecked and would therefore soon rival the power of the State. It thus required governmental regulation for its mitigation (Means, 1983). Here, then, an economic set of circumstances created an incubator for fraud and unethical practices. Corporations were growing exponentially. Some maintained good internal controls; some had nothing remotely resembling controls. The profession of accounting was floundering in attempting to report on the financial condition of these entities because of a lack of auditing standards. Americans seeking wealth were putting their life savings into corporate stock and were being totally unconcerned with methods being used by companies to amass that wealth. Regulation of markets was nonexistent, and “[i]n the absence of any regulation of the securities market, abuses were inevitable” (Carey, 1969, p. 35).

Fraudulent activities began to proliferate in the Roaring 1920s. I suggest three incidents in the early 20th century serve to define problems facing the new Securities and Exchange Commission as it attempted to mitigate bad corporate governance and restore stability and confidence in the capitalistic system. They are (1) the fraud committed by Kreuger & Toll, Inc., (2) the embezzlement by Richard Whitney, and, most particularly, (3) the fraud perpetrated by McKesson & Robbins, Inc..

Kreuger & Toll, Inc.

Kreuger & Toll's empire paralleled the Roaring 1920s with its meteoric ascendance and collapse and created much of the outcry for regulative protection for investors and stockholders of corporations (Flesher and Flesher, 1986, Clikeman, 2003). For the accounting profession, Kreuger & Toll, Inc. represented a nightmare. The founder, Ivar Kreuger, known to the world as "the Match King," insisted on complete secrecy concerning the company's financial dealings. Kreuger apparently made up all of his company's financial statements and then instructed his corporate accountants to agree the company books and records with the made-up statements (Churchill, 1957, p. 249-255, cited in Flesher and Flesher, 1986, p. 423). The Match King's empire started in 1913, when Kreuger took over control of three small match factories belonging to his family. After the First World War ended, Kreuger realized that European countries – struggling to restore their economies after the vast destruction on the Continent – would be willing to do just about anything to obtain funds to rebuild. Kreuger & Toll offered governments of these countries loans of up to \$125 million dollars. The *quid pro quo* was a complete monopoly of the match market in that country (Marcosson, 1932, Flesher and Flesher, 1986, Clikeman, 2003).

Kreuger used the company's capital, rather than earnings, to pay shareholder dividends, and then depended on increased inflow from investors, in addition to any possible repayment of the European loans, to rebuild the company's capital base. In the 1920s, however, Americans were unconcerned that the methodology of maintaining the pyramid thus built was an unknown. The stock market crash, of course, brought to an end Kreuger's Ponzi-type scheme. Faced with a significant lack of inflow from American and other investors and defaults on a number of the loans made to European countries, and unwilling to be branded as a criminal while alive, Kreuger shot himself in the heart on March 12, 1932. Within a month, Price Waterhouse auditors revealed that almost \$250 million of assets reported by Kreuger & Toll did not exist (Flesher and Flesher, 1986, p. 425).

Kreuger epitomized the fear expressed by Berle and Means in their exposition of the economic situation of the 1920s. That is, Kreuger's Ponzi-type methodologies were illicitly practiced because the man had significant power and was, to his own mind, beyond the reach of ethical dicta and precedent. His refusal to allow any examination of the financial records of his company displayed not only an understanding of the vast separation of his position from proper corporate governance but also an untouchable aura in his own self-regard. He believed he was immune to any ethical or socially responsible principles.

1929 Stock Market Crash

Five days in 1929 – from Thursday, October 24th, through Tuesday, October 29th – precipitated a period in which life in America would forever change.

The [Crash] in the fall of 1929 was a catastrophe beyond the worst predictions of the most pessimistic observers. The financial community was in a state of shock. Thirty *billion* dollars of quoted value of securities vanished in less than a month. . . . Financial paralysis gripped the country. Public reaction was bitter, and a critical review of the processes of the financial market . . . became an obvious political necessity. (Carey, 1969, p. 38, emphasis added)

The enormity of this free-fall can perhaps be put in better perspective by understanding that new Fords and Chevrolets were selling at the time for less than \$1,000. Seligman (1982) reports that the loss over the next three years, measured in real dollars of the period, increased to more than double the thirty billion initial loss. Small investors who had put their entire life savings into the market lost everything. Large investors – millionaires before the Crash – became little better than wage-earners within the ensuing first year. Indeed, as demonstrated by the loss of more than sixty billion in securities value over these

following three years, the American Dream crept close to extinction. Initially, the government under President Hoover exuded confidence that the American economic system would stabilize. Everything would be all right in a few months; let those companies who faced bankruptcy do so; have faith in the capitalistic system (Berle, 1963, p. 80). When things did not stabilize, investors pressured the federal government to step in and mandate reforms that would bring about stabilization.

1933 Through 1939

Birth of the SEC

A new and energetic President assumed leadership of the United States government in 1933. He promised to deliver democracy from Wall Street conservatives back into the hands of the American people. Franklin D. Roosevelt's inaugural address assured the American people that "the only thing we have to fear is fear itself – nameless, unreasoning, unjustified terror which paralyzes needed efforts to convert retreat into advance" (Roosevelt, 1933, ¶1). A theme that resonated with many who had lost everything was Roosevelt's description of the Wall Street managers as "unscrupulous money changers" (Roosevelt, 1933, ¶1).

Within a very short time the new administration established control over publicly held securities by enacting the Securities Act of 1933 and the Securities Exchange Act of 1934. The latter created the SEC, a federal agency to which any corporation selling their stocks and bonds on public markets were required to report on an annual basis. All during these early years of the SEC, when disagreements between New Deal liberals and big business conservatives created a form of political limbo in the United States, the fate of the new organization was less than firm. On the one hand, President Roosevelt had promised to create stability in the marketplace and restore confidence of investors in the U.S. capitalistic system. On the other hand, business conservatives were adamant that the *status quo* remain solidly in their favor.

New Dealers in the Congress and the administration were facing a very strong lobby in the business powers of the day on the one hand and an unhappy accounting profession on the other (Kaplan and Reaugh, 1939). An SEC Accounting Series Release (ASR) in 1938 provided for compromise: accounting principles were to be promulgated by the accounting profession (with governmental oversight provided by the SEC), rather than by federal fiat (SEC, 1938). To a limited degree, then, this acquiescence by federal powers portrays a tenor of SEC early years. That is, enforcement hesitancy and willingness to accede to conservative Wall Street power signaled to managers of large corporations that much, if not all, SEC rhetoric was symbolic only and not meant to be rigidly enforced (Edelman, 1964, Merino and Neimark, 1982, Kalbers and Fogarty, 1998, Merino and Mayer, 2001, Merino, 2003).

Richard Whitney Embezzlement

A significant part of the disputation between those empowered by the new legislation – the New Dealers – and the "old guard" conservative business faction was the question of whether those who had been in a position of power could be relegated to a lower status by governmental fiat. Businesspersons who were accustomed to authority that was virtually unchallenged were now being required to follow mandates that were not to their liking. A habitude to unchallenged authority, however, creates an acquisitive need to maintain a constant or higher level of power and status, regardless of the methodology used to achieve this. The result in many cases was disdain for morality or ethics. Richard Whitney was such a case, but disposition of the Whitney fraud by the SEC represents another example of appeasement by the SEC.

Whitney was president of the New York Stock Exchange (NYSE) from 1931 to 1935. He was the embodiment of the moneyed "old guard" of Wall Street, having been born into wealth and position. He was educated in the finest of schools, represented the J. P. Morgan Company as its Wall Street financier,

lived in very expensive residences, and functioned as treasurer of the exclusive New York Yacht Club. Whitney had a glowing reputation among investors and a worried public, yet this well-respected individual had been embezzling for years from funds of investors who were using him as their Wall Street representative, thereby supporting his extravagant lifestyle (Anonymous, n.d., Maeder, 1999).

I suggest the Whitney fraud represents a telling example of action that should have happened and did not. Such a blatant case of fraud, even when uncontested by Whitney himself, affecting the American investing public should have elicited an immediate investigation by the SEC. Faced with this overwhelming evidence that outright fraud had occurred within the NYSE, however, the SEC drafted a response which basically stated their belief that matters were of a private club nature and should be handled internally by the NYSE. When it became clear that the NYSE would do little more than censure Whitney, the SEC functioned as it should have in the first place, convicting Whitney of embezzlement.. Two points appear salient: (1) The SEC, faced with very strong opposition from moneyed financiers who had considerable clout with members of Congress, had a very real necessity to use appeasement/compromise/acquiescence to maintain continued funding and existence (Oliver, 1991, p. 146). President Roosevelt, seeking earnestly to restore confidence in the capitalistic system and placate investors, while at the same time advancing his New Deal policies, must have also understood that “draconic control” and regulatory enforcement would not be in his best interest.

(2) Corporate managers quickly perceived from both the Richard Whitney case and the McKesson & Robbins investigation that rigid regulatory enforcement by the SEC would not ensue. These rules were *symbolic* – meant only to dissuade investor worries by stating regulatory corrections to wrongdoings – and could be ignored or obeyed only superficially. Punitive measures for noncompliance would be nonexistent or enforced only lightly.

William O. Douglas

In the years before he became the third SEC chair, William O. Douglas argued, as did Berle and Means, that because of the widespread ownership of corporate stock, “managers came to be their own supervisors, and the stockholders were moved into a position of effective subservience to those who by tradition and law were their servants” (Douglas, 1934, p. 1308). He asserted (p. 1327) that a fiduciary relationship between the board of directors and shareholders must be embodied in the board of directors as an initial contention of proper corporate governance. This necessity emanated from disparate shareholders’ inability to control management or to “act intelligently” (p. 1316) in matters involving their investments. Government, therefore, must intervene, enforcing regulations for fiduciary relationships and protecting shareholders from rampant managerial power, as well as from themselves.

Merino and Mayper (2001) suggest that after he assumed SEC chair, Douglas “appears to act in favor of the *status quo* [restoring the American Dream in a liberal environment] due to his close relations with the accounting profession [and with business] and, in our view, being ‘captured’ by the [accounting] profession” (p. 502). They note that although he had been a strong proponent of regulatory enforcement in the years prior to his assuming chairperson, Douglas nevertheless became an active proponent of acquiescence as SEC head. I submit that Douglas may not have had much choice in this matter. I suggest Douglas was not so much “captured” by the accounting profession as he was placed in a precarious and delicate balancing position by circumstances over which he had only partial control. Douglas was, after all, directly responsible for the continued existence of the fledgling SEC organization. External pressures on the SEC were significant – from all sides – and its continued existence very likely depended on a “middle of the road” posture. In addition, President Roosevelt could not afford to lose any majority opinion that may have been present in Congress for his New Deal policies, nor could he afford to renege on his commitment to the American people to have social values as bedrock for their part of the American

Dream. Unfortunately, this compromising governmental posture translated to corporate managers as nothing more than symbolic rhetoric.

McKesson & Robbins

Just as the Richard Whitney embezzlement appeared to have given the SEC a victory in establishing a modicum of governmental oversight in the public marketplace, a third major fraud – perhaps the largest – came to light and challenged SEC authority – the McKesson & Robbins fraud. McKesson & Robbins (McKesson) was the largest distributor of pharmaceuticals in the United States at the time. The total consolidated assets reported on the December 31, 1937, McKesson balance sheet were somewhere in excess of \$87 million. Approximately \$19 million of these assets (approximately 21 percent) were nonexistent inventories and accounts receivable of the drug division of the Connecticut subsidiary of McKesson and of the Canadian subsidiary of the company (SEC, 1940, p. 3).

Conclusions of a preponderance of twelve expert witnesses at the SEC investigation agreed that having a “buffer” between the auditor and the CEO would have alleviated to some degree the inability of the auditor to challenge the power of corporate CEOs. These witnesses pointed out that (1) auditors were appointed by the CEO or senior managerial personnel of the corporation, and (2) limitations by client management on the extent of the audit were a reality. Most importantly, eight of the twelve witnesses said they would strongly favor a committee of the board of directors (which several of the witnesses even called an “audit committee”) as being responsible for appointing the auditor and handling the details of the audit, such as scope and fee. Three of the remaining four said the board itself should be responsible for this task (SEC, 1940). Of singular importance to corporate managerial understanding of the *status quo*, regulatory pronouncements emanating from the McKesson & Robbins investigation by the SEC were directed *at the accounting profession*, not corporate managers. I suggest it was significantly easier for the SEC to impose regulatory promulgations on the external auditing profession – the CPA – than it was to inject these into corporate accounting and corporate governance. To foist regulatory edicts on major corporations meant the SEC would be challenging corporate power, something the liberal encampment was unwilling to do. Were this to be done, I submit the SEC very likely would have been committing political suicide. Realization of this meant symbolic pronouncements were needed, and translation of this symbolism to corporate managers meant “business as usual” for the foreseeable future.

CONCLUSIONS

Following Berle and Means (1933), I note an incredible amount of power was placed in the hands of a few key corporate individuals because of the way in which the capitalistic system in the U.S. evolved. Many of these individuals, instead of functioning as fiduciaries for corporate owners throughout the U.S. and the world, used their power to create unassailable empires for themselves. I posit ethical misconduct in the capitalistic system and “bending” the system to one’s advantage, done in the early 20th century by a number of key management persons in large U.S. corporations emanates from the symbolic enforcement of the securities laws by the SEC in its early years. I suggest these corporate managers “learned,” from this symbolic enforcement of regulatory edicts by the SEC in its early years, that aggressive accounting and bad corporate governance not only was still possible but also was the methodology that should be employed to maintain the immense power held by these individuals.

This conciliatory approach to oversight of America’s capitalistic system is best shown by what amounts to an abrupt political metamorphosis of the third chair of the SEC, William O. Douglas. My analysis of the political situation during the first decade of the SEC’s existence suggests that Douglas may have adopted this acquiescent stance to maintain Congressional funding of the SEC and maintain its viability, not because of any “capturing” by the accounting profession.

The fledgling organization was expected from the outset to control unchecked corporate managerial power and restore morality and social ethicality to the system. From the outset, though, the organization was faced with a multitude of conflicting concepts, each powerful in its own right, of the way the system should be corrected (or left alone). Both Congress and the SEC were pressured by a very powerful bloc of conservative businesspersons to thwart any attempt at federal regulation of corporations. If the SEC were to achieve institutionalization, however, it would need continued funding from these Congressional legislators. Labor unions actively sought federal regulation of corporations and of the accounting profession; the accounting profession was adamant in its refusal to agree to this federal control. Faced with pressures from these different factions, the SEC adopted a conciliatory stance in many of its early decisions and rulings. Finally, the SEC succeeded in two important ways: (1) It mollified investors and re-established a modicum of faith in the capitalistic system, and (2) it institutionalized itself by maintaining continued funding from Congress. In the final analysis, it was very likely the use of conciliatory/acquiescent action that allowed these successes.

IDENTITY AND STATE-BUILDING: INSIGHTS FROM POST-COMMUNIST EASTERN EUROPE FOR POST-PARTITION KOREA

Benedict E. DeDominicis, The Catholic University of Korea

ABSTRACT

The political circumstances of Korean reunification will help determine the overarching political environment for future public administration. This context will create the parameters for government capability to implement the imperative of the exercise of sovereignty over the newly-reunified Korean peninsula. A reunified community emphasis will be upon shared commonalities that serve to mobilize cooperation after nearly 70 years of separate development under radically opposed political and economic regimes. Pan-Korean nationalism will be problematic in generating political mobilizational resources for creating the foundations for pan-Korean civil society. The North's vestiges will remain in the form of organized crime formations in a post-reunification state. Political strategists should prepare to respond to the political tendency to manipulate and exploit anti-Japanese symbolic messages by Korean political entrepreneurs mobilizing prospective supporters both in North and South Korea. Some relevant comparisons with the East European cases of transition from Communism provide insights into what to expect.

KEY WORDS: Bulgaria, China, Cold War, collaboration, colonialism, communism, consumerism, corruption, DPRK, East Germany, Eastern Europe, GDR, Germany, globalization, image, imperialism, Iran, Iraq, lustration, Japan, Korea, mafia, nation, North Korea, organized crime, public administration, reunification, ROK, Romania, social movement, state-building, stereotype, totalitarian, United States, West Germany

INTRODUCTION

A strong political attitudinal legacy from the historical experience of Communism will remain in northern Korea in a post-reunification environment. While a comparison of this legacy with Germany may seem most appropriate, comparison with the Bulgaria and the Balkans would also be relevant because North Korea's current political and economic contextual conditions are arguably more similar to Communist-era Bulgaria than to East Germany. Post-reunification economic scenarios are more likely to follow the German model; the economic and political disparities between North and South will result in the latter being the nucleus for a Korean nation-state. However, the political course by which this reunification will occur will significantly affect the extent to which corruption and organized crime centered on the North will characterize the political economy of a newly-reunified Korean nation state. The level of efficacy that the authorities in a unified Korea will demonstrate in suppressing corruption will not likely be as effective as it has been in the reunified German nation state.

Historical political development: the legacy of colonialism

The Bulgarian state, partly as a consequence of centuries of colonialism and dependent development, is a comparatively weak administrative state today as evidenced by its relatively high levels of corruption (Miller, 2008). In the 1989 Eastern European "demonstration effect" environment, mass demonstrations also occurred in Bulgaria to bring down the Communist regime on 10 November 1989 (Linden, 2009). Yet, as in North Korea Communist Bulgaria never manifested a comparatively significant elite dissident

social movement, not to mention one with active support among the mass public base (US Government). The comparative examples of dissident social movements in neo-Stalinist post-1968 Czechoslovakia or in the German Democratic Republic indicate that explaining the relative absence of organized societal dissent in the Bulgarian or North Korean case as due to exceptional levels of coercion is necessary, but not sufficient. The vibrancy of the Czechoslovak dissident movement is highlighted in Gale Stokes, ed. (1991). Steven Pfaff provides an overview of the development of the dissident movement in the 1970s in the German Democratic Republic that focused on the Lutheran Church (2001). An explanation should include the paradoxes and dilemmas in Bulgarian “national” identity that significantly stem from its largely dependent, colonial Balkan historical political evolution. A comprehensive understanding of Bulgaria and North Korean contemporary political attitudes towards the state requires an understanding of the attitudes towards authority that generations of Bulgarians and North Koreans learned during periods of imperial occupation and passed on through socialization to their offspring.

Figure 1: Types of Imperial Control (Cottam, 1977)

The method by which the external imperial power attempts to control another community will affect significantly the latter's subsequent political development. The history of imperialism should be examined in terms of the temperament and the forms of control. The legacies of these imperial experiences affect the process of national political value formation and attitude expression, which includes both the prevailing identity community basis for nationalism as well as the prevailing ideology that associates with it (Rock, 2008). In direct, formal colonial rule, the imperial power imposes its ultimate control through placement of a supreme political authority publicly representing the sovereign authority of the imperial state. This type of colonial experience has a greater potential to unify the native political elite of different constituencies in the community in the course of resistance to this form of imperial control. This form of imperial control is probably the least detrimental in terms of its legacy for state-society relations; the local population at least can more clearly 'see' who the enemy is. Japanese imperialism in Korea may be categorized as such. In contrast, indirect-formal rule is in place when local, traditional elites rule in the community with the 'advice' of the imperial power in the form of advisors, security arrangements, etc. Today, it may also be attempted through legitimation of an external

intervention by international organizational mandates granted, for example, by NATO, the EU or the UN Security Council. Indirect-informal imperial control is maintained without the overt presence of imperial personnel, although the imperial power continues to exercise ultimate control over the local ruling elite.

During the postwar period, Moscow exercised control through its client elite in local Communist parties and the respective security apparatus in each Warsaw Pact country. If these control mechanisms collapsed, the USSR would directly intervene, as in East Berlin in 1953, Hungary in 1956 and Czechoslovakia in 1968. The USSR did not have military bases in Bulgaria and Romania, unlike in Poland, Hungary, East Germany and Czechoslovakia. A current topic of media speculation is whether the People's Republic of China would militarily intervene to prevent the collapse of the Communist regime so as to prevent reunification with the US-allied South (Lim, 2012). In this case, the nature of the North Korean regime would change with the overt presence of Chinese soldiers supporting the DPRK authorities. Such a scenario would constitute another test of the strength of pan-Korean nationalism today in the DPRK. Finally, in informal, direct imperial control, the imperial power invades and becomes the ruling class (e.g. Arabs into Egypt, Normans into England). In the contemporary era, one case that may plausibly be moving in this direction is the Israeli colonization of Palestine.

Informal imperial rule typically means that the imperial power does not acknowledge that it has sovereign authority within the country; it has only an embassy and the imperial power works through the local bureaucracy (Chandler, 2010). Chandler (2010) focuses on Africa. David Chandler (2006), focusing on Eastern Europe, argues that imperial powers today do not admit that they control countries because it is no longer publicly acceptable. A theme in both works is a comparatively greater disconnect between the state ruling authorities and their international patrons in Western Europe and North America, on the one hand, and the mass public in post-colonial states, on the other hand. The inference is that indirect control aims to reduce the costs of imperial control by lessening resistance to it through attempting to obscure it. This obfuscation can be promoted through a dependent, compliant local elite that has formal sovereignty.

Whether or not the political influence of an external imperial power is intolerably high is a subjective judgment by different groups and identity constituencies having varying degrees of authority within the target community. One unfortunate legacy particularly of informal imperial intervention is a strong propensity for the emergence and crystallization of community identity cleavages, polarizing stereotypes and intense suspicions within the previously subjected community regarding who 'collaborated' with the imperial powers in the past and therefore is more likely to 'collaborate again' in the contemporary machinations of the imperial powers in the area. During intense conflicts, the result may be genocidal violence.

Political Psychology And Korean Nationalism

Cottam and Cottam's theory of nationalism presents patterns in perception of group image stereotypes towards perceived sources of challenge to the national "in-group," as well as associated behavioral predispositions and derivative political strategies:

In responding to a negative social comparison by an in-group towards an out-group, e.g. particular Koreans' self-image in relation to North or South Korea, Japan, the US or China, an in-group may respond psychologically in different ways. Between actors perceived as relative power equals, social "competition" refers to direct competition between groups for status and influence. In intense conflicts thereby perceived as zero-sum, one side's perceived systematic gain in influence and status in the domestic or in the global political system, as in full-scale war (hot or cold) situations, is perceived as the other side's loss (Cottam and Cottam, 2001). North and South Korean regime competition both for international and intra-Korean recognition for nationalist legitimacy can be understood in these terms.

Table 1: Image Attributes of a perceived source of comparative challenge (i.e. threat or opportunity) to perceived status of the nation (in this case, Korea) (adapted from Cottam and Cottam, 2001):

Image/ Stereotype	Capability (as perceived)	Culture (as perceived)	Intentions (as perceived)	Decision Makers (as perceived)	Threat/ Opportunity (as perceived)
“Enemy”	Equal	Equal	Harmful	Small elite	Threat
“Barbarian”	Superior	Inferior	Harmful	Small elite	Threat
“Imperial” (stereotype of targeted imperial power by the colonial/client)	Superior	Superior	Harmful	A few groups	Threat
“Colonial/Client” (stereotype of targeted colonial subject by the imperial power)	Inferior	Inferior	Benign	Small elite	Opportunity
“Degenerate”	Superior or equal	Weak-willed	Harmful	Confused, differentiated	Opportunity
“Rogue”	Inferior	Inferior	Harmful	Small elite	Threat
“Ally” (the individual social relationship analogue is “friend.”)	Equal	Equal (today, tends to be equated with perceived technological proficiency)	Good	Many groups	Threat (jointly shared towards a third actor by two “allies”; i.e. the enemy of my enemy is my “friend”)

The legacy of imperialism includes a predisposition by the subject of control to stereotype the controlling external actor in accordance with the “imperial” stereotype. The controlling power, in turn, is prone to stereotypically view the controlled community in accordance with the “colonial/client” stereotype. After generations of domination by Russia, the post Cold War democratic regime in Bulgaria has recently become a Western ally in the US-dominated North Atlantic Community. After 35 years of occupation by Japan, postwar South Korea is historically a client and today an ally of the US against North Korea/USSR/China.

Table 2: Political Images and Social-Identity Strategies towards the challenger (Cottam and Cottam, 2001):

Group Image/Stereotype of perceived challenger	Social-Identity orientation behavioral patterns towards the perceived challenger
“Enemy”	out-group; creativity, competition when possible
“Barbarian”	out-group; creativity, indirect competition
“Imperial”	out-group; mobility, creativity, competition when relationship is unstable
“Colonial/Client”	out-group; maintain status quo
“Degenerate”	out-group; competition
“Rogue”	out-group; competition, destroy
“Ally”	in-group; mobility, creativity

Stereotypes developing out of extended, conflictual political relationships on the basis of perceived critical group cultural and capability differences produce patterns of social perception and behavior towards the perceived source of political challenge. The social psychological perception of an in-group towards and an out-group in turn produces systematic behavioral attitudinal predisposition patterns in interaction categorized in terms of social “mobility,” “competition,” and “creativity” by the perceiver on the basis of these stereotypes.

Social “creativity” strategies aim to preserve a positive group self-image through creating a collective perceptual reality in which different, equally valid ‘yardsticks’ for evaluation apply to different groups, i.e. “different but equal.” One may argue, for example, that the North Korean renewed emphasis on the *juche* (“self-reliance”) policy may be understood partly as a new regime self-justification with the collapse of its USSR patron and the ending of its subsidies following the end of the Cold War. In this regard, B. R. Myers notes North Korea’s self-referent derogatory references to South Korea as a “yankee colony” (2011). Daniel Byman and Jennifer Lind note the North’s reference to the South as “the foul whore of America.”

Social “mobility” strategies refer to seeking to join and assimilate into the perceived, ‘superior’ out-group, including an Americanized-globalized multinational political and economic community. The pervasive influence of American political, economic and cultural models within South Korea, are

arguably more acceptable due to the social mobility opportunities that very successful economic development within the context of American hegemony has provided.

South Korea's Cold War client status relationship with the US provided enormous social mobility options both for individuals and the southern two-thirds of the Korean nation while confronting the Communist control of the northern third of the population and its territory. American tutelage helped provide this social mobility (Cottam and Cottam, 2001). It provides a strong incentive to the ROK to continue to acquiesce to American hegemony while national unification as a prerequisite for national self-determination has not been achieved (Greenberg, 2004). South Korea serves to validate the development model that the US promoted during the global Cold War conflict. American authorities advocated this model in the midst of the perceived competition with the USSR for allegiance among the newly independent countries emerging or re-emerging from the postwar wreckage of empires (Linantud, 2008). The neighboring propinquity of North Korea magnifies this South Korean appeal: the failed, "alternative" Korea lies across the 38th parallel conveniently available for immediate comparison. The division of the Korean nation apparently created a de facto laboratory for comparing the two systems to determine their value. The application of image theory from political psychology provides insights into the challenges confronting pan-Korean state building. National communities inheriting a recent legacy of Great Power imperial domination may manifest this legacy in an attitudinal behavioral predisposition which derives from a national ethnic majority image of 'self' versus the external and internal 'other' which corresponds to the imperialist-colonial/client image relationship (Cottam and Cottam, 2001).

Table 3: Images and Policy Predispositions (Cottam and Cottam, 2001)

Image of perceived challenger	General Policy Predispositions towards perceived challenger	Policy Predispositions towards perceived challenger in intense conflicts
"Enemy"	Wary suspicion, containment	Hostility, defense
"Barbarian"	Fear, form alliances	Preemptive strikes, precipitate alliance intervention (potential for genocide)
"Imperial"	When domination is stable: fear, avoid conflict, submit	When conflict is unstable: anger, shame, struggle for liberation
"Colonial/Client"	Paternalistic policy guidance and direction	Most commonly nonviolent repression
"Degenerate"	Contempt, mobilize for competition	Disgust, offensive aggression
"Rogue"	Derogate, isolate	Hostility, violent repression (potential for genocide)

Perceptual and behavioral attitudinal patterns in turn generate policy behavioral predispositions by an in-group towards the perceived source of political challenge. Policy behavioral predispositions may change as the political relationship becomes unstable, weakening assumptions regarding relative capability and cultural superiority and inferiority. Perceived opportunities and threats may thereby intensify, producing more intense political conflicts, reinforcing stereotypes and the emotional affect that accompanies them, creating significant potentials for violence.

A future, unified Korea's integration under the ROK regime attitudinally will include various constituencies which have a collective historical memory of domination by others. In states with a historical legacy of imperial control by external actors, the state is more likely to be seen in popular attitudes as a distant, threatening, powerful entity serving its own interests. Moreover, although South Korea has had a liberal political regime for a generation since 1987, the contemporary North Korea state itself had much of its foundations laid under the "Sultanism" of the continuing, decades-long dictatorship of the Kim dynasty (Hymans, 2008). Gene Sharp, an analyst of non-violent direct action challenging the status quo that characterizes critical social movement reform activity, portrayed this view as a monolithic or "self-sufficient" image of the state and its power capabilities. It stands in contrast to a popular consent-based image of the state and its power (Sharp, 1973; Ackerman & Kruegler, 1994).

Comparative Communist And Post-Communist National Development

With the arrival of Communism with the Soviet Red Army, Germany was already a fully industrialized and politically mobilized society. The section of the German public that lived in what geographically became the German Democratic Republic had already undergone the political socialization process into German national statehood. German national identity, in other words, had already been established. As a

consequence, an East German “national” identity never gained sufficient intensity to supersede pan-German national identity, despite strong efforts by the Communist regime to inculcate one (Federal, “East Germany”). Partly for this reason, the collapse of the East German regime was not only remarkably peaceful, but the GDR legacy left comparatively little impact on prevailing political attitudes in the former East Germany. The post-Communist “Party of Democratic Socialism” had some electoral support, but east German politics is dominated by the same major parties that have dominated west German politics since the formation of the German Federal Republic in the 1950s.

During the postwar period, both Bulgaria and North Korea underwent a period of rapid, forced economic, social and political change under a Communist totalitarian regime. This change can be labeled modernization depending on the indicators that one may choose, but both did rapidly change. During this same period, the People’s Republic of Bulgaria acquired a reputation as the closest ally of the USSR in the Warsaw Pact (Dyer, “Bulgaria won’t be celebrating 1989”). North Korea’s political development under Communism was rather more similar to the experience of the east European nation states, in particular more similar to the Balkan states. In these states, Communism largely brought “modernity” to these societies that, with few regional exceptions (e.g. the Czech lands) had been overwhelmingly rural. Consequently, the respective former national Communist parties, after reforming themselves, have become one of the pre-eminent political parties in all of these states. Indeed, there seems to be a positive correlation between the level of economic development in these states at the time of the arrival of Communism and the level of popular political support for post-Communist/socialist parties (Toole, 2007). Toole concludes that the pre-Communist historical legacy of Eastern Europe affected significantly the respective post-Communist political party structure that emerged in east central Europe. Toole views this structure as in accordance with the Lipset-Rokkan model’s focus on the historical legacy in political cleavage formation in contemporary west Europe. In countries such as Bulgaria and Romania, these parties have successfully transformed themselves into viable majority parties. They have kept, lost, and then regained control of the government through elections, and they still represent an organizational model for a successful East European political party (Klesner, 2007).

In the Communist Romanian case, the correspondence with North Korea is not only empirical, but also intentional. According to some reports, Nicolae Ceausescu actually sought to emulate the political model he personally witnessed in North Korea while visiting there in 1971 (Tolnay). In the case of Bulgaria, a stronger parallel exists with North Korea insofar as the entire Bulgarian polity entered modernity, like North Korea, through exceptionally close modeling of its own development strategy after one or both of the Communist Great Powers. Bulgarian politics today, a generation since the 1989 changes, continues to include charges against the Bulgarian Socialist Party for its refusal to repudiate its leaders in the 1970s who voted to apply to join the USSR as the USSR’s 16th republic (“Bulgaria,” 2012).

Communist Romania under the Ceausescu dictatorship adopted the posture of vigorous non-alignment vis-à-vis the Warsaw Treaty Organization until the late 1980s and the entrance of Solidarity into the government in Poland (Deletant, 2007). Yet, Romania remained in the Council for Mutual Economic Assistance and therefore it remained economically integrated in the Communist block. The DPRK did not have the public pretense of being ostentatiously independent from either the USSR or the PRC or both until the end of the Cold War resulted in far-reaching declines in economic subsidies heretofore provided to the DPRK. The DPRK was integrated into the Communist block economic system to the extent that the loss of the Soviet economic subsidies in the early 1990s resulted in mass starvation and death for perhaps 5% of its population (O, 2011). Thus, the DPRK’s continuing political inability to adapt to the loss of these subsidies contributed to the famine that killed hundreds of thousands, perhaps millions, in North Korea in the 1990s. At this time, the regime accentuated its *juche* (self-reliance) official ideological doctrine.

Prior to the end of the Cold War, North Korean development strategy appeared to be the most ideological orthodox in terms of conformity with Marxist-Leninist-Stalinist principles. North Korea represented the attempt by the North Korean leadership to prevail in the domestic and international competition for representational legitimacy for the entire Korean nation through greater development success in comparison with the American-dominated South. North Korea had comparative success with the ROK until the 1970s, until which time per capita income was similar to that in the ROK (Lankov, 2006).

The DPRK confronted adversaries in South Korea, the United States and Japan after the disastrous and catastrophically destructive Korean war. Accordingly, the DPRK regime had strong political incentives to ally closely with the USSR and the PRC and adopt their economic and political models. The legacy of this commitment, however, remains a critical political issue because unlike Bulgaria, the survival of the DPRK regime equates with the survival of the state. Whereas post-1989 Bulgaria could adopt far reaching political and economic reforms, albeit in comparative fits and starts, the DPRK regime does not have this option without abnegating itself like East Germany (Cottam and Cottam, 2001).

Therefore, modernity in DPRK generates unsolvable political dilemmas that will likely translate into elements of the coercive apparatus transferring their identity profile into parochial identities, including mafia organizations in a reunified Korea. The DPRK identity profile is notably much stronger than was the GDR among its population (Myers, 2011). The greater comparatively political obeisance of the DPRK public to the DPRK authorities contrasts with the comparatively more problematic identity allegiance of the South Korean public with regard to the ROK state (as opposed to the pan-Korean nation) (Myers, 2011). The security apparatus is not so readily going to disintegrate as it did in the former GDR. Rather, they are more likely to transform into organizations that specialize in organized illegal economic activity, such as illicit arms shipments, like their Bulgarian counterparts (Hope and Troev, “Bulgaria struggles”). The legacy of Japanese, Chinese, Soviet and American imperialism in Korea will likely generate a significant potential for intense polarizations in this regard in a post-unification political environment. As in Bulgaria and in the Balkans more generally, Korean organized criminal organizations emerging out of the security services will likely seek domestic political support by associating themselves with romantic nationalist stereotypes. The heroic mythologization of Kim Il-sung and his family as guerrilla unit fighters in the anti-Japanese struggle is noted, for example, in Daniel Byman and Jennifer Lind (2010).

It compares with the romantic “bandit” image in Balkan folk imagery of early resistance against the Ottoman Turks (Giatzidis, 2007). It implies that this theme would be a readily available one as a set of romantic national symbols to manipulate to appeal for public support by political entrepreneurs in a reunified Korea. The disputed legacy of the ROK state with its foundations during the Syngman Rhee era will become more prominent in the competitive political discourse of a reunited Korea (Greenberg, 2004). Greenberg recounts Syngman Rhee’s reliance on the Japanese-affiliated Korean National Police, with American backing, to assassinate the most prominent political figure in the South, Yo Unhyong, and thousands of his supporters to pave the way for his own election as President. Without the lingering threat from the North to motivate some degree of collective regime-enforced or self-censorship, a full discussion by groups, parties and constituencies competing for political support in the democratic political system will ensue regarding the Japanese occupation and subsequent partition period (e.g. “Censorship”; “South Korean Journal Backs Down”).

During the Cold War, the US worked with local authorities that were seen as cooperating with the US containment strategy in Asia. Containment contributed to horrendous suffering, but it also contributed to South Korea’s economic “miracle” (Linantud, 2008). China’s intervention in the Korean war saved the Kim Il-sung regime. China’s perceptions of and policies toward a reunited Korea will largely depend upon the political circumstances and scenarios under which this reunification occurs.

A plausible supposition, however, is that China's acquiescence to the disintegration of the DPRK regime and its absorption by the ROK will require that the Chinese authorities view the ROK as not being a threat to China's security interests in East Asia. Success in persuading the Chinese authorities of the benign intentions of the ROK will depend upon various factors, some of which are not directly under ROK control, i.e. the intensity of conflict in the US-PRC relationship. Nevertheless, the ROK authorities will need to persuade the PRC that the ROK is not a threat to PRC security and economic interests. Indeed, the ROK authorities may work to convince the PRC that a re-united Korea under the ROK regime will generate greater economic and security benefits for the PRC. In this scenario, then, the ROK authorities would feel strong pressure to accommodate to the economic investments that the PRC is evidently already undertaking in the DPRK in mining and other sectors (Choe, "North Korea"). The South Korean leadership has emphasized that recently adopted ROK-US Free Trade Agreement will make the ROK a more attractive site for Chinese and Japanese investment in order to export to the US market ("S.Korea," 2012). China's current investments in the DPRK, therefore, may become even more valuable as part of an expanded ROK. It will also serve as another incentive to China to accommodate to the extension of sovereign ROK law, including public administration law, into the North.

The potential for Japanese scapegoating in Korea

In Korea the portrayal of the founding South Korean authorities as "traitors" to the nation may receive a surprisingly receptive audience (Myers, 2011). This disturbing realization implies that the prospect for violence in the reunification process may be significant. In terms of reunification political scenarios, the legacy of the conditions during 1945-50 will in all likelihood re-emerge as competing elite factions and their constituencies in a reunified Korea seek to mobilize public opinion to the extent possible around claims to nationalist legitimacy (Lankov, 2006). Lankov highlights the ongoing official public commitment to pan-Korean nationalism defining the formal ideology of the ROK, despite the quite different reality of increasing ROK discouragement of economically burdensome DPRK refugee flows into the ROK as of the mid-2000s. Note that South Korean political discourse today has legitimated renewed investigations regarding charges of collaboration with the Japanese.

As recently as 2008, South Korea's equivalent of a "truth commission" issued a report listing various foundational ROK figures officially as "collaborators" with the Japanese, including Park Chung-hee, the military ruler during 1961-79 popularly credited with overseeing the formative period of South Korea's economic "miracle" (Kang, 2009). Kang's article commemorates the 30th anniversary of Park's assassination by one of his closest aides, the Director of the Korean Central Intelligence Agency, Kim Jae-gyu. Park Chung-hee's daughter, Park Geun-hee, is one of the leading nominees to be the next president of the ROK in December 2012 elections (McCurry, 2012). Park Geun-hye has received primary credit for leading the ruling "New Frontier" (*Saenuri*) party to a surprise retention of its majority in parliamentary elections in April 2012. The current ROK president, Lee Myoung-bak, of the *Saenuri* party is constitutionally prohibited from seeking re-election.

In a process that accelerated beginning in 2006, the South Korean authorities expropriated property from the descendants of identified collaborators with the Japanese (Ryall, 2010). According to this report, the South Korean authorities had seized 11 million square meters of land evaluated at 112 million British pounds. In sum, South Korean political discourse has already contributed to the legitimization of this theme of collaboration. Integration of a post-Communist North into the ROK state will very likely witness an intensification of this theme in democratic ROK politics to appeal to discontented constituencies across the political spectrum. In the South will be located those constituencies footing the very large bill for integrating the economically decrepit North into South Korean market institutions. Similarly, in post-unification Korea, calls will likely intensify for indemnities and reparations from Japan for its actions during the colonial period (Hancocks, 2012). Japanese reparations to S. Korea were supposedly resolved under the "Treaty on Basic Relations between Japan and the Republic of Korea"

signed in 1965, under the Park Chung-hee military dictatorship. However, the nature of the S. Korean regime and its policies, together with subsequent publication in 2005 of the treaty preparation documents, have contributed to continual demands for revision of the terms of the treaty.

These calls have a particular focus on the plight of S. Korean women enslaved as sex workers for the Japanese imperial military during World War, the so-called “comfort women” (“Treaty”). The intensification of the ROK-Japanese territorial and historical conflicts with South Korean president Lee Myoung-bak’s first-ever visit to disputed Dok island by a sitting president in the lead up to the December 2012 ROK presidential elections illustrates the incentives to Korean politicians to exploit this issue (e.g. “BBC,” 2012). In a post-reunification context, this discontent will be larger in response to the high profile political attitudinal differences between Southern residents and Northern internal economic migrants seeking work and economic support in the South. In the North will be located constituencies and groups facing invidious comparison and often perceived humiliating treatment by the South (O, 2011). The political context will be favorable for political entrepreneurs manipulating romantic anti-Japanese Korean nationalist symbols to mobilize political support and activity that bridges the numerous legacies of the North-South divide.

CONCLUSION

The legacy of imperialism and partition in Korea will manifest itself in a reunified Korean peninsula in terms of challenges to public administration. The conflictive situational political dynamics on the Korean peninsula leading to DPRK collapse are likely to include appeals to pan-Koreanism focusing on anti-Japanese demands. DPRK military and police security structures are likely to enjoy lingering, strong albeit declining national popular authority in northern Korea. The interrelated sources of this authority are likely to include habitual normative obedience as well as utilitarian authority through the economic resources that they will still control. Other sources of support will include their leadership’s public calls associating themselves with popular anti-Japanese sentiment that would transcend the substantial perceptual, attitudinal and value differences between northern and southern populations that would characterize a reunified Korea. These security structures will likely continue to linger on as organized crime networks at least on a scale comparable to that witnessed in post-Communist states in Southeast Europe. Elements among them are likely to transform into the nuclei for political factional and party formations. In order to work to prepare to counteract the effects of nationalist demagoguery in Korean public opinion, South Korean civil society actors such as universities and churches should continue to work to develop cooperative ties with Japanese governmental and non-governmental society representatives.

DEVELOPING BUSINESS COMPETENCES THROUGH THE USE OF A LANGUAGE PORTFOLIO

Rubén Molina Martínez, Universidad Michoacana de San Nicolás de Hidalgo
Argelia Calderón Gutiérrez, Universidad Michoacana de San Nicolás de Hidalgo

ABSTRACT

Competence formation is one of the most effective ways to prepare future professionals to successfully deal with constantly changing working conditions. In Mexico, the implementation of such educational model is already taking place. This paper proposes the use of a Language Portfolio to develop the communicative competence in English as a Foreign Language (EFL) of university students aiming to achieve B2 level according to the Common European Framework of Reference for Languages. The use of portfolios has proven to be a useful tool to enhance learning by asking students to reflect on their own motivation/need to learn and their learning strategies while promoting autonomous learning and self-evaluation strategies. By allowing both teachers and students to experience the benefits of using a Language Portfolio, the learning and metacognitive strategies developed can be expanded to the learning of business competences through the use of English and, thus, contributing to their learning of both professional and communicative competences.

JEL: I2, I23

KEYWORDS: competences, communicative competence, autonomous learning, business competences.

INTRODUCTION

The competence concept in education concerns with the capacity of students to analyze, reason and communicate effectively as they pose, solve and interpret problems in a variety of subject areas and has been considered important due to its relevance to lifelong learning. Being able to do so in one's mother tongue is by itself one of the aims of public education policies, leaving behind the very basic objective of teaching literacy and numeracy and including today information technology as well as the learning of a foreign language. Thus, the role of education in school is seen as to provide the generic skills needed to acquire new knowledge and specialist skills in the future: learning how to learn.

In México such a foreign language is of course English. English as a Foreign Language (EFL) was introduced as a mandatory subject into the middle-school curriculum for all public schools since 1993 (Ministry of Education -Secretaría de Educación Pública- Agreement 182) and last year's education reform made it mandatory for basic education (Agreement 592, dated August 19, 2011), as a part of the implementation of a competence-based curriculum. Besides intending to raise the quality of education, this measure was implemented with the long term objective of facilitating international student and academic staff mobility. This seems to confirm that the learning of English appears to be losing its separate identity as a discipline and merging with general education (Graddol, 2006).

Historically, the need to fluently communicate in English has become essential in business and for travel. Besides the communicative function of the language itself, English is essential to the deepening integration of global service-based economies. But even in non-English speaking countries, being communicative competent in English can be considered necessary (sometimes even a must) to get a well-paid job, regardless of the professional area one works in. This is particularly true as the outsourcing business grows, since most of the offshore contracts come from English speaking corporations and global enterprises create their own business process outsourcing centers in other countries to diminish costs.

Up to now, English is the language that facilitates transnational encounters and allows nations, institutions, and individuals in any part of the world, to communicate their world view and identities. This study attempts to provide a tool students can use to make connections between positive learning outcomes and success experienced in a coursework on learning English for general purposes and using the language to perform tasks required in the professional domain of business administration.

The article concludes with a discussion of the possible benefits of implementing a learning portfolio within the curriculum of the business management degree at undergraduate level at the Universidad Michoacana de San Nicolás de Hidalgo (UMSNH). The communicative COMPETENCE Users and learners of a language draw upon a number of competences developed in the course of their previous experience in order to carry out the tasks and activities required to deal with the communicative situations in which they are involved. In return, participation in communicative events (including, of course, those events specifically designed to promote language learning) results in the further development of the learner's competences, for both immediate and long-term use. In that sense, all human competences contribute in one way or another to the language user's ability to communicate and may be regarded as aspects of communicative competence. The Council of Europe (2001) defines some essential terms to facilitate the communication among users of a language and teaching professionals in the Common European Framework of Reference for Languages (CEFR). To begin with, competences are the sum of knowledge, skills and characteristics or personal resources that allow a person to perform actions. General competences are those not specific to language, but which are called upon for actions of all kinds, including language activities, which include:

- a) Declarative knowledge (*savoir*): knowledge of the world (which derives from experience, education or from information sources, etc.), sociocultural knowledge, and intercultural awareness.
- b) Skills and know-how (*savoir-faire*): everything that has to do more with the ability to carry out procedures than on declarative knowledge. This skill may be facilitated by the acquisition of 'forgettable' knowledge and be accompanied by forms of existential competence (for example relaxed attitude or tension in carrying out a task). It comprises practical skills and know-how (social, living, leisure, and occupational skills) as well as intercultural skills and know-how.
- c) 'Existential' competence (*savoir-être*): it may be considered as the sum of the individual characteristics, personality traits and attitudes which concern, for example, self-image and one's view of others and willingness to engage with other people in social interaction. Attitudes and personality factors greatly affect not only the language users'/learners' roles in communicative acts but also their ability to learn. It consists of attitudes, motivations, values, beliefs, cognitive styles, and personality factors. This type of competence is not seen simply as resulting from immutable personality characteristics. It includes factors which are the product of various kinds of acculturation and may be modified.
- d) Ability to learn (*savoir-apprendre*): it mobilizes existential competence, declarative knowledge and skills, and draws on various types of competence. Ability to learn may also be conceived as 'knowing how, or being disposed, to discover *otherness*' – whether the other is another language, another culture, other people or new areas of knowledge.

Communicative language competences are next defined as those which empower a person to act using specifically linguistic means. The language activity required to perform communicative acts always occurs in a context that imposes conditions and constraints of many different kinds (also called domains of language use: public, personal, educational and occupational). Thus, for communicative intentions, users/learners of a language bring to bear their general capacities as detailed above together with a more specifically language-related communicative competence. Communicative competence in this narrower

sense has the following components: linguistic, sociolinguistic and pragmatic. Each of these components is postulated as comprising, in particular, knowledge and skills and know-how.

a) *Linguistic competences*: include lexical, phonological, syntactical knowledge and skills and other dimensions of language as a system, independently of the sociolinguistic value of its variations and the pragmatic functions of its realizations.

b) *Sociolinguistic competences*: refer to the sociocultural conditions of language use. Through its sensitivity to social conventions (rules of politeness, norms governing relations between generations, sexes, classes and social groups, linguistic codification of certain fundamental rituals in the functioning of a community), the sociolinguistic component strictly affects all language communication between representatives of different cultures, even though participants may often be unaware of its influence.

c) *Pragmatic competences*: are concerned with the functional use of linguistic resources (production of language functions, speech acts), drawing on scenarios or scripts of interactional exchanges. It also concerns the mastery of discourse, cohesion and coherence, the identification of text types and forms, irony, and parody. For this component even more than the linguistic component, it is hardly necessary to stress the major impact of interactions and cultural environments in which such abilities are constructed.

The resulting outcome of the Council of Europe was a very comprehensive work that describes the competences necessary for communication, the related knowledge and skills and the situations and domains of communication. Communicative acts comprise language activity, which is divided into four kinds: reception, production, interaction and mediation. Reception entails understanding language produced by others, whether in speech or in writing, while production entails producing speech or writing. Interaction refers to spoken or written exchanges between two or more individuals, while mediation (often involving translation or interpretation) makes communication possible between individuals or groups who are unable to communicate directly. Clearly, interaction and mediation involve both reception and production. While learning EFL for general purposes, all language activities are stressed, but when focusing on developing business competences, interaction becomes an essential aim.

The b2 Language Portfolio According to Zubizarreta (2009), a learning portfolio is a flexible, evidence-based process that combines reflection and documentation. It engages students in ongoing, reflective, and collaborative analysis of learning. It also focuses on purposeful, selective outcomes for both improving and assessing learning. The B2 Language Portfolio was designed in 2011 to meet the needs of students of English as a Foreign Language (EFL) at the Language Department at Universidad Michoacana de San Nicolás de Hidalgo (UMSNH) in the capital city campus, Morelia. It was based on the model launched in 2000 by the European Language Portfolio (ELP) and it conforms to the Principles and Guidelines defined by the Council of Europe that same year. It was designed as a tool to make sure that at the end of their studies, the Language Department students reach the B2 level of proficiency in English, according to the Common European Framework of Reference for Languages (CEFR). Although there is a general template for learning portfolios (Zubizarreta, 2009) we decided to base ours on the model proposed by the Council of Europe (2004), since it has been specifically designed for languages by an international group of experts. The Council of Europe developed the ELP in order to serve two complementary functions.

The first is pedagogical: the ELP is designed to make the language learning process more transparent to learners and to foster the development of learner autonomy; that is why it assigns a central role to reflection and self-assessment. This function reflects the Council of Europe's long-established commitment to learner autonomy as an essential part of education for democratic citizenship and a prerequisite for lifelong learning. The second function is to provide concrete evidence of second/foreign language communicative proficiency and intercultural experience. In addition the ELP is intended to promote the development of plurilingualism, the ability to communicate in two or more languages besides one's first language. The European Language Portfolio (ELP) has three obligatory components: a Language Passport, a Language Biography, and a Dossier. The B2 Language Portfolio designed at the

Language Department adds a list of suggested activities in the Dossier section and a comprehensive list of websites for learning English. This was done in order to accompany the students while they develop both communicative competence and learner autonomy.

METHODOLOGY

This paper proposes that university business/management students use a Portfolio similar to the B2 Language Portfolio, the Business Competences Portfolio (BCP). The BCP uses English as a means to introduce both teachers and students to competence-based work. Thus, students have the chance to improve their linguistic proficiency in English while learning and developing business competences, which at present are left aside in the formal curriculum. At the UMSNH's undergraduate program, it is currently left to the teacher to decide whether to include the development of business competences in the course contents, assuming he or she knows how to do it or is interested in doing it. On the other hand, many of our students are still very dependent on their teachers. Using a learning portfolio fosters both learner autonomy and the use of self-assessment (Little, D. & Perclová, R., 2003, 2007; Zubizarreta, J., 2009; Chen, H. & Black, T., 2011; Dobrow, S., Smith, W. & Posner, M., 2011), which are also core objectives of this project. Successful students assume the responsibility of their own learning and are willing to expand it to other subjects of interest as a lifelong activity. Furthermore, Daniels (2010) reports that Human Resources managers find that, in general, being proficient in a foreign/second language adds professional and personal value to employees.

The Business Competences Portfolio (BCP) is to be piloted at the Universidad Michoacana (UMSNH)'s Faculty of Administration and Accounting, with two testing groups and two control groups. One control group and its correspondent testing group will be freshmen who are basic users of English (A1 level of the CEFR); and the other two groups will be students who are independent users of the language (B1+ level). The study will also aim to find if students who attend more advanced courses in the Faculty of Administration and Accounting (the ones who are also more likely to have a higher level of proficiency in English) have indeed learned more business schools than freshmen. The BCP is currently being developed by Faculty staff and is intended to be piloted during the spring semester 2013.

EXPECTED RESULTS

Based on the literature review done so far and our own experience, the authors expect to find the following: a) if there is a correlation between the students' level of achievement in developing communicative competence and business competences; b) what business competences our students are best at and which ones need to be reinforced; c) the students' feelings about motivation when they play a more active role directing their learning process; d) whether students' attitudes towards evaluation change; e) what aspects of the portfolio need to be improved or replaced; f) how much interest the tool raises among faculty teachers and students, and if it does not diminish once enthusiasm for novelty fades; g) set the basis for launching the definite version of an ePortfolio; and h) whether the students' intercultural competence improves, since Michoacan is home to the P'urepecha, one of the many native people striving to survive in Mexico, and if the BCP promotes awareness of a foreign culture while reinforcing our local identity.

CONCLUSIONS

Language is one of the foundations of human behavior: we use it continuously to perform communicative acts. Those acts may be external and social. In business settings, apart from holding conversations with colleagues, we are expected to hold formal meetings, make speeches or give lectures, write personal and official letters and of course extend knowledge in our domain of expertise. Communicative acts may also be internal and private. All forms of reading and some forms of listening are examples of this; so too are

the many different ways in which we use language for purposes of thinking things through – for example, to plan the apology we have to make for absence from an important business meeting, or to prepare ourselves for a difficult interview by trying to anticipate the questions we shall be asked and working out what our answers should be. Productive activities have an important function in many academic and professional fields (oral presentations, written studies and reports) and particular social value is attached to them (judgments made of what has been submitted in writing or of fluency in speaking and delivering oral presentations). By providing university students with a Business Competence Portfolio, the authors expect to help them not only develop communicative competence in English, but to help them build the key competences they will need to set up a successful career.

A competence-based approach implies that learners practice on how to do business in English, recognizing that people need more than just phrase lists and useful language boxes to operate effectively in real-life business situations. Personal and professional competences provide a framework to manage organizational culture, core competency management, leadership development, and drive organizational performance and become the greatest determinants of employee performance, assuming the individual possesses the required threshold of technical competencies.

Finally, Graddol (2006) states that it is time for a change in the teaching/learning paradigm, and that by using English for global communication (English as a Lingua Franca, ELF) we focus on pragmatic strategies required in intercultural communication, the second main objective of the Language Portfolio. The target model of English, within this framework, is not a native speaker but a fluent bilingual speaker, who retains a national identity in terms of accent, and who also has the special skills required to negotiate understanding with another non-native speaker. Research is also beginning to show how bad some native speakers are at using English for international communication. He suggests that elements of an ELF syllabus could usefully be taught within a mother tongue curriculum. We look forward to integrating such intercultural awareness through English, as a complement to the curriculum in Spanish.

ORGANIZATION DESIGN AND PERFORMANCE: A STUDY OF SELECTED INDIAN ORGANIZATIONS IN THE LIBERALIZED ECONOMY

Arabinda Bhattacharya, Department of Business Management, University of Calcutta

Amit Kundu, School of Management Studies, Techno India

ABSTRACT

The exhaustive research on organization design, its transformation, change management, organizational restructuring for the last two decades makes it a challenging and complex research issue. The central problem is to design the organizations for superior performance on the basis of redesign mechanisms such as uncertainty, differentiation and integration. The design-performance relationship is also dependent on the business environment as well as the sector of the specific business environment. In the backdrop of the ongoing economic liberalization in India, the specified sector that includes Chemical; Petro-chemical Process Industry; Agricultural related Industry; Processed Food Industry; Bio-Chemical related Industry was undertaken for research. It is important to understand the measures of organization design parameters such as measures of uncertainty, differentiation and integration in relation to those of competitive organizations and the impact of the relative redesign mechanisms on the performance of the organizations. The objective is to identify the homogeneous groups present in the sector to develop the mathematical functional form for establishing the functional relationship between organization design parameters and performance. It is also intended to examine the differences across the groups in respect of the strength of the influence of the design parameters and the organizational performance and also the nature of relationship among the variables considered in the model.

KEYWORDS: Organization design, Performance, India, Chemical sector

INTRODUCTION

Organizations, in general, are complex. They are economic entities as they have to acquire various human, financial, material and managerial resources. Now, they have to allocate the resources in such a way that utilization of resources has been made in an efficient and effective way. Organization, as a social system, has to interact with external entities constantly. Besides that, organizations have internal system and process which have specific norms and rules, ideals, values, beliefs and practices that govern their behavior. Within the organizations, people interact daily and also they have specific skills, values, feelings, motivation and feelings. All the organizations have to maintain their external and internal consistency for their growth, sustenance and development.

Given organizational complexity, designing and managing effectively any sizeable organization anywhere is a daunting task (Khandwalla, 1992). It is much more difficult in the Third World Countries. The main reasons are many, such as operating environment, shortages of resources, political and bureaucratic interference, and lack of social and physical infrastructural facilities etc. Within these constraints, the achievement of organizational excellence requires specific strategies. The strategic choices also depend on nature of organizations, size of organizations and also on its operating environment. The discussion of organization and its excellence, in this research paper, has specific context. Liberalization of the Indian economy for the last two decades makes it highly dynamic and complex. During the past two decades, India has been moving from an insular, command and planning oriented economy towards an increasingly liberalized, globalized, and market oriented economy (Ray, 2004). India becomes one of the largest

emerging markets with a huge potential for sustained economic growth. Attempt has been made in this research study to establish the organization design –performance relationship for a specific sector in the context of liberalized Indian Economy.

LITERATURE SURVEY

Organization

A complex organization is an open social action system consisting of multi-forms of structures and processes. The cyclic repetitive process converts input resources to value added output resources by definite methods/measures. The value of the product/service depends on mainly two facts:

- a) Development of the structured process with specified predictable pattern is concerned with the organization design which should minimize the variability of the output level
- b) The assessment of the environment in which they operate, determines the strategic choices to be made, considering that those strategies must “fit” the specific environment. So the process should be configured properly to cope with the different environment (Andrew H. van de Ven, 1976).

To address the first issue we have to define organization in its design perspective: “An organization is defined as a system of interrelated behavior of people who are performing a task that has been differentiated in to several distinct subsystems, each subsystem performing a portion of task, and the efforts of each being integrated to achieve effective performance of the system.” (Lawrence and Lorsch, 1967). The second issue indicates the compatibility of organization design with the environment: “In varying degrees all organizations are dependent upon their environment for survival. The environment is defined as the organizations and associates in the factor markets that supply an organization with its input resources and the organizations and associates in the product markets that obtain the output products or services from an organization. Uncertainty in the environment in every aspect of situation considers internal and external as well as social, economic and environmental factors etc.” (Andrew H. van de Ven, 1976).

Organization Design Perspectives

Organization design research must compare the efficacy of organizational structures and developmental processes, and organization designers must create methods for implementing effective structures and processes. Organization design has been a central topic in the management research. The continuous research indicates that organization design is a dynamic culture and the objective is to develop an effective organization but that is both time and environment specific. Completeness of the design can only be possible by the pre-specification of the problem, the identification of pre-fixed alternatives and choosing of the best alternatives. For such a scientific approach, there needs to be a clear and stable boundary between the organization being designed and the context for which it is being designed.

Organization Re-Design

In case the organizations remain static in respect of design parameters they do not become competitive with the changing environment. The challenge of the organization redesign is to shift the organization from their stable state of equilibrium and to make it more dynamic in the future point of view. It is more so in the era of liberalized economic system. Over the last four decade there has been a wide range of

research considering change management, organizational restructuring, organizational transformation etc. This literature started with advent of the work of Burns and Stalker(1961), Chandler(1962), Lawrence and Lorsch(1967), Pugh et al.(1968), Galbraith(1973), Khandwalla(1973), Mintzberg(1979), Miller and Friesen(1984), Miller(1986,1987,1996), Scott (1995) and more recently in the special issue of Organization Design in Organizational Science (Dunbar and Starbuck,2006).

Dunbar and Starbuck's (2006) question is closely related to a central research objective of organization theory concerning the design of organization for effectiveness and performance. Two contrasting ideas have been developed to nurture the issues. Contingency model (Lawrence and Lorsch, 1967; Khandwalla, 1977) implicitly assume that high-level performer within an organization are able to point out the constraints imposed by the environment and are able to design the organizations in an appropriate way to address those issues. The role of top management /strategist of an organization are, therefore, to respond to the changing environment in a continuous manner by adapting the necessary changes in the organization (Andrew H. van de Ven, 1976).

The second theme uses a congruence model of organizational design (Randolph and Dess, 1984; Nadler & Tushman, 1997; Russo and Harrison, 2005) to study how internal process influence organizational performance. The research attention has focused on what components to include in designs and how to evaluate design performance. The assumption is that if a design includes the appropriate components, if the relationships between these components are logically consistent, and if they are congruent with organization goals, then the design will perform well. The main emphasis has been given to "alignment" of the design component that should be deemed "fit" for organizational performance and the greater the "congruence", the higher is the performance of the organization. Over time, organization design research has made progress by becoming more specific in identifying the components to be aligned, more detailed in identifying the criteria for evaluating fits, and broader in terms of the range of rigorous research methodologies used to explore ideas about fit. As a consequence, discussions of organization design have grown more complex (Dunbar and Starbuck, 2006).

Hence, the dynamism of the organization redesign makes the field much attractive towards organization theorists. There are wide scopes to revisit the organization redesign and theorise the concept from different perspective. To summarize, Nystorm and Starbuck (1981) captured the idea perfectly when they said: "a well-designed organization is not a stable solution to achieve, but a developmental process to keep active." The work of Lawrence and Lorsch (1967) suggests that differentiation and integration are two major elements of organizational design. To cope more effectively with the diverse contingencies in their task environment, they must differentiate themselves more efficiently and at the same time strive to coordinate their activities by integrating their operations. Thus, we expect that the more the organization has been able to achieve a closure (the greater the reduction in uncertainty it has been able to effect and the clearer the identification it has been able to make of the crucial contingencies in its environment), the more capable it will be of differentiation, and the more differentiated it is, the more it will strive to use integrative mechanisms (Khandwalla, 1973).

It is necessary to understand the state of differentiation in relation to the properties of environment but we have also understand the relationship between two design mechanism, differentiation and integration in complex organization and ultimately how these are related to organizational performance.

Determinants of Organizational Performance

Performance is the ultimate criterion in the assessment of organizations. Performance measurement is a complex construct as number of factors identified by the decisions makers to assess it. A dynamic model has been developed by R.T.Lenz (1981) to portray the relationship between environment, organization design and performance. Based on the task environment that specified the required output utilizing the

indicated input, firm develop the internal consistency such as division of task, interdependence of the department etc in such a way that it would provide the optimum level of performance in that specified firm sector. The measurement is also time specific. It would be better to strategize in such a way that the process of co-alignment can occur i.e. successful adaptation of environmental change and leads the organization for sustainable development path.

RESEARCH OBJECTIVES

This research study explains the concept of effective firm design/redesign in the Indian context focusing on Chemical; Petro-chemical Process Industry; Agricultural related Industry; Processed Food Industry; Bio-Chemical related Industry. The following issues will be addressed in this research paper: It is important to understand the measures of organization design parameters such as measures of uncertainty, differentiation and integration in relation to those of competitive organizations and the impact of the relative redesign mechanisms on the performance of the organizations. This impact of the organization design parameters on the performance can not be reflected in one mathematical functional form because of the heterogeneity nature of the context in which the organizations operate. Therefore, the first objective is to identify the homogeneous groups. The second objective is to estimate the functional relationship between the design parameters and the organizational performance in case of individual segment of the mentioned sector and also to ascertain the nature of relationship. It is also intended to examine the differences across the segments in respect of the strength of the influence of the design parameters and the organizational performance and also the nature of relationship among the variables considered in the model.

RESEARCH METHODOLOGY

Data

The unit of observation for this study includes the Chemical; Petro-chemical Process Industry; Agricultural related Industry; Processed Food Industry; Bio-Chemical related Industry. The selection of the firms of the specified sector are basically made by the exhaustive study of the Print version of Economic Intelligence Service named Industry Market Size & Shares published by Centre for Monitoring Indian Economy Private Ltd(CMIE). Attempt has been made to cover all the chemical & chemical related industries in the Eastern Region of India. All total 68 organizations of this sector were participated in this study. The top management of those selected organizations was contacted through telephone or email and was requested to provide the appointment stating the objectives of the research. A structured questionnaire has developed based on the model of Prof P N Khandwalla (2001) and Prof A Som(2002). Personal interviews has been made with structured questionnaire with more that one senior executives who had an adequate knowledge of company's history , business strategy, changes in the business environment and the changes with the organization to discuss over the questionnaire and get his/her perception. The final section of the questionnaire contains the tools to measure the performance of the organization. The databases of CMIE of the detailed performance report of the firms are used as the source of performance data of the respective organizations.

Model

Organization design mechanisms are taken as independent variables. From the structured questionnaire, the perception of the respondents on the three redesign mechanism are taken (No. of respondent=175). All the respondents are asked to provide the level of uncertainty for their organizations (it has been indicated as ur12s in the dataset) as well as their close competitor (it has been indicated as ur12c in the dataset) in the rating scale. The ratio of these two values is indicated as relative uncertainty (RUR) and that measure is taken as one of the independent variables. Similarly, all the respondents also indicate the

level of differentiation for their organizations (it has been indicated as dr10s) as well as their close competitor (it has been indicated as 10c in the dataset) in the rating scale. The ratios of the two values in both the cases are named as relative differentiation (RDR). All the respondents are asked to provide the level of integration for their organizations (it has been indicated as ir10s in the dataset) as well as their close competitor (it has been indicated as ir10c in the dataset) in the rating scale and the ratio of these two values is indicated as relative integration (RIR). The relative measures of three design variables (RUR, RDR, RIR) are taken as independent variables to measure the organizational performance. The sales turnover and capital employed ratio of each organization is taken as performance measures and that is indicated as TRNCAPE in the dataset. That value is taken as dependent variable.

ANALYSIS

Analysis –Stage I

The objectives of the section are stated as follows:

- Formation of the two clusters based on design parameters, RUR, RDR and RIR and based on these two clusters, the discriminant function has to be estimated. Finally, the discriminant score has been obtained through this.
- In this way, the functional relationship between performance and three design parameters is modeled in terms of performance parameters and the discriminant scores reflecting the effect of three design parameters. And, hence the situations can be shown in the two dimensional space, one dimension being performance measures (TRNCAPE) and the other discriminant scores.

The scatter diagram is subjectively categorized into three segments on the basis of TRNCAPE & the discriminant scores. After having segmentation, attempt has been made to estimate the relationship between the performance measures of the organization with the organization design mechanism. These three categories of industries are formed subjectively so as to estimate consistent regression equation

Analysis- Stage II

The three categories of industries are formed subjectively based on the scatter diagram. Now the objectives of the section are as follows:

- The three groups are distinct in respect of the parameter such as sales turnover and capital employed ratio (TRNCAPE), Profit after Tax (PAT) etc. The value of TRNCAPE is greatest in the case of Group III, followed by the value in Group II, and it is the least in the case of Group I. The same trend is observed for the other key financial parameter, PAT, also.
- Regression analysis has been performed directly considering financial performance turnover/Avg. Capital Employed [TRNCAPE] as dependent variable and the three design parameters relative uncertainty (RUR), relative differentiation (RDR) and relative integration (RIR) as independent variables. In this case, the problems of multicollinearity emerge.
- To get rid of this, factor analysis is performed and the regression analysis is performed based on three factors F1, F2 and F3.

Development Of The Model

Regression analysis has been performed to analyze associative relationship between a dependent variable (TRNCAPE) and three Factor Scores that are completely represents the redesign variables RUR, RDR and RIR. The summarized results are given in the following table (ref Table I).

Table I: Summarized Results of Coefficients of Factor Score and Group

	Case I [Group I]	Case II [Group II]	Case III [Group III]
Constant	1.230	2.170	3.907
Regression Factor Score 1[F ₁]	-0.153 (0.092)	-0.513* (0.118)	-1.286* (0.303)
Regression Factor Score 2[F ₂]	0.175 (0.092)	0.471* (0.118)	0.595 (0.303)
Regression Factor Score 3[F ₃]	0.453 * (0.092)	-0.04 (0.118)	0.795* (0.303)
R Square Value	0.837	0.762	0.742

The figures in the brackets indicate the standard error value. * Statistically significant

Mathematical Model of Group I

$$\text{TRNCAPE} = \beta_0 + \beta_3 F_3 \text{----- (I)}$$

From the output, the above equation can be written as:

$$\text{TRNCAPE} = 1.230 + 0.453 F_3 \text{----- (I A)}$$

$$\text{TRANCAPE} = 1.230 + 0.453 F_3$$

$$\text{TRANCAPE} = 1.230 + 0.453(1.66x \text{RUR} - 1.412x\text{RDR} + 4.865x\text{RIR} - 5.41)$$

$$\text{TRNCAPE} = [-1.22 + 0.75x\text{RUR} - 0.639x\text{RDR} + 2.20x\text{RIR}] \text{----- (II)}$$

6.3 Mathematical Model of Group II

$$\text{TRNCAPE} = \beta_0 + \beta_1 F_1 + \beta_2 F_2 \text{----- (III)}$$

From the output, the equation (IV) can be written as:

$$\text{TRNCAPE} = 2.170 + (-0.513) F_1 + (0.471) F_2 \text{----- (IIIA)}$$

$$\text{TRNCAPE} = 2.170 + (-0.513) \times [3.42 \times \text{RUR} - 0.029 \times \text{RDR} + 1.393 \times \text{RIR} - 5.289] + (0.471) \times [-0.0415 \times \text{RUR} + 2.462 \times \text{RDR} - 1.369 \times \text{RIR} - 1.2317]$$

$$\text{TRNCAPE} = [4.303 - 1.769x\text{RUR} + 1.174x\text{RDR} - 1.359x\text{RIR}] \text{----- (IV)}$$

Mathematical Model of Group III

The equation of the regression model becomes:

$$\text{TRNCAPE} = \beta_0 + \beta_1 F_1 + \beta_3 F_3 \text{----- (V)}$$

From the output, the equation (VII) can be written as:

$$\text{TRNCAPE} = 3.907 + (-1.286) F_1 + (0.795) F_3 \text{ ----- (VA)}$$

$$\text{TRNCAPE} = 3.907 + (-1.286) [1.754 \times \text{RUR} + 0.61 \times \text{RDR} + 1.11 \times \text{RIR} - 4.154] + (0.795) [0.436 \times \text{RUR} - 1.846 \times \text{RDR} + 6.15 \times \text{RIR} - 4.882]$$

$$\text{TRNCAPE} = 5.368 - 1.908 \times \text{RUR} - 2.251 \times \text{RDR} + 3.463 \times \text{RIR} \text{ ----- (VI)}$$

CONCLUSIONS

The results of the regression model for three groups are summarized as follows (ref Table II) for detailed analysis of the impact of design parameters on the performance of the organizations.

Table II: Representation of results of Regression Analysis

	Group I	Group II	Group III
No of Organization	10	15	14
No of Respondents	25	37	54
R Value	0.814	0.871	0.802
R-Square Value	0.663	0.759	0.643
Constant	-1.22	4.303	5.368
Coefficient of Uncertainty(RUR)	0.75	-1.769	-1.908
Coefficient of Differentiation (RDR)	-0.639	1.174	-2.251
Coefficient of Integration (RIR)	2.20	-1.359	3.463

The above discussion clearly indicates that all the redesign variables such as relative measures of uncertainty, relative measures of differentiation and integration have an impact on organizational performance and R-square value of these three cases are significantly high. The relationship between organizational performance and design mechanisms has been established. The specific sector has confronted with significant pressures of liberalization and the organizations have to redesign their organization structure to be fit in the changed market environment. The differentiation mechanism proves to be important parameter to explain the performance of the organization. The integration mechanism also becomes the key parameter to influence the performance of the organization.

The organizations are subjectively segmented into three groups and the redesign mechanisms such as RUR, RDR & RIR has an impact on organizational performance. The regression equation that has developed in the three cases has the coefficients to indicate the extent of correlation with the dependent variables with independent variables. The coefficient values of design parameters are indicative of the impact of design mechanisms on the performance of the organizations of the respective sector. The results of regression analysis indicate that the degrees of importance of the design mechanisms on the performance of the organizations of each of the three sectors are quite different. It is quite interesting that organizations of these three sectors have to face the business environment quite differently. Their restructuring mechanisms also vary from one sector to another. So, those three groups have to formulate the three redesign strategies in different ways for superior performance. The detailed discussion has been made in the next section to explain the importance of the design mechanisms on the organizations of the three individual groups separately.

ACKNOWLEDGEMENT

The authors are thankful to Prof. Ananda Mohan Pal, Head-Department of Business Management, University of Calcutta for going through an earlier draft of the paper and giving his critical comments. The authors wish to express their gratitude to their respective organizations, namely, University of Calcutta and School of Management Studies, Techno India for all kind of support provided for the entire effort.

BIOGRAPHY

Arabinda Bhattacharya has been teaching in the Department of Business Management as an Associate Professor for the last 36 years. He has completed his M.Stat from the Indian Statistical Institute in 1974. He obtained M.Phil. in Economics from the Centre for Development Studies, Trivandrum affiliated to Jawaharlal Nehru University, New Delhi. He has also done FDP in Management from Indian Institute of Management, Ahmedabad. His research interest is in the area of Organization Behavior, Market Research. [Email: ara_bha@yahoo.co.in]

Amit Kundu has been associated with the School of Management Studies, Techno India as an Assistant Professor, since June, 2006. He has also been associated with the corporate world. Previously he was Business Development Executive of Consulting Engineering Services (India) Private Limited. Still he is associated with them as Consultant in the areas of marketing strategy, market research study, feasibility analysis, project planning and implementation. He has completed his B.Tech in Food Technology and Bio-chemical engineering from Jadavpur University, Kolkata and obtained his MBA from Bengal Engineering and Science University. His research interest is in the area of Organization Design and Performance, Quality standards in Food and allied industries. [Email: amit.kundu74@gmail.com]

CORPORATE CHIT FUND: AN ALTERNATIVE SHORT TERM FUNDING SOURCE FOR MICRO, SMALL AND MEDIUM ENTERPRISES (MSMEs)

S S N Raju Indukoori, IMT Nagpur

ABSTRACT

Short-term funding is one of the key areas for a company to meet liquidity and survival issues which needs instant money without any tedious documentation and other processes. Chit fund is one of the Indian financial engineering products which fulfilled the short-term borrowing and investing needs of individuals and small enterprises which also has the potential to serve corporate working capital requirements and parking idle funds. Being a successful and innovative tool for short term investing and borrowing requirements it failed to receive the attention of academic fraternity, commercial enterprises and finance houses to make it applicable in the corporate world. This paper looks into costs, benefits and valuations aspects of chit fund to know the feasibility of chit fund in the corporate world.

JEL CODE: G 20, G23, G 32.

KEY WORDS: Auction, Bidding, Cost of Bidding, Dividend

INTRODUCTION

It is similar to a mutual benefit schemes or a kitty party. It is also known as chitty, cheety, kuri and boli. It can be defined as a series of financial transactions for mutual benefit of organized members through the status of “association of persons” with and an agreement between each member of the fund and the foreman who is the initiator, organizer and caretaker of the fund. Chit fund is organized with foreman as the key person in initiating, operating and settlement of funds for every month. It has a limited number of members or subscribers including foreman. The chit fund exists for a period of time usually in multiple of months. In terms of its objectives and association it is similar to Rotating Savings and Credit Association (ROSCA) in USA and other countries.

It is the most ancient system of lending and borrowing needs even before banking. It is as old as agriculture in India which originated as self-help among small farmers with grains. After the development of banking system chit fund lost its identity as lending and borrowing tool. Modern chit fund had unique influence in south India as an alternative savings tool known to every house hold. The turnover of chit funds in India in 1986 was Rs 81.6 billion and it grew for the later decades. ‘Model Chit Fund’ was the first company to launch one crore rupees chit fund for companies for their short term funding.

Theory And Practices Of Chit Fund Bidding

The chit fund has ‘n’ members making ‘n’ months for the chit fund, which means the number of members result in number of months. Chit amount, duration and number of members are pre-determined. Once the target number of members is met, the chit fund gets started. For ‘n’ months all ‘n’ members compete to take the chit value through bidding ‘b’ except for the last month as only one member would be left. Chit members meet every month on a date and day mentioned by the organizers for all the months. One of the members would be eligible to take the chit amount every month through bidding. Auction would be invited from all the members to take the chit fund. The auction is for the discount amount on the chit fund. Whoever bids highest for the discount amount he/she would be awarded with the net chit value (NCV). The auction sets the platform and competition to lose more. The probability of an option varies

from $1/n$ in the first month to $1/(n-i)$ in the $(n-i)$ month where i is the number of month of auction. The successful bidder cannot participate in the later auctions. Bid amount is to a minimum of 5% and maximum is decided based on the nature of members and demand for the chit fund which may range from 30% to 40% of the chit value. In case there is more than one member willing to bid for more than cap percentage, lots are drawn for all the interested members willing to take nearest month chit fund. The bid amount would be high in the initial months and low in the last months. All members have a common objective to maximize dividend if not participating in bidding or minimize the bid if participating in bidding. The bid value 'b' is distributed to all 'n' members equally (b/n) . But the distribution of the bid is net of commission 'c' taken by the organizer or chit fund company $(b-c)$ making the net distribution as $(b-c)/n$. The subscribers or members have to pay the subscription amount less the discount amount equated to all the members. Corporate Chit fund is basically borrowers oriented and designed to meet corporate borrowers' requirements. Borrowers are the members who are in desperate need for funds in a specific month and are willing to take higher cost of borrowing. Chit fund is more relevant and important source of funding for Micro, Small and Medium Enterprises (MSMEs) due to the fact that all banks doesn't give easy loans to MSMEs as they don't have good track record and proper accounting system. Borrowers would get full amount of the chit after bidding without any deductions or charges.

Most of the MSMEs rely on bank credit or hand loans for their short term capital requirements which consume more processing time at high cost of capital due to the urgency of for capital needs which arises without any notice demanding the firms to raise funds within few weeks or a month. Chit fund provides a wonderful opportunity for MSMEs to take the benefit of instant and easy access to short term funds. Most of the MSMEs find difficulty in finding the lender as there is always a scope for mismatch between the lender principles and borrower's needs. Corporate chit fund will be a potential alternative to short-term loans taken by MSMEs from Commercial banks and Non Banking Financial Company (NBFC). The cost of borrowing and time consumed to process a single loan is tedious which may hit the business operations sometimes it effects survival of the business. Compared to other traditional borrowings chit funds have low cost of borrowing, flexible monthly payments and choice of borrowing or remain invested. In India First enactment on chit fund was made before independence in 1914 by government of Travancore. Andhra Pradesh was the first state after independence to pass an act on chit fund in 1973 followed by Karnataka in 1984. Currently all the chit funds are regulated directly by Registrar Chits in respective states. Central government introduced an act on chit fund in 1982. In addition to governments acts chit fund also comes under 'Transfer of Properties Act' Sec 69.

Chit funds are also regulated by RBI as they come under NBFC category of RBI. Joint Registrar of Chits (JRC) is a statutory body to control chit fund companies and safeguard the interests of the subscribers of the chit fund. The company should have commencement certificate from JRC to start a group. Chit operator has to file regular returns with JRC. For each fund the chit fund company has to deposit Fixed Deposit Receipt (FDR) with a bank favoring JRC as security which can be withdrawn after the closure of the particular chit fund of the company. In case the chit operator bankrupts all the FDRs and immovable properties of the chit fund company or operator are taken over by JRC and distributed to the subscribers of the chit fund according to the chit fund act.

LITERATURE REVIEW

As interpreted by Simon Rottenberg (1968), the methods to arrive at bid value and the factors influencing the bid value depends on chit members' capacity to distinguish the relative values of different outcomes. These differentiating values and outcomes influence the cost of bidding. Besley Timothy, Stephen Coate and Glenn Loury (2002) provided inputs on the value of chit fund in terms of bidding and borrowing lies between need for short term funding and choice to remain till the last month of the chit tenure which has pure economic sense which drives the members to compete in bidding.

In the working paper of Preethi Rao (2007) it was evident that the chit fund is serving all the classes of borrowers including individuals and small scale enterprises fulfilling personal and business needs. Chit fund industry needs stringent regulation on unorganized sector to transform them to organized sector. Tight regulation on unorganized sector is beneficial to government in generating revenues and also ensures safety and security to all the members. Government should be liberal with organized chit fund industry which contributes to the growth of the industry and pulls more variety of borrowers including companies.

DATA & METHODOLOGY

To arrive at cost of bidding of SMSE's chit fund and other issues related to a chit fund, six chit funds of three different chit fund companies were considered which had tenure of twenty five months and fifty months. To exemplify the method of calculation one of the chit funds with following details in Table 1 is chosen. The chit fund started in September 2007 and ended in the month of October 2011 for fifty months. Considering the exchange rate of Rs 50 per US Dollar the rupee value is converted into US Dollar value.

Table 1: Chit fund details

Chit Fund Company	Margadarsi Chit Fund Limited.
Subscriber	Medium Scale Enterprise
Chit Value	Rs 2,500,000 / USD 50,000
Gross Monthly Installment (GMI)	Rs 50,000 / USD 1,000
Bid Cap	35%
Bid Cap Months	10 Months
Method of Bidding	Auction
Auction Day	2 nd Sunday of every month.
Commission	5% of the chit value (Rs 125,000 / USD 2,500).

This table provides all the details of a chit fund needed for data analysis. The members or the subscribers of Margadarsi Chit Fund, Vishakhapatnam, India are the sources of data. They provided monthly statements as well as consolidated sheet of the chit fund at the end of the fund's term for the purpose of data analysis.

To have a comparison of cost of bidding and cost of borrowing for MSMEs from commercial banks, the repo rates of Reserve Bank of India (RBI) for the period matching with chit fund tenure are taken.

Bid Value Determination

The amount of bidding is based on the firms need for capital requirements and accordingly expected cost of bidding. The discounted value (present value) of the chit fund for the remaining number of months with a given cost of bidding should be the criteria to go for bidding which may differ from member to member and month to month. Following is the equation depicting cut-off for bidding.

$$\text{Bid Price} \cong \text{Chit Value} - \text{Net Chit Value}$$

$$\text{Net Chit Value} \geq \text{Present Value of the Chit Fund}$$

$$NCV \geq PV_{CF}$$

$$NCV = \text{Chit Value} - \text{Bid Price} \quad (1)$$

Bidding Price Calculation: To arrive at cost of bidding for every month, the IRR approach is used. It equates Net Chit Value (NCV_n) at the end of chit term i.e. Rs 2,375,000 with compounded (NCV_i) for a month using the following equation.

$$NCV_n = NCV_i(1 + k)^{n-i} \quad (2)$$

Rs 2,375,000 = NCV_i This model is useful for bidders to arrive at required rate of return and target bid amount before participating in auction. The model to arrive at cost of bidding in this study helps the existing chit members of a chit fund to know the expected cost of bidding for a given NCV and target bid amount. It also helps to make a decision on choice of chit fund and traditional alternatives for short term funding based on historic cost of bidding calculations.

Dividend Calculation: Bid value which is net of commission to the company is equally distributed to all the member for the respective months is termed as dividend

$$Dividend = \frac{Bid\ Value - Commission}{Total\ Number\ of\ Members} = \frac{Net\ Bid\ Value}{Total\ Number\ of\ Members} = \frac{NBV}{n} \quad (3)$$

UMI Calculation: Unequaled Monthly Installment (UMI) is the net of gross monthly installment (GMI) and dividend. UMI is calculated after deducting the dividend from GMI represented in the following equation.

$$UMI = GMI - Dividend \quad (4)$$

As an alternative to equation (1), the dividend can be calculated as the net of GMI and Unequaled Monthly Installment (UMI) which can be expressed as

$$Dividend = GMI - UMI$$

Umi Irr

To have a fair idea on monthly change in dividend, monthly IRR is calculated by equating Rs 50,000 with compounded value of UMI for a given month using the following equation.

$$GMI = UMI_i(1 + k)^{n-i} \quad (5)$$

Rs 50,000 = $UMI(1 + k)^{n-i}$ Return on chit fund to an investor is calculated by using Internal Rate of Return (IRR) approach which equates the compounded value of all UMIs to net chit value (NCV_n) to be received at the end of the chit term. The equation is stated as follows

$$NCV_n = \sum_{i=1}^n UMI_i(1 + k)^i \quad (6)$$

The sum of compounded value of all individual UMIs is equated to the Net Chit Value (NCV_n) at the end of chit term i.e. Rs 2,375,000 (Rs 125,000 commissions is deducted from chit value). We substitute Rs 2,375,000 for NCV_n in equation (3) to get UMI IRR as follows.

$$Rs\ 2,375,000 = \sum_{i=1}^n UMI_i(1 + k)^i$$

RESULTS AND DISCUSSIONS

The results of the analysis of the data are presented in Table 2. The results show monthly bid amount, NCV, dividend and UMI for respective months in each row represented with a month number, name and year. The cost of bidding (2) in borrowers' perspective and UMI IRR (5) in investors' perspective and are calculated for the respective months. Cost of bidding through equation (2) is the primary proposition in this model and the mean cost of bidding for all months is calculated to arrive at an indicative cost of

bidding for a chit fund which can be compared to other fund of the same chit fund company or other company. Similarly Monthly UMI IRR through equation (5) is indicative and has no significance in this model. UMI IRR through equation (6) is the significant calculation in this model.

Cost of Bidding

According to equation (6), equating the net chit value of Rs 2,375,000 with the sum of all fifty compounded UMIs we get an IRR of 4.31%. It means a subscriber who didn't bid for NCV in any of the fifty months and waited till the end of the fiftieth month to receive Rs 2,375,000 by paying all the UMIs got an IRR of 4.31%.

Mean Cost of bidding of all months = 5.95% Using equation (6) UMI IRR = 4.31% All the equations proposed from equation (1) to equations (6) are applied on the chit fund data available and interpreted in this table. Respective equation names and numbers are labeled in the column heads. Cost of bidding (equation (2)) in column 5 and UMI IRR (equation (6)) at the foot of column 8 are the important calculations in borrower and investor point of view of a chit member.

Table 2 gives the list of cost of bidding in the fifth column which is relatively higher in the initial months up to twelfth month and came down to lowest in the mid of the chit fund term. It was zero in the last five months as there are no active bidders for the NCV. The same movement is represented in the following figure 1. Zero IRR for first and fifth month indicate that the chit value is taken by the chit fund company without any bidding.

Figure 1: Cost of Bidding

The above figure shows the movement of monthly cost of bidding for the fifty months chit fund. The cost of bidding in percentage is shown on Y axis and number of months is represented on X axis.

The cost of bidding and UMI IRR are calculated for other chit funds and tenure between September 2007 and October 2011 using the same method. The summary of results with tenure, UMI IRR and mean cost of bidding are interpreted in the following table 3. The results showed different UMI IRR and mean cost of bidding for 25 month and 50 month tenures but they are similar in the same tenure. The mean cost of bidding is approximately 6% for 50 month tenure and 4.5% for 25 month tenure.

Table 3: Summary of Cost of Bidding in various chit fund companies and terms

#	Chit Fund Company	Term / Tenure in Months	UMI IRR in %	Mean Cost of Bidding in %
1	Shriram Chit Fund	50	4.24	5.79
2	Shriram Chit Fund	25	3.14	4.36
3	Margadarsi Chit Fund	50	4.31	5.95
4	Margadarsi Chit Fund	25	3.11	4.29
5	Kapil Chit Fund	50	4.39	6.12
6	Kapil Chit Fund	25	3.16	4.48

This table shows the summary of tenure, mean cost of bidding and UMI IRR of 3 different companies with twenty five months and 50 months tenure each.

Cost of Bidding vs Cost of Borrowing

The lending rates of commercial banks vary from one bank and they are bench marked to repo rate of Reserve Bank of India (RBI) making bank lending rates to fluctuate continually. Lending rates are well above the repo rate and are usually spread between 2% to 3%. As a mean of the given range, 2.5% is considered as the spread to arrive at commercial banks' lending rate which is referred as hypothetical cost of borrowing in Table 4. Further this cost of borrowing is compared to cost of bidding.

Table 4: Comparison of Cost of Bidding and Cost of Borrowing

Month & Year	Cost Of Bidding	Repo Rates	Hypothetical Cost of borrowing	Month & Year	Cost Of Bidding	Repo Rates	Hypothetical Cost of borrowing

The comparison of cost of bidding and hypothetical cost of borrowing by MSMEs for 50 months is shown in this table from Sep 2007 to Oct 2011. Note that the hypothetical cost of bidding is based on RBI's repo rate.

The study showed that the cost of bidding and the cost of borrowing from commercial banks have no correlation indicating the cost of bidding is according the need for funds within the members rather than prevailing market interest rates. Following figure 1 shows the trend lines of cost of bidding and cost of borrowing with their respective volatility for fifty months.

CONCLUDING COMMENTS

This paper worked on analysis of costs and benefits of SMSEs chit fund when compared to the cost of borrowing from various commercial banks. Major findings from this study are that the cost of bidding is less than the cost of borrowing for all the months of the chit tenure and cost of bidding for the same period is not influenced by the prevailing lending rates of commercial banks. Chit funds can be utilized for short-borrowing options for private and public limited companies as corporate chit fund. This transformation needs transparency, tight regulation and liquidity for the existing and prospective members. Tight regulation in the lines of RBI or SEBI in India would be a boost to the corporate world in mobilizing short term funds through chit funds. Indian Corporate chit fund model can also be introduced as a new tool or as a transformation of ROSCA to corporate chit fund in USA and other countries with

further research in the respective countries to arrive at feasibility to fit into the unexplored corporate dynamics in the process of short term funding.

Figure 2: Cost of Bidding and Cost of borrowing

Comparison of cost of bidding and cost of borrowings of MSMEs is represented in the above figure for the chit fund tenure of fifty months i.e. from September 2007 to October 2011.

XP PROJECT PERFORMANCE MANAGEMENT VIA STATISTICAL EVA

Wei Lu, Duke University

Li Lu, University of Electronic Science and Technology of China

ABSTRACT

As an important project type of Agile Software Development, the performance evaluation and prediction for Extreme Programming (XP) project has significant meanings. Targeting on the short release life cycle and concurrent multitask features, a statistical earned value analysis (SEVA) model is proposed. Based on the traditional concept of earned value analysis, the SEVA model introduced Elastic Net regression function and Laplacian hierarchical model to construct a Bayesian Elastic Net model fitted for project performance evaluation and prediction. The model is demonstrated with the JAX Laboratory software development project data. With simulated coefficients estimation, we realized an empirical data support for project performance assessment.

INTRODUCTION

There has been growing tendency for the usage of the Agile Software Development paradigm these years, due to its claimed lower costs, better performance, productivity, business satisfaction features by Mishra (2011). This paradigm can be applied to supply chain management (SCM), a complex software development project. Considering its wide scope and complex requirements, predictable models for software development process cannot be used. Targeting such problems involving variability and uncertainty, agile methodologies are adaptive rather than predictive. Thus, for project management, how to evaluate and manage the process performance aiming this development mode is an important issue.

Project Management Body of Knowledge (PMBOK), presented by U.S.A Project Management Institution (PMI), regards earned value management as a key method for project performance management. By conducting progress and cost analysis through Schedule Performance Index (SPI) and Cost Performance Index (CPI), this method is effective conditioned on two premises: first, earned value is convenient for acquiring and estimating, such as engineering project instance, completed progress's proportion of the total work amount would be easier to estimate; second, the ultimate goal of the project is relatively fixed, which would make the earned value estimation benchmark more constant. For Extreme Programming (XP) software project, the difficulty for spreading the application lies in the earned value determination during the process. Especially due to the variability of targets on a later stage of the project, the determination of earned value seems more difficult.

Kim and Reinschmidt (2011) proposed a probabilistic cost forecasting method based on self-adaptive inside view (the bottom-up estimate), combining with outside (top-down) view of project cost estimates using Bayesian inferences and model averaging technique. During the execution phase, through incorporating actual predictive performance and pre-project cost estimation modification, this method can sufficiently use available prior information. Its precision is high under the condition of linear cumulative cost curve, but models with highly nonlinear features will affect its suitability.

In this paper, we introduced a concept of statistical earned value analysis (SEVA). Targeted on the concurrent features of short release cycle, programming, test, and maintaining units for software extreme programming, an analytical model is proposed. This model is able to combine the data of project implementation process with Bayesian theory, and conduct posterior analysis according to the nonlinear characteristics, thus provide timely performance evaluation data analysis to project manager.

The paper's structure includes a short introduction to EVA, then an explanation of the Bayesian Elastic Net model followed by a description of the statistical inference methods employed. The project case used is illustrated; subsequently, the analytical results are presented.

METHODOLOGY

The nature of the XP problem is shown in Figure 1; from which we can see that the prophase and interim performance prediction analysis, with the prophase performance benchmark obtained at early stage, will gradually be adjusted during the development process when performance information and clearer project requirements are gathered from clients and developers.

Figure 1: Performance evaluation and prediction before and after requirements change

This figure shows the idea behind XP project where darker bars indicate expected performance while lighter color bars are performance evaluations after requirements change

Considering the differences between base and empirical performance for XP projects, the life cycle data is regarded as having truncated features. That is to suppose that only partial life cycle of subroutine individual (explicit requirement) is less than certain value, while the residual potential demand development time exceeds certain value. Since distinct truncation will lead to differences, the SEVA methods are based on Bayesian survival analytical theories. Using Elastic Net method and MCMC steady-state simulation method or variational Bayesian (VB) inference algorithms as derived by Park and Casella (2008), we constructed project Bayesian survival analysis model, in order to solve the difficulties of high dimensional numerical integration. By constructing XP project life period regression model, the influence of environmental and target conditions variability on the project performance is effectively reflected. The key steps for this analytical model, which are derived in detail by Chen, Carlson and Zaas (2011) are as follows:

Step 1: Construct Elastic Net regression target function to solve multi-linear problem as a substitution of Principal factor analysis;

$$\hat{\beta}(\text{Naive ENet}) = \arg \min \|y - X\beta\|_2^2 + \lambda_1 \|\beta\|_1 + \lambda_2 \|\beta\|_2^2 \quad (1)$$

This is the naïve elastic net criterion, which can be viewed as a penalized least squares method and a convex combination of the lasso and ridge penalty.

Step 2: Construct Laplacian Hierarchical Model with the following Laplace prior form;

$$\begin{aligned} p(\beta|\tau, \gamma) &= \prod_{j=1}^p \frac{\sqrt{\gamma_j \tau}}{2} \exp(-\sqrt{\gamma_j \tau} |\beta_j|) \\ &= \prod_{j=1}^p \int N(\beta_j; 0, \tau^{-1} \alpha_j^{-1}) \text{InvGa}(\alpha_j; 1, \frac{\gamma_j}{2}) d\alpha_j \end{aligned} \quad (2)$$

Step 3: Construct the complete Bayesian Elastic Net Model. A Gamma prior is imposed on each individual γ_j to avoid tuning;

$$\begin{aligned} \mathbf{y} &\sim N(\mathbf{y}; \mathbf{X}\beta, \tau^{-1}I) \\ \beta_j &\sim N(\beta_j; 0, \tau^{-1}(\alpha_j + \lambda_2)^{-1}) \\ \tau &\sim \text{Ga}(\tau; c_0, d_0) \\ \alpha_j &\sim \eta(\alpha_j / (\alpha_j + \lambda_2))^{\frac{1}{2}} \text{InvGa}(\alpha_j; 1, \frac{\gamma_j}{2}) \text{Ga}(\gamma_j; a_0, b_0) \end{aligned} \quad (3)$$

Where η is a normalizing constant, and λ_2 is a parameter tuned by cross validation.

Step 4: Put forward the specific hyper-parameters of fully extended model.

$$\begin{aligned} p(\mathbf{y}, \beta, \tau, \alpha, \gamma) &\propto N(\mathbf{y}; \mathbf{X}\beta, \tau^{-1}I) \text{Ga}(\tau; c_0, d_0) \\ &\times \prod_{j=1}^p N(\beta_j; 0, \tau^{-1}(\alpha_j + \lambda_2)^{-1}) (\alpha_j / (\alpha_j + \lambda_2))^{\frac{1}{2}} \\ &\times \text{InvGa}(\alpha_j; 1, \frac{\gamma_j}{2}) \text{Ga}(\gamma_j; a_0, b_0) \end{aligned} \quad (4)$$

Case Analysis

A case study of software development at JAX Laboratory is presented in this section. This is a comprehensive system development project which requires data preprocessing, singular value decomposition (SVD), single-locus regression, Extreme Value Decomposition (EVD) test, pair-wise linear regression analysis, error propagation calculation, permutation test and networking construction in a 3-month period. Using extreme programming (XP) mode, this project gradually perfects the identification and range definition of final target. Thus, an EVA method combining with dynamic prediction is required. Due to the uncertainty in initial phases of development, there are several modifications of bench plan during the process requiring prediction analysis to determine the best action strategy. Here, we use character A-J to represent each step of JAX project. Each of them contains about 50 activities. Performance analysis is conducted on a daily basis. By adopting statistical earned value analysis (SEVA) methods, we applied Bayesian posterior model to performance prediction. Based on Bayesian Enet model presented in the previous section, SEVA results during the project implementation process are shown in Table 1.

Table 1: Statistical earned value analysis during the project implementation phases

A	B	C	D	E	F	G	H	I	J
0.077	0.096	0.161	0.064	0.161	0.096	0.080	0.064	0.125	0.074
0.073	0.091	0.152	0.061	0.152	0.091	0.076	0.061	0.119	0.070
0.073	0.118	0.210	0.085	0.152	0.091	0.076	0.061	0.119	0.070
0.069	0.112	0.199	0.080	0.144	0.087	0.072	0.058	0.113	0.066

This table shows the earned value of each project stage, where A-J represents the steps in sequence.

After simulating with Schedule Performance Index (SPI) and Cost Performance Index (CPI) analysis, we can obtain the project performance evaluation for each stage (Table 2).

Table 2: SPI and CPI analysis during the implementation process

SPI	1.7	3.6	1.5	2.2	0.5	1.4	1.6	2.2	2.9	1.4
CPI	0.5	1.0	1.4	1.9	0.3	1.4	1.8	1.1	3.5	3.2

This table shows the SPI and CPI values of each project stage.

We applied the Bayesian Elastic Net model introduced in the previous section to 12 groups of simulated data, where each group includes 10 earned values of sequential steps A-J. The simulation results are shown in Figure 2. The circles represent our prior expectations of the project performance, while the crosses represent posterior performance estimations. After using five samples for regression coefficient training, we modified our performance beliefs for the left seven samples. From the figure, we can see that the residuals are within acceptable range, which proves the effectiveness of SEVA method.

Figure 2: Performance prediction using Bayesian Enet Model

This figure shows the Bayesian Enet estimation for performance prediction. Circles represent prior beliefs, while crosses indicate the posterior performance values for each simulated sample. The first five samples are used for regression coefficient training, and the last seven ones are used for prediction testing.

CONCLUSION

A unique feature of XP project is its changing target with increasing clarity. This requires a correspondent reliable performance management mode. The SEVA method we proposed in this paper

solves the prediction difficulty occurring in traditional earned value analysis due to constant change of targets. Thus provides an efficient approach for dynamic project prediction and strategy management

DESIGN OF A LOGISTICS MANAGEMENT MODEL FOR SMEs OF TEXTILE MANUFACTURE

Patricia Cano-Olivos, UPAEP
Fernando Orue-Carrasco, UPAEP
José Luis Martínez-Flores, UPAEP
Yésica Mayett-Moreno, UPAEP

ABSTRACT

The world-wide markets opening and consequently the supply chain globalization, demands a structural series of changes to which logistics must answer. Nowadays customers are more demanding and not only do they assess the product quality but also the added value of it; what used to be special services are now standard services this implies to reduce costs in order to be competitive on the market without affecting the quality of the service or product. The logistics is not only important for itself, but also generates a traction effect of the private sector development and the economic growth of the country or region. A supply chain accessible and efficient is a key element for the enterprise; particularly the small and medium compete successfully in the globalization. This investigation is descriptive and uses secondary information which was the base for designed a logistics management model for SMEs that allows integrate resources, abilities and required systems to improve its performance as part of a supply chain.

JEL: L25, M11

KEY WORDS: SMEs, competitiveness, logistic, supply-chain, logistic management models.

INTRODUCTION

Given the constant changes where the markets, the products and the competitors transform so rapidly, organizations can difficultly respond to new circumstances, especially in textile manufacture SMEs in order to maintain a competitiveness level solid enough and sustainable so it can guarantee its survival on the market. One of the biggest problems of SMEs is the formality absence (Díaz, Corona & Mayett, 2012), meaning, the lack of procedures, of a organized structure, of programs and planning, on the other hand the economic development of an enterprise is directly related with its management and effectiveness. Therefore is important that enterprises seek optimization of its logistic management in all the supply-chain, so that they expedite the flow of products and information at the lowest cost. One model of logistic management for SMEs is different from big enterprises, basically for the technological resources used, language, the structure and the culture under which this model operates (Velásquez, 2003).

LITERATURE REVIEW

Several researchers have found out that SMEs generally lack of a formal structure in most of its areas (Díaz *et al.*, 2012; Robles, 2003). Due to its size and the lack of economic resources, it's common that the employees perform more than one activity and many of them haven't got any specialization; it's common to observe the same persons who manage perform financial planning functions, production, personnel management and commercialization, among others. The lack of specialization makes them develop logistic activities of lower level due to the lack of technical knowledge and the incorrect implementation of the concept chain supply (Banco Interamericano de Desarrollo [BID], 2011). The different internal crises which this causes influence its productivity and competitiveness (Daft, 2011; Rodríguez, 2003). Competitiveness is the capacity to attract and withhold investments and talent (Consejo

Ejecutivo de Empresas Globales [CEEG], 2004; Instituto Mexicano para la Competitividad [IMCO], 2010), and the capacity to sustain and increase the market participation with business strategies without sacrifice profits (Hernández, 2000). The structure and organizational processes are the key element to fulfill the activities internal cohesion (Daft, 2011; Jones, 2006); logistics allows to project such activities in an external scenario, visualize the necessary links and activities in order to commercialize the product and increase competitiveness to regional or national level. The logistic activities are the engine and support for new investments in infrastructure for which the logistic integral platforms is a way to connect offer and demand (Secretaría de Economía [SE], 2011) to national and business level. Some experts have proposed integral management models logistics to increase competitiveness on the market.

- ✓ Mexico's Economy Ministry (2011) designed a model which considers 16 capacities, such as; strategy and performance of organization, customer service, processes management, demand administration, supply and purchase, customer order processing, warehouse operation, stock administration, transport, inverse-logistics, merchandise, transport-safety, import process/export, financial capacity, environmental awareness, information systems, data management, organization, personnel and competence.
- ✓ The operations reference model of the supply chain (SCOR-model: Supply - Chain Operations Reference - model) developed in 1996 by *Supply Chain Council of North America*, is a standar which analyze and enhance the performance of the supply-chain of organizations the SCOR identifies mainly 5 processes of management, like planning, provisioning, manufacture, delivery, distribution and return.

The formerly mentioned models are far too ambitious for a SMEs due to its informal structure and the lack of technical knowledge. Other autor and organizations have developed logistics management models based on the specific characteristics of SMEs.

- ✓ Díaz Gómez, García Cáceres and Porcell Mancilla (2008) identified 3 main componets in the supply chain: provisioning, production and distribution. Although they involve all the participants of the supply-chain integration, the autors only study the suceptible parts of cost in it, setting apart the importance of management to improve the logistic performance of the supply-chain.
- ✓ González Camargo, Martínez, Malcón and Cavazos (2012) introduce a logistic management methodology for small enterprises improvement, and identify 5 opportunity áreas, such as provisioning, storing, distribution, customer cost and service. This investigation proposes logistic improvement tools in each area of opportunity which lead to reduce logistic cost, but this is not an integral model.
- ✓ The logistic management model proposed by Velásquez (2003), identifies on first stage production, sales and logistics; the second stage is the materials planning, inventory management and storage of raw material, the purchasing plan and the order placement to the supplier, and the third stage is based mainly on the sales planning and of course the execution of the same. This investigation describes an integral model of logistic management for SMEs, however the model loses integration force when identifies the indicators that a SMEs should have, for they are based in the accomplishing of them in an isolated way.
- ✓ The Policy General Management of Small and Medium Enterprise of Spain (2007) conducted a logistic management model derived from SCOR identifying the following áreas: procurement, production, storage, distribution and transport as well as customer service. This model is designed with the characteristics of SMEs, however the end of this research work is a Manual of best practices in logistics. In the revised models in the literature, some authors make indirect reference to the

importance of internal information flows of logistic management, for this reason the interrelation among the interest areas is weak, which implies a total disintegration of the system.

Proposed Conceptual Model

The present study of descriptive type is based on secondary information which allowed to design a model that eased the integral management of 4 the most important areas for SMEs of textile manufacture: inventory, storage, production and distribution, and the implementation of the tools which will improve the logistic performance of the supply chain.

Figure 1: Proposed model

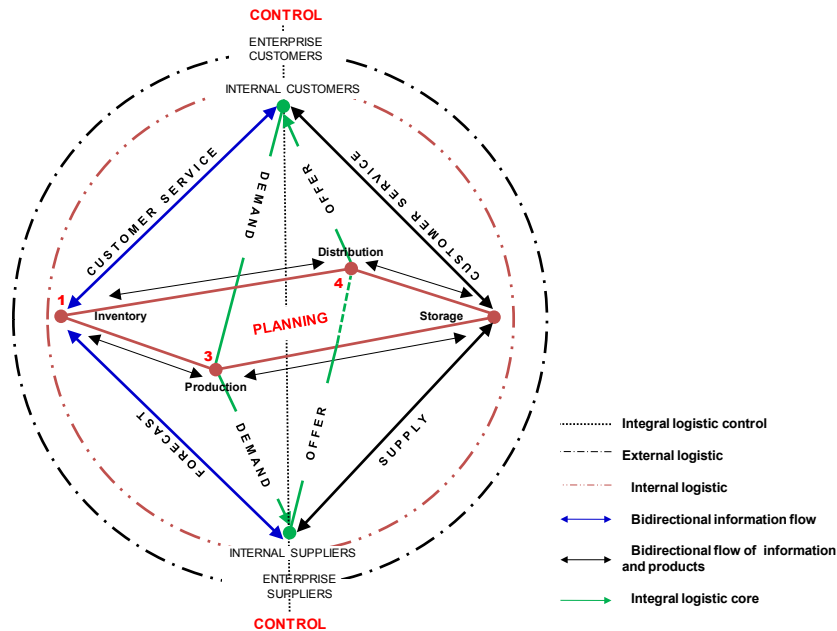

Figure 1 shows a model of logistic management. Source: Authors

This way the model core is the customers and suppliers information synchronized flow and vice versa, which means, the demand which starts in upper octahedron node (internal customers) and the offer in the lower node (internal suppliers) of it. Consequently the forecast demand thru the historical sales and the necessary material supply in the time and indicated place under the approach of just in time, are the support to initiate the planning of the 4 main areas of the model, these at the same time will interrelate, plan and control as an unit to impact directly the customer service level. The principal characteristic of the model is that it should be capable enough to share the key information among all members of the supply chain (from suppliers to customers) to reduce the uncertainty of it, because the decisions made at any vertex of the octahedron will impact all the others.

A production control hybrid system pull/push that operates in the right way and continues combining the advantages of both systems is able to reach a higher level of effectiveness. The push systems are commonly defined with the demand forecast for the materials planning. The pull systems are those in which the quantities of orders are determined based on the real demand. (Hirakawa, Hoshino & Katayama, 1992) The model will function under the approach of a hybrid system push/pull supply chain: for the process of pushing in the chain, this achieved with anticipation of the customer demand which means, warehouse and inventory level must be planned and controlled.

1. Inventory: the purpose of this area is to determine through quantitative models how much and when to require materials.
2. Storage: the purpose of this area is to work under operative regulations to safeguard and control efficiently the raw materials.

The process of pulling in chain is achieved based on the response of customer demand which means, the production and distribution activity level must be planned and controlled.

3. Production: the purpose of this area must function based on a master production program which will have to satisfy the customer demands; time, quantity and quality. It is necessary to identify the necessary tools and feasible to continuous improvement in the implementation of the process of goods transformation and the inventory in process.
4. Distribution: the purpose of this area must have a high capacity of customer response at the lowest cost, this implies to creating value in the supply chain thru the optimization of the inventory level of finished product, and transportation and delivery of the same.

The push/pull system must satisfy the customer in time, place, quality, quantity, service at the lowest possible cost.

CONCLUSIONS

In this investigation propose a logistics management model of the supply chain is of easy implementation for SMEs in the textil sector; for simplicity in each of the areas is very feasible that these companies adopt it as reference to improve logistics performance of the supply chain, since in each of the areas should take advantage of the technical knowledge and experience of human capital, so that they will propose the reachable improvements at a low cost. If this model is adopted by the studied SMEs, it will allow them to face the local and international markets globalization. This model can be transported to any SMEs sector.

MANAGEMENT ACCOUNTING PRACTICES (MAPS) IN ROMANIA SMALL BUSINESS

Ionica Oncioiu, Dimitrie Cantemir Christian University

ABSTRACT

Management Accounting is providing information to managers in a way to control and direct businesses. Traditionally, management accounting is more towards the principle of variance analysis and still used by some of small manufacturing businesses. However, most of the traditional practices are using in conjunction with new management accounting practices (MAPs) such as life cycle cost analysis and activity based costing. Previously, most of the study is more concerned with financial accounting practices with providing information to shareholders and stakeholders of the businesses. In addition, the results of this study are expected to present the current practice level for each management accounting practices and considering a new practice in future as well as researchers believe that the purpose of management accounting practices is crucial in assisting the effectiveness of managing, decision making and controlling process in Romanian small businesses. The aim of this paper is to contribute in bringing more clarity into the question: what is the current status of Management Accounting Practices in Romanian small business?

INTRODUCTION

The role of managerial accounting is very different now then it was a decade ago. This process is known as identifying, measuring, analyzing, interpreting, and communicating information in achievement of organization's purpose and goals. It's also an integral part of the management process, managerial accountants which are important strategic partners in management team.

At various times cost accounting has been driven by financial accounting and the need to supply information on inventory value and costs (Johnson & Kaplan, 1987) and the environment that management accountants work in has changed in the last century therefore traditional economies has moved from a state of mass production to mass customisation (Ross, 1990).

However, Kaplan (1984) has argued that there has been no development of management accounting techniques during the period of 1925 to the 1980s. Furthermore, Atkinson (1987) confirmed a crisis of management accounting profession that has lost relevance in Canada. But, Boer (2000) acknowledges that there is a change in management accounting practice, but is unsure what the change has been to. Thus, researches implement this survey in order to investigate the behaviour of management accounting practices particularly in small business.

LITERATURE REVIEW

They found that traditional management accounting techniques were widely adopted than recently developed techniques. However, most of the companies intended to adopt newer techniques in future especially activity based technique and benchmarking.

In adoption of new and developed techniques, the most important factor is the size of company perhaps since the adoption will be too costly and the changes are too complex. Management accounting practices survey has been conducted by Dick-Forde et al, (2007) and also consists of the importance of management information to management decision making in organization. At present, management is

really focusing on financial accounting report instead the importance of cost management in organization. In fact, the cost management is the one importance aspect in determining the successful of organization operation.

Moreover, the objective of organization perceived management accounting practices are very important to determine. According to Dick-Forde et al, (2007), they found the most important objectives were for the purpose of cost control, cost allocation, pricing decision and cost reduction. Guilding et al. (2005) has suggests that Barbadian companies has some control over the prices they set and as a result seek to manage their profitability through cost plus pricing strategies. Beside the objectives, management accounting practices are for the purpose of information for annual reports, strategic decision making, inventory management planning, planning, performance evaluation and risk management.

IMPACT OF MANAGEMENT ACCOUNTING PRACTICES (MAPS)

A disparity exists among the registration methods used by the traditional accounting that they have its sustenance in a normative that doesn't recognize the intangible participation of certain assets, same that generate wealth, this causes that the entities can lose value when not determining its investment in human capital. Through the pattern it is possible to relate the capacity that they have the human capital and those other active intangible in the generation of economic value in an entity, for it is necessary to recognize the importance of the corporate strategy, the one that in turn you are reflected in the value of market of the action which can be explained starting from their price in more books the components related to the human capital, relational and structural, as well as of the perspective of the economy, of the industry and of the company. The preliminary result of this investigation hurls that the intangible assets such as the human capital according to the steps that are mentioned previously, can be transformed in active tangible that which would become part of the financial states of the company therefore one can say that it interferes in the economic value of the action of the same one. You can identify in the same way in the entities the use that they make of their intangible assets, that their inclination to the one human capital, to the structural capital, or to the relational, allowing to show to the investors and analysts information for the taking of decisions.

The managerial system of the company contains the shaping and exertion of the processes and managerial relations in a certain manner, as to determine the obtaining of high competitiveness. In other words, the managerial system, can be defined as the total of the elements with a decisional, organized, informational, motivational aspect from within the organization, through which is exerted the management process and relation ensemble.

When it comes to them, the elements which compose the informational system greatly mark the running of the managerial instrument. The biggest impact is held by the quality of the information delivered, which, evidently, depend greatly of the characteristics of the procedures, circuits, transfer and informational means.

The data and information represent, accompanied by the decisions as well, the main inputs in the methodical – managing system, seriously limiting its effects generated directly and indirectly. The relations between the informational system and the organization system are both functional and structural-constructive. The entire informational system is held by the organizational structure of the company. Working with the data and information, the operation of the moving of information and the informational procedures, the use of means to deal the information are the result of the tasks, competences and responsibilities exertion of certain managers. Their reasoning has a great impact over all the components of the informational system. Simultaneously, there's a strong influence of the organizational culture over the informational elements. This influence is functional, and is exerted especially over the operational way of the components of the informational system.

By the correlative measuring of the performances, we call upon concepts of competitiveness and competitor advantage. Inevitably, the notion of performance brings to light the efficiency and efficacy, and the indicators of performance acquire a special diversity. Therefore, the obtaining of performances at a company level assumes, directly or indirectly, the revaluation of the concepts of competitiveness, competitor advantage, efficiency and efficacy. Performance is not a simple ascertained fact of a result, but just the opposite, is the consequence of a comparison between result and objective.

The proportions the term “practice” of performance has achieved, led to outline of a new concept, the one of performance management, itself debatable, but justified by the orientations which the stating of performance in the centre of the managerial concerns of the organization gives the present steps and especially to the future ones of it.

Also, performance cannot be defined as a great result obtained in the field of management, economics, commercial which gives characteristics of competitiveness, efficiency and efficacy to the organization and its procession and structural components. Which is particularly interesting are the theory and managerial practice from Romania, the managerial performances, which are absolutely necessary to obtain economic and financial performances in the fields they run.

The unanimous recognized conditions by specialists in this area of scientific concerns are clear: only a performing management, exerted by professional managers, is capable of managerial performances, generated by social, economic, financial performances. For this it is necessary to know the accomplishments of other organizations in the reference fields in order to compare (volume indicators, quantity, as well as efficiency). The pattern gives the rule for a perspective of long term, showing the future possibilities of benefit of the company, developing an entire strategy starting from the intangible ones when having a tool for its installation, what guarantees the coherence between this and the defined indicators.

One can inform about the capacity of the entity to generate sustainable results and of continuous improvement. It is contributed to the improvement of the competitiveness of the entity using for it the diagnosis and the administration of their intangible elements that although they don't appear in the traditional financial states, they contribute in a significant way in the generation of present and future results, for what should be appropriately negotiated, allowing to evaluate through measures quantitative areas that are generally evaluated in base perceptions (human resources, administration of the knowledge, relationship with clients), for what offers the administrators a tool to evaluate their administration. It intends a methodology that allows to develop and I diagnose, identifying the cause through the tools of the administrative theory the possible solutions, indicating the parameters of the before and of the one later. Through the strategic mapped it is demonstrated the value of the activities and processes with the rising increment of the added value. The pattern helps to identify the differentiation of the entity by means of the administration of the knowledge, giving rule to develop a language shared between the entity and the individual. Equally it can settle down that by means of tools like the square of integral control and the systemic focus strategies can be created to go increasing this tangible value in economic use of the action of the company. Therefore, this procedure type will bring a lot of polemic to be able to look for the form of settling down in what it leaves of the financial states you can quantify the human capital, you can conclude that in a future not very distant when this model is implemented in some company she will give as a result that the value of the action based on a part proportional for the human capital will acquire bigger value.

METHODOLOGY

The methodology of research was focused on two directions: first, we tried to identify the elements that constitute the Management Accounting Practices potential from the firm point of view; second we analyzed outlines differentiate results for various participating groups according to the objectives of this paper.

The method was chosen as it is web-based questionnaire and the survey instrument used in this study was a structured questionnaire for the quantitative study. The questionnaire was made up of two parts and it comprises a total of 25 questions. The first part of the questionnaire gathered background information of the respondents from different Romanian SME's, which filled up the questionnaires and representing Management Accounting Practices users. The second part of the questionnaire addressed the scale items related to the social organizations (Management Accounting Practices non-users or indecisive). The variables were measured using multiple items. All of the scale items represented in the survey instrument utilized a five – point categorical rating scale. The anchors used included: a) 1 = not at all, b) 2 = few, c) 3 = partly, d) 4 = good, e) 5 = very good. The online survey system provides a total of 1145 data records.

RESULTS

Based on the scoring results in the questionnaire 54 percent of the participants associated Management Accounting Practices with strategy whereas 34 percent regarded the topic as an additional instrument for corporate management and even 19 percent acknowledged Management Accounting Practices as one of the most important competitive advantages in future. Eleven percent identified a current trend and for another ten percent the topic was yet completely undeveloped. This result indicates a general confession of Romanian SME's to Management Accounting Practices as an important management topic. Considering different sub-groups it is remarkable that micro enterprises assumed with 19 percent an over-average attitude that the topic is only trendy which is intensified with an under-average vote of only 12 percent for the consideration of Management Accounting Practices as a competitive advantage. From those participants considering the topic yet as a completely unimproved land, 82 percent argued that they heard for the first time about Management Accounting Practices in the survey.

The questionnaire survey has demonstrated that 21 percent of all participants committed themselves to the use of Management Accounting Practices, 49 percent were non-users and 30 percent were not sure if it is used in their companies. This is not remarkable because general comprehension expects an increasing willingness for strategic planning and the availability of resources as a function of increasing company size.

The results (figure 1 and figure 2) show that the question “Does the Romanian SME's use Management Accounting Practices?” categorizes the participants quantitatively in Management Accounting Practices users, non-users and indecisive.

Figure 1. Level of Management Accounting Practices users

Figure 2. Level of Management Accounting Practices non-users

According with data the result admits the follow considerations: either the participating Romanian SME's have a different understanding of managing Management Accounting or they are pioneers in Management Accounting Practices yet before large-sized enterprises which appear unreasonable. This result reflects that the importance and relevance of the topic is associated correctly to corresponding functional areas. It leads to the conclusion that Management Accounting Practices users are aware of a proper integration into business.

THEORETICAL AND PRACTICAL IMPLICATIONS

The important effects on Management Accounting Practices in Romanian SMEs which have to be taken in account is the number of channels which have to be considered increases and comes along with a higher speed on building Management Accounting as well as an additional coverage of publicity.

The results of present study leads to the conclusion that all mean values are over-average, which confirms that Romanian SME's have already a considerable level of proficiency in Management Accounting Practices. The well-balanced best practice shows that it is definitely possible for SME's to use Management Accounting Practices in a professional and successful way. Regarding the mean value it is obviously that, beside of the internal dimension, there is a large potential for advanced optimisation. The worst practice shows the example of a company that is mainly market-driven whereas other aspects are regarded of lower priority.

After regarding the influence of Management Accounting Practices obtain with this design, it is useful to confront the expectations of non-users with the experiences of users. As experiences prove that many enterprises introduce Management Accounting Practices as a reaction on a sudden damage of reputation. Practical in the Romanian SMEs case, the Management Accounting Practices is useful to think about an enhanced or modified measurement.

CONCLUSIONS

This study attempts to determine the Management Accounting Practices (MAPs) in Small Business. Beside that, this study will also indicate the most important objective for Management Accounting Practices (MAPs) in Small Business. The result shows most of the businesses have their own used of management accounting practices (MAPs). However, they need to improve their knowledge and skills in accounting in order to increase the usage frequency in management accounting practices. Then, most of the business also preferred to prepare the monthly report for costing and management accounting. This report is seems useful in management for decision making particularly for costing because monthly report is one of accurate and sufficient information. Further, the most preferable usage for Management Accounting Practices (MAPs) are standard costing, annual budget, process costing, cash budget, and fixed/variable cost analysis. The usage of new technique of MAPs application is depends on business transaction and operation because we can assume that the more complicated the operation, the more advances technique or approach needs to be implemented in order to confirm their efficiency.

The originality value of this research are: considerations regarding the role of Management Accounting Practice (MAP) as a pivotal instrument to support management in changing organizations and actual concerns regarding the maintain Management Accounting of Romanian SMEs for measure progress because there is no control to anticipate concerted activities or step in if requested.

This study confirmed that the use of Management Accounting Practice (MAP) in Romanian SMEs improves the exchange with all stakeholders and enhances the knowledge of stakeholder needs. Management Accounting Practice (MAP) users have a high contact rate with their environment and work intensively on business improvements.

Finally, the results also show that the most importance objective perceived for each Management Accounting Practice (MAP) are pricing decision, cost control and reduction, planning and budgeting and cost allocation. This objective perceived importance to business in order to confirm the advancement of management accounting practices.

So, the Romanian SMEs must be opened for external support in Management Accounting Practices and is better to create a measurement system referring to six beneficial aspects regarding this concept: internal, financial, market, public relations, political-legal and online. Due to the fact that Management Accounting Practices influence all dimensions and is the most important theme today.

Management Accounting Practices (MAPs) in Small Business is a phenomenon which exists and it is helpful to know that the work is dealing with socially constructed interpretations of people and companies. Moreover, the Management Accounting Practices in Romanian SMEs is subject to permanent changes and is influenced by individual perception.

DEVELOPMENT OF STRATEGIC PARENTING MODELS IN SMALL HOLDING COMPANIES: A RESEARCH AGENDA

Ralph Winkelmolen, Herder Implementos e Maquinas Agricolas Ltda
W. Christian Buss, Temple University

ABSTRACT

Goold & Campbell (1994) were one of the first to develop guidelines on how a holding company can build a portfolio of businesses using their parenting advantage model. The parent company is an independent company whose role is to create value its subsidiaries. If the parent lacks the capability, or if another owner could add more values, the original parent should consider selling the subsidiary. This paper examines three parenting frameworks including the Strategic Planner, the Strategic Controller and the Financial Controller. The Strategic Planner model exists when the parent has a significant influence on the strategy and planning of the subsidiary. The Financial Controller model occurs when the parent focuses on the financial performance and control of the subsidiary. The Strategic Controller parent balances the other two roles. Research has been done on strategic parenting in large holding companies, but less is known about the normative and theoretical behaviour of small holding companies. This paper recommends research on this topic and lays out a preliminary research agenda.

KEYWORDS: conglomerate management, business-parenting models, parent company, holding-company theory

INTRODUCTION

During the 1960's and 1970's, corporate conglomerates emerged in the financial the market place. Many became a new kind of holding company that functioned as a center of control for a group of related or unrelated subsidiaries. The focus of many corporate holding companies was on enhancing the individual performance of the business, the business strategy and not on the overall holding company strategy. This was not done because Chief Executive Officers lacked the tools to successfully address this issue (Campbell, Goold and Alexander, 1995). In the 1970s the first models on corporate level strategy were introduced such as the Boston Consulting Group growth/share matrix.

In the 1980's, Peters and Waterman (1981) published *In Search of Excellence*. Their view suggested that holding companies should only focus on companies with superior performance. Having a portfolio with companies to achieve financial diversification reasons was not desirable. More recently, Macleod and Stuckey (2009) revisit the McKinsey-General Electric Strategy Grid and adapt to the analysis of holding company performance by considering the subsidiary's stand-alone value with its value within its holding company. Hamel and Prahalad (1990) introduced "the Core Competence principle" in the *Harvard Business Review*. According to them, companies should build their portfolios around their core competences. Core competencies will create a competitive advantage. The issue left unexplored is can strategic parenting behaviour be a core competence that justifies the parent's position. This theory and that of Peters and Waterman (1981) lack guidelines on how to build a holding-company strategy that can drive excellence in or enhance strategic position of a subsidiary. Furthermore, there are many examples of successful conglomerates that consist of companies that have nothing operational or technical in common and with all different kind of competences, so these two views will not hold for all conglomerates. Goold and Campbell (1987) had already introduced a framework that fills the gap of the

core-competence model. It has developed and evolved over the years and now provides the CEO with practical guidelines on how to build a successful conglomerate. They called it *the Parenting Advantage Framework*. This framework can be applied to the special case of small holding companies. This paper lays out a research agenda to show how this model can be used to explore methods to enhance the performance of small holding companies.

Parenting Advantage Framework

Different parenting models are explained in depth in Goold and Campbell's book *Strategies & Styles* (1987). Their model addresses two corporate-strategy questions: 1) *What businesses should owned by the parent*, and 2) *How can the parent create optimal value from those subsidiaries*. The answers to these questions depend on how the parent influences subsidiary manager behaviour, affects decisions they make, and drives the resulting subsidiary performance. Their parenting models result from extensive research at multibusiness companies. Their framework is built on two dimensions of holding company influence: control and planning. By achieving the correct balance between these two dimensions, the parent can create subsidiary and holding company value. This parenting framework focuses not on the businesses as such, but on the competences of the parent and the value created from the relation between the parent and the businesses. The degree to which the parent use planning and control results in a certain parenting style.

If the holding company acts to shape strategies and guide strategic decisions, the parent is exerting "planning influence." Planning influence concerns the input side of a decision. According to Goold and Campbell (1987), there are at least seven tools the parent can use to influence the planning of the businesses: organisation structure, review of subsidiary plans, strategic themes, broad strategic thrusts, specific suggestions, management of overlaps between businesses and allocation of resources

The second type of influence is "control influence." Control influence focuses on the output and results of decisions. It is comprised of activities the holding company uses to drive the performance of subsidiaries. It emerges from the performance targets that are set, the monitoring of those targets and the pressures and incentives from achieving or failing to achieve the set targets. From these influences, seven different parenting styles have been identified that fit into three overarching styles: Financial Control, Strategic Control, and Strategic Planning. One of the most important conclusions of the research of Goold and Campbell is that no single model is perfect for every company. What the researchers have done is to give a framework for describing the variety of approaches. Goold and Campbell (1987) identified seven different parenting styles depending on the difference in control or planning influence. The framework shows the key differences between the different approaches to make the company choose its style of preference thorough research to support that choice. The framework was up-dated and its normative value was enhanced in Campbell, Goold and Anderson (1995).

Strategic Parenting Styles: Financial Control, Strategic Control, And Strategic Planner

In Financial Controller companies there are clear strategic responsibilities for the business units. The Financial Controller parent will exert little influence on the formulation of strategy but puts most attention on the financial performance of the subsidiary. The subsidiary director is responsible for the business and the company is as independent of operational influence from the holding company as possible. Each business unit is a profit centre. It is possible that a divisional layer is in place, but responsibilities are delegated as much as possible. The holding company is small with a strong finance function. Finance directors have an important role in the decision making process. Subsidiary finance directors may report directly to the holding company CFO and therefore have a higher status than in other type of parenting models. Financial Controller companies in general set the same financial objectives for their businesses: a stretching standard that the managing director has to achieve. A managing director proposes a target

that he can achieve and if possible, that is better than the previous one. It is challenging to get the proposed targets accepted. Managing directors are questioned on why the targets are suggested as such in great detail. This could result in a revised profit forecast. It is important that the targets are stretched. They will put great demand on the subsidiary managers.

In general financial results are monitored on a monthly and quarterly basis. Together with the numbers an explanation is presented, in which specific deviations from the set target are highlighted. The results are reviewed by the Financial Controllers and presented to the line management. In some companies the CEO will contact a managing director if his results are not in line with the budget. As it is sometimes difficult to project budgets in unpredictable businesses, Financial Controller companies in many cases avoid businesses in unpredictable markets. Financial Controller companies have strong incentive schemes. As they strongly believe in upholding these, managers are replaced quite quickly if they do not achieve their targets. In Strategic Planner companies, the holding company has a very important role in the development of both holding company and the business unit strategy. The main reasoning for a holding company to adopt this strategy is the fear that operational managers will not look beyond a short-term, up to two-year time horizon. To motivate a longer-term orientation, the holding company exercises its influence within the subsidiary planning and implementation process.

The organisation of a strategic planning company is more complicated than a Financial Controller company. Responsibility is still with the subsidiaries, but non-finance functions have more influence under this model, and the resulting organization is more complex. There often are levels that provide input on the strategy of a business. By setting up a more complex structure, Strategic Planning companies hope to make better use of the interdependence and synergies between the businesses and they hope a more complex structure from the different perspectives results in a more effective overall strategy.

Strategic Planning companies give their ideas on the business strategy to the managing directors of subsidiary businesses. They may propose clear top-down strategic themes and thrusts for the entire portfolio. The holding company is more likely to provide specific suggestions for the strategy of individual business. The strategic planning company may for example tell a business unit to expand in the United States to leverage scope economies from the distribution channel of another subsidiary. Strategic Planning companies have elaborate planning systems to measure strategic achievements, but do not rely on control as much as Financial Controller companies. The targets are the result of the strategic planning sessions. In general both short and long-term targets are set. Both financial and non-financial targets are set. Even though there are incentives to achieve these results, the goal is more to follow the long-term strategy than specific short-term goals. As long as the business is on track with regard to the strategy, deviations from agreed upon specific goals is often accepted.

In **Strategic Controller** companies want to have influence on the business unit planning, there are clear strategic responsibilities for the business units. The strategic initiative is left as much as possible to the subsidiaries. Each business is a profit center and there is less coordination between the different subsidiaries. The managing director is responsible for the subsidiary. The holding company is small with strong finance and strategic functions. Strategic Controller companies have a formal and structured planning process: both the budget and plans are set and reviewed in a structured way. Like in Strategic Planning companies the process starts with guidelines sent out by the parent including topics and forms of reporting. On the basis of this a narrative strategic plan is made, which is the foundation for a more detailed three-year plan. Finally, a more detailed one year operating plan is made which includes the budget and the steps to make towards the achievement of the strategy. The plan will be analysed in detail to achieve a final plan. All plans (both financial and strategic) should be consistent with the strategy. Strategic themes, directions and suggestions are, often not given. Some Strategic Controller companies do however give general guidelines on the strategic direction of the conglomerate and thus give rough direction to the businesses' strategic direction. As independence of the businesses is one of the most

important factors of this model, in general synergies are not sought or heavily coordinated by corporate. At divisional level, this is however done. While for example transfer pricing is at arm's length, there is some intercompany preference, as long as the prices are competitive.

Targets in Strategic Controller companies often result from the elaborate discussions on the plan to achieve a certain strategy. One could therefore suggest that the targets are formulated bottom-up, as the businesses formulate the plans. This is however not entirely true as the holding company through the discussions can stretch the targets set by the businesses. As with Strategic Planning companies the plans generate long term plans and short-term operational actions and milestones, again consistent with the strategic plan. The targets that will be set will be both financial and non-financial. A balance has to be struck between long- and short-term goals, as well as strategic and operational results. Strategic Controller companies like Financial Controller companies have strong incentive schemes. The incentive scheme has both a carrot and stick affect. Failure to achieve the set targets is penalised, often with dismissal (stick), but achievement is rewarded (carrot). The biggest problem of a Strategic Controller company is that the combination of tight enforcement of targets and the balance of long-term strategic goals lies with the measurement of the goals. Contrary to financial goals, (non-financial) strategic goals are hard to define and therefore hard to measure. The risk is that either financial (easily measurable) are given more priority or that the control function as such becomes less important, thus undermining the entire control system.

RESEARCH AGENDA

The relationship between a holding company and its subsidiaries can be viewed as a special type of strategic alliance. Anecdotal evidence suggests that a strategic alliance is more likely to be stable if three attributes are present. 1) Stability is increased if there is a financial incentive for both partners to remain in the alliance. 2) Strategic alliances are more likely to arise and continue if there is a continuing congruence between strategic needs of both partners. 3) Strategic alliances are more stable if there is consistency between the partners' cultural value systems. The Goold and Campbell (1987, 1994) strategic parenting model fit within this overall framework. The financial parenting model is designed to maintain the financial fit. The strategic parenting model maintains the strategic fit. The cultural fit either arose naturally or can be imposed by *fiat* from the holding company. A number of research issues emerge from this general view of strategic alliance stability. When applied to holding companies that act as "strategic parents" of subsidiaries, the following researchable issues emerge:

- 1) How does relationship stability develop in the parent-subsidiary relationship?
- 2) Are there other stabilizing factors in parent-subsidiary beyond the three identified above?
- 3) What are the specific effects of those three factors on parent-subsidiary alliances?
- 4) How should parent-subsidiary alliances be managed to maximise the value of the subsidiary and the parent? This is the primary focus of the Goold and Campbell typology.
- 5) Can the overall competitive strength and financial portfolio effect within a holding company be assessed? How?
- 6) Can the holding company provide branding or other marketing value to the subsidiaries?
- 7) How can synergies between subsidiaries be defined, assessed, built, and enhanced by the holding company?
- 8) What are the most effective methods of assessing the portfolio managing capability of the holding company?
- 9) Are there differences in research approach, research issues and management effectiveness measures across holding company sizes? Are there differences between a \$500M holding company and a \$5B one?
- 10) How can research studies of holding company management be operationalized?
- 11) Are there unique approaches available for studying holding company theory?

- 12) How does holding company or subsidiary proactivity affect performance of the holding company and the subsidiary?
- 13) What are the most effective ways of governing the subsidiaries? This is the main question approached by Goold and Campbell (1987).
- 14) How does the governance of the holding company-subsidiary and subsidiary-to-subsidiary relationship affect overall portfolio value? How does overall portfolio coordination affect portfolio financial value?
- 15) Is there a theoretically and empirically defensible of parent-subsidiary portfolio value that has been developed? How can it be tested? Defended?

These are a subset of the researchable issues that may have been partially explored. However, much opportunity for future research exists in this field.

CONCLUSIONS

We have used the theoretical foundations developed by Goold and Campbell as a foundation to explore the possible research issues inherent in parent-company value enhancement and subsidiary management. From this foundation, we looked at their theory and its implications for holding company management as defined by Goold and Campbell. This short review shows that there are many potential areas of research available in this field. A thorough review of this literature was not found during this exploratory phase of this project. A good next step would be to determine if there has been a recent, relatively complete review of parent-subsidiary management research published. If not, there will be real value in filling this research gap. We then identified a short inventory of potential research issues within this field in order to chart a path for a multi-year research project on parent-subsidiary management.

INNOVATION OF ROMANIAN SMEs - A DEVELOPING STRATEGY OF THE ECONOMICAL ACTIVITY PERSPECTIVE

Ionica Oncioiu, Dimitrie Cantemir Christian University, Romania

Dan Balamaci, Free International University of Moldova

ABSTRACT

Small businesses do not receive the recognition they deserve in a world where success is mandatory. This is a strange fact, if one considers that 70% of the world business is represented by small businesses owned by visionary persons who take advantages of acting at small scale and help create a more dynamic economy. With the current rapid transformation of markets, the first element which influences the strategy of economic activity of SMEs is the character of the innovation - what challenges does the innovation present. The second element is the capability of the SMEs to address those inherent challenges and also the capacity of the enterprise to muster resources and to act in a sufficiently dynamic way. The aim of this paper is to investigate the current state of innovation in Romanian SMEs and try to answer to the following question: What are the factors that influence in the low level of innovation of Romanian SMEs? The research will also establish constituents which are essential for the successful strategies of development of an innovation framework for SMEs.

INTRODUCTION

The Small and Medium Enterprises' (SME) sector is important in the overcoming social tension brought up by the globalization tendencies connected with the rapid transfer of certain industrial programs to countries with lower wage costs and with a high intensity of global competition. The Romanian SMEs are outnumbering other types of firms in the economy based on innovation. For this reason, the importance given to this type of enterprises must increase. Today, these small and medium-sized enterprises (SMEs) are active contributors to the Romanian economic development as a whole. Innovation, in general, means all those scientific, organizational, financial and commercial lead steps, intentionally or not, the implementation of new or improved products or processes. Innovation is based on the results of new technological developments, the combination of existing technologies and other knowledge acquired by a particular organization. According to the last researches, approximately 30-60% from the small and medium enterprises from the production sector from OCDE countries can be characterized as innovative.

Smaller firms tend to be more and more innovative, engaging step by step in efforts for research and development and innovation in fields related to commercialization of the existing technologies, creation of products and services and the implementation of the flexible working practices. The smaller innovative firms have the agility to answer quickly to the technological changes and customer's needs. However, they can experience problems in acquiring the resources needed to answer to rapid changes; some of them solved this problem by joining to the cooperation networks in order to improve their innovative capabilities. On the other hand, innovations may represent novelties in one or along several dimensions. They may provide new products or services to a market; they may introduce new technology to existing products; they may introduce new forms of organization of a SMEs or a value creation chain.

The focus here is on innovation processes that are more than minor improvements of existing products or processes. Our interest is the introduction of products or processes that are novelties to the degree that they represent new business concepts, and will require and provisions outside daily operations. The innovation infrastructure includes: incubators (infrastructure for start-ups), technological parks (experimental facilities), technical transfer centers and the system of intellectual property. Regarding the infrastructure,

the government consistent policy is measured according to the recently launched National Plan for Developing the Infrastructure for Innovation and Technological Transfer. In this plan, it is mentioned the amount which is destined to co-finance centers of technological transfer, office for connection with industry, technological parks and technological incubators.

For Romania, the small and medium businesses are the engine of the economic growth and a vector for disseminating the research and development results. The increase of the small and medium businesses sector had a positive influence upon the businesses environment reducing the unemployment rate and increasing the productivity. It is necessary for the Romanian state to rethink the fiscal system in order to better sustain the growth of the small and medium businesses sector taking into consideration that even though its major role in the development of the country is known and admitted the support is not likewise. We think of this considering that even though the number of the small and medium businesses in Romania has grown, the number of small and medium businesses to 1000 inhabitants is under the number from the European Union (in Romania the number of small and medium businesses to 1000 inhabitants is 25 and in the European Union is 64). The methodology of research was focused on two directions: first, we tried to identify the elements that constitute to investigate the current state of innovation from the Romanian SMEs point of view; second we analysed the barriers that stand in the way of implementing such a system used by these firms. Strategies related to the environmental characteristics, when an accentuate competition on the internal market and a rapid change rhythm in their activity domain can be associated with the orientation to the international market- between them it should be mentioned the niche's strategy, which presupposes their concentration on the products and services for which it is disposed competitive advantages as a result of their capacity of innovation, adaptability and personalization of the production in connection with the request exigencies.

LITERATURE REVIEW

In discussions on innovation there is a tendency to associate it with large, technologically advanced firms. This was already a sensitive point for Schumpeter, as can be read in the contribution of C. Freeman in the Palgrave dictionary: "Schumpeter (1928 and 1942) is often known for his emphasis of the advantages of large size and monopoly on innovative performance, whilst traditional theory has continued to stress the advantages of competitive market structures".

Business innovation processes require access to new resources, including competence (Bayer & Gann, 2007; Chell & Baines, 2000), which are frequently tapped from external sources. Many therefore consider better access to such external resources to be a vital policy instrument to support the innovative capacity of the business sector, especially for smaller enterprises. The term innovation system (Cooke, 2001) has often been used to describe the interaction between an individual firm, on the one hand, and firms and institutions that can provide such resources on the other hand. Innovation systems have received attention from researchers as well as policy-makers as possible instruments for improving the innovation capacity of enterprises. It is imperative that innovation systems are developed with a thorough understanding of how enterprises utilize external resources in their innovation processes.

During times of dramatic changes in the business environment or when SMEs exploited completely new opportunities, incremental innovations would not provide sufficient le for rapid and large transformations. We refer to these large transitions over a short time period as radical innovations. They are also referred to with terms such as discontinuous or really-new innovate (Garcia & Calantone, 2002; McDermott & O'Connor, 2002). The innovation capacity of an enterprise thus rests on the foundation of its resources, which have been accumulated as a result of previous activities. These resources have been shaped by the needs of the past and are subsequently applied in the current innovation process to respond to the needs of the future. The ability to come up with novel solutions will therefore depend on an ability to adapt the

resources in response to the new requirements of the innovation process (Eisenhardt & Martin, 2000; Pek-Hooi, Mahmood, & Mitchell, 2004; Teece, Pisano, & Shuen, 1997).

To become or to remain competitive, Romanian companies must continually develop ways of operating through more sophisticated strategies aimed at increasing research and innovation capacity and functioning in a business environment to the highest level. The competitive advantage of Romanian SMEs will depend on the state to create attractive conditions for such local or foreign companies to find ways most effective way to mobilize them. Creating a stimulating business environment for SME growth and their competitiveness is based on the national strategy and government policies to facilitate an incentive framework for foreign investment and development of commercial partnerships with small and medium firms in other countries. This should be stimulated and the concentration of domestic private capital to help boost the sector's role the Romanian economy.

However, economic analysts are optimistic considering that previous experiences show that any difficult situation stimulates legal, fiscal or accounting creativity, and that management innovation helps companies quickly overcome the crisis by strengthening the administration of the competition for new customers and new markets. One of the leverage keys to increase competitiveness is management innovation. Still, Romania stands out through a low degree of innovation, but what is even more worrying, also through a highly reduced capacity to disseminate innovation. Economic analysts also state that this period provides Romanian companies with the opportunity of self-analysis and improvement, since the need for good strategies is particularly intense.

METHODOLOGY

The survey instrument used in this study was as a combination of a questionnaire survey and research interviews. The type of questionnaire is a self-administered postal one and it included a short glossary explaining the purpose of the survey. The questionnaire is divided into three parts and has a total of 35 questions. To collect data from interviewees a number of 415 companies were contacted by phone between January 2012 and June 2012. Research interviews will then deepen and expand the results of the questionnaire topics. The development and the design of the questionnaire and the research interviews will be obey and observe three maxims of scientific method: construct validity, internal validity and external validity. A central role in both the questionnaire and interview surveys will play the construction of scoring variables. They will be the pivotal element in developing a typology classifying an innovation of Romanian SMEs in strategies of development economic activity.

RESULTS

This study analyses the quantitative and qualitative results of questionnaire and interview. Four hundred fifty representatives from different Romanian SMEs that approved to participate in this survey were distributed the questionnaires as sample respondents for this study. Despite the repeated reminders 341 filled - up questionnaires were received back in total. After elimination of received filled - up questionnaires in which item responses were missing, the final sample consisted of 295 responses. The usable response rate of 42,71% based on total number of respondents received the questionnaires are within the range typically reported for research studies in social sciences. Based on the scoring results in the questionnaire and the interview cases presented in table 1, typology for the companies' innovation process was derived. The typology of Bayer and Gann is widely accepted as being useful to assess the organizational behaviour Romanian SMEs.

Table 1: Frequencies of the Types of Innovation process

Type of innovation process	Questionnaire Results		Interview Results	
Reactor	126	42,71%	20	44,44%
Defender/Prospector	72	24,41%	10	22,22%
Analysar	79	26,78%	7	15,56%
Pattern not evaluated	18	6,10%	8	17,78%
Total	295	100%	45	100%

To validate the scoring approaches, the multivariate methods of factor and cluster analyses was applied. The constituents of the scoring variables was undertaken a factor analysis, and the resulting factors would the input of a cluster analysis. The present analysis also had the aim to investigate the state of planning and how innovation process of Romanian SMEs is linked with it. However, the investigation has also revealed that business planning for Romanian SMEs is developed only in a rudimentary way. The results of the questionnaire and the research views have shown that firms having a controlling unit use to assign it implement an innovation process of the strategy of economic development.

CONCLUSION

Innovation is a broad concept. Innovation is not in contradiction with tradition. Any type of entrepreneur, even when working in traditional sectors or in businesses with strong traditions such as family businesses can be innovative with the product, the production process or any aspect of doing business. The degree of innovation is monitored by policy makers. A high degree of innovation is considered to make the economy more 'competitive'. Innovation will not only support the development of new products or increase the productivity of labor and capital, but also bring more economic growth, employment, a better balance of payments, improve the labor conditions etc. There is a series of measures that can facilitate the maintenance of SME' innovation in order to operate further more competitive and playing a more important role on the autochthonous market, even if sometimes this matter is unrealistically neglected.

This innovation process is based on defining groups of companies having similar sets of scoring values and for validation are applied there types of risk management (reactor, defender/prospector, analyzer) in contrast to the original four types of Bayer and Gann (2007). As justified by the scoring approach, this category led to merging of the two central types of Bayer and Gann into one. Empirical SMEs research in Romanian faces several problems. Regarding size classes, the research object of Romanian SMEs has a very homogeneous structure. This study aims at covering the total range of SMEs including also the class of micro firms. So, for future studies it would be interesting to focus exclusively on the class of micro firms. Such a research project would require investing considerable time in collecting data.

We certainly have many casualties among SMEs due to the incorrect application of innovation process, as we will have winners of the crisis, and the winners will be those who will be able to make accurate forecasts on medium and long term and manage the risks. The results of questionnaire and interview deliver that the company size is an essential factor to distinguish the sophistication of Romania innovation systems. Another factor for judging innovation of SMEs is the personality of the owner or the Romanian managing director. Here the educational background and the interest business management topics play an important role, with owner-management showing more deficits than other managers. The interviews have revealed that some Romanian owner-managers have quite a fatalistic attitude toward innovation process. With increasing company size the problem becomes dramatic, but regulations for replacement and succession are generally established badly. It is not easy to measure innovation. Businesses operate in international markets while policy makers focus on a territory. Very often the effect of a policy is felt beyond the territory of the government. In a large area such as the European Economic area there is much interdependence and many spillovers. This is especially the case in a small open economy operating in this type of market as is illustrated by the case of Romanian. In conclusion, the influence of innovation in

the strategy of Romanian SMEs development economic is mixed, both negative, by the superior concurrence, the increase of the turbulence of the businesses environment, and positive, facilitating the access at new markets of provision and sale, the acceleration of the know-how transfer, the access at new technologies, partnerships and strategic alliances at international level, etc.

APPLYING COMMON SENSE LEADERSHIP: EVIDENCE FROM SENIOR LEADERS

Jon K. Webber, University of Phoenix
Gregory W. Goussak, Ashford University
Elliot M. Ser, Florida Atlantic University

ABSTRACT

The purpose of this study is call for further academic conversations into how to practice common sense leadership in a 21st century organization. This qualitative study was performed from July 29th through December 7th, 2010, which involved 26 participants from across the United States who were identified as senior leaders in their organization. These executives indicated that leading by example; managing your human assets; doing the right thing; seeing the big picture; developing a plan for the future; and making the right hiring and transitional decisions were key common sense leadership best practices. Participants concluded that common sense leadership is a full, hands-on effort, which requires attention to every detail of the business from financial to human asset management toward all members of the organization.

JEL: M12, M15

KEYWORDS: Leadership, Human Assets, Common Sense Leadership

INTRODUCTION

Our previous study (Webber, Goussak, & Ser, 2012), examined how 26 senior leaders defined common sense as it relates to the 21st century organization. Their conclusion was that while there was no agreed upon term that best describes common sense one could readily recognize its imprint on organizational practice (Webber, et al.). The following summarizes the findings of the second question asked of this group: “What are some common sense, best practice leadership examples you could provide from your lived experiences as a senior executive”?

Research Background

As was noted in the previous work (Webber et al., 2012), the researchers first pursued this line of inquiry after one of the authors made some observations on emerging leaders in Eastern Europe who seemed to embrace Western management practices but did not seem to understand how to move their learning into actual practice. Common sense was then theorized to be the hitching post that would help leaders in the former Soviet bloc nations to connect with a different paradigm that they asked to be adopted. Additional thoughts on other developing countries facing similar challenges led researchers to review common sense leadership understanding and practice among the kinds of leaders who were thought worthy of emulation because of their background and moral authority. It is acknowledged that before the study was undertaken, the researchers made an assumption that common sense was a term that was widely understood and identified by practitioners in the leadership field. However, after an exhaustive search of the literature, it was discovered there was no universally acceptable definition that could benchmark such behavior within an organizational setting. This finding was also echoed by the senior leaders who revealed their answers when asked about similar matters involving their companies (Webber et al., 2012).

The participants in the previous study revealed that common sense could be recognized among three predominant groupings, which guided how these senior leaders determined what was and was not included within the broad research question. These areas were identified as goal setting, decision making,

and motivation (Webber et al, 2012). In order to open up further dialogue on how the leaders interpreted the jargon, the same participants were then asked a second question related to common sense practices. This added level of inquiry further helped the researchers pinpoint how the terminology was embraced in the workplace by those recognized its existence. Once it was determined that common sense was the principle connector between leaders and organizational best practices, the next step for the researchers was to investigate the nexus between such areas. Unlike the previous study where there was not an agreed upon determination of the terminology's meaning, participants in this second study were able to provide examples from their experience, which revealed why they believe common sense leadership is relevant within the context of their current operating structure. Their responses provide some interesting talking points for further research and academic dialogue.

LITERATURE REVIEW

The study of common sense leadership appears to be relatively new to the literature. Webber, Goussak and Ser (2012) found that common sense leadership cannot be defined in one single way, but as a compilation of three different traits: (a) goal-setting, (b) decision making and (c) employee motivation. One approach for applying common sense in leadership is to understand the depth of the traits identified in our previous study. Goll (1993) found that respect drives leadership and popularity supports respect and not the reverse. Management by Values (MBV), a theory developed by Goll, is a leadership model that falls under the behavioral leadership approach consisting of a mix between each of the Scott (2003) perspectives. Scott (2003) believed that behavioral leadership originated from three distinct perspectives: (a) the rational system, (b) the natural system and (c) the open system. Rational system theories center on the attainment of goals. As found in the previous study, goals were a critical component of common sense leadership because an organization must center on a specific direction. Models of rational systems theory depend on a formal process and set of procedures towards accomplishing organizational goals.

The goals of the individual are not a concern under rational system theories. Natural system theories emphasize organizations as collectives (Scott, 2003). In contrast to rational system theories, natural system theories acknowledge that organizations differ in their goals and methods for attaining those goals. This concept was also confirmed by our previous study because a balance is necessary between attaining goals and making decisions that affects both the organization and the individuals that service that organization. According to Scott, the open systems perspective is more flexible than the rational or natural systems perspectives. The primary difference between the open systems perspective and the other perspectives is the affect of the environment in the operational and leadership process.

MBV represents a philosophy incorporating a number of styles and concepts working in conjunction with one another in order to maximize benefits for any organization's success. The central premise of MBV is the *action triad*. The action triad consists of three components: (a) norms, (b) values and (c) goals (Goll). MBV is a balanced approach to leading in the 21st century. The balance between the norms, values, and goals of the organization in conjunction with the members of the organization is critical to long-term success and an important component of balancing the three traits of common sense leadership. Prior to MBV, academia and business relied on such theories as Management by Directing (MBD) and Drucker's Management by Objectives (MBO) (Goll, 1993). According to Goll, the problem with the earlier theories was the weight given to participants that are more aggressive and lesser consideration to less aggressive members in directing an organization (Goll). How the organization balances each of the three elements of the action triad will determine the influence and quality of the people that make up the organization. A strong consistency between each of the elements will influence the overall quality of the organization's environment (Goll). Although not the first element, values are the foundation of MBV because they give meaning to the organization and everything that the organization does.

Values are not necessarily achieved goals, but are standards by which we live. According to Goll, values determine the direction and manner in which people behave. Values focus an organization on the question of “why” (Goll, 1993, p. 7). Webber et al. found that common sense leadership begins with an understanding of the individual team members values and uses those values to determine what motivates people in order to make the necessary decisions to achieve organizational goals.

Goals provide the tangible *what* of the organization, “the physical manifestation of the organization’s values” (Goll, 1993, p. 8). In the MBV model, goals equate to the rational system of organizational behavior. The key focus of the goal component concerns the reason for organizational existence. Goals provide a quantifiable purpose for organizational direction. The balanced management approach of MBV takes the concept of goal attainment to the next level. Under MBV, the goals of both organization and the individuals involved in the organization are equally important. The responsibility of the organization’s leadership involves determining the needs and desires of the members of the organization in order to focus on specific organizational goals. Norms enhance and protect the values of the organization.

According to Goll (1993) the norms in an organization, “place certain limitations on behaviors of persons within the organization” (p. 9). The norms of an organization relate to Scott’s rational system of organizational behavior. At some point in the process, an organization prescribes how to accomplish the organization’s goals and objectives. In order to understand MBV, a leader focuses on understanding each of the elements that make up the action triad. It was this philosophy that guided the original study by Webber, Goussak and Ser. Common sense leadership utilized a rational approach to demonstrate a focus on the goals of the organization in conjunction with the needs of the team (employees). Understanding MBV and the balance of the action triad could help management understand how common sense leadership helps promote a positive environment within the organization resulting in successful organizational productivity.

DATA AND METHODOLOGY

This qualitative study on providing best practice, common sense leadership examples was performed from July 29th through December 7th, 2010. It involved 26 participants who were identified as senior leaders in their organization, which meant the participants were at least a Vice-President to be considered for inclusion in the study. A convenience sample was used, which involved individuals from both the public and private sector. The study included leaders from information technology, insurance, investment, legal services, manufacturing, marketing, public utilities, real estate, restaurants, and staffing. Participants were polled from Georgia (50%), Nevada (23%) and other regions of the United States (Alabama, Connecticut, Florida, Maryland, Minnesota, North Carolina, and Pennsylvania). SurveyMonkey.com was used as the platform for the participants to provide their viewpoints on this issue (Webber, et al., 2012).

Findings

Similar to what we discovered when we asked the same group of people questions to direct us toward how common sense was recognized (Webber, et al., 2012), this group pointed to six predominant groupings they felt represented the best practice common sense leadership principles that transformational organizations could apply: (a) Leading by example, (b) Managing your human assets, (c) Doing the right thing, (d) Seeing the big picture, (e) Making the right hiring and transitional decisions, and (f) Developing a plan that works.

Leading by Example (LBE)

Participants noted that common sense practices begin with leaders doing what they ask others to emulate. CS3 opined that it starts with not allowing superiors to get caught up in the success of the moment and “continually move the bar”. CS 13 added that in their industry it means to model the kind of behavior that they want employees to follow so agents empathize with their customers and fully explore their actual business needs. CS 14 connects this with “always provide just a little bit more, which is tough in this

competitive environment”. They go on to note that for “customers/clients, understand what they need and want before making a commitment”. CS 15 likens these to how “treating others with kindness and respect garner more in terms of productivity and quality work than other forms of management. Leadership should inspect what it expects”. One way this is done, according to CS 18, is by discovering “that success is achieved when I am out front, leading by example, while truly listening to my associates and giving them proper credit and rewards for their efforts”. When things do not go right for the organization, CS 20 suggests that leaders accept the mistakes and move on. Leading by example starts at the top of the hierarchy, too. CS 24 frames it in terms of “the best leaders still aspire to consistently [provide] an ethical, honest, trustworthy example of servant leadership in which they value the people with whom they work as important to their overall success in business and life”.

Finally, CS 26 notes five keys to leading by example, which are best common sense leadership practices: 1. Remain positive even in the presence of what appears to be extreme negative. 2. Inspire others to kindness, decency, and the Golden Rule. 3. Act today as if someone is writing down all of your deeds and you’ll have to read the book of our life out loud in 10 years to a room full of people, 4. Fairness is the basis for all human activity. 5. Relentlessness and perseverance are traits that will frequently trump others. CS 13 likens this to being a Boy Scout leader where “adult leaders who would go out of their way to show the scouts and interesting project, or tell an engaging story, or ask about their lives were the adult leaders who had a keen common sense that the boy scouts responded to” in a positive way.

Managing Your Human Assets (MHA)

Common sense leadership engages the organization through the management of its human resources. There were a number of short responses in this area but it shows these participants interest in good fiduciaries of the human wealth that they invest in on a daily basis. Rules and regulations are considered the hallmark of how organizations function but CS 6 notes “sometimes it’s okay to bend company policies depending on the situation; especially as it relates to employee retention and management”. In other words, while guarding the ethical stronghold of the organization there are times where, as CS 16 notes, “sometimes common sense has to trump policy. Therefore, be sure you have people in positions of responsibility and authority who have good common sense”.

Goleman’s (1995) emotional intelligence ideas came up several times among participants in knowing how to manage one’s followers. For example, CS 7 likened common sense leadership best practices to “understanding human nature and how that plays a part in determining the strength and weaknesses of an employee and knowing how to play to their strengths”. CS 10 adds that means not worrying “who gets the credit. Team members work twice as hard when they believe they have ownership of the project”. CS 15 connects this with common sense understanding that “you are only as good as the people you work with”. Communication is a vital part of the area of managing one’s assets. CS 9 notes that means providing timely feedback and coaching for times when the follower has both positive and negative performance. CS 19 adds that means one needs to “be a better listener than a talker”. To keep the communication lines open, CS 20 notes that means to keep an open-door policy and to use social media to allow different channels of communication. CS 26 adds two rules to this section: 6. Communicate clearly and with the audience/listener in mind. 7. Getting people to happily get where you want them to go on their own.

Doing the Right Thing (DRT)

This area of inquiry matches similar statements made in our previous study when we asked the same group to define what common sense leadership meant to them (Webber, et al., 2012). Moral and ethical considerations were highlighted in areas such as “live your values and be of good character. Walk the walk and talk the talk. Do what you say you will do” (CS 1) and “think of what you are going to say before you say it; don’t do things that knowingly can get you fired or in jail. Check your ego before you make a decision” (CS 4). What this means is common sense leaders need to set up an organizational environment where “before a decision is made [one should] evaluate the effect it has on others and whether you could be proud of the decision. Evaluate what is being considered and if it meets the

company values and objectives” (CS 17). Within such a setting, the leader needs to celebrate accountability and openness; high moral, ethical and customer service standards (CS 20) and “integrity, courage, honesty, and reliability (a practical application of integrity, actually)(CS 21). CS 19 say this all boils down to treating others as you would like to be treated, which points us back to the Golden Rule.

Seeing the big picture (SBP)

Participants note that common sense leadership application also lends itself to good macro-management practices. CS 8 believes that it is just as important to not what to say no to as what an organization decides to move forward with. They note that “choosing wisely what to ignore frees up bandwidth to work on the meaningful stuff”. CS 12 says it comes down to placing before the company the items that are important for them to succeed and to grow the business. CS 25 adds that a good understanding of budgetary data is a key ingredient in helping both leaders and followers to move the organization in a positive direction for the future. Competition also came up as a consideration in the study. CS 14 notes it starts knowing how your product or service compares with your competitors and then operate in an environment where it is your privilege to provide such items to your customers. CS 5 cautions, though, that one should be careful in seeking alliances with competitors, which might undermine one’s own profitability. CS 24 puts everything in perspective by noting common sense leadership practices work best when there is a personal balance between “one’s home and family with work, leisure, and inspirational growth”. This means “spending lots of time with one’s leadership team so that the cultural principles of the organization are so strongly inculcated that the team can make independent decisions that are in keeping with the principles of leadership”.

Developing a plan that works (DAP)

Another area involves what participants see as common sense leadership planning best practices. CS 8 sees this as a role issue where the CEO deals with “what if” and the COO deals with “what is”. CS 3 notes that leaders do this through a regular review of progress being made in comparison with documented goals. CS 20 points to staying ahead of the game by looking ahead at least two years ahead in relationship to required staffing needs and operational needs. When doing this, CS 22 advises to keep “the product simple and [have] the marketing align with the needs of the consumers”. Planning means to consider not the boom years of the organization as well as the ones where potential ruin is possible. CS 23 sees this in relationship to a small business manager who sensed the downturn in the economy and began reducing various expense categories in anticipation of a lessened cash flow. By doing so, layoffs were not needed and his company was able to maintain market position. CS 26 adds these final words of wisdom by noting that common sense leadership practices involve: 8. [The] vision to see what is currently not visible and [the] faith to not pay attention to what everyone else is looking at. 9. Commonness is a very uncommon manner.

Making the Right Hiring and Transitional Decisions (MRH)

The start and end of individual hiring decisions is a tough one for any leader and common sense leadership practices especially when the future outcome of the organization may rest in that person’s productivity and connection to the established cultural beliefs. CS 3 notes the process should start with picking the best and brightest people who help drive the organization’s success. CS 8 adds that leaders should not confuse a good match in the job description categories with people who are talented. CS 24 says there is no substitute “for hiring the best people and investing the time and resources into them to develop their full potential. On the back side of employment is that moment when the person becomes a liability for the organization due to cutback or poor performance. CS 2 notes there are times when you just have to as a common sense best practice terminate someone who is no longer a good fit with corporate goals. There are also rough economic times when, through no fault of their own, the employee cannot be kept on the payroll because of poor income flow. In such times, CS 14 believes that organizations have a responsibility to pay for outplacement services as a wise exit strategy to bring closure to the relationship.

CONCLUSIONS

There were six areas that the study identified as the top common sense leadership best practices that leaders should model. What is interesting to note is that the actual number of responses did not always correlate with how much was actually written on the subject. For example, while *Managing your human assets* tied in the number of actual posts submitted (9) the second place number of lines written about common sense leadership best practices was *Seeing the big picture* (20). The same thing happened with the number three responses of *Doing the right thing* where the third place number of lines written about the subject actually went to *Developing a plan that works*. The following tables show both the total number of responses and number of lines written about them for each of the six study areas.

Table 1. Number of responses per category

Table 2. Number of lines of response

CAP AND TRADE POLICIES FOR AIR QUALITY: A COMPUTER-ASSISTED SMART MARKET WITH A MARGIN OF SAFETY

Keith Willett, Oklahoma State University

Anetta Caplanova, University of Economics in Bratislava

Rudolf Sivak, University of Economics in Bratislava

ABSTRACT

The process of calculating market clearing prices for cap and trade policies for air quality remains problematic. The permit trading processes are designed to mimic the cost-minimizing outcome. An additional shortcoming is the lack of attention to elements of uncertainty in the permit price calculations. In this paper we design a market process for allocating permits to achieve the same type of behavior we observe for each decision maker in the overall cost minimization model. We use a method known as a computer assisted “smart market,” which has been used in a number of electricity pricing situations. This approach has been proposed and applied also to some types of environmental and resource management problems. We provide the theoretical structure of the “smart market” model with a safety margin and the elements of the margin of safety are explored in depth. Also a set of pricing rules for the permits that reflect a margin of safety are examined.

KEYWORDS: environmental pollution policies, air pollution, permit trading, smart markets, margin of safety

INTRODUCTION

In the early 1960s Coase (1960) argued that property rights could be used to develop a market-based policy for pollution control if the property rights for environmental assets were made explicit and transferable. The practical applications of Coase's argument were developed by Dales (1968) for water and Crocker (1966) for air quality. Tietenberg (2006) provided important contributions by relating the property right definition to the type of a pollutant. One type of pollutant is the uniformly mixed assimilative pollutant. Its important characteristic is that the environment's ability to absorb it is significantly large relative to the emission rate, so the pollutant is not accumulated over time. For this type of pollutant the ambient concentration depends on the emissions, but not on the spatial distribution of the emissions among various sources. Moreover, the possible distributions of control responsibility for these emissions within an air shed will produce approximately the same effect on the pollution target. One example of this type of pollutant is greenhouse gases, since their contribution to the climate change is thought to be independent of where they are emitted into the atmosphere (Tietenberg, 2006).

The second type of pollutant is the non-uniformly mixed assimilative pollutant. Its important characteristic is the location of the emissions releases with respect to the pollution policy target. In general, the policy target is stated in terms of an upper limit on the permissible ambient concentration level at specific receptor locations. Location is important because ambient concentrations are sensitive to the source clustering as well as to the level of emissions. Clustered or highly concentrated sources are more likely to trigger violations of an ambient concentration limit than dispersed sources with the same aggregate emissions rate because the clustered emissions would be

concentrated in a smaller volume of air. Examples of non-uniformly mixed assimilative pollutants include total suspended solids, sulfur dioxide, and nitrogen oxide (Tietenberg, 2006).

The objective specified for cap and trade policies is cost minimization, while the policy target depends on the type of pollutant under evaluation (Tietenberg, 2006). In case of a uniformly mixed assimilative pollutant, the policy target is the level of aggregate emissions, or the total weight of emissions released to an environmental medium such as air. A legal limit is established for the allowable weight of emissions and then the responsibility for meeting the target is based on the cost-effective criterion. The key result here is that the effective allocation of pollution control responsibility requires the equalization of marginal cost. The property right that is traded for the cost-effective solution for the uniformly mixed assimilative pollutant is then an emissions permit. Tietenberg (1980) classifies this as an undifferentiated permit (UDP), when the same entitlement to emit is given to every emitter and the trades among emitters are carried out on a one-for-one basis.

The non-uniformly mixed assimilative pollutants, can be described as local pollutants (Tietenberg, 1980) because the damage they cause is related to their ground level concentrations in the air. Their concentrations are based upon the relative location of emitters, the process of accumulation within the environment and the amount of emissions emitted. The policy target level or cap for these pollutants is stated as an ambient concentration limit, which is measured at a specific location for a specific averaging of time. As noted previously with respect to this type of pollutant, the contribution of any individual emitter at a particular location depends on the emitter location with respect to a particular receptor location and the flow characteristics of the environmental medium between the emitter's site and the monitoring (receptor) site. Tietenberg argues that the ambient cost-effective (ACE) criterion requires that the responsibility for pollution abatement was allocated among emitters so as to minimize the cost of meeting the ambient standard as measured at specific monitoring points. The key result for this environmental problem is that the marginal cost of emissions reduction should be equated with a weighted average of the marginal cost of concentration reductions at each receptor point.

The property right traded for the cost-effective solution in the case of this kind of pollutant is an ambient permit, which is traded in an ambient permit system. An ambient permit market is then defined with respect to each receptor location. Each emission source has then to hold a portfolio of permits that legitimize its emissions rate. Ideally, the policy target for the cap and trade policy is that the permits would be traded in a competitive market that yields a cost effective outcome for a given value of the cap or policy target. Montgomery (1972) has shown in a rigorous manner that instantaneous multilateral trading of permits will yield a competitive equilibrium that coincides with the cost-effective outcomes. However, the existing literature in the area has little to say about two important components of the air quality policy problem. The first one is related to health risk and uncertainty. Lichtenberg and Zilberman (1988) and Harper and Zilberman (1992) used a safety-rule model structure as a way to introduce health risk and uncertainty into the environmental regulation framework. Ellis et al. (1985) and Batterman and Amman (1991) used a safety-rule model structure to address the acid rain strategies. The second issue is related to how to compute the market equilibrium clearing prices and efficient allocation of permits. Alternatives, which can be considered, include having a market coordinator, acting like a Walrasian auctioneer, or to use a direct a centrally controlled permit market to set ambient and discharge prices.

In the paper we design a market process for allocating permits to achieve the same behavior that is observed for each decision maker in the overall cost minimization model. We use a method known as a computer assisted "smart market," which has been used in a number of electricity pricing situations. We provide the theoretical structure of the "smart market" model with a safety margin. In the following section the smart market with the margin of safety is presented and consequently the elements of the margin of safety are explored. Then a set of pricing rules for the permits that reflect a margin of safety are examined and the issues related to their implementation are explored. Finally, we conclude the paper.

The Initial Market Model

We assume that the property right to be traded is an emission discharge permit (EDP) in an emissions discharge permit system (EDPS), which is similar to the system discussed in Atkinson (1983). Further, it is assumed that emissions are traded at a national or regional level and the regulation is used to achieve local ambient air quality standards. This policy is an example of regulatory tiering and is similar in some respects to the U.S. Sulfur Allowance Program (see Tietenberg, 2006).

The decision problem for an emission source (firm) in the presence of an EDPS is equivalent to minimizing the cost of controlling emissions. The cost minimization problem for an individual source (firm) can be formulated in the following way. Let i represent the discharge source ($i = 1, \dots, I$), j is the receptor location or monitoring point ($j = 1, \dots, J$), e_i are untreated emissions released by source i , and d_{ij} the transfer coefficient for source i , receptor j . In addition, let l_i represent the volume of EDPs purchased by firm i and P^e to be their price. The emissions reduction or abatement cost function for firm i is represented by $C_i(e_i)$ with $C'_i(e_i) < 0$. The decision problem for each firm i with respect to abatement and purchasing EDP is then the following:

$$\text{Min} \quad C_i(e_i) + P^e l_i \quad (1)$$

$$\text{Subject to} \quad e_i \leq l_i \quad (2)$$

Equation (1) represents the total cost of abatement for firm i , while equation (2) indicates that untreated emission releases must not exceed the i -th firm's purchase of EDPs. We assume that the individual decision maker does not have information on the set of aggregate stochastic relations nor on the environmental decision makers' uncertainty aversion parameters. The marginal conditions for the i -th firm's equilibrium for emissions reduction and also for the purchase of EDPs can be formulated as follows:

$$-C'_i(e_i) = P^e \quad (3)$$

$$e_i - l_i \leq 0 \quad (4)$$

$$P^e(e_i - l_i) = 0 \quad (5)$$

Equation (3) indicates that each firm i emitting emissions equates the marginal cost of emissions control with the market price of an EDP. Equations (4) and (5) state that firm i must cover its total untreated emissions with the purchase of EDPs. The i -th firm's decision to purchase or sell EDPs follows from the equation (3). First, assume that $-C'_i(e_i) > P^e$. In such situation, firm i has an incentive to increase its emissions (i.e. reduce emission control) and purchase EDPs until (3) is reached. Alternatively, let us assume that $-C'_i(e_i) < P^e$. Then firm i has an incentive to reduce emissions releases (i.e. increase emission control) and sell EDPs until (3) is achieved. Let's assume that the EDPS market consists of I firms, each of which will have some level of emissions control and untreated emissions release. The EDPS market equilibrium is characterized by each firm having a set of equilibrium conditions analogous to equations (3)-(5). In addition, the following market clearing condition is required:

$$P^e \sum_{i=1}^I l_i = 0. \quad (6)$$

Equation (6) guarantees that total expenditures are equal to total permit revenues among all firms by an accounting identity (Atkinson, 1983). The equilibrium outcome described by equations (3)-(6) does not account for the possibility of hot spots. The solution of this would be to adjust the total number of permits after observing actual air quality measured at various receptor locations, or use the air quality diffusion model. A key observation is that EDPs are unrelated to ambient degradation, so ambient standards will not initially be satisfied by equations (3) except if it happened by chance. This concern can be addressed by imposing on EDP trades the trading rules. However, these additional regulatory actions can increase the complexity and the administrative and transactions costs.

In theory, the market-clearing price P^e in an EDPS corresponds with the cost-effective shadow price associated with the cap imposed emissions. But the process of actually solving an EDP market model for market-clearing prices remains problematic. Thus, we should look into the ways of finding a set of optimal prices that can ration permits relative to each firm's emission control cost function while satisfying all environmental and other relevant constraints. Ermoliev et al. (2000) argue that a market coordinator, acting like a Walrasian auctioneer, could direct a centrally controlled permit market to a set of ambient and discharge prices. The Walrasian auction is not necessary if emitters can provide a central market coordinator with the information on quantities of EDPs to be traded at each possible price.

In this case it is possible to determine optimal prices and allocation of EDPs using a computer-assisted smart market model. This type of market allows for the pricing and allocation of resources in technologically interdependent environments. The basic idea is based on the combination of information and advantages of economic incentives derived from a decentralized property rights system with the coordinating advantages of the central processing based on an optimization process. The optimization data requirements include willingness-to-pay demand, willingness-to-accept supply, budget, capacity and other problem-specific constraints. The data are provided by the decentralized decision makers, whenever price and allocation decisions are needed. The central processing is based on the application of optimization algorithms to the submitted bid-offer messages to determine the prices and allocations that maximize net gains from exchange. These types of markets have been used in natural gas and electricity markets (McCabe et al., 1991) and in water quality management problems (Prabodanie et al., 2010, 2011). On the example of the Israeli water sector Becker (1995) used a similar type of model structure to consider the value of moving from the central planning to the market system. In general, the market is a periodic auction that is cleared using mathematical programming techniques. Pricing information is based on a range of shadow prices generated from the mathematical programming model. The smart market is operated by a market manager, and the trades are to or from a pool rather than based on bilateral trades.

The Smart Market Programming Model

Our smart market linear programming model is based on the following assumptions. First, we assume that the bid functions for each emitter are discrete functions with each step being called a tranche. The index for each bidding firm's tranche is denoted by the index n ($n = 1, \dots, N$). The trading activities are assumed to account for the possibility of hot spots occurring spatially, so we include ambient air quality standards at various receptor points in the model. Let Q_j^0 represent the ambient concentration level at the receptor location j , B_{in} the size (quantity) of the bid tranche n submitted by the bidding firm i , P_{in}^b the price specified in the bid tranche n submitted by the bidding firm i , and l_{in}^b the quantity of EDPs accepted from the bid tranche n by the bidding firm i . The basic smart market model formulation is

$$\text{Max} \quad \sum_{i=1}^I \sum_{n=1}^N P_{in}^b l_{in}^b \quad (7)$$

subject to

$$\sum_{n=1}^N l_{in}^b = l_i \quad (\pi_i) \quad (8)$$

$$(i = 1, \dots, I) \quad (\theta_{in}) \quad (9)$$

$$l_{in}^b \leq B_{in} \quad (\phi_{in}) \quad (10)$$

$$\begin{aligned} (n = 1, \dots, N) \\ (i = 1, \dots, I) \end{aligned} \quad (\rho_j) \quad (11)$$

$$-l_{in}^b \leq 0$$

$$\begin{aligned} (n = 1, \dots, N) \\ (i = 1, \dots, I) \end{aligned} \quad (\psi) \quad (12)$$

$$\Pr \left\{ \sum_{i=1}^I d_{ij} l_i \leq Q_j^0 \right\} \geq (1 - \alpha_j)$$

$$(j = 1, \dots, J)$$

$$\sum_{i=1}^I l_i \leq \bar{l}$$

The variables in parentheses to the right of equations (8) – (12) are Lagrangean multipliers. The objective function equation (7) represents the joint net economic benefits of undertaking the permit trading assuming that the constraints on ambient concentration standards at a range of receptor locations are satisfied. The linear programming model is defined as a gross pool formulation. This formulation is independent of the initial distribution of permits (Prabodanie et al., 2011). The bids reflect the additional quantity of EDPs preferred at each price by a bidder if there are no initial holdings. The linear programming model is solved and the optimal quantities are found, the net buyers and sellers are determined by the final position and initial position of EDPs for each bidder. Firms adding to their initial position are net buyers and those, who have reduced the initial level of the EDP holdings, are net sellers. The payments and receipts are calculated from net receipts.

The coefficients P_{in}^b in the objective function equation (7) indicate how much each block of EDPs is worth to the bidder. The constraint (10) indicates that the quantity of bids accepted in each bid tranche cannot be negative. The constraint (9) places an upper bound on each tranche, ensuring that the quantity of permits cleared does not exceed the maximum specified by the bidder. The equation (8) represents an allocation constraint, which specifies the quantities of EDPs accepted and the final permit positions. The constraints (11) are spatial constraints, which represent the capacity restrictions on the market, because they restrict the tradable resource capacities. Alternatively, these constraints are designed to control for spots that might occur at the respective receptor points. The constraint (12) states that the total number of EDPs purchased cannot exceed the total number of permits issued by the environmental authority.

The presence of emission releases and their spatial transport to various receptor points is modeled in a stochastic manner as shown by (11), which represent “chance constraints.” The expression $(1 - \alpha_j)$ is defined as an exceedance probability for the air pollutant at receptor location j ($0 < \alpha_j < 1$). These probabilities are assumed to be determined exogenously by the environmental policy decision makers, given their aversion to uncertainty. The stochastic specifications in (11) include the transfer coefficients d_{ij} . The distributed parameter simulation models can be used to estimate the expected values and probability distributions of the transfer coefficients (Ellis, McBean and Farquhar, 1985). The ambient

concentration standard Q_j^0 is also assumed to be stochastic. The equations (11) must be converted into a more convenient form for solving the model as a mathematical programming problem. The following assumptions are used in this process. First, the d_{ij} and Q_j^0 are assumed to be normally distributed with their means being d'_{ij} and Q'_j . In addition, both sets of parameters are assumed to be statistically independent. These assumptions allow us to rewrite (11) as follows:

$$\sum_{i=1}^I d'_{ij} l_i + \varphi_j \left[\sum_{i=1}^I \sigma_{ij}^2 l_i^2 + \varepsilon_j^2 \right]^{0.5} \leq Q'_j \quad (\rho_j) \quad (13)$$

$$(j = 1, \dots, J)$$

where the φ_j are critical values of the standard normal distribution exceeded only with probabilities $(1 - \alpha_j)$. The smart market model with a safety margin now consists of the maximizing equation (7) subject to (8), (9), (10), (12) and (13). The information on the market-clearing EDP prices can be found from the first order necessary conditions for the smart market model. Let us first assume that none of the receptor constraints represented by (13) is binding, but the constraint (12) is binding, which we will assume for the remaining part of the discussion. In such a situation we can conclude that

$$\pi_i = \psi \quad (14)$$

for all i ($i = 1, \dots, I$). ψ is the shadow price for the EDP constraint. It indicates the reduction in the emission control costs, if the environmental authority were to add one additional EDP to the total number of permits in the market. This shadow price is the market-clearing price in the EDP market and in this case all firms pay the same permit price. Now assume the constraint (13) being binding. In such a case we have the following condition:

$$\pi_i = \psi + \sum_{j=1}^J \rho_j \left\{ d'_{ij} + \varphi_j \left[\sum_{i=1}^I \sigma_{ij}^2 l_i^2 + \varepsilon_j^2 \right]^{-0.5} \sigma_{ij}^2 l_i \right\} \quad (15)$$

$$(i = 1, \dots, I)$$

The equation (15) shows the shadow price with included uncertainty. The variable ρ_j is then the shadow price for the health risk-based ambient concentration standard at the receptor location j as well as the uncertainty of this standard. If the ambient concentration standard at the receptor location is reduced by one unit, given a particular level of uncertainty ε_j^2 for Q_j^0 , the level of the trading surplus given by (7) is reduced by $\sum_{j=1}^J \sum_{i=1}^I \rho_j d'_{ij}$ across the firms given all monitoring stations, where the constraints are binding. On the other hand if there is an increase in all ε_j , the marginal opportunity cost of the error in the health risk based ambient concentration standards is measured by $\sum_{j=1}^J \sum_{i=1}^I \rho_j d'_{ij}$.

CONCLUSIONS

We have designed a computer assisted “smart market” model for allocating the permits so as to achieve the same type of behavior we observe for each decision maker in the overall cost minimization model. We have provided the theoretical structure of the “smart market” model with a safety margin. Also, the elements of the margin of safety have been explored in detail. We have also looked at the pricing rules for the permits that reflect a margin of safety. We believe that this approach represents a useful addition to

the existing smart market literature. However, the issues of the implementation of this approach aimed at addressing environmental problems need further consideration. The relevant empirical evidence to test the model could be obtained by its preliminary testing in the experimental settings. This remains the open venue also for our future research.

ANTHROPOMETRY IMPACT IN THE DESIGN OF MILITARY EQUIPMENT

Mihai Opincă, Academy Of Economics Studies Bucharest

Adrian Antip, Romanian Ministry Of Defence

Alexandrina Deaconu, Academy Of Economics Studies Bucharest

ABSTRACT

The design technique is necessary to take into account the characteristics and innate human skills because they do not change substantially in time and space, so that human engineering must start from the dimensions, possibilities and limitations of human being. Increasingly for body size and its weight and anthropometry modern studies have led to continuous improvement of measurement tools and techniques so that data collected meet those requirements clearly and accurately.

JEL: M11, M12

KEYWORDS: anthropometry, ergonomics, human resources, design, technique

INTRODUCTION

Combat equipment is highly complex characterized, with mechanisms which ensure greater effectiveness and a great power of destruction. The design of combat equipment must consider the human being possibilities, being essential and mandatory, because regardless of the type of structure and use of fighting, they are served by people who have limited mental and physical qualities. Taking into account the military opportunities, they should be given special importance, as technical mismatch between man and technique, between man and his work, cause status stress, errors in daily activity, low performance.

Anthropometry used in military ergonomics intends that all people be able to work with any combat equipment, by designing early design phase of adjustment possibilities size technique appropriate to performers requirements. Discomfort restricting the possibility of driving, inefficiency, risk of injury, can be removed from the design. Application anthropometry in design must be based on a number of methodological requirements and general principles such as:

- Consider man as an integral part of system design. This principle considers man an essential, central component, of system design, involves designing junctions between humans and other technical components (machines, desktop or control panel, furniture, tools, safety equipment). This means that dimensional and functional features of human should be considered from the first phase of the development of any design system;
- Giving priority to operational or functional aspects. Human operator must imagined and study relationship of techniques;
- Knowledge and interpretation of variability. Dimensional variability of man is determined by a number of factors of variability of internal order, hereditary (age, sex, race, people) and amplified by many factors of variation acquired (external), such as occupation (profession), nutrition, health physical activity, position work clothing and protective equipment;
- Providing an indication of space tolerances allowed for people and equipment. This principle of applying anthropometry in ergonomic design takes into account any specific conditions that may perform work or other voluntary body modifications;

- Performance evaluation and accommodating of fully equipped man-fully equipped technique. Principle envisages that dimensional differences might be important, as subjects are measured with or without clothing worn with or without work equipment or protection. Thus, using different types of clothing (summer, winter) or protective equipment leads to not only weight gain, but that the size of which must be taken into account in ergonomics design;
- Promoting safety and health. This principle is fully aware that man (human resource) is the most important resource, today and tomorrow, all organization providing survival and development of their competitive success, which means that the resource (person) will be preserved in all ways and also through the preservation and promotion of occupational safety.

Man and combat equipment form a system where human and techniques functions are closely connected, so that it becomes impossible to solve the problems of this system correctly if we limit ourselves to consider only the technical aspects and neglect human factors and not heed human dimensions, size workspace settling from the basic dimensions (weight, height). The design phase should observe some general principles for the application of ergonomics as follows:

- Since the planning and design, stage must take out the possibilities and limitations of operator. Redesign is inefficient and has an expensive price of the product;
- The operator must use functional images. Designer makes human-technical system to start from functional dimensions;
- Need to take into account the variability of the human dimensions factors which are of internal order (hereditary) and external (environmental conditions);
- To provide proper limits of tolerance for people and equipment. Under stress, range of motion is always greater than the constant normal work;
- Accommodating and performance to evaluate fully equipped man.

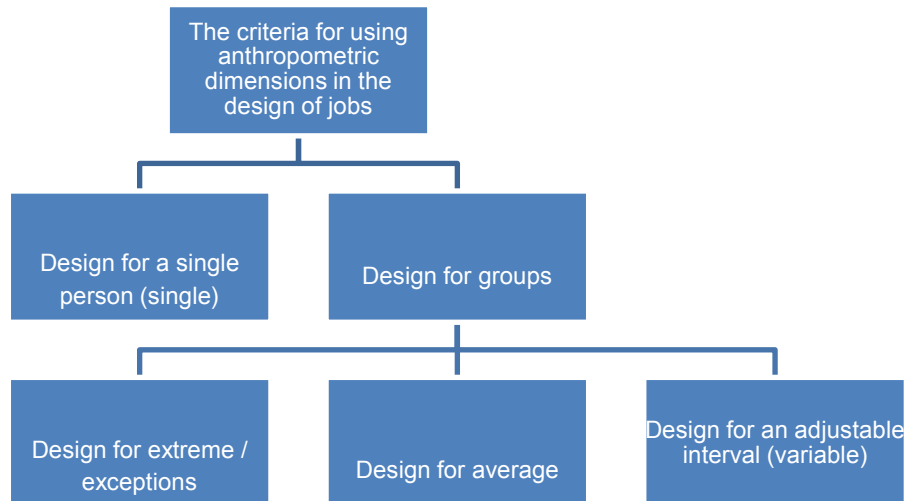

The workspace is calculated according to the body size and we refer to:

- Weight, using as support in designing the stand, seats, parachutes, lifting and transport means;
- Height, a parameter necessary for designing: rooms, passageways, vehicles, overhead-arranged structures.

Therefore, as many specialists affirm such as Diego Gonzalez Maestro, knowledge anthropometric dimensions of operator are a fundamental element for design work systems. Anthropometry applications are not found only in designing work space but also in the media work (equipment, machinery, tools, environmental factors, etc.), information and signaling devices, personal protective equipment and protective clothing. The criteria for using anthropometric dimensions in the design of jobs are (Figure 1):

- design for a single person (single);
- design for groups;
- design for extreme / exceptions;
- design for average;
- design for an adjustable interval (variable).

Figure 1: Criteria for the design of jobs

This figure shows the criteria for the design of jobs. Figures were taken from G.D. Maestre , Ergonomia y psicopsicologia, FC Editorial, Madrid, 2007, pp.137

Therefore, some difficulties in orientation of ergonomic design result from variations of human body dimensions, so that they cannot be established with the general and permanent validity, but they must be determined according to the concrete conditions of work and reviewed at least every ten years, taking into account the fact that, might arise some important changes. To be useful in ergonomics designing, anthropometric data must satisfy certain requirements:

- Measured human group must be representative to the operators who actually use military equipment;
- Samples must be large enough to ensure full extension results in well-defined socio-professional group which these samples from;
- Techniques able to be some specific purpose;
- Anthropometric data are not always sufficient for all requirements design. Experience should help the designer to evaluate existing data and to deduce from other dimensions required;
- It is necessary for the small operator be able to enter, and the large operator to fit.

So far, many project managers and designers are still reluctant to consider human factors as an essential and integral part of design. This is sometimes due to their lack of education in ergonomics. However, there is more than ever an evident progress in accepting this discipline in a wide variety of applications and processes. U.S. Army is particularly concerned with the implementation of ergonomics at each stage of the procurement process systems and devices. Just because every piece, tool, from a multi-billion dollar aircraft, aircraft carrier until the military boots, takes human factors engineering analyses before procurement, and throughout their life cycle. The lesson learned from the conflicts involving the U.S., determined to take measures to improve safety in the use of military technology for human systems integration to be initiated at the beginning of the procurement process, to ensure that human performance is considered crucial in the overall design labor system. It is necessary a human perspective approach to construct and use the military combat equipment that cannot meet requirements is needed? Since the World War II, military engineers and technicians have been smitten by a series of errors, difficult to explain, which military personnel commit in handling machines, devices and military equipment. Carefully errors analysis revealed that apparatus involved requests, especially the military operators,

surpassing their possibilities. Requirements modeling technique after human capabilities have led to a significant reduction of errors.

CONCLUSION

In military training and especially in modern battlefield of military equipment, builders and designers must pay particular attention to the military term exposure to a hostile environment, which leads to lower capacity of perceiving the characteristics of combat, the ability to produce damage. Also due to concentration, radically reducing precision movements or actions, decisions, there is a loss of capacity of the military personnel to fight. Concordance between dimensions machinery, equipment or products and dimensions users is very important both for their use and in terms of human health and safety. Resources are used more effectively by matching personal skills with job requirements of each project; increasing individual performs, job satisfaction and thus decreases the number of those who want to leave the system.

DOES GENDER PLAY ROLE IN DECISION MAKING ON REGULATED MARKET?

Jana Peliova, University of Economics in Bratislava

ABSTRACT

Nowadays there is a big discussion connected with imposing of different forms of regulation on financial markets. Governments try to prevent individual investors from losing money in unexpected downfall. In our study we focus on the impact of financial market regulation on risk attitudes of men and women. We conducted laboratory experiment on risk taking under regulation on market at Economic Science Institute (ESI) of Chapman University. Our results support the outcomes of large scale surveys, whose results shown significant difference in risk taking among genders. Our empirical results show the difference in risk taking decisions on both, unregulated market as well as on regulated markets. Female subjects did not reflect the change in market settings into the change in their decisions. Male subjects increased their wagers in regulated market settings.

JEL: G11, G28

KEYWORDS: long term decisions, risk taking, financial market regulation

INTRODUCTION

There is an amount of titles in economic literature which list reasons why government should intervene on the market. The most important ones are market failures and losses in efficiency. Possible way how to overcome market imperfectness and increase social efficiency is to impose regulation. Nowadays there is big discussion about introduction different regulations on financial markets. The area of our interest is to investigate the influence of regulation of potential losses on investment behavior. We focus on long term investment decisions (pension funds, long term savings accounts). In order to prevent individuals from losses caused by wrong decisions, governments impose market regulations on financial markets such as minimum pension, guaranties on savings (e.g. in the form of insurance). In presented article we refer to regulated markets as to the ones with imposed rules to “prevent” investors from losses of this kind.

Actually there is big discussion about the decision of European commission on equality between men and women in insurance procedures. This issue re-opens the question of gender connected influences on financial decision making. We decided to investigate the difference in investment between genders. Literature and academic studies based on field data tend to conclude that women are relatively more risk averse than men, whereas the laboratory experiments render inconclusive results.

LITERATURE REVIEW

The existence of gender differences in willingness to undertake risks has been documented in a large number of questionnaire and experimental studies. One of the most cited is a meta-analysis by Byrnes, Miller, and Schafer (1999), which reviewed over 150 papers on gender differences in risk perception. They concluded that the literature “clearly” indicated that “male participants are more likely to take risks than female participants”. Fehr-Duda and de Gennaro (2006) used for analysis abstract and contextual environment. They stated that gender differences in risk taking may be due to differences in subjects’ valuations of outcomes or due to the way probabilities are processed. Published results of their experiment indicate that men and women differ in their probability weighting schemes; however, they did not find a significant difference in the value functions. Women tend to be less sensitive to probability

changes and also tend to underestimate large probabilities of gains to a higher degree than do men, i.e. women are more pessimistic in the gain domain. The combination of both effects results in significant gender differences in average probability weights in lotteries framed as investment decisions. The analysis concludes that women's relative insensitivity to probabilities combined with pessimism may indeed lead to higher risk aversion.

Different results were described by Harris and Jenkins (2006). They observed 657 participants and assessed their likelihood of engaging in various risky activities relating to four different domains (gambling, health, recreation, and social domain), and reported their perceptions of (1) probability of negative outcomes, (2) severity of potential negative outcomes, and (3) enjoyment expected from the risky activities. Women's greater perceived likelihood of negative outcomes and lower expectation of enjoyment partially mediated their lower propensity toward risky choices in gambling, recreation, and health domains. Perceptions of severity of potential outcomes were a partial mediator in the gambling and health domains. The genders did not differ in their propensity towards taking social risks. A fifth domain of activities associated with high potential payoffs and fixed minor costs was also assessed. In contrast to other domains, women reported being more likely to engage in behaviors in this domain. This gender difference was partially mediated by women's more optimistic judgments of the probability of good outcomes and of outcomes being more intensely positive.

In this paper we focus on long term investment decisions inspired by Benartzi and Thaler (1995) who were trying to answer the question: Why is the equity premium so large or why is anyone willing to hold bonds? Their answer is based on two concepts from psychology of decision-making. (1) loss aversion (the tendency of individuals to be more sensitive to reductions in their levels of well-being than to increases – summarized in prospect theory by Kahneman and Tversky (1979); and (2) mental accounting – the implicit method individuals use to evaluate and code financial outcomes - Kahneman and Tversky (1984), Thaler (1985). Myopic loss aversion refers to loss aversion and short evaluation period.

To simulate long term decision making in the design of an experiment we use repeated gambles. Klos et al. (2005) points out that while everyone agrees that risk reduction is a desirable goal, not all definitions of risk are consistent with the observation that risk is reduced by repeated plays. Equating risk with the probability of a loss is only one possibility. Most people would agree that the magnitude of potential losses needs to be considered as well. They investigate the effect of time horizon on investment behavior, and report the results of an experiment in which business graduate students provided certainty equivalents and judged various dimensions of the outcome distribution of simple gambles that were played either once or repeatedly for 5 or 50 times. Despite correctly realizing that outcome standard deviation increases with the number of plays, respondents showed evidence of Samuelson's (1963) fallacy of large numbers. Perceived risk judgments showed only low correlations with standard deviation estimates, but were instead related to the anticipated probability of a loss (which was overestimated), mean excess loss, and the coefficient of variation.

DATA AND METHODOLOGY

We conducted laboratory experiment at ESI of Chapman University on group of 58 subjects (students of the Chapman University). 33 males and 25 females were randomly chosen from the database. 10 to 14 subjects participated in each experimental session. One session lasted for approximately 50 minutes and the average earning for participant was approximately 20 USD (show up fee included). Each experimental session consisted of three parts. We designed an experiment with two different lotteries (representing two treatments: Unregulated and Regulated market). Each treatment consists of three rounds of three consecutive lotteries. Subjects were asked to place the wager for three of lotteries in one round. Wager was done from initial endowment of 200 cents within the interval of 0 to 200 for one round consisted of three lotteries (200 cents of initial endowment for each lottery). A remarkable series of laboratory

experiments has found that subjects are more willing to invest in risky assets with positive expected returns if only aggregated returns are reported to them, rather than the individual component returns. We informed subjects about monetary result for one lottery as a whole. In “Fair treatment” we defined lottery with 2/3 chance of losing the wager and 1/3 chance of chance of winning 2.5 times the wager. In second treatment (“Unfair lottery”) we limited the possible loss in the case of negative outcome from the lottery to the half of the wager. The third part of experiment was risk elicitation. For risk elicitation we used standard Holt - Laury test (Holt - Laury, 2002). After fulfilling all three parts of experiment, subjects were asked to fill the questionnaire.

RESULTS

For the evaluation and statistical analysis of results we used the SPSS program. 33 male and 25 female subjects participated in the experiment. According to previous reported large scale analysis results males are significantly more risk positive than females. In our sample males were bidding higher wagers, with the exception of wager number three, but the difference is not statistically significant (see the Independent sample test in Appendix 1) as equal variances were not assumed.

Table 1: General statistics for wagers according to gender

	Gender	N	Mean	Std. deviation	Std. error mean
wager1	Male	33	121.55	59.553	10.367
	Female	25	104.04	45.572	9.114
wager2	Male	33	124.67	56.783	9.885
	Female	25	112.68	45.249	9.050
wager3	Male	33	126.67	63.153	10.994
	Female	25	127.80	42.058	8.412
	Gender	N	Mean	Std. deviation	Std. error mean
wagerII1	Male	33	147.42	57.539	10.016
	Female	25	108.84	38.685	7.737
wagerII2	Male	33	145.939	59.8519	10.4189
	Female	25	110.000	42.2325	8.4465
wagerII3	Male	33	142.03	65.150	11.341
	Female	25	119.12	48.356	9.671

* Wager is referring to the “Fair lottery”. WagerII is referring to the “Unfair lottery”. In this table we present general statistics for wagers in three “Fair lotteries” and in three “Unfair lotteries”.

In regulated setting (Unfair lottery) losses were limited to the half of the wager in the case of negative outcome from three lotteries in one round. The amount of wager increased significantly in this treatment among male subjects. It rose from 121.55 cents for the first wager in “Fair lottery” to 147.42 cents for the first wager in “Unfair lottery”. In contrary, females had consistent amount of wagers for both treatment, in “Unfair lottery” they reported slightly lower wagers.

Table 2: Wagers according to the order of treatments

Order of Treatments		N	Mean	Std. Deviation	Std. Error Mean
wager1	Fair First	32	118.94	58.670	10.372
	Unfair First	26	107.92	48.680	9.547
wager2	Fair First	32	131.09	56.162	9.928
	Unfair First	26	105.23	43.352	8.502
wager3	Fair First	32	131.03	61.600	10.889
	Unfair First	26	122.38	45.341	8.892
wagerII1	Fair First	32	150.41	56.719	10.027
	Unfair First	26	106.65	37.867	7.426
wagerII2	Fair First	32	155.438	51.9410	9.1820
	Unfair First	26	99.692	43.6346	8.5575
wagerII3	Fair First	32	152.63	59.786	10.569
	Unfair First	26	106.96	48.452	9.502

* We refer to “Fair lottery” in the case, that there is no limit on losses and gains from lottery, this setting represents unregulated market environment. We refer to “Unfair lottery” if loss in the case of negative outcome is limited to half of the wager. This table shows mean wagers for all subjects according to the order of treatment.

Wagers in situation when subjects were facing fair market conditions followed with regulated market are significantly higher, except for the first wager. We can also observe significant increase in amount of wagers in situation with limited losses. In “Fair lottery” there is no statistically significant difference in the amount of wagers depending on the order of lotteries. We can observe statistically significant difference in wagers in lottery with limited losses. In this treatment, wagers tend to be higher if subjects start an experiment with “Fair lottery”. We investigated if the different order of treatments caused different wagers between male and female subjects. T test statistics for both groups approved that the order of treatments affects more female than male subjects. Female starting with Unfair lottery tend to bid lower in Unfair lottery than in Fair lottery treatment. This results support some previous findings that females are more likely misjudging the level of risk.

To support our outcome we run statistical analysis for averages of wagers in “Fair” and in “Unfair lottery” for every subject. Results are reporting increase in average amount of wager in “Fair lottery” in comparison to “Unfair lottery” within male subjects from 124 to 145 units. Within female subjects the average wager was higher in Fair lottery (but the difference was not statistically significant). Male subjects had higher bids in “Unfair lottery” than in “Fair lottery” and it is statistically significant on the 90% level of confidence. Female subjects were bidding equally low in both treatments. Supporting statistical evidence is presented in Appendix 2.

Table 3: Paired Samples Test for Order of Treatments and Gender

Gender	Order of Treatment	Average Fair Wager	Average Unfair Wager	Paired Differences				t	df	Sig. (2-tailed)
				Std. Deviation	Std. Error Mean	95% Confidence Interval				
						Lower	Upper			
Male	Fair First	123,8056	134,6389	57,68459	12,89867	-61,78055	-7,78611	-2,697	19	,014
	Unfair First	117,1282	116,5128	53,71700	14,89841	-31,84547	33,07624	,041	12	,968
Female	Fair First	128,9500	163,7333	30,93215	8,92934	-30,48668	8,82002	-1,213	11	,250
	Unfair First	106,5641	92,3590	18,40065	5,10342	3,08572	25,32453	2,783	12	,017

This table shows that females were more affected by the order of treatments when deciding about wager more than males.

We analyzed the impact of the order of lotteries on the amount of wager. Subjects who participated in “Unfair lottery” as the first treatment bid lower average wagers in “Fair lottery”, but this observation is not statistically significant on the 95% level of confidence. We can confirm that with 95% level of confidence that subject tend to bid lower wagers if they start with “Unfair lottery”.

To measure the risk attitudes of subjects we used Holt - Laury test on risk elicitation. Within our sample of 58 subjects 44 subjects clearly expressed their risk attitudes and we could divide them into groups of sensitivity (slightly risk loving, risk neutral, slightly risk averse, risk averse, very risk averse and extremely risk averse). We grouped outcomes and created three groups of subjects according to their risk attitudes (Risk loving, Risk neutral and Risk Averse). In contradiction to our expectations, risk loving subjects were bidding the lowest wagers in both order of treatments.

Figure 1: Average wagers in Fair First Treatment

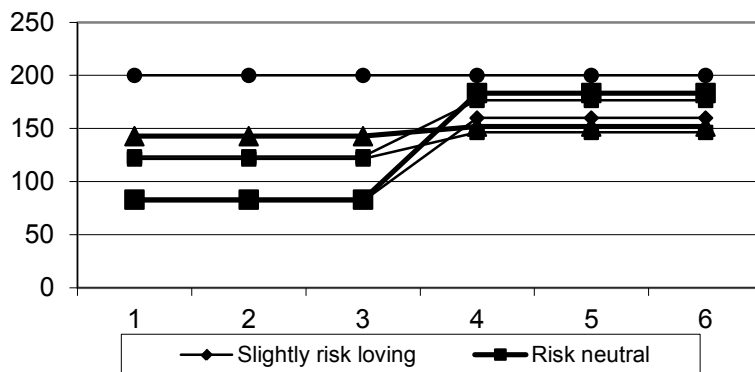

Figure 2: Average wagers in Unfair First Treatment

CONCLUSIONS

Financial market regulation is imposed by governments on markets to preserve individual investors from wrong decisions. We were focused on long-term decisions, using multiple gambles to simulate this environment. Consistent with previous research studies we expected that male subjects would bid higher wagers than female subjects, that both groups, males and females, would increase their wagers in regulated market (“Unfair lottery”).

In conducted experiment subjects were exposed to two different environments. In Fair lottery they could win 2.5 times their wager with the probability of 33.33 % and loose the wager with probability of 66.66 %. This setting was representing unregulated market. In Unfair lottery losses from lottery were limited to the half of wager. This setting represents regulated market. The results of our investigation showed that male subjects were bidding higher wagers than female subjects in both treatments. This outcome is consistent with large scale surveys. Within male population we found support for our second expectation as well. Average wagers of males were higher in regulated lottery. Average wagers of females were lower comparing the ones of males.

Surprisingly, female subjects bid lower wagers in regulated lottery setting but not on reasonable level of statistical significance, which means that they did not change their behavior. In comparison the male subjects were able to better assess the change in risk and were learning to higher wagers in unfair lottery. We can explain this using observation from large scale surveys, which state that females are less sensitive to the change in conditions and level of risk. This conclusion remark needs to be investigated in further research.

FACTORS INFLUENCING THE DURATION TAKEN BY SMALL AND MEDIUM ENTERPRISES TO ACHIEVE THE BREAK-EVEN POINT IN THEIR OPERATIONS: EVIDENCE FROM URBAN SLUM SETTLEMENTS OF NAIROBI, KENYA

Charles M. Rambo, University of Nairobi, Kenya

ABSTRACT

The past two decades have seen an exponential growth in the number of small and medium enterprises in Sub-Saharan Africa; however, about two-thirds of such enterprises often fail to take off, resulting to negative economic impacts at the micro and macro-levels. However, documentation of the subject remains limited, especially in Kenya. This study involved 146 enterprises that had been operational for between 1 and 5 years. Inclusion criteria included availability of consistent financial records as well as willingness to share such information. The findings showed that the duration taken to break-even ranged between 3 and 40 months. The level of training in financial management was the most important covariate, explaining up to 12.1% of variation in the duration taken to break-even. Ever training in financial management accounted for 10.2%, marketing (9.7%); educational attainment (8.6%), capitiation-funding level (7.5%) and firm size (6.8%). The study recommends the need for universal entrepreneurship training programs, integration of entrepreneurship training in national plans, a multisectoral approach to entrepreneurship training, linkages between the private sector, academia and development partners as well as support centres at the county level to facilitate the development of such enterprises.

KEYWORDS: Small and Medium Enterprises, Break-Even Analysis, Break-Even Point, Urban Slums

INTRODUCTION

Break-even analysis is one of the key tools available for planning and managing a firm's financial performance, particularly during the initial years of operation. As noted by LeFever (1998), break-even analysis is a useful tool for planning the success of young business ventures as well as new products and services. It facilitates budgeting and long-range planning of cash inflows and outflows. Break-even analysis is logically appealing and readily applicable to business firms of all sizes. Once constructed, break-even charts provide the management with a convenient guide for judging operational performance, adjusting pricing levels or controlling cost components (Deakins, Logan & Steel, 2001; Rothberg, 2012).

The break-even point is achievable when the total costs of production or services equals the total revenue received from sales. It is a point where a business neither makes profits nor incurs losses (Ndaliman & Bala, 2007; Rothberg, 2012). For new business ventures or new products launched in the market, achieving the break-even point (BEP) is a great milestone towards success. The duration taken to achieve the BEP is an indication of the management's capacity to plan and manage the inflow and outflow of financial resources. It also reflects a firm's success in marketing its products or services, as well as supportiveness of the business environment (Rothberg, 2012).

The duration taken by SMEs to achieve the BEP is critical for Sub-Saharan African (SSA) economies; however, there is a dearth of relevant empirical literature to inform the planning, policy formulation and

financing of SMEs, particularly in Kenya. Although many SMEs are emerging, poverty levels remain all time high in most parts of the country, which raises concern about the preparedness of entrepreneurs with relevant financial management skills, the capacity to plan and manage cash inflows and outflows to expedite financial stability (Wanjohi, 2008; Mbithi & Mainga, 2006; Atieno, 2009).

The issues also raise concern on whether the business environment is supportive to the growth of SMEs or otherwise (Mbithi & Mainga, 2006). The duration taken by SMEs to achieve the BEP has significant micro- and macro-economic implications; thus, necessitating empirical investigations. The main objective of this study was to determine factors influencing the duration taken by SMEs in Nairobi's slum settlements to achieve break-even in their operations. The focus on Nairobi's slums stems from the high population growth rate, resulting from rural-urban migration. SMEs remain the largest provider of employment opportunities for rural-urban migrants; thus, their financial stability and growth becomes of paramount interest to management scholars and development agencies. The information generated by the study is also useful to financial institutions providing credit to SMEs, particularly because the financial success of SMEs translates to their own success, while SME failure increases the incidence of bad debts and court cases, with far-reaching negative effects at the micro and macro-economic levels.

DATA AND METHODOLOGY

The study targeted small and medium enterprises (SMEs) that had been operational for between 1 and 5 years. Inclusion in the sample depended on the availability of consistent financial records detailing monthly sales and expenditures, as well as willingness to share such information and to participate in the interview. Out of 266 SMEs contacted, 146 (54.9%) met inclusion criteria and their managers participated in interviews in early 2012. Data collection included identification of SMEs meeting the inclusion criteria, consenting, interviews and extraction of information from financial records. We applied a cross-sectional survey design, with quantitative and qualitative approaches to guide the research process. Detailed description of the design and approaches used in this study are available in following publications (Nachmias & Nachmias, 1996; Bryman & Cramer 1997; American Statistical Association, 1999; Owens, 2002; Rindfleisch, Malter, Ganesan & Moorman, 2008). Quantitative analysis generated cross-tabulations with Chi-square (χ^2) tests, correlation co-efficients, scattergram with F-statistic and *odds ratios* [$Exp(\beta)$]. In addition, we processed and analyzed qualitative data using thematic analysis, which involved transcription of responses, creating thematic nodes and systematic interpretation.

RESULTS AND DISCUSSIONS

Of the 146 small and medium enterprises (SMEs), 19% dealt in woodwork products, 21% traded in metalwork products, 13% sold clothing products, while another 12% specialized in bakery products. Other business forms involved in the study included beadwork (10%), automobile (9%), chemists (6%), drycleaners (6%) and supermarkets (4%). Up to 82.2% of SMEs dealing in wooden products operated as retailers. For metalwork traders, 58.4% served the market as both retailers and wholesalers, while 54.6% of SMEs dealing in clothing products operated as both retailers and wholesalers. In the case of bakery products, nearly two-thirds (58.1%) were involved in retailing, while 79.3% of SMEs specializing in beaded products also operated as retailers. Table 1 shows the mean duration taken by business ventures in each category to break-even. The results show that supermarkets took the longest time (24.5 months) to achieve BEP, followed by drugstores (23.1 months), automobile services (22.1 months) and beadwork (17.5 months). Contrastingly, businesses specializing in bakery products recorded the shortest mean duration (13.1 months) to break even, with the fastest firms taking 3 months. Next in line from the top were SMEs specializing in metalwork products (13.7 months) and woodwork products (14.8 months).

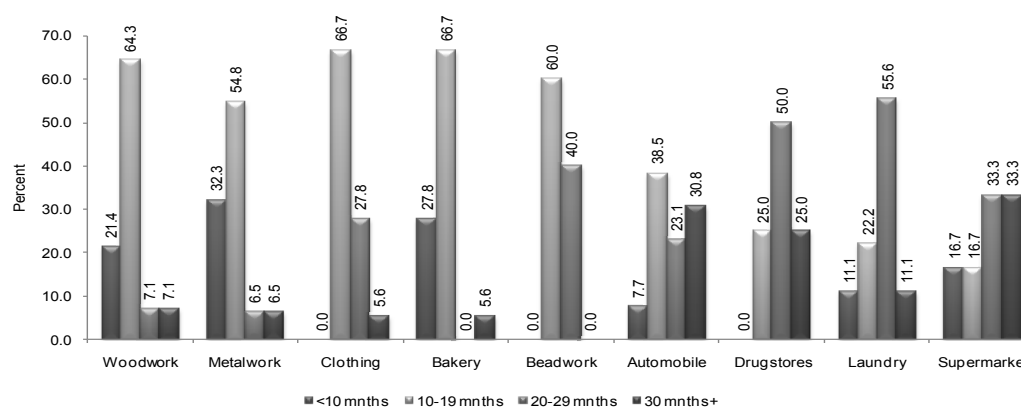

Table 1: Mean Duration Taken to achieve the Break-Even Point (months)

Sub-sector	N	Mean	Std. Deviation	Minimum	Maximum
Woodwork	28	14.79	7.35	3	34
Metalwork	31	13.74	7.57	4	39
Clothing	18	16.72	7.00	10	36
Bakery	18	13.11	6.76	3	33
Beadwork	15	17.47	6.40	11	27
Automobile	13	22.08	9.09	8	35
Drugstores	8	23.12	7.55	11	33
Drycleaners	9	20.89	9.06	4	34
Supermarkets	6	24.50	10.91	9	40
Overall	146	16.75	8.24	3	40

The table shows the mean duration taken by firms in various sub-sectors to achieve the break-even point. The first column shows the sub-sectors captured by the study, the second column shows the number of firms in each sub-sector, the third column is the standard deviation from the mean in each group, while the fourth and fifth columns show the minimum and maximum duration (in months) taken by firms in each sub-sector to break-even.

Firms dealing in wooden and bakery products reported the shortest time taken to achieve BEP, supermarkets showed the longest duration. Overall, SMEs included in the study took an average of 16.8 months to break-even. Figure 1 shows that up to 21.4% of the SMEs in the woodwork achieved the break-even level within the first 10 months of their operations.

Figure 1: Sectoral Variation in the Duration Taken to Achieve Break-Even Point

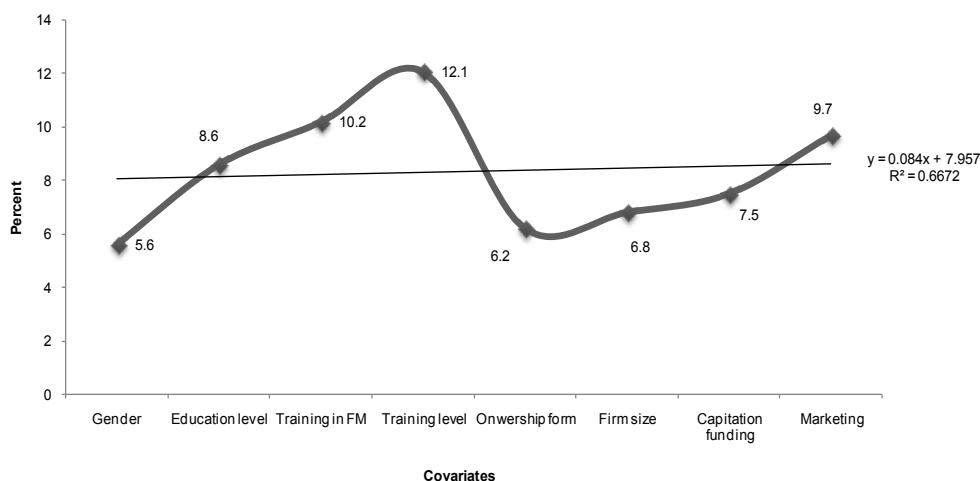

The figure shows the average duration taken by small and medium enterprises in each sub-sector to achieve the break-even point. The duration has been grouped into four categories, including 'less than 10 months', which is represented by the first bar from left; '10 to 19 months', represented by the second bar; '20 to 29 months' represented by the third bar and '30 months or higher'. Within the text, I designate the categories as first, second, third and fourth terms, respectively. Besides, I refer to firms reaching BEP within the first 10 months as early bloomers and those doing so at 30 months or higher as late bloomers.

Among SMEs dealing in metalwork products, about one-third (32.3%) reached the break-even point within 10 months. The proportion of firms achieving BEP within the first term was high among traders in the metalwork, woodwork and bakery sub-sectors, while the proportion of late bloomers was high among drycleaners, drugstores, beadwork dealers and supermarkets. The analysis obtained a computed χ^2 value of 56.381, with 24 degrees of freedom and a p-value of 0.000. The result is significant at 0.01 error margin, implying up to 99% chance that the duration taken to achieve BEP was significantly different across the various sectors. The duration taken by SMEs to break-even is a function of various factors both within and outside business firms. Internal factors include attributes of SME managers and attributes specific to SMEs. Besides, external factors arise from the environment in which a firm operates and may include market demand and supply forces, competition, cartels and distribution channels as well as government policy. Factors captured by this study included gender of SME managers, education level,

professional training in financial management, ownership form, amount of capital invested, firm size in terms of number of paid workers and business age.

The study found that the duration taken by firms to achieve BEP significantly associated with gender, educational attainment, ever training in financial management, level of training in financial management and ownership type. In addition, the duration taken by SMEs to break even significantly correlated to the number of paid workers, the level of capititation funding as well as the advertisement of merchandise, while external factors included competition, high poverty levels, high cost of electricity and high transportation cost. Based on the proportion of variance in the duration taken to break-even, we plotted the resultant proportions on a scattergram as indicated in figure 2.

Figure 2: Effect of Covariates on the Duration Taken to Break-Even

This figure shows the distribution of covariates on a scatter-gram, which was also used to generate best-fit line and co-efficient of determination R^2 , representing the predictive power of the model. The linear equation for the model is $y = 0.049x + 4.181$, with $R^2 = 0.6672$. Overall, the model explains up to 66.7% of variance in the duration taken by small and medium enterprises to break even in their operations.

The results in figure 7 show that training level accounted for up to 12.1% of variation in the duration taken by SMEs to attain BEP. In other words, supporting SME managers to attain the highest level of training in financial management is likely to reduce the time taken to break-even by up to 12.1%. Training in financial management explained up to 10.2% of variation in the duration taken to achieve BEP. Next in order are marketing initiative (9.7%), education level (8.6%), the level of capititation funding (7.5%), firm size (6.8%), ownership form (6.2%) and gender of SME managers (5.6%). Overall, the model explains 66.7% of variance in the duration taken by SMEs to attain BEP.

CONCLUSIONS

Government of Kenya (GoK) has formulated various policy frameworks to spur the growth of SMEs, however, there is lack of programs designed to improve the management capacity of entrepreneurs, which in turn, undermines the survival of SMEs. As a result, about two-thirds of SMEs often fail to realize their potential and purposes for which they are established. SME failure negatively affects the economy at the household and national levels. The study found that the duration taken by SMEs to break-even varies significantly from one sector to the other. While some firms reached the BEP within a few months of operation, the study showed that others took as long as 40 months before breaking-even. Furthermore, training in financial management was the most important covariate explaining up to 12.1% of variation in the duration taken by SMEs to attain the BEP. This is followed by ever training in financial management,

which accounted for 10.2% of variation in the duration taken to break-even, ever marketing (9.7%), educational attainment (8.6%), the level of capitation funding (7.5%), firm size (6.8%), ownership form (6.2%) and gender of SME managers (5.6%). However, the central theme of factors influencing the duration taken by SMEs to achieve BEP is poor planning and management of financial resources vis-à-vis the external environment.

With appropriate skills in financial management, SME managers are likely to reduce up to 10.2% of delays in breaking even. Better still, with training of up to higher diploma level, SME managers are likely to reduce up to 12.1% of delays in achieving financial stability. This implies that enhancing access to credit facilities, easing taxation and providing infrastructural facilities alone is incomplete if such measures are not accompanied with training programs to enable potential entrepreneurs acquire and develop skills in financial management. In view of this, SSA governments should consider investing in entrepreneurial training programs to support the growth of SMEs. Already countries such as Rwanda and Mozambique have made efforts to target entrepreneurship education to women and rural populations, as part of their poverty reduction strategy. The experiences of these two countries can provide useful lessons to inform entrepreneurship education in other SSA countries.

Training in financial management and the level of such training are the most crucial covariates explaining the duration taken by SMEs to achieve the BEP in their operations. The Government of Kenya continues to support the development of SMEs by improving access to funding through programs such as the Youth and Women's Enterprise Funds. The government also strives to create an enabling business environment by easing-off taxation and providing necessary infrastructural facilities. However, there is limited evidence of strong and well-funded training programs targeting potential entrepreneurs in all parts of the country. Consequently, measures such as enhancing access to funding and creating an enabling environment are less likely to reduce the proportion of SMEs sinking with capitation funding. Financial management skills are particularly important in resource-poor countries, particularly in SSA.

Initiating appropriate training programs for entrepreneurs is likely to shorten the duration taken to achieve the BEP by SMEs, which in turn, is likely to synergize the positive role of SMEs in economic development, rather than perpetuate poverty. Furthermore, efforts to support the growth of SMEs should have a long-term scope of investment, particularly through training programs, designed to help prospective entrepreneurs identify their abilities, analyze the environmental setup of small-scale business and industry, fulfill entrepreneurial ambition and acquire skills. Entrepreneurship education should not only help people incubate business ideas but also how to steer business ventures to great heights of financial stability. Entrepreneurship education should form part of the education system. The idea is to embed entrepreneurial culture in the education and training systems to prepare people for effective management of SMEs. Besides, national development strategies and plans should incorporate entrepreneurship education. Entrepreneurship education should not be a continuous process that is accessible to all entrepreneurs. An effective entrepreneurship education should involve all stakeholders in the private sector, education institutions and development partners. This necessitates linkages to facilitate the flow of skills, information and resources to support curriculum development and actual training activities at all levels. Such linkages are also necessary to open up opportunities for trainees to access opportunities to practices and develop their skills.

ACKNOWLEDGEMENT

The conduct of this study would have not been successful without the financial support of Karl JA Fiina Ojansuun Foundation. I thank my research assistants, including Tom Odhiambo, Vincent Onyango, Peter Njeru and Flora Mwangi, who went out to the community to source the requisite information. Most importantly, I remain indebted to all SME managers for committing their time to provide the information. To all those who contributed in one way, accept my acknowledgment.

THE EFFECT OF CORRUPTION ON FDI INFLOW: EMPIRICAL EVIDENCE FROM ASIAN ECONOMIES

Aye Mengistu Alemu, SolBridge International School of Business

ABSTRACT

The effect of corruption on FDI inflow is still debatable among scholars in the field. On one hand, some studies provide support for the idea that corruption in the host country may hinder FDI inflow by increasing economic uncertainty, and thereby weakening investors' confidence in the market systems and on political institutions. On the other hand, some scholars argue that corruption can have a positive impact on investment by facilitating transactions in countries and reported a positive relationship between corruption and FDI. This study has made fresh insights and investigates the effects of corruption on FDI inflow for a panel of 16 Asian economies from 1995-2009, taking the possible endogeneity problems between corruption and FDI inflow into consideration. The empirical result suggests a one unit increase in the level of corruption triggers a decrease in FDI inflow by approximately 9.1 percentage points. Thus, some of the arguments that corruption does not keep FDI out of those corrupt countries were either flawed or invalid. In fact it is reasonable to claim that some of the countries that are characterized by high level of corruption but also with a remarkable FDI inflow could even double their inward FDI if they manage to reduce the present pervasive level of corruption.

KEY WORDS: Corruption; FDI Inflow; Panel Data; REM, FGLS; Economic Growth; Openness; Human Capital

INTRODUCTION

Until recently, there was a strong consensus in the literature that multinational corporations (MNCs) invest in specific locations mainly because of strong economic fundamentals in the host countries for example, large market size, stable macroeconomic environment, availability of skilled labor, infrastructure etc and thereby influence the attractiveness of the country to FDI inflows (Dunning, 1993; Shapiro and Globerman, 2001). However, the host country's economic fundamentals may not be sufficient for inward FDI. Therefore it now becomes important to study afresh what determines inflow of FDI. In this regard, one of the most damaging risks that MNCs must consider in entering emerging market economies is the threat of corruption. Corruption raises the cost of doing business, distorts the allocation of resources and the price of goods and services for consumers, and discourages foreign direct investment (Zhao, Kim, and Du, 2003). According to Myint (2000), corruption is defined as the use of public office for private gain. Following from this definition, examples of corrupt behavior would include: (a) bribery, (b) extortion, (c) fraud, (d) embezzlement, (e) nepotism, (f) cronyism, (g) appropriation of public assets and property for private use, and (h) influence peddling. Corruption exists throughout the world, in developed and developing countries alike. Nevertheless, corruption is worse in countries where institutions, such as the legislature, the judiciary, and the rule of law are weak (Lawal, 2007). Likewise, corruption acts as an irregular tax on business, increasing costs, and distorting incentives to invest (Shleifer and Vishny, 1993; Mauro, 1995; Wei, 2000a).

Accordingly, corruption is a frequent occurrence for international investors. A World Bank study (1999) revealed that more than 85 percent of polled multinational companies "always" or "mostly" encounter corruption while dealing with public sectors. According to Quah (1982), the consequences of corruption can be minimized if government has an effective anticorruption strategy and implements it impartially. In doing so, Quah (1982) develops a matrix of anticorruption strategies can be used to analyze the anticorruption efforts of several Asian countries as shown in table 1 below.

Table 1: A Matrix of Anticorruption Strategies

		Anticorruption Measures	
Commitment of political leadership	Strong Weak	Adequate Effective strategy Ineffective strategy I	Inadequate Ineffective strategy II “Hopeless” strategy
Source: Quah (1982)			

Table 1 shows four strategies for combating corruption, depending on the adequacy of the anticorruption measures employed and the strength of political leaders' commitment. The effectiveness of anti-corruption measures depends on two factors: (1) the adequacy of the measures in terms of the comprehensiveness of their scope and powers; and (2) the level of commitment of political leaders to the goal of minimizing corruption. In other words, for anticorruption measures to be effective, they must be properly designed (to attack the causes of corruption), and they must be sponsored and upheld sincerely by political leaders. Apparently, it was only Singapore and Hong Kong are the two least corrupt Asian city states that institutionalized both strong commitment of political leadership and adequate anticorruption measures, and ultimately managed to greatly minimize, if not eliminated, corruption. The remaining countries either don not strong commitment of political leadership or adequate anticorruption measures.

The Nexus Of Corruption And Fdi Inflow: Theory, Empirics And Conflicting Views

The “*Grabbing-Hand*” theory of corruption, supported by economists such as Shleifer and Vishny (1993), Bliss and Di Telia (1997) and Aidt (2003), claimed that corruption in an economy is like a grabbing hand that increases the costs of carrying out economic activities in the market. According to this theory, corruption raises the cost of doing business (irregular tax), distorts the allocation of resources and decreases the output-generating capacity of investment (Zhao, Kim, and Du, 2003). Thus, corruption is a double edged sword: it reduces both the volume & efficiency of investment (Sarkar and Hasan, 2001).

On the other hand, the “*Helping-Hand*” theory of corruption, supported by economists such as Lui (1985), Beck and Maher (1986) and Saha (2001), claimed that rather than obstacle for business, corruption could be an efficient “lubrication” for rigid economic regulation and red-tape. Similarly, Huntington (1968) and Leff (1989) argue that corruption can have a positive impact on investment by facilitating transactions in countries with excessive regulations. Furthermore, some countries with high level of corruption, such as China, India, or Nigeria, are the recipients of a great deal of FDI. Corruption doesn’t keep FDI out of very corrupt countries.

The third view is that although countries like India, China and Nigeria are performing very well in attracting FDI despite their high record of corruption doesn’t conceal the reality that those countries would have even doubled their FDI inflow if corruption level had been low. According to Vittal (2001), if China manages to reduce red tape and corruption and enhance better rule of law and property protection, it can even double its FDI. Likewise, if corruption in India declines to those of Scandinavian countries, GDP and FDI would increase by 1.5% and 12%, respectively. The fourth view is that the level of corruption in the host economy may affect FDI inflow, or *vice versa* or both (Pinto and Zhu, 2008). Thus, it is important to conduct further research to understand in detail just how corruption affects FDI.

Other Important Factors Influeincing Fdi Inflow

In addition to our variable of interest, i.e. level of corruption, the following important factors are also influencing FDI inflow and treated as control variables.

- (i) *GDP Growth*: a government that has generated impressive economic growth in the past is

- likely to attract more foreign investors to its country.
- (ii) *Human capital* captures both education and health. Thus, both education and health (life expectancy) variables are assumed to be positively affecting FDI inflow.
 - (iii) *Income per capita*:-income per capita which is captured by GDP/capita (PPP) measures the level of development of that country and also tells us the purchasing power of the people of the host economy. It is therefore expected to have a positive relationship with FDI inflow.
 - (iv) *Infrastructure*:-infrastructure is expected to directly contribute to FDI inflow.
 - (v) *Domestic Interest rate*:-the effect of interest rate on FDI inflow is ambiguous.
 - (vi) *Openness*:- The degree of openness of a host economy is assumed to be one of the necessary stimulants to attract FDI.

Main Objectives Of The Study

The main objective of this study is to verify the extent to which corruption will have an effect on FDI under the context of Asian economies. As a result, this study will contribute to create greater awareness and fresh insights into the problem and to suggest concrete ideas and approaches on possible measures to combat it.

The Data And Stylized Facts

This study deals with a panel of 16 Asian economies from 1995 to 2009. The year 1995 was chosen as our starting point because it is a year for which we have full, annual data coverage on the “freedom from corruption (FFC)” index which is derived from the annual reports of the *Index of Economic Freedom* which has been published by the *Heritage Foundation*, in partnership with the *Wall Street Journal*. The FFC index is measured on a scale from 0 to 100, where 100 represent the highest level of freedom from corruption/or the lowest level of corruption. List of countries included in this study as shown in table 2 below. These countries are selected mainly because of the availability of data throughout the years.

Table 2: Countries included in the study

Bangladesh, Cambodia, China, Hong Kong, India, Indonesia, Japan, Korea Republic, Malaysia, Nepal, Pakistan, Philippines, Singapore, Thailand, Vietnam, and Sri Lanka
--

Moreover, the independent variables, which were discussed in the preceding section and their expected relationships with economic FDI inflow, are summarized in table 3 below.

Table 3: Independent variables, their expected signs and data sources

Variable	+/-	Data Sources

Corruption And Fdi Inflow In Asian Economies: Descriptive Statistics

China is the major FDI destination economy in Asia which receives an average FDI inflow of \$60.6 billion every year (Table 1). Meanwhile, Hong Kong, Singapore, and India followed China at a distance with an FDI inflow performance of \$30.1 billion, \$15.85 billion, and \$11.1 billion, respectively. Major

economies in Asia such as Japan and Korea republic have managed to attract only \$ 7.5 billion and \$ 5.3 billion FDI inflow, respectively. At the opposite extreme, Nepal, Cambodia, and Bangladesh achieved the lowest FDI inflow in the region with a record of \$0.01 billion, \$0.32 billion, and \$0.53 billion, respectively. Ironically, countries such as Philippines and Pakistan with a high level of trained human capital and significant natural resources couldn't manage to attract significant amount of FDI.

Figure 1: Average FDI Inflow into Asian Economies (1995-2009)

Figure 2 below indicates Singapore and Hong Kong are the top two countries which enhanced a better and relatively corruption-free economy's. The level of corruption in some of the economies such as Japan, Malaysia, and Korea are modest and they exactly achieved a modest level of FDI inflow as it has been displayed in figure 1. Of course, there are some exceptions like China and India with a high level of corruption but among the top FDI recipients in Asia. However, it can be argued that though China and India are performing very well in attracting remarkable FDI, they are still performing well below-potential. Also, it has become more clear from figure 2 that those countries with a high level of corruption including Nepal, Bangladesh, Cambodia, Sri Lanka and the Philippines are also experiencing a very low level of FDI inflow.

Figure 2: Average Index for 'Freedom from Corruption (FFC)' in Asian Economies (1995-2009)

The Correlation between FDI Inflow and the Independent Variables

Before we move to the regression analysis, it is worth to examine the correlations that exist between FDI Inflow and the independent variables. From table 4, it has become evident that the more the economy is free from corruption, the more the economy is able to attract inward FDI. Similarly, the correlation analysis reveals economic growth has been directly and significantly associated with FDI inflow, implying an impressive growth record in the past might have provided better confidence for foreign investors. The evidence also points out that there is a positive and significant correlation between FDI inflow and human capital. By the same token, income per capita and physical infrastructures are also positively and significantly correlated with FDI inflow at 5% level of significance. Other important control variables that were found to be directly and significantly correlated with FDI inflow include openness and interest rates.

Table 4: Partial Correlation of FDI Inflow with other Independent Variables

Variable	Correlation	Significance
Freedom from Corruption (FFC)	0.2045	0.052**

RESEARCH METHODOLOGIES

Given the panel structure of the data in this study, the model to investigate the effects of *corruption* on *FDI inflow* was constructed for a balanced panel data of 16 Asian economies from 1995 to 2009 as follows:

$$FDI_{it} = \beta_0 + \beta_1 FFC_{it} + \beta_j \sum Z_{it} + \alpha_i + \delta_t + \varepsilon_{it} \quad (1)$$

Where, index i refers to the unit of observation, t refers to the time period, FDI refers the ratio of FDI to GDP (FDI/GDP), FFC refers *freedom from corruption* index of the host economy, Z refers other control variables, α_i refers individual specific unobserved factors, δ_t refers time specific unobserved factors, and ε_{it} are individual and time specific residuals (a random shock term, which represents the possible shocks for the source-host combination at time t). Here it is worth mentioning that MNCs normally make their investment decisions at time t based on information about past corruption and other control factors. Therefore, it is reasonable to assume that the level of FDI inflow into a host economy (i) at a time (t) is a function of explanatory variables in the last period (i.e. $t - 1$). Here, lagging the explanatory variables including the corruption variable by one year is quite important not only to highlight those variables have delayed effect on FDI performance, but also is essential to address the issue of potential endogeneity problems provide that future values of FDI inflow have no influence whatsoever on the control set, i.e., the future does not cause the present. Thus, the FDI inflow model takes the form:

$$FDI_{it} = \beta_0 + \beta_1 FFC_{it-1} + \beta_j Z_{it-1} + \alpha_i + \delta_{t-1} + \varepsilon_{it-1} \quad (2)$$

Since unobserved heterogeneity is the main problem of un-experimental research, panel data estimation techniques can allow us to control for individual unobserved heterogeneity. Furthermore, panel data give more informative data, more variability, less collinearity among variables, more degrees of freedom and more efficiency (Gujarati, 2003). Moreover, the Hausman (1978) specification test was conducted and

confirmed the suitability of random effect model (REM) instead of fixed effect model. Furthermore, a “Lagrange Multiplier (LM) test for Random Effects” was performed and the result has led to choose the REM against the pooled OLS model. Thus, the REM can be denoted as:

$$FDI_{it} = \beta_0 + \beta_1 FFC_{it-1} + \beta_j Z_{it-1} + \delta_{t-1} + u_{it-1}, \text{ where } u_{it-1} = \alpha_i + \varepsilon_{it-1} \quad (3)$$

In line with this, a White’s general test for *heteroscedasticity* was conducted and the result rejected the null hypothesis of *homoscedasticity*. Similarly, Wooldridge’s tests for autocorrelation in panel data were conducted and the null hypothesis that there is no first order autocorrelation was not rejected. Furthermore, panel data unit root test was conducted using Levin-Lin-Chu test for FDI and the result confirms the data is stationary. According to Wooldridge (2002), if heteroscedasticity is detected but serial correlation is not, then the usual heteroscedasticity-robust standard errors and test statistics can be used using the appropriate estimation techniques such as REM. In order to verify the consistency of the results from REM, this study also used other appropriate panel data analysis methods such as Feasible General Least Square Method (FGLS) and Regression with Panels Corrected Heteroskedastic Standard Errors (PCSE) for the reason that heteroskedastic models are usually fitted with FGLS. Accordingly, the main empirical results using the above mentioned panel estimation methods are shown in table 5.

Regression Results And Main Findings

The empirical evidences from Table 5 reveal that freedom from corruption (FFC) is statistically significant using the three panel estimation methods. This implies that the more the country is free from corruption, the more the ability of the country to build confidence among foreign investors and to be a major destination for FDI inflow. For instance, the evidence from the REM implies that keeping other factors constant, a 1 percent decrease in the level of corruption may trigger inward FDI into the economy with an increase of 9.1 percentage points. By the same token, the empirical results derived from the FGLS and PCSE estimation methods verify that keeping other factors constant, a 1 percent improvement in the FFC index may increase FDI inflow by 11.4 and 14.4 percentage points, respectively. Thus, some of the arguments that corruption does not keep FDI out of those corrupt countries were either flawed or invalid. In fact, those countries that are characterized by high level of corruption but also with a remarkable FDI inflow could even double their inward FDI if they manage to reduce the present pervasive level of corruption.

Therefore, the main implication of these findings is that there is a crucial need for curbing the current level of deep-rooted corruption in many of Asian economies by enhancing good governance and better economic institutions including strengthening the effectiveness and predictability of the judiciary, enforceable contracts and the rule of law, drying up the root causes of corruption and rent seeking, and developing an environment where fair and predictable rules form the basis for social and economic interactions. The regression results using the three estimation methods also confirm sustainable economic growth in a country is one of the main positive attributing factors to promote inward FDI. In line with this, this study verified that the two components of *human capital*: education and health were both found to be positive and significant determinants of FDI inflow. The *income per capita* variable which captures the level of development of the host economy and the purchasing power of the people may also significantly influence FDI inflow into a host economy. By the same token, *infrastructures* and *degree of openness* were found to be directly and significantly influencing inward FDI in Asian economies. However, the evidence from REM and FGLS found no evidence for domestic interest rate to influence the rate of FDI inflow (table 5).

CONCLUDING REMARKS

The empirical evidence in this study generally confirms that corruption remains a significant problem for inward FDI in Asian economies. This is equivalent to say that if a country is able to decrease the level of corruption by 1 percent, it may trigger inward FDI into the economy with an increase of about 9.1 percentage points. Thus, some scholars' argument that corruption doesn't keep FDI out of those corrupt countries is either flawed or invalid. In fact it is reasonable to claim that some of the countries such as China and India that are characterized by high level of corruption but also with a remarkable FDI inflow could even double their inward FDI if they manage to reduce the present pervasive level of corruption in their respective countries. The level of corruption in Asian economies and its main causes vary from one country to the next. The main contributing factors for corruption in any country includes policies, programs and activities that are poorly conceived and managed, failing institutions, poverty, income disparities, and inadequate civil servants' remuneration, lack of accountability and lack of transparency. Ultimately, all parts of society must share the responsibility for containing corruption because all are willing or unwilling participants. Each corrupt transaction requires a "buyer" and a "seller." Thus, on one hand, governments need to introduce appropriate legislation to reduce corruption and provide whatever means are necessary to ensure that appropriate steps are taken to build systems of integrity and rule of law. Thus, Singapore and Hong Kong's experiences demonstrate that combating corruption depends on the *adequacy of the anticorruption measures* employed and the *strength of political leaders' commitment*. In line with introducing appropriate legislation to reduce corruption, educating and involving the public in building integrity is the key to preventing corruption. In addition to enhancing a free-corruption economy, the following key factors also influence FDI inflow into a host economy: *good track record of economic growth*, *investment in human capital (education) and health*, *the purchasing power of the people*, *physical infrastructure*, and *more openness in the economy*. The findings have wide implications especially for Asian economies that have a high potential of attracting enormous FDI into their economies due to their endowment in abundant skilled and semi-skilled workforce as well as their geographical proximity to major FDI origin countries

HERD BEHAVIOR IN SAUDI ARABIAN STOCK MARKET: EVIDENCE FROM BOTH LINEAR AND NON-LINEAR MODELS

M. Arifur Rahman, University of Brunei Darussalam

Shah Saeed Hassan Chowdhury, Prince Mohammad Bin Fahd University

M. Shibley Sadique, University of Rajshahi

ABSTRACT

Herding in financial markets is a behavioral tendency of the investors to suppress their own belief and information in favor of the market consensus in their trading activities. This may cause short-term trend in financial markets. Our study investigates this phenomenon in Saudi Arabian stock market, where domestic individual investors are very aggressive traders and dominate approximately 90% of stock trading. In the empirical market-wide herding literature, either a decreasing dispersion of stock returns, or an increasing dispersion at a decreasing rate, with respect to market return is interpreted as evidence of herding. We examine both the linear and the non-linear models of the relationship between dispersion of returns across stocks and the market return. Perhaps due to its inherent shortcomings, the linear methodology yields no evidence of herd behavior. In sharp contrast, however, the non-linear model of the relationship indicates to a widespread prevalence of herding tendency among the investors. The evidence of herding is found to be independent of different market conditions, although it tends to be higher when the market rises and becomes more turbulent. In further analysis, we model the dispersion of stock betas following Hwang and Salmon (2004) to separate out herding from possible common movements in stock returns induced by the correlated movements in fundamentals. We find consistent results indicating strong and persistent herding towards the market, which is robust to the effects of different market conditions and macroeconomic factors.

INTRODUCTION

According to the classical finance theory, asset prices are expected to reflect all the relevant information in an unbiased and instantaneous manner. It presupposes a trader's ability to form rational expectations by correctly assessing and interpreting all the available information. There is no scope for human psychology to interfere with the function of the market. In contrast, since its emergence in the late 1980s, the behavioral finance literature has acknowledged the role of human psychology and attempted to rationalize many of the commonly observed asset pricing anomalies from the viewpoint of human psychology. Since herding is mainly associated with the group psychology, it provides an alternative explanation as to how investors form expectations and make investment choices from the behavioral finance perspective. Convergence of investor behavior in financial market is often viewed as the consequence of irrational decision making (Hirshleifer, 2001; Shiller, 2005). Scharfstein and Stein (1990) suggest that herding may arise when it is potentially reputation-damaging for agents to deviate from the consensus. Even when the behavior is considered rational from an individual's perspective, herding in financial market may be inefficient from a collective point of view unless it is driven by the same fundamental information (Bikhchandani and Sharma, 2001). Hence is the motivation for empirical research on herd behavior in financial markets.

Empirical literature on herding, to a large extent, has aimed at detecting correlated behavior within a certain group of institutional market participants such as the fund managers (for example, Lakonishok, Shleifer and Vishny, 1992; Grinblatt, Titman and Wermers, 1995; Wermers, 1999; Nofsinger and Sias, 1999; Sias, 2004; Choi and Sias, 2009; Patterson and Sharma, 2010). In detecting herd behavior, such group-based studies focus on buying or selling of the same stock by a particular type of investors in the market over a particular period of time.

A second category of empirical literature attempts to detect herd behavior by examining how the observed risk-return relationship in the cross-section of stocks differs from the predicted relationship by the rational asset pricing models. Unlike the group-based studies, empirical studies on market-wide herding focus on the behavior of all investors towards the consensus market view. In their pioneering study of market-wide herding, Christie and Huang (1995) analyze the co-movements of returns in the cross-section of US stocks. They find that the cross-sectional return co-movements in their sample conform to the predictions of the rational pricing model and thus suggest no evidence of herding. By applying a similar but modified approach, Chang, Cheng and Khorana (2000) examine herd behavior in the US, Japan, Hong Kong, Taiwan and South Korea. While they do not find evidence supporting herd behavior in the US and Hong Kong, they report significant evidence for the Taiwanese and South Korean market. Following Chang et al. (2000) approach, Chiang and Zheng (2010) examine herd behavior in several markets across the continents and report a mixed finding for the well-developed and emerging markets. They find evidence of herding in developed stock markets except the US as well as in the Asian emerging markets.

Hwang and Salmon (2004) propose an alternative approach that explores the behavior of cross-sectional factor sensitivity (risk), rather than return, of stocks. In their study of the US and South Korean market, they find significant evidence of herding in both markets under both bear and bull market conditions. Following this recently developed approach, Andronikidi and Kallinterakis (2010) and Demirer, Kutan and Chen (2010) report significant evidence of herding in Israeli stock market and Taiwanese industry portfolios. We select Saudi Arabian stock market for the study of market-wide herd behavior. At least a couple of important reasons drive our choice. First, to the extent that the theoretical predictions as well as existing empirical and anecdotal evidence are concerned, the emerging markets are likely to represent a thriving herding environment. Investors in these markets are likely to herd mainly due to the presence of information asymmetry, and lack of quality information and financial analysts. Although the Saudi Arabian stock market is by far the largest and most actively traded market in the Arab world, it still remains under consideration for being included as one of the pre-emerging frontier stock markets by the MSCI due to the country's weak regulatory environment, low market liquidity, limited access for foreign investors, and lack of financial transparency. Local individual investors heavily dominate the stock trading. Their trading accounts for more than 92 percent of stock turnover (Arab Monetary Fund, 2011).

Even more interestingly, Saudis are very aggressive traders. Individual investor accounts have a very high level of churn (turnover/net investment) – 118x/year vis-à-vis the mutual funds' 30x/year (NCB Capital, 2008). Therefore, unlike many other emerging/frontier markets, Saudi market presents a natural ground to test the herd behavior of mainly local individual investors. It is often argued in the literature that individual investors are more prone to herding. However, in markets where both individuals and institutions account for a sizable proportion of trading, it may be difficult to attribute herding solely to the activities of the individual investors. Therefore, by focusing on the Saudi stock market, our study is expected to provide a relatively cleaner picture of individual investors' herd behavior.

Secondly, although Saudi stock market does not currently allow direct ownership by the non-resident foreign investors, the government is actively considering opening it up to the global investors by the end of 2012 (Saadi, 2012, March 21; Hankir, 2012, February 22). Before pouring their money into a newly opened-up market, it is important for the prospective foreign investors to understand the stock price behavior of the market. And an understanding of the behavior of stock price would necessarily require an understanding of the investment strategies of currently active investors (Lakonishok, et al. 1992). Our

study, therefore, may prove very timely especially for the future global investors interested in the Saudi stock market. Finally, almost all previous studies of market-wide herd behavior rely on a particular testing methodology, which often leads to contradictory findings.

For example, using their respective methodologies, Chang et al. (2000) and Hwang and Salmon (2004) report completely opposite findings of herd behavior in the US stock market. Similarly, using the Christie and Huang (1995) and Chang et al. (2000) methodologies, respectively, Demirer and Kutun (2006) and Tan, Chiang, Mason and Nelling (2008) come to a completely different conclusion with regard to herding in the Chinese stock market. In our analysis, we subject Saudi stock market data to all major testing methodologies in the current literature, which is, therefore, expected to produce a more robust finding on possible herd behavior in the market. Looking ahead, the rest of the paper is organized as follows: Section 2 provides a description of alternative methodologies and the dataset used in our study, Section 3 presents empirical results of the analysis, and Section 4 summarizes and concludes the paper.

METHODOLOGY AND DATA

When investors herd, it leads to a distortion in the risk-return relationship as suggested by the rational asset pricing models such as the CAPM. Accordingly, in order to test the presence of market-wide herd behavior, there have been broadly two different types of methodologies in the literature: the methodologies based on return dispersion – cross-sectional standard (absolute) deviation of returns and the ones based on beta dispersion – cross-sectional standard deviation of factor sensitivities of individual stocks. We employ both types of methodologies in our analysis to test the presence of herd behavior.

Return Dispersion Methodologies

Christie and Huang (1995) propose the first return dispersion based methodology using the cross-sectional standard deviation (CSSD) of individual returns around the market portfolio return. According to them, if herding is present in the market, individual security returns will tend to cluster around the overall market return, causing return dispersion to decline. They also argue that market participants are likely to suppress their own beliefs and information most during the periods of extreme market movements. Accordingly, they suggest the following dummy variable regression specification to test whether return dispersions are significantly lower than average during periods of extreme market movements:

$$CSSD_t = \alpha + \beta_L D_t^L + \beta_U D_t^U + \varepsilon_t \quad (1)$$

Where $CSSD_t = \sqrt{(1/N - 1) \sum_{i=1}^N (R_{i,t} - R_{m,t})^2}$ is the cross-sectional standard deviation ($CSSD_t$) of N individual security returns ($R_{i,t}$) around equally weighted cross-sectional average of the N returns in the aggregate market portfolio ($R_{m,t}$) at time t . $D_t^U = 1$ if market return at time t is in the extreme upper tail of the distribution, and equal to 0 otherwise, and $D_t^L = 1$ if market return at time t is in the extreme lower tail of the returns distribution, and equal to 0 otherwise. Since during the period of herding in the stock market investors behave similarly, significantly negative β_L and β_U coefficients give the indication of the presence of herding phenomenon. In conformity with the related literature, we define extreme market return as one that lies in the 1%, 5% and 10% lower or upper tail of the market return distribution.

The second return dispersion based methodology employed in this paper is based on Chang et al. (2000) that uses cross-sectional absolute deviation (CSAD) of individual stock returns as a measure of return dispersion. They contend that the presence of herding violates the linearly increasing relationship and

render it to be non-linearly increasing, or even decreasing in cases where market return surpasses a certain threshold value. Based on this intuition and using $CSAD_t = (1/N) \sum_{i=1}^N |R_{i,t} - R_{m,t}|$ as the proxy of $CSAD_t$, respectively, they suggest the following non-linear specification to detect herd behavior in the market:

$$CSAD_t = \gamma_0 + \gamma_1 |R_{m,t}| + \gamma_2 R_{m,t}^2 + \varepsilon_t \quad (2)$$

Where $R_{m,t}$ is the market return at time t . A significantly negative γ_2 coefficient would indicate the presence of herding.

We employ a second type of methodology as suggested by Hwang and Salmon (2004) that distinguishes between fundamental and non-fundamental co-movements across asset returns by construction. Rather than examining the return dispersion, Hwang and Salmon (2004) explores the time variation in the dispersion of the fundamental factor sensitivity or beta across assets in the market portfolio. They attribute the time variation in observed CAPM beta to behavioral anomalies such as herding. They suggest that, in the event of market-wide herding, the cross-sectional dispersion of stocks' beta would be expected to be smaller as the values of individual asset betas would tend towards the value of the market beta, i.e., unity. In original Hwang and Salmon (2004) framework, it is the market-wide herd behavior that drives the changes in $Std_c(\beta_{imt}^b)$, the standard deviation of cross-sectional betas of all the firms in the market. Therefore, it is important that we check if there are other potentially fundamental variables influencing $Std_c(\beta_{imt}^b)$ that may turn herding inconsequential for the dynamics of $Std_c(\beta_{imt}^b)$.

In addition to domestic stock market related variables, we also consider the influence of three other macro variables that are potentially critical for the Saudi economy in general and Saudi stock market in particular, viz., the change in crude oil price, 90-day US T-bill rate and the S&P 500 index return. Therefore, we estimate the regression of the following form:

$$\log[Std_c(\beta_{imt}^b)] = \mu_m + H_{mt} + c_{m1} \log \sigma_{mt} + c_{m2} r_{mt} + c_{m3} OIL_{mt} + c_{m4} INT_{mt} + c_{m5} r_{mt}^{US} + v_{mt} \quad (3)$$

where $\log[Std_c(\beta_{imt}^b)]$, H_{mt} , OIL_{mt} , INT_{mt} and r_{mt}^{US} are the logarithm of cross-sectional standard deviation of estimated betas in month t , latent measure of herding, change in WTI oil price, 90-day US T-bill rate and S&P 500 returns, respectively. Additionally, $\log \sigma_{mt}$ and r_{mt} are market log-volatility estimated using the Schwert (1989) method and market returns, respectively. Under the state space model, H_{mt} is defined as $H_{mt} = \phi_m H_{mt-1} + \eta_{mt}$. Finally, it is noteworthy that in order to estimate $Std_c(\beta_{imt}^b)$, we first obtain standard market model betas using daily return data within monthly windows.

Data

All necessary Saudi stock related data as well as macroeconomic variables such as the West Texas Intermediate (WTI) spot crude oil price, 90-day US Treasury bill rate and S&P 500 stock index values used in this study are retrieved from Thomson Datastream. Our cross-firm dispersion measures are based on daily stock price of constituent firms in the Tadawul All Share Index (TASI) of the Saudi Stock Exchange (Tadawul) over the period from January 2002 to March 2012. Data of 159 stocks are available from the Datastream. From this initial sample, we filter out stocks that have not been traded for at least six months. To alleviate the effect of non-trading on our results, we have also dropped stocks that remained non-traded consecutively for more than 30 days in their respective trading records. Consequently, we have ended up with 140 stocks in our final sample representing the Saudi stock market.

Returns are calculated as the log difference of daily stock prices times 100. The percentage Saudi Interbank 1-month Offered Rate is subtracted from stock returns to obtain excess returns.

EMPIRICAL RESULTS

Return Dispersion And Herding

Table 1 presents the results of estimating equation (1). Using CSSD as the measure of dispersion and three cutoff points of 1%, 5% and 10% to define extreme market movements, Panel A, B and C of the table report estimates for the full sample period (Jan 2002 – Mar 2011), first sub-period (Jan 2002 – Dec 2006) and second sub-period (Jan 2007 – Mar 2012), respectively. We find that, except for the case when we apply 1% criterion to the second sub-sample data, our regressions yield consistently significantly positive β_L and β_U estimates for the full-sample and sub-sample periods. Thus, results indicate absence of herding in the Saudi stock market.

This table presents the results of estimating the following regression using the full-sample (Jan 2002 – Mar 2012), first sub-sample (Jan 2002 – Dec 2006) and second sub-sample (Jan 2007 – Mar 2012) daily data: $CSSD_t = \alpha + \beta_L D_t^L + \beta_U D_t^U + \varepsilon_t$ where $CSSD_t$ is the equally weighted cross-sectional standard deviation, $D_t^L = 1$ [$D_t^U = 1$] if market return at time t is in the extreme lower [upper] tail of the returns distribution, and equal to 0 otherwise. Extreme market return is defined as one that lies in the 1%, 5% and 10% lower or upper tail of the market return distribution. t -statistics based on the Newey-West robust standard errors are in parentheses. ***, ** and * denote significance of the coefficients at 1%, 5% and 10% level of significance, respectively. The Wald F-test statistic for the equality of parameters $H_0: \beta_L = \beta_U$ and corresponding p -value are reported. R^2 is the adjusted R^2 . N is the number of daily observations used in estimation.

Table 2 presents the results of estimating the non-linear specification of equation (2), in the spirit of Chang et al. (2000). In this specification, γ_1 – the coefficient on the linear term $|R_{m,t}|$ – shows whether dispersion of stock returns as measured by CSAD increases with the absolute value of market return and γ_2 – the coefficients of the non-linear term $R_{m,t}^2$ – indicates whether CSAD increases linearly with absolute market return. A statistically significant negative value of γ_2 is consistent with herding.

Table 2: OLS estimates using the Chang, Cheng and Khorana (2000) model

R^2	0.333	0.349	0.422		

This table presents the results of estimating the following regression using the full-sample (Jan 2002 – Mar 2012), sub-sample-I (Jan 2002 – Dec 2006) and sub-sample-II (Jan 2007 – Mar 2012) daily data: $CSAD_t = \gamma_0 + \gamma_1 |R_{m,t}| + \gamma_2 R_{m,t}^2 + \varepsilon_t$ where $CSAD_t$ is the equally weighted cross-sectional absolute deviation on day t , and $R_{m,t}$ is equally weighted portfolio return on day t . t -statistics based on the Newey-West robust standard errors are in parentheses. ***, ** and * denote significance of the coefficients at 1%, 5% and 10% level of significance, respectively. The Wald F-test statistic for the equality of i -th parameter for sub-sample-I (ss1) and sub-sample-II (ss2), $H_0: \gamma_i^{ss1} = \gamma_i^{ss2}$, and corresponding p -value are reported in the last two columns of the table. R^2 is the adjusted R^2 . N is the number of daily observations used in estimation.

We find that all parameter values of γ_1 estimated using the full-sample and sub-sample data are significantly positive. Therefore, these coefficients *per se* tend to provide an initial support to our previous finding based on the dummy variable regressions in the sense that dispersion of individual returns increases with the absolute value of average market return. However, our concurrent finding of a statistically significant and negative γ_2 estimate across different sample periods strongly rejects the prediction of the rational asset pricing model that dispersion of stock returns increases *linearly* with the average market return in absolute terms. A significantly positive γ_1 coupled with a significantly negative γ_2 suggest that as the average market return becomes large in absolute terms, CSAD increases non-linearly at a decreasing rate – a phenomenon which is consistent with the occurrence of herding.

In fact, under similar circumstances, CSAD may even decline once absolute market return goes beyond a certain threshold value. Notably, this particular scenario is also consistent with the intuition of Christie and Huang (1995). If investors suppress their own beliefs and make their investment decisions based on the collective actions in the market, this behavioral bias would overwhelm the effect of variation in the factor sensitivities of individual stocks during periods of extreme market movements and cause individual returns to cluster around the market return. Table 2 also reports Chi-square statistics and their associated *p*-values to test the null hypotheses that estimated regression parameters are equal across two sub-samples of data. We find that the estimates of γ_2 – our parameter of interest – are not significantly different, implying that the strength of observed herd behavior remains similar across sub-periods of analysis.

Asymmetry in Herd behavior

In this subsection, we investigate whether herd behavior documented above vary with market conditions. Some studies in behavioral finance also suggest that investors' trading behavior tend to vary across market conditions. For example, Grinblatt and Keloharju (2001) and Cooper, Gutierrez, and Hameed (2004) find indirect evidence that investors are more likely to enter the stock market when market returns are high. We test potential asymmetry in herding by using three different measures to distinguish market states – (i) up-versus-down market return, (ii) high-versus-low market turnover, and (iii) high-versus-low market volatility. For that purpose, we use the equation of following form:

$$CSAD_t = \gamma_0 + \gamma_1(1-D)|R_{m,t}| + \gamma_2 D|R_{m,t}| + \gamma_3(1-D)R_{m,t}^2 + \gamma_4 DR_{m,t}^2 + \varepsilon_t \quad (4)$$

where D is the market state dummy with value 1 referring to (a) down market return defined as $R_{m,t} < 0$, or (b) low market turnover defined as market turnover on day t being lower than its previous 30-day moving average, or (c) low market volatility defined as market volatility on day t being lower than its previous 30-day moving average, and 0 otherwise. Therefore, γ_3 (γ_4) captures the degree of herding when (a) market return is up (down), or (b) market turnover is high (low), or (c) market volatility is high (low). Table 3 reports the results of estimating the specification of equation (4) to capture potential asymmetry in herd behavior. First, in Panel A of the table, we present results where asymmetric market conditions are distinguished in terms of the movements in market returns. Results show that the estimates of both the herding parameters $-\gamma_3$ and γ_4 – are statistically significantly negative across sample periods. Therefore, it appears that, no matter whether the market is rising or falling, the trading decisions of Saudi investors are significantly influenced by others in the market. More importantly, the test results of the null hypothesis $H_0: \gamma_3 = \gamma_4$ across sample periods reveal that the tendency of investors to follow others is stronger when the market is rising than when it is falling. This finding may suggest that the correlated trading behavior in Saudi stock market is driven by market-wide investor sentiment.

This table presents the results of estimating the following regression using the full-sample (Jan 2002 – Mar 2012), sub-sample-I (Jan 2002 – Dec 2006) and sub-sample-II (Jan 2007 – Mar 2012) daily data: $CSAD_t = \gamma_0 + \gamma_1(1-D)R_{m,t} + \gamma_2 D |R_{m,t}| + \gamma_3(1-D)R_{m,t}^2 + \gamma_4 D R_{m,t}^2 + \varepsilon_t$, where $CSAD_t$ is the equally weighted cross-sectional absolute deviation on day t , $R_{m,t}$ is equally weighted portfolio return on day t , and D is the market state dummy with value 1 referring to down market return defined as $R_{m,t} < 0$ (Panel-A), or low market turnover defined as market turnover on day t being lower than its previous 30-day moving average (Panel-B), or low market volatility defined as market volatility on day t being lower than its previous 30-day moving average (Panel-C), and 0 otherwise. t -statistics based on the Newey-West robust standard errors are in parentheses. ***, ** and * denote significance of the coefficients at 1%, 5% and 10% level of significance, respectively. The Wald F-test statistic for the equality of herding parameters $H_0: \gamma_3 = \gamma_4$ and corresponding p -value are reported. R^2 is the adjusted R^2 . N is the number of daily observations used in estimation.

Panel B and C of Table 3 present results under asymmetric conditions defined in terms of market trading volume and market volatility, respectively. Results show that all the estimates of herding parameters are significantly negative irrespective of the definitions of market condition and sample period we use. Additionally, the test results of the null hypothesis of $H_0: \gamma_3 = \gamma_4$ in Panel B suggest that a greater tendency of herding is associated with a higher trading activity in the market. Obviously, this finding is not consistent with the information-flow interpretation of trading volume (see, e.g., Clark, 1973; Lamoureux and Lastrapes, 1990). According to this interpretation, information arrival is random and changes in trading volume reflect differential information. However, as Black (1986) notes, higher trading volume may also be the result of sentiment driven noise trading. Since our finding suggests a negative relationship of trading volume and return dispersion, it may be the case that trading volume serves as an observable signal that helps coordinate the action of herding in Saudi stock market. Finally, the results presented in Panel C provides us some evidence (full sample) that Saudi investors tend to follow each other more in times of more volatile market conditions.

Beta Dispersion And Herding

Table 4 presents the results from the Hwang and Salmon (2004) beta dispersion model in its original form as well as its two alternative augmented forms – one including additional market variables and the other including both the market and potentially important macro variables in Column-I, Column-II and Column-III, respectively. With regard to our results reported in Column-I, we first examine the important parameters of the state-equation of H_{mt} . We find that the estimate of $\sigma_{m\eta}$ (the standard deviation of the state-equation errors, η_{mt}) is highly significant, which is consistent with our previous findings from the non-linear model and supports the existence of significant herding in the market portfolio over the sample

period. In addition, we observe that H_{mt} is also highly persistent with a large positive and significant value of ϕ_m . Our estimate of the signal-proportion value ($\sigma_{m\eta}$ /standard deviation of the $\log[Std_c(\beta_{imt}^b)]$ series) indicates that herding explains around 70 percent of the total variation in the time-series of log-transformed cross-sectional standard deviation of observed beta. This estimate is considerably higher than that reported by Hwang and Salmon (2004) for the US market – roughly 40% using 1991–2002 data. A higher value of the signal-proportion implies that herding takes a relatively less smooth path in its evolution in the Saudi stock market.

The results presented in Column-II of Table 4 consider potential effects of the movements in market return and its volatility while extracting herd behavior from $\log[Std_c(\beta_{imt}^b)]$. Although the two market variables appear significant in the measurement equation, we still find a strong evidence of herding as the standard deviation of η_{mt} is significantly different from zero and H_{mt} continues to be highly persistent with a significant value of ϕ_m . Column-III of Table 4 shows that among the additional factors, only the US T-bill rate has been found to have an impact on $\log[Std_c(\beta_{imt}^b)]$. More importantly, since we find that $\sigma_{m\eta}$ is significantly non-zero along with a slightly deteriorated but highly significant persistence parameter ϕ_m , we can conclude that there is significant herd behavior in Saudi stock market even after accounting for the simultaneous effect of the market and macro variables in our analysis.

This table presents the results of estimating the following state space model using monthly data over the period from January 2002 to March 2012: $\log[Std_c(\beta_{imt}^b)] = \mu_m + H_{mt} + c_{m1} \log \sigma_{mt} + c_{m2} r_{mt} + c_{m3} OIL_{mt} + c_{m4} INT_{mt} + c_{m5} r_{mt}^{US} + v_{mt}$, where $\log[Std_c(\beta_{imt}^b)]$ is the logarithm of cross-sectional standard deviation of estimated betas in month t , H_{mt} is the latent measure of herding. Variables σ_{mt} , r_{mt} , OIL_{mt} , INT_{mt} and r_{mt}^{US} denote, respectively, Saudi market volatility, Saudi market return, change in WTI spot crude oil price, 90-day US T-bill rate and US market return. Column-I of the table reports the results of estimating the model by restricting $c_{m1} = c_{m2} = c_{m3} = c_{m4} = c_{m5} = 0$, Column-II reports the results of estimation by restricting $c_{m3} = c_{m4} = c_{m5} = 0$, and Column-III reports the results derived using the unrestricted model. The numbers in parentheses are t -statistics. ***, ** and * denote significance of the coefficients at 1%, 5% and 10% level of significance, respectively.

CONCLUSION

We investigate whether herd phenomenon exists in Saudi Arabian stock market, where domestic individual investors dominate stock trading. Unlike most previous studies, we employ the linear and non-

linear models of the dispersion of stock returns as well as alternative specifications of the state-space model of the dispersion of estimated stock betas in our investigation.

While our linear testing methodology based on return dispersion shows no evidence of herding, alternative implementations of the non-linear model indicates a widespread prevalence of herd behavior among the investors. Although Saudi investors are found to herd to take their investment decisions irrespective of different market conditions, their behavioral bias tends to get stronger in periods of rising market return, trading volume and volatility.

Our results based on the state-space models of beta dispersion further corroborate the findings from the non-linear model of return dispersion. At the same time, these models of beta dispersion also yield some additional insights. First, by conditioning return co-movements automatically on fundamentals, it suggests that the observed cross-sectional co-movements in Saudi stock returns do not reflect possible correlated movements in stock fundamentals. The evidence of herd behavior remains significant even when we further condition the movements in beta dispersion to the effects of several market-related and macro variables. Second, since our state-space models of beta dispersion provide evidence of a persistent and slow-moving herd behavior utilizing monthly data, herding in Saudi stock market is not necessarily a short-lived phenomenon occurring at only daily or intra-daily frequency. This study also shows that Saudi investors are prone to herd both under the turbulent as well as tranquil market conditions.

EXECUTIVE COMPENSATION AND EARNINGS MANAGEMENT: EMPIRICAL STUDY IN CHINA'S LISTED COMPANIES

Jie Zhou, Xi'an Jiaotong Liverpool University
Ling Yan ZUO, Xi'an Jiaotong Liverpool University

ABSTRACT

This paper investigates the relevance between executive compensation and earnings management of listed companies in China using discretionary accruals, and based on the assumption that executive compensation contract could react significantly differently to extraordinary items and ordinary items. The sample is composed of 5806 firm-years observations from 2006 to 2010. The findings support the prior empirical research that executive compensation and discretionary accruals have positive significance correlation, which indicates that managers prefer to use discretionary accounting choices especially for extraordinary items to increase their compensation, so that to achieve the goal of earnings management. Additionally, the results also demonstrate the correlation between earnings quality and the contract of executive compensation. Therefore, after the analysis of the whole sample, we think that to standardize earnings management and improve the contract of executive compensation are two important tasks for the listed companies in China.

KEYWORDS: earnings management; executive compensation; discretionary accruals; earnings quality; extraordinary items.

INTRODUCTION

Recently, with the development of securities market, accounting information distortion has been a conspicuous problem in China. Among these information distortions, some belong to the violation of the accounting standards, and others are caused by earnings management. A common definition of earnings management is that:

"Earnings management occurs when managers use judgment in financial reporting and in structuring transactions to alter financial reports, to either mislead some stakeholders about the underlying economic performance of the economy, or to influence contractual outcomes that depend on reported accounting numbers". Healy and Wahlen (1998)

Generally, because of the asymmetric information between managers and stakeholders, managers could adopt earnings management to pursue self-interest maximization. Namely, the main motivation of earnings management is to match or evade the supervision and control of the government, and meet the qualification of IPO and share allotment, the "security shell" demand and so on. The general method of earnings management is usually represented by discretionary accruals manipulation. Particularly, for the special regime in Chinese securities market and the particular relationship among listed company, its parent company and government, the public company is easy to undertake earnings management through government subsidies, related-party transaction and property recombines such one-off and occasional projects, which normally arise extraordinary items exist in financial statements.

The main purpose of this paper is to investigate the relationship between incentive-based compensation and earnings management which measured by discretionary accruals in China's listed companies. Specially, it examines the effects of extraordinary items which imply the handling surplus and deficit by

managers, and to check whether executive compensation contract can react significantly differently to extraordinary items and earnings before extraordinary items.

LITERATURE REVIEW

The conflict of interest between companies' dispersed shareholders and directors who are hired to determine the overall operations and strategies is the central tension in the corporate governance. The separation of the ownership and management creates the opportunity of discretionary accounting choices to executives. Healy (1985) is the first person to explicitly indicate the adoption or modification of managers' bonus plan might cause the changes in the accounting procedures, and income-reporting incentives which based on their bonus contracts were associated with accrual policies. Thereafter, other studies from many researchers (Holthausen et al., 1995

; Guidry et al.,

a similar conclusion. In addition, Shuto (2007) found that the use of discretionary accruals correlated positively with Japanese executive compensation, and the analyses of his results showed that firm managers preferred to adopt income-decreasing accruals and extraordinary items when they received no bonus. At the meantime, evidence demonstrated that this correlated relationship would change with different firm circumstances.

The similar investigations have been done on the problem of managers' payment in China as well. Wei (2000) conducted an empirical examination which used the sample composed of 816 A-stock listed companies in 1999. He found that the phenomena of 'zero compensation' and 'zero stock holding' for managers were serious and common. Due to highly limited executive compensation, it was difficult to discover whether firm value was significant positive with executive compensation. Chen et al. (2005) noticed that there existed the controls of executive payment in China. Because of the occurrence of this situation, company-paid consumption was highly likely to be chosen by managers in Chinese state-owned listed company, thus reducing the firm value. The control of executive emolument led company-paid consumption to be the alternative choice of managers, and the lack of incentive effect was significantly existed in state-owned listed companies. Furthermore, Li et al. (2007) used the cross-sectional adaptation of the modified Jones model to measure the degree of earnings management by discretionary accruals. What they examined was the relationship between management compensations, the supervision of the board of directors and earnings management. They discovered the positive relationship between management compensation and the total discretionary accruals under the control of the assets size and debts levels of Chinese listed companies. However, to decrease reported earnings there was no significant evidence to show that the supervision of board directors could hold the extent of earnings management. While to increase reported earnings a negative relationship existed between those two elements.

Additionally, Barnea et al. (1976) examined American companies and found managers had the tendency to make extraordinary items into different partitions based on operating performance in order to smooth the profit. Other countries also confirmed the similar results. Graig & Walsh (1989) made empirical analysis on extraordinary projects of public companies in Australia. Their findings demonstrated companies which had continuously increasing profit tend to decrease current profit through extraordinary items. Meanwhile, the bigger the size of the company is, the higher the possibility of such behavior will be. Walsh et al. (1991) found Australian companies used extraordinary to take a 'bathing' so as to make profit reserve for future twisting deficit. However, after the financial crisis, Min et al.

(1998) used the sample of companies in Singapore and discovered that the results did not support the hypothesis that extraordinary items were used in earnings management. In additional, Vasiliki et al. (2010) found that in order to satisfy the analysts, companies reversed the core expense into extraordinary projects. Simultaneously, there is no correlation between extraordinary items and future operating performance through the entire sample. Here, the researches on extraordinary items in China are frequently. Wei (2000) definitely pointed out that one of the methods of earnings management is

extraordinary items, and this was the first paper to examine this topic in China. Jiang & Wei (2001) suggested companies with ROE higher than 0 and lower than 6% had higher proportion of extraordinary items divided by net income. Furthermore, Mao & Shen (2009) examined the relevance between earnings quality and CFO compensation of listed companies in China. The results showed that significantly distinction was reflected by CFO compensation between extraordinary items and earnings before extraordinary. However, it was failed to reacts differently to accruals and operating cash flows in their first study. Then they trended to test a subsample and the findings indicated that because the current compensation plan assigned the inappropriate weights to extraordinary items and earnings before extraordinary items, earnings management was more probably to be made by CFOs in eliminated loss firms.

METHODOLOGY

Data

The sample is selected from the period between 2006 and 2010 using the GTA Database, which contains 5806 firm-years observations from 1373 listed companies in Shanghai and Shenzhen Stock Exchange. In order to make the data more accurate, the sample of financial industry has been eliminated. Meanwhile, based on the consideration of prudent principle, we make data processing on the extreme value according to 'Winsorize' method (at 1% upper and lower).

Variables Measurement

In order to investigate the relationship of earnings management and executive compensation, executive compensation would be researched as dependent variable, while independent variables are earnings that embodied earnings management, discretionary accruals, extraordinary items and ordinary items. According to the analysis of the past literatures in China or overseas, executive compensation also effects by operating cash flow, firm size, return on assets, the characteristics of the actual controller of the listed company, the debt to asset ratio and industry classification, etc. Therefore, these variables would be controlled for the accuracy of research as the control variables.

In this study, earnings denote the comprehensive income disclosed by financial reporting of the listed companies, which include extraordinary items and ordinary items. Here, extraordinary items are generated by non-daily transactions and events respectively, and ordinary items are the net profit, which can be disaggregated as accruals and operating cash flow. And at present, executive compensation accurately disclosed by financial reporting of Chinese listed company only means the obtained monetary compensation, and not include the benefits that are generated by stock or other incentives. Due to the unsatisfactory measurements of some incentives such as option and stock, the companies implemented stock incentives only occupies minority by 2010, and the value of such incentive is difficult to determine. Therefore, it can be considered that the compensation disclosed by financial reporting adequately represents executive compensation.

Hypotheses

From studies above, it shows that with the development of China security market, some new characteristics of managerial compensation in listed company have been appeared, and the relationship between the executive payment and accountancy information quality is remained to be discussed further. In particular, Chen (2009) said that researchers usually assumed that the improved extent of compensation was one of the fundamental inducements in earnings management of listed companies, but the direct investigation about the influence of executive compensation on accounting quality was scarce. For the firms' contract of compensation, accounting performance was significantly related with executive

payment. If managers believed that the discretionary accounting policy could increase their compensation level which based on the compensation arrangement of accounting performance index, they would have the motivation to achieve this goal by using the increasing-income choices under discretionary accounting policy. Therefore, the first hypothesis arises,

Hypothesis 1: Under the control of influence on non-discretionary accruals and cash flow, discretionary accruals are significantly positive correlated with executive compensation.

For further examination of the relationship between executive compensation and earnings management, we also need to discuss the proxy used by managers to achieve earnings management. Wei et al. (2007) used the sample of A-stock listed companies in China to research the behavior of these companies which utilized extraordinary items to conduct earnings management, and found no matter the company was deficit or surplus, it quite relied on extraordinary items to attain earnings management. The main purpose of losing companies was twisting deficits or to avoid loss, while high surplus companies was to smooth profits or refrain from the decrease of profits. The empirical results also demonstrated the influence on twisting deficits or even continuous loss in the future by extraordinary items was really important, and the effects were much bigger than discretionary accruals after extraordinary items. Therefore,

Hypothesis 2: Extraordinary items are strongly associated with earnings management.

Furthermore, earnings in accounting report include two parts, extraordinary items and ordinary items. Ordinary items are the profit or loss during the daily operational activities in business, and it has sustainability and stability because of its role of the core of earnings in business. According to this, investors could forecast the profitability of a company in the future and estimate the ability of going concern. While extraordinary items are occasional and one-off, it will be difficult to investors to forecast the future development prospect of the business. Li & Zhang (2003) examined an empirical study indicated that investors has distinguished extraordinary items from earnings, so that they could evaluate earnings quality in listed company. Due to the different characteristics in the sustainability of earnings between extraordinary items and ordinary items, the distinct forms should be reflected effectively on executive compensation, not only just focus on the values of total earnings in accounting report.

Hypothesis 3: The executive profit-oriented incentive compensation mechanism can distinguish effectively between extraordinary items and ordinary items in Chinese listed companies.

Model

The estimation of discretionary accruals follows the approach used in studies by Peasnell, et al. (2000, 2005), denoted PPY hereinafter. They use a cross-sectional version of the modified Jones model and focus on working capital accruals rather than total operating accruals. Their rationale for this focus is that systematic earnings management via the depreciation accrual is likely to have limited potential (see Beneish, 1999). Therefore, this paper follows PPY directly, and according to Jones (1991) and Al-Attar et al. (2008), an equation can be established by lagged total assets:

$$WC_{j,s,t} = \alpha_{0,s,t} + \alpha_{1,s,t}(\Delta REV_{j,s,t} - \Delta REC_{j,s,t}) + \tau_{j,s,t} \quad (1)$$

Where $WC_{j,s,t}$ denotes working capital accruals for firm j (in sector s and year t), and also denotes the change in non-cash current assets minus the change in current liabilities; $\Delta REV_{j,s,t}$ denotes the change on revenues from year $t-1$ to t ; $\Delta REC_{j,s,t}$ denotes the change in receivables from year $t-1$ to t ; $\alpha_{0,s,t}$ and $\alpha_{1,s,t}$ are the model parameters estimated for sector s and year t ; $\tau_{j,s,t}$ is the residual error which denotes discretionary accruals. In order to examine the correlation between executive compensation and earnings management, one model has been established as follows which based on the previous theories:

$$Comp = \beta_0 + \beta_1 DAC + \beta_2 ROA + \beta_3 ROA^2 + \beta_4 OCF + \beta_5 Debt + \beta_6 SOE + \beta_7 Control + \beta_8 Indep_director + \beta_9 Size + \beta_{10} Industry + v \quad (2)$$

The definition of the variables is showed as Table 1. β_0 denotes the constant of the models; $\beta_1 \dots \beta_9$ denote the regression coefficients of related explained variables, and v is the stochastic disturbance of the model. Through this model, we could verify whether executives choose discretionary accruals to increase their compensation or not. If this situation could be confirmed, it implies the close relevance between executive compensation and earnings management. So that enterprises should pay more attention to the means used by managers to manipulate earnings such as extraordinary items, and organize the effective implementation of policy to standardize earnings management.

Research on Hypothesis 2 is rare abroad. Even though China has more research literature, the most of them are purely academic and just some are based on empirical data. Among them, Wong & Huang (2010) used the different shares of debt restructuring earnings, operating income after impairment provision, disposal of intangible assets in total amount of extraordinary items to analyze the impact of these factors on earnings. However, their paper mainly examines the relationship between executive compensation and earnings management, and this hypothesis only plays a complementary role. In our study, we disaggregate ordinary items into discretionary accruals, non-discretionary accruals and operating cash flow, and extract the following model to test the relationship between extraordinary items and discretionary accruals:

$$Comp = \beta_0 + \beta_1 extra_items + \beta_2 DA + \beta_3 NDA + \beta_4 OCF + v \quad (3)$$

There are two models establishing under Hypothesis 3. Firstly, we could check the correlation between executive compensation and earnings which based on the corporate governance structure in China, and understand whether incentive contract of compensation are founded on earnings indexes. Then it is proposed to evaluate the relationship between executive compensation and earnings quality. According to the persistence of different parts in earnings which are previously described, the earnings would be disaggregated into extraordinary items and ordinary items. And it is assumed if $\beta_1 < \beta_2$, it means the weight of extraordinary items is less than the weight of ordinary items in incentive contract of executive compensation:

$$Comp = \beta_0 + \beta_1 earnings + \beta_2 OCF + \beta_3 Size + \beta_4 RET + \beta_5 SOE + \beta_6 Industry + v \quad (4)$$

$$Comp = \beta_0 + \beta_1 extra_items + \beta_2 Ord_items + \beta_3 OCF + \beta_4 Size + \beta_5 RET + \beta_6 SOE + \beta_7 Industry + v \quad (5)$$

RESULTS AND DISCUSSIONS

Descriptive Statistics

Table 2 demonstrates the descriptive statistics of the sample. The average executive compensation of 5,806 samples is ¥671,143, and the median is ¥490,000. This presents the right skewness of data which means a heavy tail of large values (As Figure 1). Simultaneously, it detects that the gap of executive compensation has been enlarged continuously through the analysis of high quartile. By comparison with the mean and median of other three variables except DA, we find each of their kurtosis is high, and there is higher density of distribution around the average than any other where. Meanwhile, the phenomenon of right skewness also exists. However, the left skewness of DA shows heavy and long tail of small values which may because the negative values of discretionary accruals are too large especially the minimum value (As Figure 2). Table 3 presents the cross-correlation of the main variables.

It is apparent that executive compensation is positively correlated with discretionary accruals, and this relationship is closer than others. The largest correlative coefficient in this table is 0.5740 which denotes discretionary accruals are significantly correlated with operating cash flow. The reason for this may be that managers usually manipulate discretionary accruals to change cash flow related with daily operations in order to make earnings management. From Table 4, it shows that most of accounting earnings in public companies have extraordinary items. The number of companies of which net income includes extraordinary item and ordinary items is 1373, nearly 92.79 of the total sample size, in which extraordinary items play an important role. This illustrates the total quality of accounting earnings is low in Chinese listed companies.

Table 1: Summary of Variables

	Code	Name	Definition
Dependent variables	Comp	The executive compensation	The compensation of the top three executives each year. $Comp = \ln(\text{Compensation at each year-end})$
Independent variables	DAC	Discretionary accruals	Calculated by PPY model
	Earnings	Total earnings	Comprehensive income
	Extra_items	Extraordinary items	Profit or loss generated by non-daily transactions and events
	Ordinary items	Earnings before extraordinary items	Profit or loss generated by daily transactions and events
Control variables	ROA	Return on assets	The ratio of return on the total assets
	ROA ²	The square of ROA	The square of the ratio of return on total assets
	OCF	Operating cash flow	Cash flow generated by operating activities
	Debt	Debt to asset ratio	The ratio of debt-to-asset
	SOE	The nature of the actual controller	State-owned listed company is '1', and Non-state-owned listed company is '0'
	Size	The size of the listed company	$Size = \ln(\text{The total assets at the year-end})$
	RET	Stock return per year	The ratio of the stock return per year
	Control	The chairman is the CEO	The chairman and the CEO are the same person is '1'. Not the same person is '0'
	Indep_director	The ratio of the No. of the independent director	The ratio of the number of independent directors divided by total number of directors
	Industry	The industry of the listed company	Manufacturing industry is '1'. Others is '0'

Compensation, Extraordinary Items & Discretionary Accruals

According to Table 5, it is apparent that t-value of discretionary accruals correlated with executive compensation is 3.07 which means the significant positive relationship exist. For discretionary accruals as the proxy of earnings management here, therefore, it illustrates executives utilize earnings management to obtain their self-interest expressed as executive compensation. In addition, the most significant correlation exists between size and executive compensation as the t-value is 33.63. This demonstrates that the size of company is still the main reason to influence executive compensation in China. Also, the findings show the 5% level of significant correlation between executive compensation and all variables respectively. In conclusion, the results from Equation (2) verifies the Hypothesis 1 that earnings management is used by executives to gain their compensation. It means the system of supervision is not thorough, and company should take some measurements to standardize earnings management.

It is also obviously from Table 6 that discretionary accruals are significantly related with extraordinary items. The correlated coefficient is 0.293 which is much higher than other numbers in the table. That is to say, there exists the positive relationship between extraordinary items and earnings management. Therefore, Hypothesis 2 is evidence-directed in this approach.

Earnings Quality & Compensation--The Analysis For The Whole Sample

Panel A of Table 7 lists the results of the regression in the whole sample size 5806. Similar with previous researches in China, it exist positive relationship between executive compensation and earnings indexes, which means executive compensation incentive system based on earnings indexes has been established elementarily in Chinese listed company so far. The t-value of earnings is 4.63 which illustrates executive compensation is significantly correlated with earnings at the 5% level of significance. This evidence of significant correlation prepares the ground for the examination of the relationship between executive compensation and earnings quality. In other words, the research on the correlation with executive compensation and earnings quality is builds on the precondition that earnings is served as the performance index of executive compensation.

Panel B of Table 7 further verifies the correlation of executive compensation and the two parts of earnings, extraordinary items and ordinary items. In other words, it examines the relationship between earnings quality and executive compensation. (Extraordinary items have low earnings quality while ordinary items have high earnings quality.) According to the results of regression, the t-values of extraordinary items and ordinary items are -2.90 and 4.43 respectively. This means one is negatively correlated and the other one is positively correlated with executive compensation at 5% level of significance. Furthermore, the coefficient of extraordinary items is much lower than ordinary items, and together with the significant difference between these two, it testifies that executive compensation contract could react significantly differently to extraordinary items and ordinary items. It also demonstrates the ordinary items, which have higher stability and sustainability and have high quality of earnings, are given more weight ($\beta_1 < \beta_2$). Through the test of the whole sample, we find the system of executive compensation governance has been improved a lot, and the compensation incentive system based on earnings is established elementarily. Executive compensation contract has significantly distinguished extraordinary items and ordinary items which mean Hypothesis 3 is tenable.

Earnings Quality & Compensation--The Analysis For The Twisting Deficits Sample

As it says in the introduction, the main approaches of earnings management which utilized by public companies include government subsidies, related-party transaction and property recombines, provision of impairment and so on. After further analysis, it finds that the behavior of executives is closely relevant with the means of earnings management: the appraisal of disposal assets depends on executives' professional judgment; preferential policies such as government subsidy need executives to struggle; impairment provision is 'the largest private plot' for executives using professional skills to reach the goal of earnings management. Therefore, we treat extraordinary items as the standard, and select a set of data to be the research objective, which is the sample of 636 deficits companies.

According to Table 8, we find executive compensation of twisting deficits companies and earnings have positive significance correlation.(t-value is 3.42) It also illustrates the implementation of the executive compensation incentive system which based on earnings in twisting loss companies has been done. However, the correlated regression results between executive compensation and the two parts of earnings which are extraordinary items and ordinary items differ from our expectation. Although the executive compensation incentive contract has distinguished extraordinary items and ordinary items slightly, it is positively correlated with extraordinary items which have low earnings quality (t-value is 2.81).

CONCLUSION

This paper establishes three hypotheses and testifies the relationship between executive compensation and earnings management step by step. Firstly, after the analysis of the entire sample, we find the companies' supervision and management are not perfect in China and managers usually use earnings management to

gain their own profit which represented as executive compensation in this paper. This demonstrates that earnings management should be standardized by some measurements in Chinese public companies.

Secondly, in order to set the stage for the further study of earnings quality with executive compensation contract, we assume that extraordinary items are the main means used by managers to achieve the objective of earnings management. According to the previous research and findings though the special methods used by this paper, it verifies this hypothesis that extraordinary items are positively related with earnings management. Therefore, it is valuable to examine whether earnings quality which represented by extraordinary items and ordinary items are closely related with executive compensation or not.

Thirdly, after the whole sample analysis of the two models in the third hypothesis, we find that the incentive system of executive compensation which based on earnings is founded elementarily. The results confirm the positive correlation between earnings and executive compensation is significant. Meanwhile, the contract of executive compensation has distinguished effectively between extraordinary items and ordinary items, and gives high quality earnings, ordinary items, much more weight. This is useful and incentive for companies to do more efforts on ordinary items. Furthermore, after the analysis of twisting deficits sample, we find the different correlation compared with the entire sample. Extraordinary items are positively correlated with executive compensation while the whole sample shows they have negative relationship. But executive compensation contract still reflects the differences between extraordinary items and ordinary items slightly. In conclusion, we think that Chinese listed companies should take some measurements to standardize earnings management especially for extraordinary items. In the meantime, the incentive system of executive compensation should attach importance to distinguish extraordinary items and ordinary items in earnings, and give them corresponding and reasonable coefficient or weight to restrain the behavior of earnings management in the public companies, particularly for those twisting deficits listed companies.

Limitations

As in the introduction, some studies do not support that discretionary items could represent earnings management. For instance, Zhang (2002) verified that deferred tax expense was better able to use than discretionary accruals were. However, for this paper, we assume that earnings management is represented in discretionary accruals. Therefore, there exist some limitations to some extent in this situation. In addition, the R^2 in this paper are not very high. For example, regression in Hypothesis 1 has 0.2033 R^2 . Similarly, R^2 in Hypothesis 3 are 0.2182, 0.2185, 0.1988 and 0.1966 respectively. It means the goodness of fit is not very high, which still needs to improve. Thirdly, from Table 4, it is apparently that the number of companies of which net income has no data on extraordinary item and ordinary items is 99, nearly 7.21% of the total sample size. This illustrates net income index cannot completely reflect companies' real level of performance. In further study, we can attempt to remove the sample of companies with deficient data, and then compared with the results in this paper to research whether it exist difference and why.

A STUDY OF SUSTAINABLE BEHAVIORS AMONG CALIFORNIA HISPANICS REGARDING TRANSPORTATION

Mary Beth McCabe, National University

Ramon Corona, National University

Richard Weaver, National University

ABSTRACT

Hispanics represent a significant and growing population segment in the United States, (56% of all population growth) and California represents the largest percentage of Hispanics (37%). This research concentrated on learning more about Hispanics and their sustainable behaviors regarding transportation, both public and private. By studying Hispanic transportation behaviors, marketers can understand their future needs, supplying the products/services through effective promotional media channels. This project allowed researchers to identify behaviors of Hispanics in California regarding green transportation and the media that influences them. We studied the use and purchase patterns of hybrid vehicles, the use of car pools and public transportation, current gas mileage (mpg) and media they prefer. We found that Hispanics drive hybrids slightly less than non-Hispanics. There is a somewhat higher preference for the next purchased car to be a hybrid for Hispanics than for non-Hispanics. In addition, fewer Hispanics use public transportation or a car pool than non-Hispanics. We believe that the conclusions from this exploratory study will help marketers of transportation services in the public and private sectors. We expect that because of this pilot study, discussions and additional research on Hispanics and sustainable transportation will occur.

KEYWORDS: Sustainable transportation, hybrid vehicles, Hispanic Marketing, sustainable behavior, green transportation, marketing strategies, shared transportation, green advertising, mpg, eco-friendly.

INTRODUCTION

In the 2010 Census, Hispanics represented over half of the population growth (56%) of the United States, and California represents the largest percentage of US Hispanics (37%). This study uncovers more details about segments of Hispanics and their sustainable behaviors regarding public, i.e., government and private, i.e., commercial transportation and related industries. We researched Hispanics vs. non-Hispanics personal use of hybrid vehicles, miles per gallon (mpg), and modes of transportation. Hispanic transportation behavior studies such as this can help marketers understand future needs of this segment and therefore provide crucial information for decision-making.

REVIEW OF LITERATURE

Hispanic Culture And Marketing

Family, religion, language, and music are important to Hispanics. (Meneses, 2011) Hispanics use products with less attachment to schedules and timeframes, and enjoy the moment. It is an advantage to be poor but happy rather than rich and unhappy. Income levels lag, with the percentage of households with incomes over \$100k indexed at half of the general population. However, for many Hispanics, just have enough to get by is satisfactory. Hispanics cultural values retain optimism, enhance human experience, and embrace spirituality. (Korzenny, Korzenny, 2005)

Hispanic Education And Income Levels

In California, 81% had a high school diploma in 2005, ranking #46 out of 50 states. However, for Bachelor's Degrees, California ranks #10 with 31%. For masters or additional education/degree, there were four million out of 50 million in the West. Looking at who is enrolled in school, over 3 years of age, Blacks ranked highest, 34%, Hispanics 32% and Whites 26% (2005 results). (Gauquin, Ryan, 2007)

Companies trying to target high income Hispanics should understand their behaviors regarding environmental practices. Affluent Hispanics (\$100k+) generally used less water and recycled more waste than non-Hispanics. These same affluent Hispanics had a higher incidence of solar water heaters (23% vs. 5.7%) of non-Hispanics. (McCabe, Corona, Weaver, 2012)

Green Automobile Trends

We are spending a higher percentage of our income on transportation than we have in the past. Living in sprawling urban areas has put U.S. families in the car more often to get to work, shopping, and recreation. Since 1991, America's total transportation bill has grown faster than inflation (Katz, Puentes, 2005)

Rising gasoline prices are forcing American drivers to consider using mass transit, an electric car, moving, or changing their job. Moreover, one in three consumers would consider purchasing a higher mpg vehicle if the price of gasoline rises to more than \$5 per gallon. (Jacobe, 2011) Eco friendly beliefs can translate into improved transportation utility. Sustainable transportation is promoting our environment. Those who live in green communities have more sustainable travel experiences than others. (Kahn, Morris, 2009) Becoming more aware of the environment can improve sustainable behavior, such as more car pooling, mass transportation and hybrid use.

Why are people in California buying hybrid electric vehicles? They are concerned about 1) the environment, 2) energy efficiency, 3) global warming, 4) price of gasoline, and 5) high occupancy vehicle (HOV) lane use while driving alone. A statewide survey found that people wanted energy and the environmental information to be included in the marketing materials. (Sangkapichai, Saphores, 2009)

A California study found that even if fuel prices double, individuals are more likely to change their vehicle choice (i.e., higher mpg) than their driving patterns or usage. (Spissu Pinjari, Pendyala, Bhat, 2009) A recent study predicts global growth for hybrid vehicles of 20% through 2015. The reasons for this include more worldwide oil consumption and government initiatives, as well as buyers' awareness and acceptance. Consumers know more about the green benefits of driving a hybrid, including less carbon emissions and less of a dependence on oil as a natural resource. However, the higher cost and longer breakeven point of a new hybrid are sales barriers. (Newcomb, 2012)

Hispanics And Transportation Reform

Household vehicle consumption growth is expected to increase by 31% over 25 years to 235 million cars. More white non Hispanic and Hispanic homes will acquire vehicles than black non-Hispanic and Asian and other non Hispanic Households. The South and the West will have the greatest growth in new vehicles. (Feng, Wang, et al, 2011) Out of 15 eco-friendly activities, the fewest responded to "own or lease a hybrid vehicle" by both non-Hispanics and Hispanics in a 2011 Scarborough study report in California. Hispanics index at 24 compared to the general population, due to the large financial commitment and high involvement in the product purchase. (McCabe, Corona, 2011)

There are currently dozens of hybrid autos to choose from, including hybrid-gasoline-electric and fuel cell technologies. Americans, including US Hispanics, are making the purchase decisions on these vehicles, and businesses need to be audience relevant in their marketing messages. (Deen, 2003)

Is Green Advertising Appealing?: If someone is considered “green” or eco-friendly to begin with, his or her involvement with the environment is greater. A laundry detergent study concluded that the green involved group had no significant differences for environmental benefit vs. cost-saving benefit print advertising. However, for those not already involved with the environment, the green appeal was more persuasive than the cost appeal considering purchase intent, attitudes, and support arguments. (Schuhwerk, Lefkoff-Hagius, 1995) The conclusions here are that those who are not already green thinking could be appealed to by specific advertising.

Are Hispanics Willing To Pay For Eco-Friendly Products?

Those who rate concern for waste as highly important are willing to pay more for eco-friendly products. Educational strategies for different consumer groups, with a goal of a healthier environment are presented. Willingness to pay differs across demographic groups, with African Americans willing to spend significantly more than Caucasians on eco-friendly products. (Royne, Levy, Martinez, 2011) Hispanics participate in eco-friendly activities that require less personal or financial investment. They also do more with a financial reward, such as recycling cans or bottles and reducing their electric bill using energy efficient light bulbs. (McCabe, Corona, 2011)

Hispanics and their media habits: For marketers trying to reach Hispanics, TV is fundamental; however, competition is expected to expand, especially among digital and interactive channels. (Korzenny, Korzenny, 2005) For radio, Spanish Contemporary (Romantic, Baladas) is the most preferred format among Hispanics followed by Mexican Regional (Banda, Rancheras) in the West and Southwest US regions. (Meneses, 2011) Radio was something of a folk carrier for Hispanics for education about finances, cooking, etc. (Korzenny, Korzenny, 2005) Hispanics like to read news, and younger, more acculturated Hispanics will be using the Internet for sports news, such as soccer, baseball, and boxing, and for national and international news. For Hispanics without Internet access, newspapers in hard copy will be preferred. In addition, Hispanic consumers surf channels seeking entertainment, education and to satisfy their interests, in both English and Spanish languages. (Meneses, 2011) Overall, Hispanics prefer TV and the web for media, and non-Hispanics selected magazines/newspapers and web. Facebook® ranked about the same for both Hispanic and non-Hispanic, but Twitter® is only used by 5% of Hispanics, vs. 18.4% for non-Hispanics. (McCabe, Corona, Weaver, 2012)

METHODOLOGY

This research was designed as an exploratory study of the similarities and differences between Hispanic and non-Hispanic attitudes towards sustainability and their engagement in associated transportation activities. A convenience sample was utilized, drawn from contacts maintained by the three researchers and databases of members of a variety of Hispanic professional organizations. While convenience sampling has known limitations, such as not being representative of the larger population, this approach has been used productively in other studies, especially exploratory research. Particular attention to sample selection insured including a sizable proportion of known Hispanics from those invited to participate. The survey instrument collected behaviors such as green activities and interests plus standard demographic information. The instrument was tested and appropriate modifications increased both clarity and ease of completion. Potential responders were invited via email to participate. The instrument was made available utilizing SurveyMonkey.com over a two-week period in November 2011. Approximately 310 invitations were sent to potential responders. 144 completed the survey. This constituted a 46% response rate. Of these, 29 were discarded due to respondents not being residents of California. The remaining responses were sorted, tabulated, and correlated using standard statistical processes.

RESULTS

We have identified attitudes of Hispanics in California regarding green transportation and the media that influence Hispanics. Results include the usage and purchase patterns of hybrid vehicles, the use of car pools and public transportation, current gas mileage (mpg) and media preferences.

Figure 1: High Income Who “Always” Pay Attention To Information (%)

This figure shows the high income Hispanics vs. high income non-Hispanics and their attention level of “Always” for four categories.

Regarding hybrid cars, high income Hispanics “always” pay attention 31.3% of the time vs. 14.3% of high income non Hispanics. More than two times the percentage of respondents who are Hispanic are “always” paying attention to information on hybrid cars. This difference is significant, and near the same level of difference as solar energy (41% for Hispanics vs. 20% for non Hispanics). Of the four categories listed, the most attention is paid to water and then solar energy. Hybrids rank third, ahead of recycling.

Figure 2: Mileage Per Gallon in Primary Vehicle Driven (%)

This figure shows the miles per gallon for the primary vehicle driven, comparing Hispanics to non Hispanics.

Overall, Hispanics are driving cars with lower mpg and higher mpg. Non Hispanics are more likely to drive cars with gas mileage between 16-20 mpg. 17.1% of non Hispanics and 12.8% for Hispanics drove their primary vehicle with this mileage per gallon. The mpg averages are not significantly different for the 21-30 mpg (34.2% for non Hispanics and 33.3% for Hispanics).

Figure 3: Auto Behaviors/Intentions (%)

This chart shows the current vehicle owned and the intended purchase behavior for hybrids, comparing Hispanic and non Hispanic.

As shown in Figure 3, Auto Behaviors/Intentions, 12.8% of Hispanics currently drive a hybrid, compared to 14.5% of non Hispanics. However, 46.2% of Hispanics plan to buy a hybrid for their next car, vs. 43.1% for non-Hispanics. This is a significant jump in intentions for both groups, which would lead researchers to look for a spike in hybrid sales for the next two to three years, for both Hispanics as well as non Hispanics. There is not a significant difference between the demographic groups for this behavior and intended behavior.

Figure 4: High Income Respondents Auto Behaviors/Intentions (%)

This chart shows the high income behaviors and intentions, and mpg, comparing Hispanics and non Hispanics.

When looking at Hispanics earning \$100k and greater in Fig 4, we see a pattern of driving a hybrid and planning to purchase a hybrid. In both categories, Hispanics rank higher than non Hispanics. Hispanics with higher incomes tend to purchase and plan to buy hybrids at somewhat higher percentages than non Hispanics. We also see a difference in 21-30 mpg driving among high income Hispanics (60%) vs non Hispanics (36%). Similar to Figure 2, Hispanics rank higher in the 30+ mpg category than non Hispanics.

Figure 5: High Education Respondents Auto Behaviors/Intentions (%)

This figure shows the percentage of those with higher education, comparing Hispanics to non Hispanics on their owning or intending to purchase a hybrid vehicle.

Unlike the income factor in Figure 4, Hispanics with higher education (Figure 5) are less likely to drive a hybrid or to purchase a hybrid for their next vehicle. 10% of Hispanics with a higher education are driving a hybrid vs. 14.6% of non Hispanics. 30% of Hispanics with higher education are planning to buy a hybrid, vs. 39.1% of non Hispanics.

Figure 6: Never Use Shared Transportation (%)

This figure shows those who do not use a car pool or public transportation, comparing Hispanics to non Hispanics.

Of all Hispanics surveyed, 41% never use a car pool, vs. 37% for non Hispanics. 70.6% of Hispanics surveyed never use public transportation, and of non Hispanics, 67.6% never use public transportation. These findings indicate that Hispanics are slightly less likely to use shared transportation than non Hispanics. Note that this study was conducted in California, and that state has been known to enjoy private transportation overall rather than other parts of the United States. In many areas of California, there is no public transportation.

Figure 7: High Incomes Media Preferences (%)

This figure shows media preferences for high incomes, Hispanics vs. non Hispanics.

The chart above describes the high earning Hispanics vs. non Hispanics choices for media to inform them about environmental issues. Hispanics with high incomes selected TV as their primary choice for media information, followed by websites and radio. Non Hispanics selected magazines/newspapers as their preferred information source. Web sites were their second and TV third choice. High Income non Hispanics used radio (30.3%) and Facebook® at 27.2%. Twitter® usage is lower for higher income Hispanics (6.7% vs. 18.2%) for non-Hispanics.

Figure 8: Higher Education Media Preferences (%)

This figure shows media preferences for high incomes, Hispanics vs. non Hispanics.

The chart above describes the highly educated Hispanics vs. non Hispanics choices for media to inform them about environmental issues. Hispanics with high education selected web ads/sites as their primary choice for media information, followed by TV and radio. Non-Hispanics selected their second choice as magazines/newspapers with TV third choice. Highly educated Hispanics do not prefer to read magazines/newspapers. Facebook® and radio preferences are similar. Twitter® usage is lower for highly educated Hispanics (10.5% vs. 18.2%) for non-Hispanics.

Discussion And Implications

Green issues are among the many concerns of the world's population. Hispanics represent a significant and growing part of the US population, and California has been a bell weather state for environmental issues. In studying the behaviors of Hispanics, we learned about three areas of eco-friendly attitudes and behaviors: automobile trends, public transportation usage and media preferences. Among the most relevant findings, here are the following:

1) Nearly one third (30.3%) of high income respondents who are Hispanic are “always” paying attention to information on hybrid cars (Fig. 1) vs. 14.3% of non Hispanics in the same income category. This is a significant finding showing that Hispanics with money are seeking information about this product category, and twice as likely to pay attention always to information to news and marketing information on hybrid vehicles. Marketers who are interested in attracting the Hispanic segment should take note of the level of interest for their future advertising campaigns. Many high income Hispanic respondents (Fig. 4) are interested in buying or already drive a hybrid car. This segment of the market could be a very valued one for manufacturers and dealers of hybrids.

2) Hispanics resemble non Hispanics in the area of mpg for the most part. They differ slightly on the lower mpg and higher mpg (both are higher for Hispanics). Hispanics get more miles per gallon of gasoline or they get less mileage on their primary vehicles, however, for the most part, the patterns are similar.

3) High income Hispanics prefer TV and then websites for information (Fig 7). High income non Hispanics prefer newspaper/magazines to electronic media. High education Hispanics prefer websites well above any other media, with TV second (Fig 8). Highly educated non Hispanics answered that they prefer websites first and then newspapers/magazines as second choices. This is an indication that if you want to reach Hispanics, one media channel for high income and a different media channel for high education Hispanics would be more effective. For example, high income Hispanics may see hybrid cars on TV and make their choice from this exposure only. In addition, highly educated Hispanics may seek more detailed information that one can find online, before shopping for their hybrid car. The findings from this exploratory study of Hispanics and their transportation habits and intentions will help marketers in the government and commercial segments of commerce. Because of this study, the opportunity for further discussions and additional research to be conducted on Hispanics and their sustainable transportation needs is encouraged, available, and welcome.

LEADERSHIP STYLES AND ORGANIZATIONAL EFFECTIVENESS IN SMALL CONSTRUCTION BUSINESSES IN PUEBLA, MEXICO

Rafaela Martínez Méndez, Benemérita Universidad Autónoma de Puebla

José Gerardo Serafín Vera Muñoz, Benemérita Universidad Autónoma de Puebla

María Antonieta Monserrat Vera Muñoz, Benemérita Universidad Autónoma de Puebla

ABSTRACT

This paper presents an analysis about the types of leadership and their relationship with organizational effectiveness in small construction enterprises of Puebla. In order to know the characteristics and styles of leadership, an analysis of various authors related to the topic was practiced as the theoretical basis, so that, later, some aspects that were measured through a Likert-scale questionnaire, with a sample of 49 small construction businesses, could be taken. The goal of the research is to describe how the leadership styles, in the small construction businesses located in Puebla, are perceived, along with how to determine their relationships with the organizational effectiveness. Thus, the following research question arose: What is the type of leadership that dominates the small construction businesses of Puebla? What is the relationship among the organizational effectiveness and the types of leadership? The results of the investigation show that there is a positive and significant correlation between effectiveness, and democratic leadership, and Laissez-faire leadership. The regression model used explains 69.1% of the variations in effectiveness. In addition, there is no statistical evidence of omitted variables (the constant test = 0.914).

KEY WORDS: Styles of leadership, organizational effectiveness, small businesses.

UNDERSTANDING THE DYNAMIC OF THE ENTREPRENEURIAL PROCESS: THE INNOVATIVE ENTREPRENEUR AND THE STRATEGIC DECISIONS

Sonia De Coulon, Universidad Nacional de Mar del Plata
Fabiola Baltar, Universidad Nacional de Mar del Plata

ABSTRACT

Literature regarding to the process of firm's start-ups has supported the idea that the entrepreneur fulfills a key role in the economic development, because of his strategic vision and as a result of his capacity to generate innovations, but also employment and economic growth. Nevertheless, recent empirical studies, have mainly tackled the process from the demand perspective, with focus on institutional, economical and context aspects that favours or hinders the development of the entrepreneurial capacities. In this sense, the entrepreneur's role, his skills, his decisions and actions have been less observed from the economical field and from the strategic decision area. Even though the debate about the importance of recognizing the subjectivity forecasting of the key drivers that impact and define the observed phenomenon is increasing. The aim of the article is to understand the innovative entrepreneur's role in the entrepreneurial process through the use of a biographic design method, so as to identify throughout his life the way he decides to initiate a firm, how he experiences the process and evaluates its performance. For that reason, it is proposed to analyze Enrique Eskenazi's entrepreneurial life, Grupo Petersen's President, one of the leading economic groups in the Argentinean business arena. His public recognition is associated to the YPF S.A's shares purchase in 2008 – the Leader oil company in the Argentinean market -, which has been recently nationalized.

Key Words: Entrepreneur- biographic design method- strategic-decision making

INTRODUCTION

Several authors have investigated aspects related to the firm's start up's process, its stages, moments and subsequent performance (Reynolds 1991; Reynolds et al. 2005, Acs, 2006, between others). The relevance of understanding this process lays in the predominant role that fulfills the entrepreneurs in the capitalist system development, given its skills to innovate and create employment and economic growth. Literature's evolution has shown the different models that explain this phenomenon. In a first stage, the firm's start up theory based in the analyze through supply's perspective (*pull factors*), that is to say, relating psychological elements, natural traits and personal motivation/incentive that drives an individual to begin its entrepreneurship (Mc Clelland, 1961; Gartner, 1989). Recently, specially due to the Global Entrepreneurship Monitor's creation (GEM) and the development of statistic information that permits a comparison of the entrepreneurial activity in different countries and regions, the theoretical and empirical contributions have been focused in the analyses of push factors.

That is, institutional and market conditions that attract entrepreneurial vocations to certain environments and no others (Álvarez and Urbano, 2012). In this sense, it is observed an important peak of the institutional analyses of entrepreneurship associated to an empirical investigation's enforcement carried out through aggregated and quantitative information. Even though the scope of statistics favored the comparison and the development of politics for entrepreneurs, these restrains the entrepreneur's approach from an comprehensive and holistic view that integrate his actions and intentions, its

natural and personal traits and his relationship with the environment where he socializes and detects entrepreneurial opportunities. The purpose of this article is to connect the hypothesis of the entrepreneurial risk management and agile style management as a fuel to economies in the world. In order to expand this, it is proposed to analyze Enrique Eskenazi's entrepreneurial life, Grupo Petersen's President, one of the leading economic groups in the Argentinean business arena.

His public recognition is associated to the YPF S.A.'s shares purchase in 2008 – the Leader oil company in the Argentinean market-, which has been recently nationalized. Because of that, this paper proposes to implement a narrative approach, identifying the principle events that define his entrepreneurial career. The novelty and contribution that provides this method is its limited use in the entrepreneurial arena, even when relevant authors in the field have emphasized its relevance (Gartner, 2010). The paper is structured in the following way. In the first place, we resume the main theoretical lineaments from the Austrian perspective that analyzes the entrepreneur's figure from an active role. In the second place, we briefly describe the method, but also the entrepreneur's analyze and the results obtained from the given data. Finally, an entrepreneurial decision model is developed and its conclusions.

Austrian Entrepreneurs And Market Opportunities. Theoretical Framework.

Since the beginning of the marginalism revolution, the Austrian perspective has emphasized on the relevance of human action in explaining economic decisions. In fact, Mises (1980) built a theory based on *praxeology*. The idea of this perspective is that individuals take decisions according to their objectives, subjective valuations and specific knowledge about the world. Furthermore, those characteristics imply a dynamic and uncertain context that often is not in equilibrium, where knowledge is disperse, pragmatic and tacit. Therefore, is not possible to explain economic relations considering a static and deterministic context as neoclassic economy sustained their arguments.

Moreover, Austrian economists pointed the following traits that describe economic agents: 1) specific knowledge of their preferences and opportunities; 2) subjective interpretation of the economic facts and other agent's behaviors; 3) subjective expectations of future events; 4) active engagement in new unexploited opportunities. Summarily, market competence is promoted by different agents that know different things, manage disperse and incomplete information, sometimes in an adversarial mode. As Hayek (1998) argued, market competence is a discovery process. The searchers of new opportunities (new products or incremental innovations of existent ones) are entrepreneurs. Therefore, market competition is an entrepreneurial process; profit maximization is the exploitation of a new economic opportunity and the entrepreneur, the key economic agent in the economic system.

According to Kirzner (1973), sellers and buyers act in an entrepreneurial mode. That is, they exercise the competence of taking decisions, searching for new products and changes to pursue and maintain economic benefits. As neoclassic explanations ignore the consequences of the existence of uncertainty, the market competence is unreal. Knight's ideal (1933) situation of perfect competence has omitted the consequences that emerge from uncertainty's existence, being the intelligence and the entrepreneurial capacity the responsible of its existence "in situations in which there are no correct proceedings so as to decide what to do". Individuals should create their own structures to comprehend a decision and it is not a rational choice's process but it depends on human intelligence's traits (Loasby, 2006: 33).

In this sense, Knight joins the entrepreneurial function, a human intelligence's trait, with uncertainty or non insurable risk. In fact, this author calls entrepreneur to who decides in a company, without being the owner, because he assumes the chance that this independent entrepreneur may not invest capital in his business, just providing his work in such a sense that the capability of gaining money is his principal

guarantee. From a similar perspective, Kirzner (1973) assumed that Mises's human action is an entrepreneurial action, in the sense that is capable of discovering, innovating, predicting or appreciating opportunities in a dynamic and competitive world, where agents purchase their personal interests. The entrepreneurial activity and profits arise from instability conditions from different individuals plans; conditions that the entrepreneur captures and tries to manage with his actions. Consequently, his entrepreneurial activity is basically a coordination activity of the different personal projects, owed to his imagination and audacity. Thus, for Kirzner (1998), the entrepreneur is the agent who is seeking for opportunities and throughout his intervention reestablishes equilibrium in the market. Therefore, the entrepreneurial function basically consists in opportunity's perception, assigning an active role to the entrepreneur, as a key agent for market equilibrium's evolution and attainment. According to Kirzner (1999), the entrepreneur's role is essentially creative, develops new information where he perceives that there is a profit opportunity that the market notifies through prices, in the sense that agents learn the way they should act; coordinating their activities.

Kirzner (1973) believes that it is not an entrepreneur the one who knows how and where to buy cheap sources and where to sell them at higher prices or which are the market's technological advances. If its role was confined just to manage existing information, profits would tend to be eliminated in an equilibrium situation. On the other hand, if it is taken into account that knowledge is disperse and incomplete, it infers that from this imperfection, business opportunities may emerge. In line with this concept, this author considers that taking advantage of available information is not what characterize an entrepreneur but its perspicacity, that is to say, to know where he should seek the information for taking the most efficient and appropriate decision; that is, without knowing exactly what is looking for and without undertaking any delivered action of research, he is constantly watching over, prepared and ready to seek for new discoveries and profit opportunities. For the rest, only in a capitalist or opened economy, the entrepreneur may develop his perspicacity, arbitration and to be the driving force that motivates the markets's development (Baumol, 2003; Casson 1993).

METHODOLOGY

We develop a biographical study combining primary data (in-depth interview) and secondary one (documents) highlighting the main aspects related to entrepreneurial decisions. The method of research allows us to deeply understand Enrique Eskenazi's leadership strengths (Gartner, 2010), covering his first years as a child, providing educational and family values to all his career stages/experiences. Placing as specific lenses on risk management as well as companies's acquisitions.

In-depth interview made to this role model of entrepreneurship and also based on the documentary analysis of his autobiography, it clearly lays out the key factors that impact in the process of start up, its restructuring, expansion and diversification. By describing the different moments in his business's life and of each decision of new firms' acquisitions, this research inquires in the model of decision making that defines the entrepreneurial dynamic, the key elements in the process and the entrepreneurial qualities shown in each observed moment. The results show that behind the decision of firms' purchase there is a innovative entrepreneur leader that is constantly seeking for new opportunities in the market, and agile and innovative style that makes the big difference in business growth, manages information and networks, assumes risks, faces challenges of solving problems, makes strategic planning, makes innovation in process through companies' restructuring and devotes his life to develop his entrepreneurial personality assuming challenges when entering to diversify markets. Therefore, innovative entrepreneurs have great impact on economic growth in any market, industry or global business context.

The interview was done in February 2012 in YPF's Company. For analyzing the decisions strategy we identify the central categories using Glaser and Strauss (1999) methodology. Firstly, doing an axial codification analysis and, secondly, a selective codification with the main categories. The validation is guaranteed by the saturation of categories, the transcription of the interview, the triangulation of researchers and sources of information for the interpretation of data.

RESULTS

Enrique Eskenazi's career for sure started when he was ten years old. As we know family values are key to drive behaviours. His father, Isaac Eskenazi, gave him a tray full of toys, and said *"if you want to buy any candies or magazines, you should sell those toys in the neighbourhood"*. This upbringing approach taught Enrique Eskenazi how to manage efficiently his working capital since he was very young, and early injected him his entrepreneurial decisions. He would also define himself, as a *"curious and naughty"* whom would love to call people's attention, so temper is key as well.

Another important piece of his life was that his parents had migrated from Istanbul to the province of Santa Fe, Argentina, so from this experience he internalized the concept of risk and a complete change of the family life. *"The concept of risk thrills me, I believe that if there is someone who exposes is the person who migrates, because abandons its roots over a dream's base..."*

Nevertheless, not everything diminishes to taking risks. In the interview shared with us, he, very humbly mentioned that although he acquired knowledge after some unsuccessful episodes, luck has also been on his side. *"It is impossible to deny that before, during and after everything I could say, there is a factor that installs, a kind of diva between factors, that is the good luck. It is only in hazard's function –that neither philosophies, nor economists - can explain some results of entrepreneurial life"*.

We also understand, in this paper that formal education, training and experience in big companies are fundamental to consolidate the skills and capabilities for an innovative leader of this nature. He took up chemical engineering in the Universidad Nacional del Litoral, (UNL) and the good chance of requiring a trainee gave him the opportunity to have his first and foremost contact with the multinational Bunge & Born group (first multinational company in Argentina). Starting off with his twenty four years he drove his whole career in this group to get to the general manager position. His almost thirty years gave him the chance to expand his knowledge as a businessman, take advanced courses in the USA, manage diverse industries, and in this way gave him more confidence and expertise in the enterprise arena. In this period of his life, he got married with Sylvia who has relentlessly supported him around his career life.

It is natural in human beings to stay in the comfort zone, but a true entrepreneur challenges this concept, in the very best professional momentum Enrique Eskenazi had as a general manager in Bunge & Born he decided to resign and focus his entrepreneurial instinct to new business path and fulfilling his dream of becoming an independent businessman. *"It came a time in my career, where I had reached to the general manager's position, I was a guy with prestige and I said I want to make my ultimate stage of my career as an entrepreneur"*. Giava FBR S.A, was the company that pushed Enrique Eskenazi in his entrepreneurial dream come true -A food machine's consultancy, manufacture and sale company-, it was partnered with Italian businessmen. Though the company was very well managed, the economical and political instability didn't help, so he continued seeking for further opportunities. *"The food industry's businessmen knew me and also I'd been one of the founders of an organization that was called COPAR, that for the very first time I gathered together all the food industry and all that gave me an affection with honesty, prestige and also an upright mainstream, typical from Bunge & Born"*.

At that moment, Enrique Eskenazi met Carlos Alberto Petersen, owner of Petersen, Thiele & Cruz Arquitectos & Ingenieros, a very important firm that was on the edge of bankruptcy, and offered him the

management of the company. Because of his knowledge in the subject and the prestige reached in the field, the management of the company is given to this innovative entrepreneur. At the same time, this entrepreneur visualizes a great opportunity, buying stock from shareholders that withdrew from the company. Finally, Carlos Alberto Petersen and Enrique Eskenazi remain as partners and owners from this company.

It is interesting to go in depth in this purchase's decision, considering that thereafter, this innovative entrepreneur generated big decisions, completely restructured and turned around the company. The results, for assuming such a risk, have been extremely satisfactory for the entrepreneur. Each businessman needs to have the accurate balance of risk management, he must recognize where and how to play with it on his daily decisions. *"I remember that in certain moments of crisis some of the stockholders wanted to sell stock because they were exhausted. So I started to buy them because I honestly saw that Petersen had an excellent future in the mid-term".*

As per this new job, he starts expanding in new and different fields. The first diversification carried out by Enrique Eskenazi from Grupo Petersen is related to the financial area. This innovative entrepreneur identified as essential to support the different Argentinean economic areas such as agrarian and mining industry by creating a regional bank. There are several reasons for that: due to costs reduction, a specialized bank for different industries. Furthermore, profits would stay in the area and reinvested in the sector and would not be rerouted to the city. In line with this strategy he didn't hesitate about the decision of acquiring San Juan's bank in 1996; since then a multiple bank acquisitions: Santa Cruz Bank in 1998, Nuevo Banco de Santa Fe in 2003, Nuevo Banco de Entre Rios, in 2005. More importantly is to mention, that these acquisitions had been made in a critical context of the financial sector. The '90s, was a decade in which the financial sector had a really poor profitability. Moreover, state-owned companies have started being privatized. So, this entrepreneur, with his team takes the opportunity to participate in these biddings behind bank acquisition and thereafter having restructured. Within this financial move, he modified the name of the company as Grupo Petersen. Another relevant strategic driver is a very smart networking within the business arena, Enrique Eskenazi shows how important is, with a wide spread of examples within his experience throughout strategic associations with investors.

"We began to develop the idea of organizing a regional bank so the money didn't continue flowing to Banks in the city of Buenos Aires or to the Gran Buenos Aires. These were absorbing an important percentage of the profits that were produced by the country. That is, the concept was that the capital stayed in the region where it was produced for, from there, obtaining profits for the simple fact that in the regional banks the money has no other chance than being re-invested in the area. The key consists in retaining the money in the province's area."

Consistent with his innovative thinking process, he enters in the agricultural wine production industry, Santa Sylvia, approximately in the year 2000. He was foreseeing a strong global demand with the entrance of Asian countries. It is interesting the way, at the in-depth interview, the entrepreneur rescues the role of farmers, supporting the idea that they are the real innovative entrepreneurs, who take constant risks. What demonstrates also, that this innovative entrepreneur value the person who is capable of taking risk. This is, for him, a fundamental and necessary trait that has to have an innovative entrepreneur.

"Argentina is a country with great possibilities because there are four riches. There are agrarian riches that are the Argentinean basis because it is a combination of capable people, that even they seem to be ignorant they assume risks, that are the true entrepreneurs, that are the agricultures, big, small, medium-sized....and that they give a mainstay to Argentinean growth, with the world's needs and more now with the inclusion of the Asian countries. The other riches are mining, energy and education."

In line with the idea exposed above, the decision of entering to the energetic industry becomes the third stage of Grupo Petersen's diversification. It is a quantum leap that Enrique Eskenazi makes, the acquisition's decision, in this case, of YPF S.A shares in 2008. Is extremely important, because of the dimension of the transaction but also because of it is a national emblem for Argentina. Repsol owned approximately 85% of the stock, first Enrique Eskenazi acquired 10%, and then, in 2011 acquired an additional 15%. YPF S.A. (*Yacimientos Petrolíferos Fiscales*) was established in 1922 as a state-owned company. The company has dedicated, from its establishment, to exploration, distillation and oil sale. Afterwards, in 1992 the company is privatized. Therefore, six years later, Repsol, a Spanish company, makes the acquisition. Since May 3rd of 2012, the company returned to the government's hands. This generated an international commotion not only between the governants from different countries, that showed their annoyance but also from others that demonstrated their support to this decision. Enrique Eskenazi explained the dimension of this transaction, and background of YPF S.A. historical data.

"The decision of acquiring YPF meant a great leap for our company: we joined up to one of the most important energetic companies in Latin-America. Diversifying in a key industry, with an important growth potential for the country's development....This activity represents a sustainability base of commodities food's industry that characterize the country".

Taking into account the interpretation and the obtained elements from the interview and the documentary given by the entrepreneur, we could analyze Enrique Eskenazi's life stages as well as professional and business milestones. Such as it is summarized in the following comparative table.

Table 1: Decision-making strategies and personal traits

C1	C2	C3	C4	C5
Decision	Decision's description	Entrepreneurial traits	Opportunities's detection	Extract that relates C3 & C4
Decision N°1: becoming a businessman	Giava FBR S.A -A food machine's consultancy, manufacture and sale company-, it was partnered with Italian businessmen.	risky brave network persistant freelance independent	FBR, italian firm - dedicated to machine's manufacture for the food industry- proposes an association with Enrique Eskenazi, because of its prestige and knowhow acquired in Bunge & Born.	<i>"The food industry's businessmen knew me and also I'd been one of the founders of an organization that was called COPAR, that for the very first time I gathered together all the food industry and all that gave me an affection with honesty, prestige and also an upright mainstream, typical from Bunge & Born".</i>
Decision N°2: Great challenge	Petersen, Thiele & Cruz Arquitectos & Ingenieros, a very important firm that was on the edge of bankruptcy offered him the management of the company.	challenging seeker knowhow prestige working capability network	This entrepreneur visualizes a great opportunity, buying stock from shareholders that withdrew from the company.	<i>"I remember that in certain moments of crisis some of the stockholders wanted to sell shares because they were exhausted. So I started to buy them because I honestly saw that Petersen had an excellent future in the mid-term".</i>
Decision N°3: Diversification 1° stage: FINANCE	The first diversification carried out by Enrique Eskenazi from Grupo Petersen is related to the financial area. In line with this strategy he didn't hesitate about the decision of acquiring San Juan's bank in 1996. Santa Cruz Bank in 1998	seeker determined creative forward looking approach networker	This innovative entrepreneur identified as essential to support the different Argentinean economic areas such as agrarian and mining industry by creating a regional bank. There are several reasons for that: due to costs reduction, a specialized bank for different industries. Furthermore, profits	<i>"Resuming Grupo Petersen's idea of creating regional banks, the group supports the idea of unifying banks, either by acquiring banks or by making strategic associations, because our goal is to work in common services...for reducing costs through the centralized services purchase"</i> <i>"...the idea of investing in the Patagonia excited me, because I intuited its revolutionary's role in Argentina. There was a promising future over there: oil and gas industry, mining and fish industry and tourism..."</i>

	Nuevo Banco de Santa Fe in 2003, Nuevo Banco de Entre Rios, in 2005.	networker	would stay in the area and reinvested in the sector and would not be rerouted to the city.	<i>"We began to develop the idea of organizing a regional bank so the money didn't continue flowing to Banks in the city of Buenos Aires or to the Gran Buenos Aires. These were absorbing an important percentage of the profits that were produced by the country. That is, the concept was that the capital stayed in the region where it was produced for, from there, obtaining profits for the simple fact that in the regional banks the money has no other chance than being re-invested in the area."</i>
Decision N°4: Diversification 2° stage: AGRARIAN INDUSTRY	He enters in the agricultural wine production industry, Santa Sylvia and Xumek, approximately in the year 2000 in the province of San Juan.	seeker resolute sense	He was foreseeing a strong global demand with the entrance of Asian countries.	<i>"Argentina is a country with great possibilities because there are four riches. There are agrarian riches that are the Argentinean basis because it is a combination of capable people, that even they seem to be ignorant they assume risks, that are the true entrepreneurs, that are the agricultures, big, small, medium-sized....and that they give a mainstay to Argentinean growth, with the world's needs and more now with the inclusion of the Asian countries. The other riches are mining, energy and education."</i>
Decision N°5: Diversification 3° stage: ENERGY	Entering to the energetic industry becomes the third stage of Grupo Petersen's diversification. It is a quantum leap that Enrique Eskenazi makes, the acquisition's decision, of YPF S.A shares in 2008.	risky network	Related to context, Enrique Eskenazi mentions the developed prestige by the Grupo Petersen that gave them support from swiss, northamerican, brasilian and mexican banks, that permitted Grupo Petersen	<i>"The decision of acquiring YPF meant a great leap for our company: we joined up to one of the most important energetic companies in Latin-America. Diversifying in a key industry, with an important growth potential for the country's development....This activity represents a sustainability base of commodities food's industry that characterize the country"</i>

In addition to this, in accordance to the presented information, the following figure resumes the elements that have an impact in the entrepreneurial decision model of this entrepreneur from a naturalized and dynamic perspective

The previous diagram synthesizes the principal elements that define the entrepreneurial decisions from the analyzed entrepreneur. Following the analysis's logic proposed by several authors that give an active role to the entrepreneur in the dynamic start up's process (Casson, 1993; Gartner 1989; Foss et al. 2006; Casson and Wadenson, 2007; Buenstorf, 2007 and Shane & Venkatamaran, 2000). From the entrepreneur's active role, the model identifies as main personal traits the following: assumes risks, alertness, creative, coordinator, resolute and determined, forward looking approach, challenger, brave, persistent, networker, and strategist.

Additionally, it stresses his capability to innovate, considering that he recognizes the influence of changes in the environment. On the other hand from his actions, his abilities to evaluate and judge the market's opportunities are stressed, his capability for assigning scarce resources and his skills for entering to dynamic industries, with strategic scope and of key impact for the economic and social development of the country. The link between the actions and this entrepreneur's profile is the information availability, which is the access way to those exogenous opportunities. The network and relations developed by the entrepreneur, determined element in the entrepreneurs's decision making model, reduces the chance of committing two mistakes. On the one hand, by losing a profitable business opportunity or on the other hand, by carrying out an idea that he considers profitable presumptively and then it is not. This model considers an indispensable requirement to obtain information that allows to detect profitable business opportunity; information that maximize the entrepreneur's profits. In this case, the opportunities' structure it is not only an exogenous element, where alertness of individuals determines its exploitation, but also can create those opportunities through human actions.

Figure 1: Entrepreneurial decision model from Austrian's perspective

Source: Author's own.

From this perspective and in concordance to what was expounded by the interviewee, the market's dynamic and opening constantly generate new business opportunities, and as Buenstorf defines (2007) "like company's development, industries evolution changes the nature of the existent opportunities and also creates new ones". In this way, exist two ways to analyze new companies' arising. The first one, with an objective character, where given the opportunities' structure, firm's start up depends on the alertness of individuals to recognize and exploit them (Casson, 2003). The other view is peculiar and dynamic, as it is defined by Buenstorf (2007), and where the evolutionary perspective allows to include in the analyzes of opportunities' nature, the endogenous changes and differences between industries and regions. So, when there are diverse paths in the markets, are these markets that mark their development and dynamic. The companies that take part in it, not only can exploit the existent but not exploited opportunities but also by creating new opportunities, according to their own experience and learning process.

CONCLUSIONS

Throughout this paper, we have illustrated that the opportunities' recognition is a subjective process, even when its existence is an objective phenomenon that it is not perceived for all the individuals neither in any moment. The entrepreneurial opportunities cannot be exploited having as a reference the optimization

action because the range of options as a result of new products' introduction is unknown, excluding the possibility of making mechanic calculation for valuing the alternatives. The entrepreneurial decisions involve the identification of means and goals previously not detected by the agents in the market. The process that links the individual with the business opportunities' capture is being analyzed in three stages: 1) Discovery's phase; 2) opportunity's running, and 3) the way to materialize it.

The discovery's phase is related with the ability of some individuals to visualize new ideas towards others that doesn't have that kind of ability. This asymmetry produces entrepreneurial opportunities and it depends on personal traits and abilities, manage of information and the implemented measures that the entrepreneur develops in a specific moment, that it is not a standardized layout in the population. It is also important to point out the value that the entrepreneur gives to that opportunity; assessment which is comprehended by its capacity of foreseeing its profits and its acceptance in the market. We believe that these entrepreneurs are essential in the business arena because they forge throughout their decisions and actions, building up plans in regions and countries simply with their own dreams, ideas and traits, that mean solid structures for future generations and most importantly, they are the driving force for up and coming entrepreneurs. This entrepreneurial style propels individuals to take risks and seek for their personal interests.

EQUITY ISSUES AND THE IMPACT OF LEAD MANAGER AFFILIATION ON BROKER MARKET SHARE AND TRADING VOLUME

Elvis Jarnecic, School of Business, University of Sydney

Yubo Liu, School of Business, University of Sydney

ABSTRACT

Using a unique broker ID dataset, this paper investigates the trading volume and market share of brokers surrounding Seasoned Equity Offerings (SEOs) in the Australian primary market. It also uses pooled regression analysis to examine the key determinants of the behaviour of affiliated and unaffiliated brokers around SEOs. The results suggest that broker affiliation has a significant impact on broker trading volumes and market share on both the announcement days and issuance days. However, there is no significant evidence showing that lead managers or co-manager outperform other underwriters. Rather, the results indicate that co-managers are not expected to gain any abnormal volume or market share. Moreover, broker reputation, market capitalization and relative offer size of the offering firm are shown as the primary characteristics influencing broker performance.

JEL: G24

KEY WORDS: Seasoned Equity Offerings, Equity Issues, Broker Affiliation, Broker Market Share

INTRODUCTION

Given that seasoned equity offerings (SEOs) are widely regarded as one of the most important capital structure events, a considerable amount of research has investigated capital markets around SEOs. Masulis and Korwar (1986) state two major motivations for seasonal equity offerings: first, a firm's leverage level will be reduced when the equity capital is increased; second, the raised capital is typically used to finance capital expenditures, such as purchasing assets or financing acquisitions. The purpose of a SEO could reflect the performance or health of a firm. Therefore, investors would have various expectations on the future performance of the firm. As a result, abnormal trading activity is commonly associated with SEO events. Extant literature has documented significant changes in affiliated broker market share around various financial events in capital markets, such as SEOs, Initial Public Offerings (IPOs), and changes in analyst recommendations.

Kim and Masulis (2011) observed order imbalance activities after the SEOs in Australian financial market, suggesting that the trading pattern is a result of market-making activities by underwriters. Since underwriters have a significant role in capital markets around SEOs, it is also interesting to investigate their affiliated brokers trading pattern around these offering events. The connections between the brokerage department and the corporate finance advisory department have been discussed by Ellis et al. (2000), Irvine (2001) and Niehaus and Zhang (2010). Their findings suggest that a substantial proportion of investors tend to trade with affiliated brokers after IPOs. Similarly, in SEOs, investors are also likely to trade with affiliated brokerage firms. Previous studies mainly focus on the trading patterns in the capital markets around SEOs, including order flow imbalance, analyst coverage, and short-selling behaviour. With a unique dataset with broker identification codes provided by the Australian Securities Exchange (ASX), we attempt to investigate the trading behaviour of brokers around SEO events in the Australian financial market. Moreover, we examine the abnormal patterns of trading volumes and market share for both affiliated brokers and unaffiliated brokers around SEOs.

In this paper, we employ the methodologies in Gerard and Nanda (1993) and Henry and Koski (2010) to examine the impact of SEO events and broker affiliation on the trading volume and market share of brokerage firms. We focus on changes in and the determinants of the trading volume and market share of both affiliated and unaffiliated brokers around private placements and rights offerings in the Australian equity market between 2000 and 2009. The results in this paper will provide a better understanding of affiliated brokers' and unaffiliated brokers' trading volume and market share behaviour around SEOs in primary markets. Further regression analysis will give more insights of the key determinants that may impact on broker trading behaviour and market share around equity offering events. The findings will be informative to the management of advisory firms as well as the affiliated brokerage firms in deal structuring.

The results suggest that broker affiliation has significant impacts on broker trading volume and market share around SEO announcement days and issuance days. Affiliated brokers are shown to outperform other unaffiliated brokers by 147 percent in terms of trading volume on the SEO announcement day, and this number goes up to 179 percent in the post-announcement period. Around issuance days, affiliated brokers are expected to obtain at least 151 percent more trading volume, and their abnormal volumes are expected to be 264 percent higher than those of unaffiliated brokers. However, there's no significant evidence showing that lead managers outperform other underwriters around SEO events. Co-managers are not expected to gain any abnormal volumes or market share around SEOs according to the results. Moreover, broker reputation and market capitalization of the offering firm are shown as the two major factors that influence broker performance around SEOs.

LITERATURE REVIEW

The trading volume and market share of brokerage firms is affected by various factors. There has been a substantial amount of research investigating the link between analyst coverage and affiliated broker trading volume. Niehaus and Zhang (2010) studied the research coverage and affiliated broker market share in the US. They found that a broker's trading volume in a stock increases by 0.8 percent on average if that stock is covered by an affiliated analyst. This finding is supported by the empirical evidence in Irvine (2001) and Jackson (2005), who documented a positive relationship between analyst research coverage and broker trading volume for individual stocks on the TSE and ASX respectively. The level of analyst research coverage is considered an important factor of the quality of the underwriter's service. Francis and Philbrick (1993) argued that analysts' earnings forecasts could be influenced by analysts' recommendations as they needed to maintain their relations with the management. A firm tends to be favourable to investors when there is a high level of research coverage on the firm. Hence, it may lead to a higher level of trading volume (Krigman et al., 2001).

O'Brien and Bhushan (1990) examined the link between analyst coverage and affiliated brokers' coverage from institutional investors. They found that institutional investors' preferences and analyst coverage preferences are interactive. They suggest that analysts are likely to cover stocks with high levels of institutional ownership. On the other hand, institutional investors tend to buy stocks that are covered by analysts in the brokerage firms. From this point of view, the analyst coverage influences the trading volumes from institutional investors, while this part of volumes would also impact on the level of analyst coverage. Irvine (2001) discovered that the broker trading volume in covered stocks is 3.8 percent higher than the volume in uncovered stocks. Jackson (2005) studied the influence of analyst reputation on the trading volume of affiliated brokers. The results suggest that optimistic analysts with a good reputation tend to bring more trade for affiliated brokerage firms.

The reputation of analysts is built on their accurate forecasts. Jackson also argues that an upward bias may exist in analyst forecasts and recommendation. However, this argument has been refuted in the literature. Irvine (2004) found no evidence that analyst forecast bias would increase the level of trading volume for

brokerage firms. Ellis et al. (2000), Irvine (2001) and Niehaus and Zhang (2010) have shown interactions between the brokerage department and the corporate finance advisory department. Underwriters are likely to provide analyst research coverage for the offering firms to improve the relationships with their clients. On the other hand, investors who receive analyst coverage have the incentive to trade with the underwriter's affiliated brokers in order to build up connections for future analyst research coverage. From this perspective, the connections between broker affiliation and analyst coverage may also appear between broker affiliation and underwriters in equity offering events. Aggarwal (2000) examined abnormal trading volumes around Initial Public Offerings (IPO) in the US market. She shows that underwriters tend to manage the stabilization process in the post-IPO period, which leads to abnormal trading volumes in the market. These post-IPO activities in the US have also been studied by Ellis (2006). Ellis examined the trading volumes in the first two days following an IPO. She found that a substantial number of trades occur in the first two days after an IPO. The volume of these trades is equivalent to over 70 percent of the shares issued in the IPO. Ellis argues that the investors who cause these significant trading volumes are those who participate in IPOs and sell their allocated shares after the listing day. There are also other market participants who contribute to the abnormal volumes after IPOs. Day traders play a significant role in the market. They appear to buy and sell their positions in the first few days following IPOs in order to capture volatile price movements (Ellis, 2006, and Geczy et al., 2002).

Lead underwriters provide research recommendations for more than 80 percent of IPOs after the offer date (Bradley et al., 2003, and Cliff and Denis, 2004). Cliff and Denis (2004) discovered that IPO firms are likely to switch underwriters in Seasoned Equity Offerings (SEO) if underwriters do not provide substantial research coverage in post-IPO period. From this perspective, IPO underwriters are likely to issue analyst research coverage for their clients for future potential business opportunities. Investors who receive analyst research from the underwriting firm would have the incentive to trade with their affiliated brokerage firms (Ellis et al., 2000, and Niehaus and Zhang, 2010). Moreover, Huang and Zhang (2011) argue that investors who have connections with underwriters are more likely to participate in an SEO. Ellis et al. (2000) suggest that the lead underwriter always takes large inventory positions in the aftermarket trading, becoming the dominant market maker after IPOs. In contrast, other market makers in the market normally have inventory positions close to zero.

DATA AND METHODOLOGY

The broker trade data is obtained from a unique Australian Securities Exchange (ASX) database. ASX is the primary stock exchange group in Australia, ranked as the eighth largest exchange in the world. The major brokerage firms in the ASX consist of global investment banks. They focus their operations on large firms and provide research analysis for institutional investors. Relatively small brokerage firms mainly focus on mid and small firms and target retail traders (Grant et al., 2010, and Jackson, 2005). There are 129 active brokers in this sample, and 26 of these brokers have been affiliated in at least one of the SEO events. Due to the availability of this unique data, the sample covers the period from January 2000 to December 2009. The sample in this paper consists of 460 private placements and 67 rights offerings. The abnormal market share for broker i on day t is computed as following (See similar approach in Irvine, 2001).

$$ABMKTSHARE_{i,t} = \frac{MKTSHARE_{i,t}}{AVEMKTSHARE_i} - 1$$

Where $MKTSHARE_{i,t}$ is the market share for broker i on an individual firm on day t , $ABMKTSHARE_{i,t}$ is the abnormal market share for broker i for an individual firm on day t , and $AVEMKTSHARE_i$ is the average market share for broker i on an individual firm over the benchmark

period. In line with Henry and Koski (2010) the benchmark period used is the 60 trading days preceding 11 days prior to the event window, excluding days on which the trading volume is zero for the firm.

The abnormal trading volume (buy + sell) for an individual firm from broker i on day t is computed as following.

$$ABVOL_{i,t} = \frac{VOL_{i,t}}{AVEVOL_i} - 1$$

Where $ABVOL_{i,t}$ is the abnormal trading volume for an individual firm from broker i on day t , $VOL_{i,t}$ is the total trading volume for an individual firm from broker i on day t , and $AVEVOL_i$ is the average trading volume for an individual firm from broker i over the benchmark period.

Regression analyses are conducted in this paper to investigate the determinants of the trading volume patterns and market share of affiliated brokers. Following similar approaches in Grant et al. (2010) and Niehaus and Zhang (2010), the regression models that are employed in this paper are shown as following.

$$DEPENDENT_{i,t} = \beta_0 + \beta_1 AFFILIATION_{i,t} + \beta_2 \ln(BROKERSIZE_{i,t}) + \beta_3 \ln(MKTCAP_t) + \beta_4 STD_t + \beta_5 RELSIZE_t + \beta_6 CLOSEOFFER_t + \varepsilon_{i,t}$$

Where $BROKERSIZE_{i,t}$ refers to the total market share of broker i on day t across all stocks. $MKTCAP_t$ is the market capitalization of the offering firm on the trading day prior to the issuance day t . Since Broker Size and Market Capitalization are not normally distributed, the logarithm forms of these two variables are used in the regression model (See similar approaches in Henry and Koski, 2010). STD_t Returns refers to the standard deviation of daily returns over the 30 trading days prior to the offering. $RELSIZE_t$ is the relative offer size of the offering firm on day t . $CLOSEOFFER_t$ refers to the close-to-offer return of the offering firm on issuance day t . In Regression 1, $AFFILIATION_{i,t}$ is a dummy variable equal to one if broker i is affiliated in a SEO on day t , and zero otherwise. Regression 1 will be estimated against various dependent variables, $DEPENDENT_{i,t}$. These dependent variables consist of the abnormal market share, the raw market share, the abnormal volume, and the abnormal market.

RESULTS AND DISCUSSION

Daily average abnormal buy and sell volumes for both affiliated and unaffiliated brokers around the announcement date are presented in Figure 1. The graphs in the four panels present similar pre-event patterns: abnormal volumes remain flat and close to zero over the 20-day period prior to the announcement. In Panel A and Panel B, the pre-event activities are quite different from those in Figure 1, where significant abnormal volumes from affiliated brokers can be observed before the issuance day. In contrast, as shown in Figure 1, affiliated brokers do not attain abnormal buy or sell volume until SEOs are announced to the public. Figure 2 presents the average daily trading volume and market share for both affiliated and unaffiliated brokers around issuance days and announcements. The bar charts represent broker trading volume, and the line graph indicates broker market share.

Panel A and Panel B present these measures for affiliated brokers. The peak level of volume is observed four days prior the issuance indicating that daily turnover exceeds two million shares. This figure drops

slightly in the following days but still remains at around one million shares until two days after the issue. Average trading volume then tends to revert back to normal levels. Surprisingly, a small upward trend is evident in the final five days of the 20-day event window. This likely represents an empirical abnormality. Broker market share follows similar patterns as the trading volume. It fluctuates around seven percent at the beginning of the event window period. Broker market share then begins to increase markedly five days prior to the issuance day, and it reaches the maximum one day after the issuance day. Over the following days, market share then drops back and remains at around eight percent from the eighth day after issuance. In contrast, different patterns in affiliated broker trading volume and market share around announcements are observed in Panel B. The pre-event period is relatively quiet and flat, which is consistent with the findings in Figure 2. Broker trading volume then rises rapidly from 200,000 shares to 1.6 million shares on the announcement.

This number remains at this high level in the first two days after the announcement, and then starts to decline. Broker market share reflects movements in trading volume. The market share stays relatively stable at around six percent at the beginning of the period. Surprisingly, affiliated brokers then lose some of their market share in the last two days prior to the announcement. However, their market share subsequently increases when the SEOs are announced to the market. Also, although the trading volume of affiliated brokers decreases after the announcement, their market share remains strong in the post-event period, exceeding eight percent on average. This can be attributed to the temporary spikes and greater fluctuations in market share around issuance days. Trading Activities around SEOs

Figure 1: Abnormal Buy and Sell Volumes around Announcements

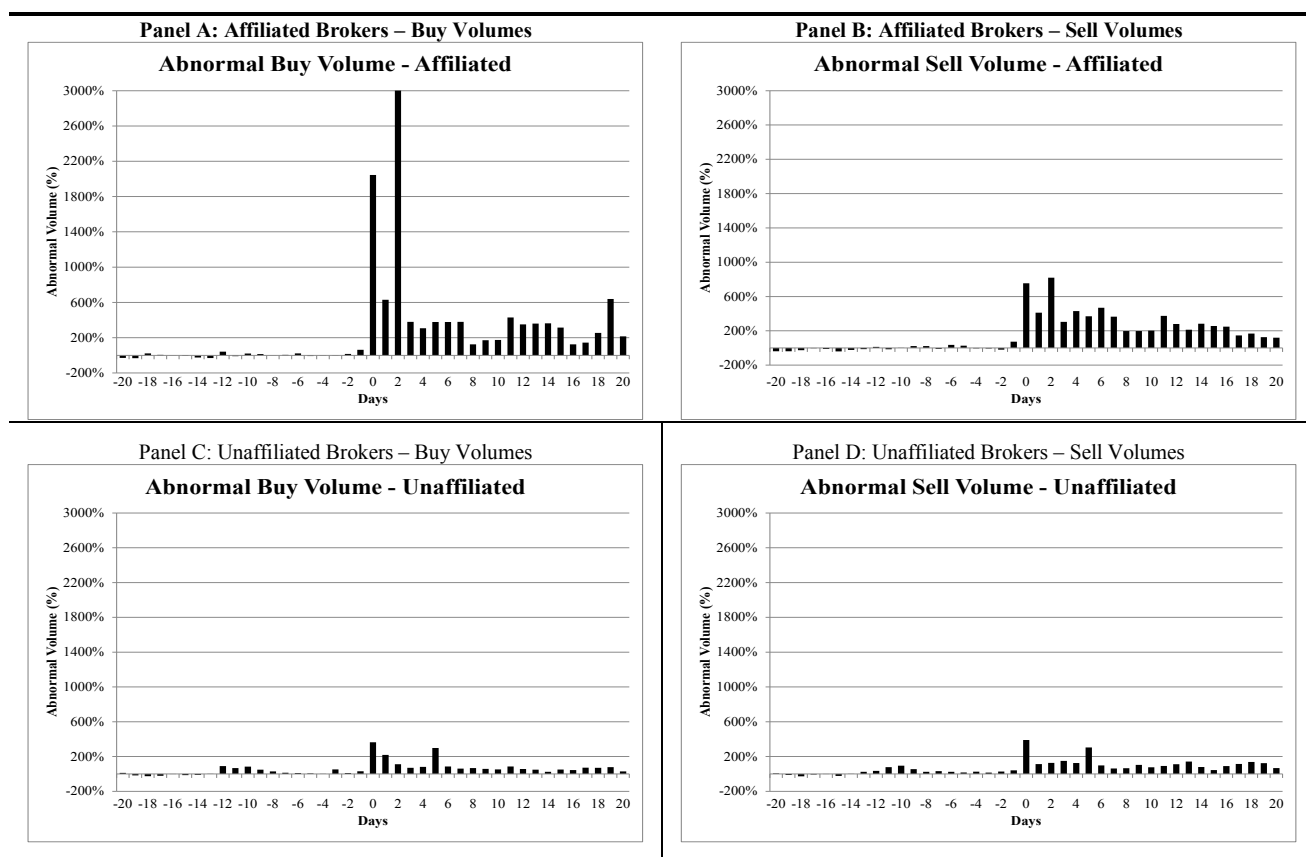

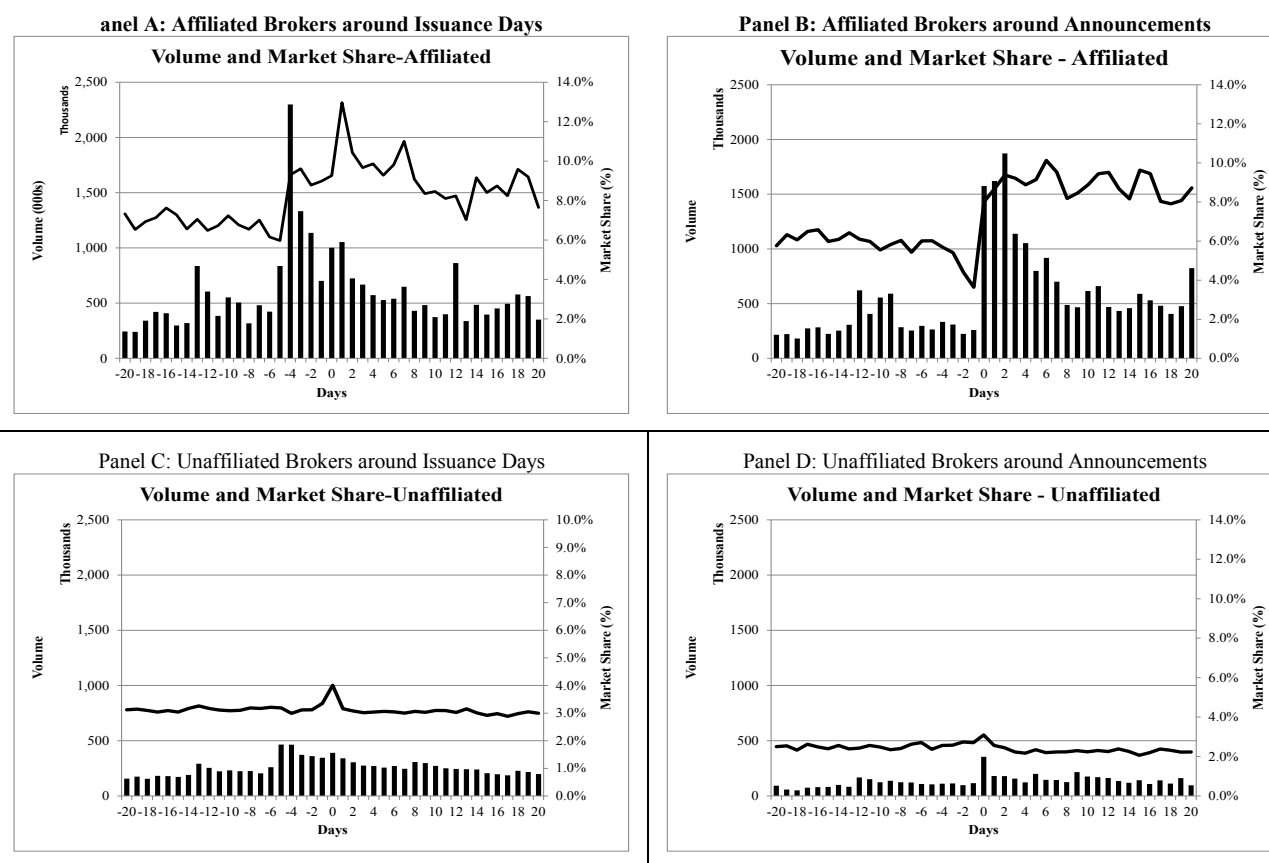

Figure 2: Broker Market Share and Volume

The average daily trading volume and market share of brokers around SEO announcement days are shown in Table 2. Panel A contains trading activities around announcements for affiliated brokers. The daily average volume measures remain relatively stable prior to the announcement day. These measures then reach their peak value on the announcement day. Following this, the numbers decrease significantly five days after the announcement. This pattern is also reflected in the market share variable and relative volume measures. Affiliated broker market shares are higher than those of unaffiliated brokers over the entire event window period. However, the daily abnormal market share of affiliated brokers in the pre-event period is negative. Panel A does not show significantly positive abnormal volumes for affiliated brokers prior to the announcements.

These measures increase rapidly on the announcement days. The abnormal volume and the abnormal sell volume each increase to over 700 percent after the announcement. Moreover, the abnormal buy volume reaches 2045 percent when SEOs are announced in the market. These abnormal measures remain strong in the 5-day period after the announcement and then progressively decrease during the rest of the post-event period. In Panel B, the raw volume measures, market share and relative volume measures for unaffiliated brokers present a symmetric pattern. Consistent with previous results, peak levels appear on the announcement days, and are much lower in magnitude than those of affiliated brokers. On the announcement day, daily average total volume of unaffiliated brokers is 353,933 shares, while affiliated brokers' daily total volume exceeds 1.5 million shares.

This contends that investors are likely to submit their orders to affiliated brokers when SEOs are announced in the market. However, there is not much difference in the relative volume measures between affiliated brokers and unaffiliated brokers, indicating that both tend to trade more on the SEO stock

around the announcement. Significant positive abnormal volume measures for unaffiliated brokers are observed on the announcement day. They are expected to receive over 300 percent more volume compared to their average level. In the first ten days of the event window period, the abnormal trading volumes of unaffiliated brokers are not significantly different from zero, indicating that their order flow is close to normal levels during this period. In contrast, the abnormal market share of unaffiliated brokers remains significantly negative over the entire event window period, reflecting the tendency for affiliated brokers to realize a substantial market share from unaffiliated brokers around SEO announcements.

Table 2: Broker Trading Activity around SEO Announcements

This table summarizes broker trading volumes and market shares around 527 SEO announcements in the sample from January 2000 to December 2009. The event window is from 20 days prior to the SEO announcement (-20) to 20 days after the announcement (20). Day(0) refers to the announcement day. The asterisks refer to the level of significance for a t-test that the mean value is equal to zero. ***, **, * denote statistical significance at the 1%, 5%, and 10% levels respectively for the abnormal measures.

Panel B: Unaffiliated Broker Volume Statistics around SEO Announcements

Determinants of Trading Volumes and Brokers' Market Shares Table 3 provides the results from the OLS regression analyses relating to the determinants of broker trading volume and market share around SEO announcements. The affiliation dummy variable is significant at the one percent level in the first three equations. The coefficient of the affiliation dummy variable indicates that affiliated broker volumes are expected to be significantly higher than those of unaffiliated brokers in pre- and post-announcement period and on the announcement day. Affiliated brokers receive 147 percent more volume than other brokers on average on the announcement days. This percentage increases to 179 percent even in the post-announcement period. However, affiliated brokers are expected to be the large brokerage firms in the market. For this reason, their volumes are higher than those from other brokerage firms. Both the broker size and the market capitalization are found to be correlated with broker trading activities around SEOs. The broker size has a positive impact on brokers trading volumes and market share, indicating that large brokers are likely to take away a substantial market share from smaller brokers. Furthermore, abnormal trading volumes and abnormal market shares are also positively correlated with broker size. This suggests

that the percentage changes in broker market share around SEOs are greater for larger brokerage firms. In comparison, market capitalization is negatively associated with broker trading activities.

Table 3: Determinants of Broker Trading Volume and Market Share around Announcement

This table summarizes the results of the regression analysis on determinants of brokers' trading volumes and market shares around SEO announcements. Ln(Volume), Abnormal Volume, Broker Market Share and Abnormal Market Share are regressed against six dependent variables. (-5)-(-1) refers to the period from five days prior to the event to one day prior to the event. Day(0) refers to the announcement day. (1)-(5) refers to the period from one day after the event to five days after the event. Standard errors are listed in parentheses. ***, **, * denote the statistical significance at the 1%, 5%, and 10% levels respectively.

Brokers are expected to obtain higher trading volumes and market shares in relatively small firms around SEOs.

When broker abnormal volumes are regressed against the six explanatory variables listed, the affiliation variable is only statistically significant in the post-announcement period and on the announcement day. When the SEO is announced in the market, the amount of additional volume that affiliated brokers receive is expected to be 10 times higher than those of unaffiliated brokers. The results also demonstrate that brokerage firms are expected to receive additional volume around SEO announcements if they are affiliated with the underwriter. The coefficients of the broker size variable are all positive, and statistically significant at the one percent level, suggesting that brokers with better reputations tend to obtain abnormal volumes. The market capitalization of the offering firm has a substantial influence on daily trading volumes only during the pre-announcement period and on the announcement day, but it is unlikely to influence broker abnormal trading volumes. The signs of the market capitalization variable are not consistent in different time periods. In the pre-announcement period, an SEO firm with a larger market capitalization provides higher trading volumes for brokers on average. However, on the announcement day, the market capitalization is shown to be negatively related to broker trading volume. Relative offer size is found to significantly impact broker trading volume only in the post-announcement period. It is unlikely to be an important factor of broker abnormal trading volume. Surprisingly, close-to-offer return is not a significant determinant, indicating that the level of underpricing is unlikely to affect

the broker trading volume around the SEO announcement, which is inconsistent with findings in Henry and Koski (2010).

Affiliation is a significant determinant of broker daily market share and abnormal market share in most of the pre- and post-announcement periods and on the announcement day. In the pre-announcement period, the abnormal market share of brokers is unlikely to be influenced by broker affiliation. This is reflected in Figure 1 and Table 3, in which the pre-announcement period appears to be relatively flat. Following the announcement, broker affiliation then becomes a significant determinant. The results indicate that a brokerage firm abnormal market share is expected to be 68 percent higher than those of unaffiliated brokers. This effect persists into the post-announcement period as well. Broker size and market capitalization are also found to be significant determinants of a broker's daily market share. All coefficients of broker size are positive, which suggests that the level of a broker's reputation has a direct relationship with their market share. Interestingly, the market capitalization of SEO firms appears to be negatively related to the daily market share of a broker. In contrast, market capitalization is expected to have significant positive impacts on broker abnormal market share. Consistent with trading volume and abnormal volume, there is no evidence showing that relative offer size and level of underpricing would determine the levels of brokers' market shares and abnormal market shares.

CONCLUDING COMMENTS

This paper investigates broker trading volume and market share behaviour around SEO events in the Australian primary market based on a unique broker ID dataset. Pooled regressions were conducted to examine the key determinants that influence affiliated and unaffiliated broker behaviour, including stock characteristics, index movements, and broker characteristics. The findings provide insights into the key determinants that may impact on broker trading behaviour and market share around equity offering events. Using the evidence from the Australian market, this paper suggests that broker affiliation has a significant impact on broker trading volume and market share around both SEO announcement days and issuance days. Affiliated brokers are shown to outperform unaffiliated brokers by 147 percent in terms of trading volume on the SEO announcement day, and this number goes up to 179 percent in the post-announcement period. Around SEO issuance days, affiliated brokers are expected to obtain at least 151 percent more trading volume, and their abnormal volume is expected to be 264 percent higher than those of unaffiliated brokers. The results indicate that brokers are able to improve their turnover and performance by participating in SEOs.

Using a pooled regression model, this paper identifies the key determinants of broker trading activities around SEOs. The results show that broker size and the market capitalization of the issuing firm are two primary characteristics affecting broker performances around SEOs. Large brokers are expected to outperform other brokers in terms of trading volume and market share (both for raw and abnormal measures). It also shows that brokers are expected to obtain a greater abnormal market share in large firms. However, broker trading volume is shown to be negatively associated with the market capitalization during announcements. This indicates that brokerage firms that underwrite large firms tend to attain greater trading volumes to obtain higher market shares.

On the other hand, SEOs of relatively small firms tend to be attractive to smaller brokerage firms, as they are able to obtain significant abnormal trading volume, indicating that they substantially outperform in the market compared to their average turnovers. Relative offer size appears to significantly impact broker trading volume in the post-announcement period, but their trading activities are unlikely to be affected by stock volatility and the level of underpricing of SEOs. Furthermore, the purpose of the offering is found to be a significant determinant. SEOs with a purpose of growth and expansion are expected to bring greater trading volume to brokers. These findings are also informative to the management of advisory firms as well as the affiliated brokerage firms. It implies that market capitalization, relative offer size, and

purpose of offering are important factors that they should consider in searching and constructing deals. During SEOs, the underwriter could be different from the IPO underwriter of the issuing firm. Firms may switch underwriters due to post-IPO performance, analyst coverage, or change of the firm size. In future research, it would be interesting to examine the factors that influence a firm's decision on the choice of underwriters after IPOs. These factors could be an important source of an underwriter's competitive advantage.

ENHANCING CUSTOMER SATISFACTION BY INCREASING THE FREQUENCY OF USE OF AGRICULTURAL BUSINESS UNITS

Liezel Alsemgeest, University of the Free State, South Africa

Van Aardt Smit, University of the Free State, South Africa

ABSTRACT

Customers are the life-blood of any business and happy customers lead to customer loyalty and ultimately repurchase behavior. It is therefore essential to ensure that the customers of a business, remains satisfied. Business units, such as retail shops, grain marketing and financing within an agricultural business provide a unique opportunity to test customer satisfaction, as the customers making use of the various business units are relatively homogeneous. The purpose of this paper is to determine whether the frequency with which business units are used is related to customer satisfaction of the particular business units. Furthermore, the relation between how frequent business units are used and the overall customer satisfaction (performance) of the company as a whole are also determined. The results indicate that the more frequent business units are used, the higher would be the opinion of the customers of the particular business unit (except in the case of retail shops). It was also found that the customers using particular business units often rather than seldom would rate the performance of the organization higher. The paper thus indicates that it is imperative to increase the frequency with which customers use business units.

INTRODUCTION

One of the major concerns in any organization is the necessity for customer satisfaction that leads to loyalty, as acquiring new customers cost more than retaining current customers. Since organizations depend on repeat business for survival, profits increase if customers are efficiently served (Nowak and Washburn, 1998). Therefore, customer satisfaction is the number one antecedent to retaining customers (Bodet, 2008). This is a well-known research area that has receives a great deal of attention (Keiningham, Perkins-Munn, Aksoy and Estrin, 2005; Martin-Consuegra, Molina and Esteban, 2007; Oliver, 2009; Prabhakar, 2007; Singh and Sirdeshmukh, 2000; Stock, 2005; Sun, Wilcox and Zhu, 2007 and Yu, 2007).

Customer relationship management is directly related to satisfying customers' needs. Through the process of customer relationship management, the expectations of customers can be reached due to the manner in which the product and/or service are presented to the customer (Hardeep and Amandeep, 2011). The benefits that customer relationship management bring forth are the critical factors namely customer satisfaction and loyalty (Krasnikov, Jayachandran and Kumar, 2009).

Customer satisfaction and loyalty are antecedents for the survival of any business; the reason being that higher levels of customer satisfaction should lead to higher levels of loyalty which would increase cash flow, an increased market value of the business and therefore higher levels of profitability (Luo and Bhattacharya, 2006). Satisfied customers are loyal customers and these customers will buy more of the products and services offered by the business and are less sensitive to prices. Loyal customers also account for the majority of the profits of a business. (Kotler, 2000:48). Relationship marketing thus leads to a stronger commitment and loyalty from the customer that would be more difficult for competitors to top (Batt & Rexha, 2000). Customer satisfaction is, therefore, a vital component in obtaining customer loyalty, which is required to ensure repeat purchases from customers (Zhao, Lu, Zhang and Chau, 2012). Cooperatives were established on the basis that they would provide the greatest benefit to the producers/owners. However, with the conversion of these agricultural cooperatives to IOF's, the focus is primarily on profit and share price maximization (Harvey and Sykuta, 2006).

According to Olson and Boehlje (2010) rivalry among agribusinesses is one of the fundamental factors affecting the survival of these firms. Also, it has been established that agribusiness firms would only be able to obtain customers from competitors and retain existing customers by competing on price and non-price factors, i.e. keeping customers satisfied. Customer relationship management therefore becomes an integral part in the organization in ensuring that customers are satisfied and loyal towards the organization (Liou, 2008). Agricultural businesses serve commercial farmers as suppliers of inputs, as marketing agents of their commodities and as service providers (Ortmann and King, 2007). Thus, the agricultural business acts as a supplier to its customers from the input side of the value-chain, as well as the marketing and the selling of commodities from the output side of the value-chain, while also providing various services such as financing and insurance. Most typical agricultural businesses as a result consist of various business units that are operated for the benefit of their customers.

Business units, such as retail shops, grain marketing and financing within an agricultural business provide a unique opportunity to test customer satisfaction, as the customers making use of the various business units are relatively homogeneous. Also, the customers making use of the business units are business owners themselves (farmers), with the effect that this analysis becomes a business-to-business research study. Therefore, each business unit will be regarded as a business in its own right, under the 'umbrella' of the agricultural business. The purpose of this paper is to determine whether the frequency with which business units are used is related to customer satisfaction of the particular business units. Furthermore, the relation between how frequent business units are used and the overall customer satisfaction (performance) of the company as a whole are also determined. The paper is structured as follows: relevant literature on customer satisfaction, customer loyalty, as well as repurchase intentions of customers is considered. The research method will be discussed and finally the results will be presented with accompanying recommendations and concluding remarks will be provided.

LITERATURE REVIEW

The literature review will examine the relationship between customer satisfaction customer loyalty, as well as the connection between customer satisfaction and repurchase intention.

Customer Satisfaction And Customer Loyalty

The majority of businesses are concerned with satisfying both themselves and their customers. Customers are satisfied when they receive good quality products and services at fair prices, while the business would be satisfied if it is profitable (Helgesen, 2006). By retaining customers and increasing customer loyalty, customers continue making use of the products and/or services of the organization and ultimately the organizational profitability should increase (Helgesen, 2008). Customer satisfaction should lead to several advantages to a business, such as increased loyalty, price inelasticity, retaining current customers by cutting them off from competitive efforts, reduced future transactions and failure costs, the enhancement of the business's reputation and a decrease in the cost of appealing to new customers (Fornell, Mithas, Morgesson & Krishnan, 2006:4). Loyalty can be described as the willingness of the average customer to repurchase the product/service as a result of psychological attachment and to maintain a relationship with the service provider/supplier (Rauyruen and Miller, 2007).

According to Fornell, *et al* (2006), the more loyal a customer is to a particular business, the longer the customer would frequent the business and consequently the revenue would increase due to the constant support of the customer. It has been suggested in various studies that the longer a customer stays with a particular business, the more loyal that customer is and the more profitable the customer becomes to the business, as future cash flows are secured (Ranaweera, 2007).

There are several ways in which customer retention could lead to increased profits. Firstly, by retaining customers a company could show a reduction in costs, as it has been established that it costs more to acquire new customers than to retain existing ones. Secondly, an increased volume of purchases is likely if the customer is satisfied with the specific business, product and or services provided. Thirdly, the business could charge premium prices if customers are loyal to the business and lastly, the retained customers could engage in increased word-of-mouth marketing (Zeithaml 2000).

Customer Satisfaction And Repurchase Intention

According to Gustafsson, Johnson & Roos (2005) the two primary reasons why individuals repeat purchases at a specific business are a lack of available alternatives (be it real or perceived by the customer) and customer satisfaction. Due to intense competition in the marketplace, customer loyalty has become a major theme in marketing research. It has been referred to as the ultimate objective of customer satisfaction (Deng, Lu, Wei & Zhang, 2010). Customer loyalty can be defined as “a deeply held commitment to re-buy or repatronize a preferred product or service consistently in the future, despite situational influences and marketing efforts having the potential to cause switching behavior” (Arnould, Price & Zinkhan, 2004). It has been found that perceived price fairness, perceived product quality, trust, as well as customer satisfaction all play a major role in forming customer loyalty (Yieh, Chiao & Chiu, 2007). Perceived price fairness and product quality are drivers of customer satisfaction, which in turn could lead to customer loyalty. If a customer buys a product or service more than once from a business, the customer is more likely to form an opinion or attitude about the business, which can be positive or negative. This attitude then forms the basis of the customer’s expectation with the next encounter with the business (Oliver, 2009). Transaction-specific satisfaction has a direct impact on overall satisfaction and that both transaction-specific satisfaction and overall satisfaction will impact whether a customer has the intention to remain a customer of the particular business.

Very importantly, however, overall satisfaction acts as a moderator between transaction-specific satisfaction and repurchases intention. Previous studies (Parasuraman, Zeithaml and Berry, 1994 and Anderson, Fornel and Lehmann, 1994) worked on the premise that transaction-specific satisfaction leads to overall satisfaction, which leads to repurchase intention. Also, it was found that even though customers might experience a service failure occasionally, they will still continue to have a high repurchase intention. The model explains this phenomenon on the basis that overall satisfaction intercedes in the event of a transaction-specific dissatisfaction (or service failure) and the customer is retained due to their overall satisfaction as a result of previous experiences. This model thus indicates that overall satisfaction is a better indicator of satisfaction than transaction-specific satisfaction, as it has a stronger influence on repurchases intention (Jones & Suh, 2000). The specific hypothesis was also tested by Zhao, *et al* (2012) and again, overall satisfaction contributed significantly more to repurchase intentions than transaction-specific satisfaction, although both are statistically significant. With regard to agricultural businesses, where the customers make use of the agricultural business over long periods of time, their overall customer satisfaction plays an important role as previous experiences with the organization will provide a basis for their satisfaction. A loyal customer would have the intention of making use of the business again (Zhao, *et al*, 2012). The two concepts ‘repurchase intentions’ and ‘loyalty’ are therefore, closely related.

METHODOLOGY

The research technique employed in this study is of a quantitative nature, making use of questionnaires to ascertain the data required. The target population comprised all active customers of a major agricultural business in Central South Africa that provide US\$ 12 166 (R100 000) or more volume of business to the agricultural business. In order to make provision for non-response, it was decided to use the whole population. This decision eliminated the use of a population sample and is therefore considered to be a census. Given that all individuals in the population had a non-zero probability of selection, each member

of the population had an equal probability of being selected. The reason the census method being used was due to the fact that the agricultural business consists of various business units with customers making use of the business unit to varying degrees. In addition, when populations are relatively small and easily accessible, accuracy will be increased by using a census rather than sampling (Cooper and Schindler, 2006). The customers making use of the business units are also businesses (farms), therefore this could be regarded as a business-to-business research study (Brennan, Canning and McDowell, 2011).

The research instrument used in this study was a questionnaire. The questionnaire made use of closed-ended and Likert scale questions and aimed to determine which of the various business units have the biggest impact on customer satisfaction with the overall company and whether the frequency of the use of the different business units affect the overall satisfaction of the customers towards the agricultural business. Since only one agricultural business was examined, there might be uncertainty as to whether this study should not be classified as a case study. The reason why this particular study is not regarded as a case study can be attributed to the fact that the business units that form part of the larger agricultural business ("umbrella" organization) is managed and organized as smaller businesses themselves. Also, the customers of the various business units are businesses themselves. The total response was 345 customers (businesses/farms), which make use of 11 various business units. This study can therefore be regarded as a business-to-business research study. A total of 963 questionnaires were sent out to respondents and 345 usable questionnaires were sent back. The response rate was therefore 35.8% of the total population.

RESULTS

The following section provides the data relevant to this study, namely the demographics of the respondents and then the empirical results that aim to establish the link between customer satisfaction and the frequency with which business units in an agricultural business are used.

Demographics

The target population comprised all active customers of a major agricultural business in Central South Africa that provide US\$ 12 166 (R100 000) or more volume of business to the agricultural business during 2009. In order to make provision for non-response, it was decided to use the whole population. This decision eliminated the use of a population sample and is therefore considered to be a census. When populations are relatively small and easily accessible, accuracy will be increased by using a census rather than sampling (Cooper and Schindler 2006). The total response was 345 customers (farms) out of a total of 963 questionnaires sent out, making the response rate 35.8%. Respondents were asked to indicate which type of farming operation they have, the years' farming experience they have, as well as their age. The demographics results also indicate the relative size of the respondents' businesses.

Table 1: Business (farm) type

Business (farm) type	Frequency	Percentage
Mainly grain	154	45.0%
Mainly live stock	106	31.0%
Proportional (Approximately 50% grain and 50% live stock)	82	24.0%
Total	342*	100%

*This table shows the different types of farming operations the respondents have. The main groups were mainly grain farmers, mainly live stock farmers, as well as a 50% grain, 50% live stock farm. *Three respondents did not answer this specific question*

Table 1 clearly indicates that a larger percentage of the overall population is mainly grain farmers, while 14% less have mainly live stock farms. The proportional farms (equally divided between grain and live stock) are 24%. The results also indicated that the majority of the respondents have more than 41 years' experience and less than 2.6% has less than 5 years' experience. It was found that the average years'

experience is 29.4 years, which suggest that the respondents have adequate knowledge with regard to agricultural businesses. The average age of the respondents was established to be 53.6, while less than 2% of the respondents were 30 and younger.

Table 2: Size of the business

Size of the business	Frequency	Percentage
Small	134	38.8%
Medium	115	33.3%
Big	96	27.8%
Total	345	100%

This table provide information with regard to different size customers, be it small, medium or big customers (from the viewpoint of the agricultural business).

The respondents were also classified according to the size of their contributions to the agricultural business into small customers (between US\$ 12 166 [R100 000] and US\$ 30 414 [R250 000] volume of business), medium customers (between US\$ 30 414 [R250 001] and US\$ 79 075 [R650 000] volume of business) and big customers (more than US\$ 79 075 [R650 001] volume of business). The three groups were roughly equally distributed with small customers being the biggest group (38.8%), while 33.3% were medium customers' respondents and 27.8% small customers' respondents. The following subsection will present the empirical data obtained from the respondents.

Empirical Data

A Likert scale question was provided to the respondents where they had to indicate the frequency with which they use the various agricultural business units available to them.

Table 3: Frequency of use of business units

Business units	Often	Seldom	Never	% of total that use	Rank
Retail shops	91.6%	7.0%	1.4%	98.6%	1
Grain storage	51.5%	22.7%	25.9%	74.2%	3
Grain marketing	29.7%	23.6%	46.6%	53.3%	5
Financing	26.0%	20.5%	53.5%	46.5%	7
Mechanization (workshops)	17.0%	31.3%	51.7%	48.3%	6
Mechanization (spare parts)	55.7%	33.5%	10.8%	89.2%	2
Mechanization (whole goods)	17.0%	38.4%	44.6%	55.4%	4
Insurance	20.4%	15.6%	64.1%	36.0%	8

Respondents had to indicate if they use each particular business unit often, seldom or never. The fifth column indicates the percentage of respondents of the total number of respondents (345 respondents) that use that particular business unit, it being often or seldom, while the last column indicates which of the business units are used most, according to a ranking system.

It is important to note that the main agricultural business units for this specific agricultural business (and the majority of agricultural businesses in South Africa) are *retail shops*, *grain storage* and *marketing*, *financing*, *mechanization (workshops, spare parts and whole goods)* and *insurance*. Table 3 indicates that the unit used most by respondents is *retail shops*. Almost 99% of the respondents make use of it, while approximately 92% of the respondents use this business unit often. More than 89% of the respondents make use of the *mechanization (spare parts)* business unit, while almost 75% of the respondents make use of *grain storage*. This is to be expected as the majority of respondents are grain farmers. Business units that are used less often are *grain marketing*, *financing*, *mechanization (workshops)*, *mechanization (farm equipment)* and *insurance*. The table also indicates that more than 50% of respondents do not make use of the following main agricultural services, such as *financing*, *mechanization (workshops)* and *insurance*. The first step in determining if the frequency of use of the various business units affects the satisfaction of customers towards the overall agricultural business, is to determine if there is a statistically significant relationship between the frequency with which a specific business unit is used and the overall

performance of that specific business unit. Therefore the Levine's test for equality of variances was used to determine which t-test to use to determine the p-value (significance) of each specific relationship.

In Table 4 the p-value column indicates that all of the t-tests were found to be statistically significant, apart from that of *retail shops*. The mean value indicates whether the respondents perceived the *performance* to be better or worse between the group that use the business unit often and the group that use it seldom.

Table 4: T-test between the overall performance per business unit with the frequency with which each business unit is used

		N	Mean	Std.Dev	T-test for equality of means		
					t	df	Sig
Retail shops							
Often		313	6.7827	1.52461			
Seldom		23	6.0870	2.06514	1.584	23.795	0.126
Grain storage							
Often		176	7.5511	1.29071			
Seldom		73	6.9452	1.41314	3.279	247	0.001
Grain marketing							
Often		101	7.2574	1.44674			
Seldom		69	6.1449	1.75126	4.516	168	0.000
Financing							
Often		83	7.5181	1.36472			
Seldom		54	6.4630	1.55057	4.189	135	0.000
Mechanization (workshops)							
Often		54	6.5370	1.71247			
Seldom		91	5.9231	1.64810	2.137	143	0.034
Mechanization (spare parts)							
Often		183	6.2678	1.83955			
Seldom		103	5.4660	2.09020	3.367	284	0.001
Mechanization (whole goods)							
Often		52	7.2500	1.65535			
Seldom		108	6.0648	1.65350	4.245	158	0.000
Insurance							
Often		67	7.6418	1.05459			
Seldom		40	6.4500	1.44914	4.534	63.793	0.000

This table provides the number of respondents that indicated their frequency of use (N), the mean value of their relative perception of performance (Mean), as well as the standard deviation (Std.Dev). The t-value for the test is also supplied, as well as the degrees of freedom (df), and most importantly the p-value (Sig) that indicates the statistical significance of the relationship.

The results indicate that there is a definite statistically significant relationship between the frequencies with which customers use the various business units, except in the case of *retail shops* ($p > 0.05$). Interestingly, all of the means indicate (excluding *retail shops*) that those individuals using the business units often are more satisfied with the business unit being used, compared to those individuals using the business unit seldom. Respondents that make use of *grain storage* more often, have a higher opinion of the *performance* of this specific business unit. The same is true for all of the other business units. *Retail shops* also shows an indication that the respondents that use the business unit more often have a more positive view than those that use it less regularly, although this is the only difference that is not significant. Table 4 thus provide an indication that farmers that use the business units more often will have a more positive attitude towards the performance of the business units.

The results from Table 5 indicated that the *performance* of every business unit correlated positively (and significantly) with the *performance* of the overall company. It can therefore be said that an improvement in the satisfaction of customers of any business unit will (to a greater or lesser extent) also improve the overall satisfaction towards the company. The coefficient of determination (R^2) measures the strength of the correlation and the percentage indicates the change in the satisfaction of the overall company that can be accounted for by a change in the *performance* of the specific business unit. It is therefore clear that a change in the satisfaction towards of *retail shops* will have the biggest impact on the overall company or

to put it differently, when there is a change in the overall level of satisfaction towards the company, 32% of that change will be explained by a change in the level of satisfaction towards *retail shops*. All three *mechanization* business units (with a R^2 of 20%) are second and *insurance* third most influential. It can therefore be deduced that the more often business units are used within an agricultural business, the higher the perception of *performance* will be with regards to the agricultural business as a whole. The next step would be to determine which of the business units' frequency has the biggest influence on the overall satisfaction towards the agricultural business as a whole.

Table 5: Correlation between the overall performance of each business unit with the performance of the company as a whole

Overall perception	Overall performance of company		
	Sig	R ²	Rank
Retail shops	0.000	32%	1
Grain storage	0.000	7%	6
Grain marketing	0.000	10%	5
Financing	0.000	12%	4
Mechanisation (workshops)	0.000	20%	2
Mechanisation (spare parts)	0.000	20%	2
Mechanisation (whole goods)	0.000	20%	2
Insurance	0.000	19%	3

This table provides information with regard to the correlation between the performance of each business unit and the performance of the business as a whole. The second column provides the *p*-values, the third column the coefficient of determination, while the last column ranks the business units in order of strength.

Table 6: One-way ANOVA analysis between the overall performance of the company and the frequency with which each individual business unit are used.

Overall performance of company	Often	Seldom	Never	Sig.
Retail shops	6.9533	6.8182	6.000	0.417
Grain storage	6.9471	6.7532	7.0649	0.325
Grain marketing	7.1237	6.5802	6.9862	0.016
Financing	7.3647	6.6286	6.8383	0.001
Mechanisation (workshops)	7.3077	6.9057	6.8232	0.065
Mechanisation (spare parts)	6.9891	6.8125	7.1071	0.414
Mechanisation (whole goods)	7.3519	6.8359	6.8489	0.033
Insurance	7.1618	6.8462	6.8844	0.278

This table provides detailed information to illustrate the relationship between the frequency with which the various business units are used and the overall performance of the agricultural business. This is done by way of a one-way ANOVA analysis.

The table displays the mean value (on a 9-point Likert scale) of how customers that often use (for instance) *retail shops*; perceive the *performance* of the agricultural business. In contrast to this, the individuals that never use *retail shops* have a lower perception of the *performance* of the agricultural business as a whole (mean of 6.000) compared to the individuals that use *retail shops* often (mean of 6.9533). The often, seldom and never columns therefore indicate the average means of overall *performance* of the agricultural business for each of the individual business units. The frequency, with which each business unit is used, is tested separately against the overall performance of the company. The results indicate that there are significant relationships between the overall *performance* of the company with *grain marketing*, *financing* and *mechanization (whole goods)*, which indicates that the frequency with which these three business units are used do have an influence on how customers view the agricultural business as a whole ($p < 0.05$). Even though the analyses designate these three business units/services to have a statistically significant relationship, it does not provide any information with regard to the nature of the relationship. Therefore it is necessary to perform a post hoc test on the values which proved to be significant to determine where the significant difference is. This is called Tukey's test (Mendenhall & Sincich, 1996:655).

Table 7: Post hoc test (Tukey's test) between the overall performance and the three business units

Tukey's test		Mean difference	Sig.
Often	Seldom	Grain marketing 0.54346	0.016
	Never	Financing 0.52638	0.007
Often	Seldom	0.73613	0.001
Often	Never	Mechanization (whole goods) 0.50293	0.044
	Seldom	0.51591	0.040

This table provides the nature of the relationship (where the significant difference is) between the three business units identified to have a statistically significant relationship with overall performance of the company.

Table 7 shows where the significant differences are with regard to how frequent the business units are used compared to how the respondents perceive the agricultural business as a whole. The results indicate the following:

- When Tukey's test is used, there seems to be no significant relationship between the overall level of satisfaction of the agricultural business and *grain marketing*. However, the results indicate that the frequency with which *grain marketing* is used has an influence when it comes to the overall level of satisfaction towards the company between the respondents that use the business unit seldom and often. The mean difference indicates that those individuals that use the business unit often have a more positive perception of the overall company.
- The frequency with which *financing* is used has an impact on the overall level of customer satisfaction towards the company as a whole between those individuals that use *financing* often and those using it seldom and never. The results indicate that the respondents that use *financing* often have a better perception of the overall company than those using the business unit seldom or never.
- Tukey's test for *mechanization (whole goods)* indicates that those respondents that use this business unit often have a significantly higher perception of the overall company than those using *mechanization (whole goods)* seldom or never.

CONCLUSION

Customer satisfaction is essential for the long-term survival of any business and even more so in agricultural businesses. The purpose of this paper was to establish whether there is a relationship between how frequent business units are used and customer satisfaction towards those business units and the company as a whole. The results indicate that the more frequent business units are used, the higher would be the opinion of the customers of the particular business unit (except in the case of *retail shops* where the results were not statistically significant). However, when the frequencies of the various business units were tested against the overall level of satisfaction of the agricultural business as a whole, it was found that the customers using *grain marketing*, *financing*, and *mechanization (whole goods)* more often rated the *performance* of the agricultural business higher than those individuals using the particular business units seldom. Also, those customers that use *financing* and *mechanization (whole goods)* often regard the *performance* of the company as a whole to be higher, compared to those that never use the particular business units. Therefore the frequency with which customers use a particular business unit is definitely related to the satisfaction customers experience towards the business unit. It is therefore necessary to ensure repurchase behavior and build customer loyalty in an effort to increase frequency, which would ultimately lead to greater customer satisfaction for both the individual business units, but also the company as a whole.

LIMITATIONS

Limitations pertaining to this specific study are, firstly, that only one agricultural business was examined during the course of the empirical research, albeit a major agricultural business in Central South Africa, in terms of reputation, reach and capacity. The second limitation centers on the fact that Central South Africa and this specific agricultural business focus on grain and on a smaller scale livestock, whereas other agricultural businesses in other geographic areas in South Africa will focus for instance on grapes and fruit. The third limitation concerns the fact that the various business units were used to different degrees by customers. For instance, roughly 99% of the customers make use of *retail shops*, while only 36% make use of *insurance*. Lastly, very little academic research was available with regard to the business units of agricultural businesses.

COMPARATIVE GEOSTRATEGIC STUDY OF MEXICO AND PANAMA FOR INSTALLATION OF AMERICA LOGISTIC PLATFORM

Adriana Rodríguez-Rojas, UPAEP

Fernando Orue-Carrasco, UPAEP

José Luis Martínez-Flores, UPAEP

Yésica Mayett-Moreno, UPAEP

ABSTRACT

When try setting up a Logistic Platform (LP) in a nation, needs knowing social, economic and logistical aspects. In this sense, an author has defined three factors (indicators) success key to create it: the geostrategic situation, intermodality and physical space. Europe and Asia have their LP: “Zaragoza and Singapore”, now is essential to study where to place the LP in America. After having done the Panama Invest 2011 and the First International Forum “Mexico, the Latin America logistic platform” in 2011, were detected as strategic the countries of Mexico and Panama to this effect. This paper proposes a comparative geostrategic study between both countries, about aspects that are considered decisive same weighted based on their relative importance, in order to identify the advantages and disadvantages of the geostrategic location of both nations to diagnose what is more viable for the America LP.

JEL: H54, F63

KEYWORDS: Logistic platform, geostrategic viability, comparative study.

INTRODUCTION

In the new context of globalized spaces, has highlighted the need to geo-locate areas and nodes where concentrate a number of business activities, raw materials availability and manufactured goods, to get them to the places that claim in shortest possible time, with minimum breaks and cargo handling costs as low as possible (Morales, 2010). One such space is occupied by logistics operators, which should not be construed as a mere physical structure, as its activities are centered mainly in management and therefore must rely on the logistics platform (LP) responsible for doing logistics operations supported by its infrastructure (Orjuela, Castro & Suspes, 2005).

García (2006) defines three factors (indicators) success key to create a LP: the geostrategic situation, intermodality and physical space. Within the geostrategic situation, must look the connectivity, accessibility or easiness with which can reach the site. Mexico and Panama have been seen as strategic countries to create the America LP (Ferrari, 2011; Martinelli, 2011). Both countries have conducted studies about logistic problems in actual infrastructure with which each account (Martner, Perez & Herrera, 2003; Henriquez, 2011), however, in the literature review not found a study on the geostrategic situation and there is not exist a comparative study of both countries showing the geostrategic advantages and disadvantage of each. Hence the importance of a geographical location study of the countries proposed as strategic, to know the advantages and disadvantages to define which of the two nations is more viable to locate the logistic platform in the American continent.

LITERATURE REVIEW

The LP is part of one of the 12 competitiveness pillars of a nation: the Infrastructure, that when is developed, reduces the distance effect between regions, integrates the domestic market and connects at low cost the others countries and regions markets (Salai, Bilbabo, Blanke, Drzeniek & Geiger, 2012).

To development competitive LP, should analyze the geostrategic situation. Within the geostrategic situation, is necessary to think about connectivity, accessibility or ease with which can reach the site. Should be noticed that the LP operates in places where there is already a development that works as countervailing dislocated element (García, 2006). In this sense, is necessary to study the LP from the geostrategic location (GSL), some authors related the geostrategic with geopolitical, military campus, war strategies and policies (Rosales, 2005; Correia, 2004). Authors as Palazuelos (2008) focus it to the commercial, to define the GSL as “various strategies that developed major countries acting as buyers and others as suppliers”. To make the diagnosis that will determine the geostrategic viability of countries, Ruibal (2011) makes a comparison strategic global business logistics selected countries in South America, however, there are not more extensively developed diagnostic applying a comparative study to determine whether a nation is viable or not to place a LP.

Proposed Comparative Study

Given the above is evident the need to do a study through a comparative chart of weighting factors, that identify the advantages and disadvantages of the geostrategic situation of both nations under the study and diagnoses which has the highest viability to be the America LP. The proposed comparative chart takes the following aspects of Ruibal (2011) studies: oceanside Atlantic and/or Pacific, territorial topography plane and/or mountain, road, rail, fluvial, maritime and air networks. In the same way, is made the contribution of the following aspects considered crucial to make the geostrategic diagnosis as: territorial extension, seasonality, geographic location, populated territory, lake network, maximum distance and transit time between littoral, subcontinents geographical connectivity (North, Central, South) and shared borders and multimodal corridors. For the study, there are 2 very important weight factors: a) Geographic location, which seeks to determine which of the two countries are better, placed strategically in relation to economies and markets in the world, if isn't well located will considered the easy way out of these markets, b) Oceanside Atlantic and/or Pacific, to define which of the nations has output infrastructure in both oceans and thus have shipping facilities to target their products to the world, quickly and directly, without having to make transfers in excess.

There are other two factors with a weight of 10%: a) Maximum distance and transit time between littoral, which, both oceans. Is essential to know how long takes in a road mode, to get from one coast to another through calculating the maximum distances, and b) Subcontinents geographical connectivity (North, Central, South) and shared borders. This aspect is defines by Ruibal (2011) as linking with subcontinents, however, more than just a link is important to know the connectivity between them and which of these have shared borders. Another important aspect that deserves comment is the inclusion of Multimodal corridors aspect, about this aspect Ruibal (2011) focuses more in inter-modality. In this paper propose to study multimodal corridors that provide insight into which of the two nations have a better use of existing infrastructure and logistics services linking. Finally, there are aspects with lower weight as seasonality and populated territory, which should be considered, but not make a definite impact when deciding where to locate the LP. The Table 1 shows the proposed chart, where can be seen that the weighting would values of 15% allocated to the most considered aspects and a 3% weight assigned to minor impact aspect. Similarly the scores for each value are on a scale of 1 to 5, where 1 corresponding to a failing grade and 5 to a very well evaluated aspect. In the characteristics column will document what each nation has evaluated aspects, if does not have these issues or are deficient the score is 1, if it has all the aspects will put it a rating of 5, this rating is weighted and at the end whoever gets the highest score of each country's total, will be geostrategically viable to create the America LP.

Table 1: Comparative study-chart proposed of logistic geostrategies aspects

WEIGHTING	ASPECTS	MEXICO		PANAMA	
		CHARACTERISTIC	SCORE (1-5)	CHARACTERISTIC	SCORE (1-5)
15%	Geographic location				
15%	Oceanside Atlantic and/or Pacific				
10%	Maximum distance and transit time between littoral				
10%	Subcontinents geographical connectivity (North, Central, South) and shared borders				
6%	Road network

Table 1 shows the comparative study-chart proposed to assess the geostrategic viability of nations studied to be the America Logistic Platform. Source: Own.

To data obtain will use secondary information sources, based on statistical and data officers websites of both countries.

CONCLUDING COMMENTS

Mexico and Panama are strategic countries to create the LP of the Americas. A comparative study that qualifies and ponders different geostrategic logistics aspects, will allow showing advantages and disadvantages and defines which of the two is viable to locate the platform in the Americas. This is only the beginning of a series of studies to be performed before deciding which should be the LP of Americas, therefore is recommended to complete with another that include socio-economic, physical facilities and logistical aspects of intermodality and multimodality with which currently every nation have.

THE CONTRIBUTION OF HUMAN CAPITAL INVESTMENT IN ECONOMIC DEVELOPMENT

Paul Lucian, Lucian Blaga University of Sibiu , Romania

ABSTRACT

Investment in human capital concerns all the countries of the world, which are in competition for progress and wealth. Human capital investment means investment in education, instruction and health. This investment concerns, on one side, and on the other side, the adaptation of human resources to imposed changes within an economy, changes imposed by the development of high end technologies.

JEL: E 22, F 63, H 52, I 25, I 28, O 15

KEYWORDS: Investments in Human Capital; Financing Investments in Human Capital, Private Education, State Education and Human Resources Development.

INTRODUCTION

Investments have a very complex role in the economic development of a country, because they influence property structures, economic branches and sub-branches, tech structures, labor structures, etc. Also, they assure an increase of capital quantity and quality, they increase economic and technical yield, they create new jobs and they ensure the participation of any country to international economic relations, created in terms of competition and competitiveness. It is a known fact that investments made with material resources have as a final destination the quantity and quality increase of fixed capital, and investments made for the increase, education and preparation of human resources generate what we call human capital.

LITERATURE REVIEW

The theories of economic increase and development have created models for the sustainment of the labor market and education and have as a basis investments in human capital. The human factor sustains the process of economic growth by increasing the volume of the given labor at a macroeconomic level, but also its quality by increasing labor productivity. The action of the human factor within the process of economic growth keeps the evolution of the occupied active available population.

Under the quantitative aspect, the action of the human factor materializes through the volume of labor given by the occupied population within the effective labor time. Although the increase of demand for labor force is associated with economic growth, we have different opinions within the economic theory concerning the nature and dependency of the two elements. Ergo, the increase of the rate of occupation through the creation of jobs favors economic growth, only that there are opinions which claim that the expansion of labor force occupation is actually an effect, not a prerequisite of economic increase and is due to the fact that GDP increase has a direct effect on investments. In general, investments sustain the effect which determines tech progress, population increase, an increase in the quality of goods, increased economic efficiency, etc. As a concept, we find human capital within the neo-classical theory as being investments made in human beings.

Human capital is represented by professional know-how, skills, abilities and health which can lead any person to an increased capacity to create and includes future income, or a capacity of people to efficiently produce goods and services. Theories concerning the issues of economic growth and development sustain

the idea that as soon as a certain level of human capital is reached, it becomes more productive, and is positively correlated with growth rates and occupation rates within models of economic growth.

There are two main schools of thought concerning the concept of human capital, the first looks at the ability to generate income and the human being as two different things and the second one regards the individual as being himself the capital. Within modern economic theory both schools regard human capital as a model of behavior based on the maximization of personal interest within a competitive market, other forms of behavior being apriori excluded, each individual wishing to live better and better.

The entire economic theory claims the necessity of investments in education, in the context of economic development, but the impact of investments in education has not yet been fully proven, meaning in terms of volume and structure, required to develop an economic process, because the same structure and volume manifests differently from individual to individual.

We believe that the policy of education is an integral part of the general development policy of a state and education becomes an integral part of ensuring well-being in the future. Education investments as a means of forming human capital is a vital element for: economic development, increased standard of being, closing social gaps and inequalities, etc. The science-tech revolution has transformed the education system from a producer of labor force into a producer of capital. Literature describes two sorts of effects which education produces in economics: quality and quantity effects.

Quality effects increase the efficiency of economic processes because the well-trained individual is able to better manage the economic act, to take complex decisions, to ensure the democracy of economic processes, in terms of competition and competitiveness. The quality / quantity effects refer to the quality and quantity increase of the human factor and thus, more and more competent and able individuals appear, which can exploit hi-tech elements and which, due to their experience, may create their own technologies. Considering the requirements of investments in education for sustaining economic growth, we have two questions: how much does this investment cost? And who finances it?

We believe that the financial support of forming and accumulating human capital not only regards expensed destined for education and labor force formation. The financing has a wider array, because it includes government expenses to auction public goods, the safeguarding of the health of the population, insuring public order and social protection, countering pollution, etc.

The size of the public financial resources destined for investments in human capital depends only on the size of the state budget which is in turn influenced by fiscal measures which rely on population income. Due to the current financial crisis, which engulfed more and more countries, the IMF and World Bank both call for austerity budgets in unproductive areas, such as education and health.

Theoretical models of economic growth and development call for the increase of government expenses destined to the formation and accumulation of human capital which becomes more and more productive. Concerning the way in which the financing of the education system should be made, there are several opinions, and we will retain two completely opposite ones, ergo one which states that higher education must be financed from private funds alone, and the other one claims that higher education must be state-financed.

In order for the individual to exist and integrate in society, he/she needs a certain degree of education which calls for a minimum of 12 classes, on which there is no doubt concerning the expenses which must be made exclusively by the state. For the higher education system, the individual can decide for himself between state or private education, and thus he can choose the source of financing.

RESULTS

After 20 years since the creation of the first private universities in Romania, their performances can be measured. According to the National Statistics Institute, there are over 140.000 students and around 400.000 students in state universities. Private universities annually charge income from their students which equal half of the amount that the Ministry of Education allocates for the financing of state universities. When the standings for Romanian universities were established, it was foreseen that no private university got the highest rating, meaning that of research and Education University. Private universities had obtained high scores in fields such as economics and law, but poor scores in terms of engineering and medicine.

These differences which occurred on various fields within private universities are not justified, because they have enough resources to invest in laboratories and machinery for creation activities for university programs. A more and more common phenomenon is the decrease of students' quality, in both the private and state sector, their lack of professional skills and lack of motivation to perfect their skills. Unemployment is a cause which we consider insignificant for the youth, although at this time unemployment within their ranks has extended to all European countries.

In this context we can still distinguish between young people which choose to continue their studies for themselves, in order to become a doctor or lawyer, or to emigrate, to pay for their studies themselves, and those young people which choose to continue their studies in other areas of the national economy, which present a lack of qualified labor force, such as engineering, economics, agricultural engineering, where the state finances these studies. We appreciate that in many fields of the economy a highly qualified labor force would determine a superior rhythm of development and society would be more and more interested in the education of individuals. Also, we can observe the way in which the financing of the higher education system is being made, and, more importantly, must be linked to the development level achieved by the economic system. If the level of family member income can support the educational costs then they should support their expenses, and if family income is not enough, then they must be supported by the state, in the case of gifted youth.

In European countries, due to the current crisis, there is a negative relation between education and unemployment due to a faster increase of jobs which require a high qualification as compared to the number of individuals who can actually do it. The European Union admits that unemployment is a difficult issue for the social system both for new and old members. The high unemployment rate prevents the E.U. to reach its economic potential within the world economy. It has been noticed that both in developed and developing countries the risk of becoming unemployed determines an increase of the education level, so that educated workers and better prepared, professionally, and stand a better chance of gaining advantages: higher wages, higher job safety and a progressive increase of income. The main result of education is an increase of labor productivity, and, as a result, an increase of salary.

In European perspective, ever since 1957 through the Treaty of Rome, a mobility of the labor force has been established, as the right to go to another member state of the European Community to find a job, either as employee or on one's own, for a higher standard of living. The liberalization of labor force traffic concerning the European Union is a very ambitious and difficult objective to accomplish, although it is acknowledged that labor force migration is a phenomenon with a certain contribution to economic growth and the flexibility of national labor force markets. Through the migration phenomenon one produces the reduction of excessive labor force quotas in certain countries and the coverage of deficits in other countries.

Within the Lisbon Strategy of the E.U. the objective of full occupation for the labor force is stated. The Sectorial Human Resource Development Program (POS - DRU) is drafted in accordance with E.U.

requirements and with the fourth theme priority of the National Strategic Reference Framework (2007 - 2013) „The development and efficient usage of human capital in Romania”. The development of human resources will be focused on the increase of investments in education and formation, insertion and maintenance on the market of more and more people, increase of labor force offer, the increase of workers` and companies` adaptability, social inclusion of vulnerable groups. POS – DRU considers the reintegration within the active population of the labor market of long term unemployed, unemployed people within rural areas, as well as vulnerable groups among which the roma population represents the main targeted group.

Also, POS – DRU contributes to the development of human capital and the increase of competitiveness by encouraging innovation and economic development based on knowledge, including the usage of new communication and information technologies.

POS – DRU supports investments in human capital and the increase of acces to occupation by reducing unemployment and inactivity, particularly for groups with a high potential of social reintegration in education and on the labor market. Romania looks to develop its economy through productive investments as well as through investments in human capital.

THE STUDY OF EARNINGS MANAGEMENT AND DIVIDEND THRESHOLD

Li-Hua Lin, Transworld University
Szu-Hsien Lin, Transworld University

ABSTRACT

The earnings of a company not only concern its survival, but also affect the manager's performance measurement and stakeholder's decision. The accrual basis of accounting provides managers the discretion of financial reports. Since the funding of dividends is often limited to earnings or equity increased, the accounting earnings is one of the important factors that determine the amount of dividends. In other words, when accounting earnings are lower than the expected dividend level, managers would have the incentive for an upward earnings management to prevent decreases in dividends. Daniel, et al. (2008) found that managers treat the expected dividend as an important earnings threshold. This paper follows Daniel, et al. (2008), and adopts the 6145 companies that listed in Taiwan Stock Exchange and OTC market, from 2005 to 2010, to examine the relationship between dividend threshold and earnings management. The empirical results support our hypothesis, which is, the dividend threshold is an important incentive for the manager to engage in earnings management, which worth the stakeholders' attention.

KEYWORDS: Earnings Management, Accruals, Discretionary Accruals, Dividend Policy

INTRODUCTION

The earnings of a company not only concern its survival, but also affect manager's performance measurement and stakeholder's decision. However, the business accounting law stipulates that a company should adopt the accrual basis of accounting, to provide managers the discretion of one's financial report, and the behavior that engage in earnings management. The past literature indicated that the incentives for the managerial earnings management are to maximize the bonus plan, smooth income, prevent decreases in earnings and Deficit, or correspond to analysts' expectation, etc.

In addition, the debt covenant of a company often stipulate that if a company pay the largest source of funding of the dividend, it must come from the earnings or the equity increased. Therefore, the earnings from the accounting report became one of the important factors that decide the amount of the dividend. In another words, when the accounting earning is lower than the expected dividend level, managers would have the incentive for engaging in an upward earnings management, to prevent decreases in payment of dividend. Daniel, et al. (2008) found that managers regard the expected dividend as an important earnings threshold. Taiwan, however, is less concerned for the relationship between expected dividend (dividend threshold) and earnings management. Thus, this study can supplement such shortage and act as a basis for conducting international comparison.

DATA AND RESEARCH METHODS

This study used Taiwan Economic Journal Database, and collected all listed and OTC companies in Taiwan Stock Exchange Corporation (TWSE) during 2005 to 2010 as the research object. We adopted the panel data analysis, after eliminating financial related industries, state-operated enterprises and objects with incomplete empirical data, there's only 7906 companies remained. Since this regression model contained many variables that need to use the data from previous year, the number of companies in 2005 has been reduced from the samples. Additionally, some variables have missing values (undeclared or without data), so the actual empirical samples only remained approximately 6145 and 4170 for our

different regression models (regression (2) and (3)). Three procedures are used to view the relation between dividend threshold and earnings management. (1) This study follows the empirical model of Daniel, et al. (2008), and firstly adopts the cross-sectional regression model of Jones (1991), as shown below:

$$\begin{aligned} &\text{Total accrual (below referred as TA)} \\ &TA_i = a_1 + a_2 \Delta S + a_3 PROP_i + a_4 EQU_i + e_i \end{aligned} \quad (1)$$

In the above equation, the variable is set as:

i: firm i

TA: total accrual = reported earnings before extra-ordinary income – operating cash flow

ΔS : Increase in annual net sales

PROP: Total property

EQU: Total plant and equipment

In addition, the discretionary accruals (DA), that is the residuals e_i of the cross-sectional regression model from Jones (1991) shown above, equals $TA - NDA$ (Non-discretionary accruals, that is the predictive value of the cross-sectional regression model from Jones (1991) shown above).

(2) We used the descriptive statistics value of each variable to observe whether a significant difference in DA between the companies that pay dividend and the companies that don't pay dividend and the companies with Deficit and the companies without Deficit.

(3) We used the multiple regression models to see the relationship between expected dividend (dividend threshold) and the managerial earnings management after controlling other factors. The empirical regression formula and the variable setting used in this study are as shown below:

$$i. \quad DA_{it} = \beta_0 + \beta_1 DEFP_{it-1} + \beta_2 DEFNP_{it-1} + \beta_3 PAYER + \beta_4 RE_{it-1} + \beta_5 CC_{it-1} + \beta_6 SIZE_{it-1} + \beta_7 LEV_{it-1} + \beta_8 MB_{it-1} + \sum_{j=1}^{19} \theta_j Ind_{jt} + \beta_9 YR + e_{it} \quad (2)$$

ii. Add previous earnings threshold (EARN) and analyst forecast threshold (FORC) to control the variables in regression.

$$DA_{it} = \beta_0 + \beta_1 DEFP_{it-1} + \beta_2 DEFNP_{it-1} + \beta_3 PAYER + \beta_4 RE_{it-1} + \beta_5 CC_{it-1} + \beta_6 SIZE_{it-1} + \beta_7 LEV_{it-1} + \beta_8 MB_{it-1} + \beta_9 EARN_{it-1} + \beta_{10} FORC_{it-1} + \sum_{j=1}^{19} \theta_j Ind_{jt} + \beta_{11} YR + e_{it} \quad (3)$$

In the equations (2)~(3), each variable setting is:

CC: The salary and bonus of managers

SIZE: Company size = Log (the total book assets)

LEV: Gearing ratio = total liabilities / total book assets

MB: Book-to-market ratio = (year-end total book assets – year-end total shareholders' equity + year-end stock price × outstanding shares) / year-end total book assets

IND: In the category of industry, we merged the industries with fewer firms into the industries with similar characteristics and obtained 20 categories.

YR: Yearly dummy variable. If the fiscal year is 2010 = 1, otherwise it will be 0.

DEFP: The Deficit of company that pays dividend;

DEFNP: The Deficit of company that does not pay dividend. For DEFP and DEFNP, Deficit = Max (0, earnings shortfall). In the formula above, earnings shortfall = expected dividends (EXPD) – pre-managed earnings (PERM). Among which, EXPD (expected dividend) = actual dividend paid in

prior year; PREM (pre-managed earnings) = Operating cash flow + NDA – preferred stock dividends.

PAYER: Dummy variable. If the amount of paid dividend in prior year is larger than zero, then PAYER=1, otherwise it will be zero.

RE: Retained earnings.

EARN : Annual earnings reported earnings before extra-ordinary income – preferred stock dividend.

FORC: Analyst forecast earnings per share at the end of each year (if there's more than one predictive value, then substitute with an average value) × number of shares outstanding.

The regression equations (2) to (3) are used to verify the H1 hypothesis: When accounting earnings are lower than expected dividend level, managers may engage in an upward earnings management, in order to avoid a reduction in payment of dividend.

EMPIRICAL RESULT

The focus of this study is to examine the relationship between cash dividend payouts and earnings management. Unlisted Table showed that in a company that paid dividend, there's about 33.75% positive Deficit, and the expected dividend (EXPD) is greater than the real earnings (PREM), and this result is slightly higher than the one of previous research (such as Daniel, et al. 2008). The average Deficit is about 6.36 hundred million NT. The average of paid dividend among all dividend-paying companies is about 8.39 hundred million NT. Besides, among dividend-paying companies without any Deficit, only 26.7% of them have positive discretionary accruals (DA). In contrast, the percentage of dividend-paying companies with Deficit is as high as 79.3% have positive DA.

If we arrange companies from having the least to the greatest Deficit, and divide into six groups, except the first group of zero-Deficit (2678 companies), the other five groups each contained approximately 273 companies. The data of Table 2 showed that in the zero-Deficit group, the average DA is negative; the average DA of each positive Deficit group is positive, and increases as Deficit increases. In the second group with the least Deficit, there're about 57.5% companies with DA that are greater than their Deficit. Yet in the fourth, fifth and sixth group, the average of DA is smaller than the average of the Deficit, which represents that the Deficit of many companies can't be eliminated by DA. Meanwhile, the percentage that DA is greater than its Deficit decreases as well.

Table 1: The Discretionary Accruals of Dividend-Paying Companies with Deficit and without Deficit

	Number Company	of Deficit(Average, million NT)	Hundred DA(Average, million NT)	Hundred DA> Deficit (%)
1 st Group Deficit=0	2678	0	-7.79	
Deficit>0 (Total)	1364	6.37	4.77	699 (51.24%)
2 nd Group	273	0.19	0.39	157(57.51%)
3 rd Group	273	0.68	1.30	149(54.58%)
4 th Group	273	1.53	1.44	117(42.86%)
5 th Group	273	3.55	3.11	137(50.18%)
6 th Group	272	25.91	17.67	139(51.10%)

This table shows the relationship between discretionary accruals and Deficits of the sample companies, which are classified into six groups according to their Deficits.

We use the regression model to control other variable to observe the relationship between Deficit and DA. In Table 2, regression equation (2) observed the impact of the payment of cash dividends (PAYER) and the Deficit upon DA. Our Deficit variable depends on whether there is cash dividends or not, and is divided into the two of variables (*DEFP* and *DEFNP*). If a dividend-paying company has positive Deficit of earnings (*PREM*), it means the premanaged-earnings do not meet the expected dividend level (*EXPD*). Table 2 shows that the regression coefficient of the Deficit of companies that pay dividend (*DEFP*) is

significant at the 1% level of significance. This means that the expected dividend level is an important earnings threshold, which is consistent with the result of Daniel, et al. (2008).

Whereas, the regression coefficient of the Deficit of a company that does not pay dividend (DEFNP) is negatively significant at the 1% level of significance. The results means that a company which is closer to zero earnings threshold will be more likely to engage in earnings management (DA positive); if farther from zero earnings threshold, companies will consider the cost of earnings management, and thus the DA values are lesser. This is consistent with Kerstein and Rai (2007). The regression coefficient upon PAYER variable is also significant at the 5% level of significance, which means a dividend-paying company's DA value significantly larger than the payment of cash dividends of companies. In addition, a coefficient of retained earnings (RE) is significantly negative, in line with theoretical expectations, which means that retained earnings is the legitimate source of cash dividends, so the higher retained earnings leads to the fewer needs of earnings management.

Table 2: The Affecting Factors of Discretionary Accruals: Regression Equation (2) and Regression Equation (3)

Name of Variable	Regression Coefficient	T value	V IF	Name of Variable	Regression Coefficient ²	T value	V IF
DEFP _{it-1}	1.449***	20.05	1.07	DEFP _{it-1}	1.158***	16.06	1.100

Number of Sample	6143			EARN _{it-1}	-0.135***	-3.18	6.072
R ²	0.156			FORC _{it-1}	-0.177***	-3.04	1.122
Adjusted R ²	0.152			Number of Sample	4170		
F value	140.40***			R ²	0.1233		
Name of Variable	Regression Coefficient	T value	V IF	Adjusted R ²	0.117		
DEFP _{it-1}	1.449***	20.05	1.07	F value	19.40***		

This table shows the empirical results of regression equation (2) and regression equation (3). The regression coefficient is at 1% level of significance. Regression coefficient1 is the result of regression equation (2); Regression coefficient2 is the result of regression equation (3). *** : $\alpha(\text{Significant Level}) < 1\%$; ** : $\alpha < 5\%$; * : $\alpha < 10\%$

Last, we added the annual earnings of the previous year (EARN) and analysts forecast earnings (FORC) of the same year into the regression equation (2) to obtain the regression equation (3). We expected to control the affect that managers engaged in earnings management to achieve the earnings thresholds (Burgstahler and Dichev 1997) of the previous year as well as analysts forecast threshold (Degeorge et al. 1999). Table 2 showed that even with the addition of these two variables, the regression coefficient upon the Deficit of a dividend-paying company (DEFP) are still positively significant, while that of the Deficit of a company that does not pay dividend (DEFNP) then become not significant at the 1% significance level. Accordingly, the empirical result of regression equation (2) to regression equation (3) supports the hypothesis of this study.

CONCLUSION

The empirical result of this study supports our hypothesis: when the accounting earnings are lower than the expected dividend level, managers might engage in an upward earnings management to avoid decrease in the dividend payout. That is, expected dividend level is an important earnings threshold. Even under the condition of controlling other affecting factors, the difference of premaneged-earnings and expected dividend level can explain most differences of discretionary accruals (DA). In other words, the dividend threshold is another important incentive for managers to engage in earnings management.

THE PRICE-VOLUME RELATIONSHIP OF FIRM SIZE INDICES: EVIDENCE FROM TAIWAN STOCK MARKET

ABSTRACT

Studies on price-volume relationship for emerging markets have been few and far between in the past primarily because emerging markets have been lacking firm size stock index. To establish firm size indices, this study uses the companies in Taiwan's stock market (listed and over-the-counter) as the sample, treating the companies' market value as the proxy variable for firm size. The companies are sequenced after eliminating the bottom 5% with the lowest turnover and then divided into 10 groups. Applying the approach of Taiwan Capitalization Weighted Stock Index, the indices of different firm sizes are obtained respectively. Then, this study uses DCC-GARCH (Engle, 2002) to examine the price-volume relationship before and after financial tsunami. Empirical results show that the dynamic conditional correlation between the two series of rate of returns and volume rate of change has a high stability, and is even more stable after the financial tsunami. Research findings also reveal that the fluctuation in Taiwan's stock market before financial tsunami period was a "price before volume" effect. After the financial tsunami, the price-volume relationship did not exist. The results may suggest that investors can focus on the changes in volume when there is no sudden financial event.

KEYWORDS: Price-Volume Relationship, Firm Size Index, Financial Tsunami, dynamic conditional correlation, DCC-GARCH

INTRODUCYION

With regards to the relationship between price and volume in stock markets, Copeland (1976), Jennings, Starks, and Fellingham (1981), and Jennings and Barry (1984) were among the first to point out the process in which market information further affects changes in returns through variations in trading volume. When a trader receives new information and reflects this in the trade, the variations in price would have the carryover relationship of "volume before price". Price-volume relationship is viewed as the process of trading message transmission. After that, many scholars started studying price-volume relationship. Majority of these studies were limited to the relationship between returns and trading volume, while only a few studies focused on the relationship between returns and fluctuations in trading volume. This study therefore examines the market's price-volume fluctuation changes under different firm sizes before and after the global financial tsunami in 2008.

Since the price-volume relationship is a relationship about the fluctuations between two variables, the empirical analysis in traditional GARCH model hypothesize that the common variance relationship between the two series is constant. That is, the residuals between the two series have a Constant Conditional Correlation (CCC). However, this hypothesis is unreasonable intuitively, since the estimated correlation coefficient would be biased if a CCC is hypothesized when the time series is faced with structural impact. Moreover, Tse (2000) also pointed out that setting CCC would result in a problem of robust estimated parameters wherein additional tests would be needed. Thus, Engle (2002) used two-stage

estimation method to avoid the problem of excessive parameters, and then set the conditional correlation as non-constant. This is the two-variable GARCH model under DCC (Dynamic Conditional Correlation Model). Since the DCC-GARCH model is being widely used in empirical studies on the fluctuations in returns of financial assets, this study adopts this model to study the price-volume relationship of firm size indices.

REVIEW OF RELATED LITERATURE

A basic economics concept is both the supply and demand in the market determine the equilibrium price and volume; thus, analysis of financial assets' prices should include trading volume in order to completely analyze trading information. The methods of previous studies generally hypothesized a fixed variance for the fluctuations in price and volume, but high frequency financial data usually has the problems of autocorrelation and conditional heteroskedasticity. Engle (1982) developed the ARCH model in order to solve these two problems, and Bollerslev (1986) expanded this model into the GARCH model to describe the volatility clustering phenomenon of time series. Many literatures (such as Engle (1982), Bollerslev (1986), and Nelson (1991)) all proposed that if the time series displays conditional heteroskedasticity, then the variance can be characterized by using the GARCH model. On the topic of overall and financial data, there are often data that rejects the homogeneous variance hypothesis scenario. The GARCH model aptly allows the variance to be dependent on past variances and interference term, which allows for the existence of conditional heteroskedasticity. At the same time, this type of model can catch the volatility clustering phenomenon commonly seen in time series data. Thus, the GARCH model is one of the primary methods for studying price-volume relationship in recent years.

RESEARCH DATA AND METHODOLOGIES

This paper primarily studies the changes in volatility of the Taiwanese stock market before and after the financial tsunami. Thus, for the post-financial tsunami analysis, this paper collects data between September 1, 2007 and August 31, 2010. In order to eliminate the impact in the pre-financial tsunami period and to be consistent, this paper collects data between September 1, 2003 and August 31, 2006 for its pre-financial tsunami analysis. The data used in this paper originates from the Taiwan Economic Journal Data Bank (TEJ). This paper mainly studies the impact of financial tsunamis, so the number of samples for the post-tsunami period is set as the target. These samples are divided into 10 groups so there are 110 companies per group. Companies with the biggest firm size comprise the big size stocks; companies with the smallest firm size comprise the small size stocks. The medium size indices are selected from the latter half of the fifth group and the former half of the sixth group. For the pre-tsunami period, 110 companies from each type are selected, so the first 110 companies with the biggest market values are classified into big-sized stocks, while the last 110 companies with the smallest market values are classified into small-sized stocks. Companies with sequence numbers 376 to 485 based on market value are classified as medium-sized stocks.

This paper employs the GARCH model as its research methodology. Bollerslev (1986) pointed out that ARCH/ GARCH required leptokurtic distribution and conditional variance. Our data show that the number of observations in this research presented high leptokurtic distribution, thus conditional variance still needs to be taken into consideration. However, the traditional GARCH empirical analysis assumes that the common variance relationship between two series is CCC, which is a rather unreasonable practice. Thus, this paper will use Engle's (2002) bivariate GARCH model under DCC to proceed with its research.

This empirical study targets to probe into the co-moving relationship of rate of returns and trading volume under different firm sizes. Table 1 shows that all the AIC values in the lagging period are very close to one another. Based on a parsimonious goal, this paper first sets AR(1)-GARCH (1,1) model for its

empirical research. The intersecting item's lagging period value in the variance equation is also set as 1. Thus, the models for the co-moving relationship between rate of returns and trading volume are shown in equations 1 to 5:

$$r_t = \alpha_1 + \beta_1 r_{t-1} + \gamma_1 v_{t-1} + \varepsilon_{r_t} \quad (1)$$

$$v_t = \alpha_2 + \beta_2 v_{t-1} + \gamma_2 r_{t-1} + \varepsilon_{v_t} \quad (2)$$

$$h_{rr,t} = \psi_1 + \phi_1 h_{rr,t-1} + \theta_1 h_{vv,t-1} + \omega_1 \varepsilon_{1,t-1}^2 \quad (3)$$

$$h_{vv,t} = \psi_2 + \phi_2 h_{vv,t-1} + \theta_2 h_{rr,t-1} + \omega_2 \varepsilon_{2,t-1}^2 \quad (4)$$

$$q_{rv,t} = \bar{\rho}_{rv} + \alpha(z_{r,t-1} z_{v,t-1} - \bar{\rho}_{rv}) + \beta(q_{rv,t-1} - \bar{\rho}_{rv}) \quad (5)$$

$$\rho_{rv,t} = q_{rv,t} / \sqrt{q_{rr,t} \cdot q_{vv,t}}$$

Empirica Analysis

Regarding the mean equation coefficient estimation in equations (1) and (5), as mentioned earlier, AR(1) is used to estimate. Since the focal point of this paper is at observing variance equations and covariance equations, thus the determination, estimation process, and results related to mean equations are not presented. Table 1 shows the coefficients of variance equations (3) and (4) and covariance equation (5) under the DCC-GARCH model of each stock market. In the covariance equation, this paper finds that the coefficients in the covariance equation for price-volume relationship α and β are significant, also that $\alpha + \beta < 1$. This means that the correlation coefficient of price-volume relationship changes according to time. This also shows whether or not using DCC-GARCH to study the variations in price-volume relationship is reasonable. Table 1's right half shows the DCC covariance equation coefficients α and β of price-volume at each type of firm size index during pre- and post-financial tsunami. It can be seen from Table 1 that majority of the coefficients are significant (only small size stocks are insignificant pre-financial tsunami). The implication of this is that using DCC-GARCH model to study the volatility relationship of price-volume is reasonable.

The α coefficient represents the effect of the previous period's standardized residual on price-volume's dynamic conditional correlation coefficient, which is also the continuity of dynamic conditional correlation. If the α coefficient is big, this means that the effect of the previous period's standardized residual on the dynamic conditional correlation coefficient is bigger. This paper finds that most α coefficients were insignificant except for big size index during pre-financial tsunami (0.0276) and small size index during post-financial tsunami (0.0616). This implies that the effect of previous period's standardized residual on dynamic conditional correlation coefficient is not big.

On the other hand, β coefficients represent the effect of the previous period on price-volume's dynamic conditional correlation. If the β coefficient value is big, this means that the dynamic conditional correlation between the two series is rather stable; but if the β coefficient is negative, this means that the volatility of the dynamic conditional correlation is rather severe. The results of this paper show that the β coefficients, regardless if pre- or post-financial tsunami, are significantly positive (0.7981→0.8597, 0.8525→0.8860, 0.6801→0.8494), which shows that the dynamic conditional relation between the two series is more stable. It also significantly increases post-financial tsunami to as high as 0.8, which implies that the dynamic conditional correlation between the two series of rate of returns and trading volume variation rate has a high stability. From the changes in the dynamic conditional coefficient pre- and post-financial tsunami, as in Table 1, it can be seen that the dynamic conditional correlation coefficients significantly increased after the financial tsunami. This means that the dynamic conditional correlation between price and volume is more stable post-financial tsunami. Tying this in with the said results for α

coefficients, it can be concluded that the stock market for all firm sizes in Taiwan shows the lessening continuity of dynamic conditional correlation and trending towards stability. This could be related to the series of policies implemented by the Taiwanese government after the financial tsunami.

Table 1: Estimated Results of Price-Volume Relationship under DCC-GARCH Model

$$h_{rr,t} = \psi_1 + \phi_1 h_{rr,t-1} + \theta_1 h_{vv,t-1} + \omega_1 \varepsilon_{1,t-1}^2$$

$$h_{vv,t} = \psi_2 + \phi_2 h_{vv,t-1} + \theta_2 h_{rr,t-1} + \omega_2 \varepsilon_{2,t-1}^2$$

$$q_{rv,t} = \bar{\rho}_{rv} + \alpha(z_{r,t-1}z_{v,t-1} - \bar{\rho}_{rv}) + \beta(q_{rv,t-1} - \bar{\rho}_{rv}), \quad \rho_{rv,t} = q_{rv,t} / \sqrt{q_{rr,t} \cdot q_{vv,t}}$$

	post-	-0.1036 ***	-0.0028	0.5919	0.2256	-0.0006	-0.0741 **	-0.4923	-0.0131	0.0616 ***	0.8494 ***
		(0.0051)	(0.9403)	(0.6525)	(0.3918)	(0.9865)	(0.0460)	(0.6190)	(0.2819)	(0.0000)	(0.0000)

The coefficients in equations (3) and (4) represent the two-step autocorrelation and the two-step intersecting correlation, wherein ϕ_1 and ϕ_2 describe the two-step autocorrelation, representing the effect of the previous period's variance on the current period's variance, or in other words, the continuity of volatility. It can be observing the values in the table that with the exception of each type of indices (0.2725, 0.2041, 0.2186) and small size trading volume (-0.4504) pre-financial tsunami, and big size trading volume (-0.7616) post-financial tsunami which were significant, all others were insignificant. If the significance is decreased to 0.05, only the small size trading volume (-0.4504) pre-financial tsunami and big size trading volume (-0.7616) post-financial tsunami were significant. This means that in comparing price-volume relationship, the continuity of price variance and trading volume variance are both insignificant. θ_1 and θ_2 represents the two-step intersecting relationship, which is also the transmission of volatility. All θ_1 are insignificant regardless if pre- or post-financial tsunami. This means that the prices of each type of Taiwan's indices are not affected by the pre-period's trading volume, so there is no volume-before-price scenario. On the other hand for θ_2 , they all show as significant and positive pre-financial tsunami (0.0522, 0.0422, 0.0413), but only small size stocks show as significantly negative (-0.0741) post-financial tsunami. This result shows that during pre-financial tsunami, all type of indices in Taiwan show price-before-volume.

CONCLUSION AND RECOMMENDATIONS

This paper mainly uses the dynamic conditional correlation model to study the spillover effect of volatility. The primary subject it looks into is the price-volume relationship of firm size indices. Using the financial tsunami, it studies the changes of the said factors pre- and post-financial tsunami. The results of this study show that the financial tsunami has a significant effect on the dynamic conditional correlation of price-volume. Thus, using the dynamic conditional correlation model is reasonable. On the price-

volume relationship related to volatility, this paper finds that during pre-financial tsunami, the volatilities of each type of index in Taiwan show a price-before-volume scenario. However after the financial tsunami, the causal relationship between price and volume no longer exist in Taiwan's stock market.

On the firm size message transmission effect related to volatility, this paper discovers that it is insignificant pre-financial tsunami, yet changes significantly into a positive relationship post-financial tsunami. This once again echoes the research results of Conrad, Gultekin, and Kaul (1991), Chelley-Steeley and Steeley (1996), and Wang Yuan Zhang (1999). However, this paper did not notice signs of firm size message transmission reversal. Based on this paper's results, during pre-financial tsunami, the financial market was operating normally so messages reflected regardless of the firm size. Thus, the firm size message transmission effect did not exist during pre-financial tsunami, and only reflected in the price-volume relationship. The results of this paper provide investors with recommendations for decision-making: when there is no sudden financial event, focus on the changes in volume; after a sudden financial event, focus on big firm size indices. This would help in the betterment of investment benefit

AN ESTIMATION OF ECUADOR'S EXPORT DEMAND FUNCTION ON TRADE WITH THE US: 1965-2011

Ranjini L Thaver, Stetson University
Christina Bova, Stetson University

ABSTRACT

This paper employs the bounds testing approach to cointegration to empirically estimate Ecuador's export demand function with the US between 1965 and 2011. We develop two different export demand models based on previous empirical studies of this nature. Model I defines real exports as a function of the US real GDP, relative prices, exchange rate volatility, and dollarization. Model II relates real exports to US real GDP, real exchange rate, volatility, and dollarization. Results confirm a unique cointegration relationship between exports and its regressors in Models I & II, permitting us to estimate the short-run and long-run elasticities of Ecuador's export demand function with the US. In the long run, in both models, GDP is positive and elastic, while volatility is positive and inelastic. Relative prices in Model I and real exchange rate in Model II are not statistically significant. Both models reveal that dollarization has had a significant, but negative and inelastic long-run and short-run impact on Ecuador's exports to the US. Further, Model I seems to be superior to Model II in terms of the strength of cointegration, long-run and short-run elasticities, adjusted R², and in satisfying the diagnostic tests.

JEL CLASSIFICATION: F14, F31

KEYWORDS: Ecuador, export demand, dollarization, elasticity, cointegration

INTRODUCTION

While Ecuador is a geographically diverse country, it has been fraught by an imposing concurrence of natural, economic and political events in the last forty years that culminated in a perfect storm of economic collapse in the latter 1990's, forcing it to abruptly dollarize its economy. Within a few months of dollarization, the monetary system steadied, calming currency speculation, financial risk, and exchange rate volatility. While numerous studies (among them, Matthews et al, 2006; Quispe-Agnoli & Whisler, 2006, Minda, 2005, Schuler, 2005) have explained the macroeconomic benefits of dollarization in Ecuador, no study exists to quantify these benefits, in particular in terms of international trade, and in this case with its host country, the US. The objective of this study is to estimate Ecuador's export demand function with the US from 1965-2011, with particular emphasis on the impact of dollarization on these functions.

METHODOLOGY

In order to estimate Ecuador's export demand function with the US, we first specify Model I in Equation (1) and Model II in Equation (2). Equations (1) and (2) may in turn be expressed as an Error Correction Model (ECM) following Pesaran, *et al.* (2001) as in Equations (3) and (4).

$$\ln REXP_t = \beta_0 + \beta_1 \ln RGDP_t + \beta_2 \ln RP_t + \beta_3 \ln VOL_t + \beta_4 D_t + \varepsilon \quad (1)$$

$$\ln REXP_t = \varphi_0 + \varphi_1 \ln RGDP_t + \varphi_2 \ln RER_t + \varphi_3 \ln VOL_t + \varphi_4 D_t + \varepsilon \quad (2)$$

$$\begin{aligned} \Delta \ln REXP_t = & \alpha_0 + \sum_{i=1}^n \theta_i \Delta \ln REXP_{t-i} + \sum_{i=0}^n \gamma_i \Delta \ln RGDP_{t-i} + \sum_{i=0}^n \delta_i \Delta \ln RP_{t-i} + \sum_{i=0}^n \eta_i \Delta \ln VOL_{t-i} + \\ & + \alpha_1 D_t + \lambda_1 \ln REXP_{t-1} + \lambda_2 \ln RGDP_{t-1} + \lambda_3 \ln RP_{t-1} + \lambda_4 \ln VOL_{t-1} + \omega_t \end{aligned} \quad (3)$$

$$\Delta \ln REXP_t = \alpha_0 + \sum_{i=1}^n \omega_i \Delta \ln REXP_{t-i} + \sum_{i=0}^n \psi_i \Delta \ln RGDP_{t-i} + \sum_{i=0}^n \kappa_i \Delta \ln RER_{t-i} + \sum_{i=0}^n \pi_i \Delta \ln VOL_{t-i} + \nu_1 D_{1t} + \theta_1 \ln REXP_{t-1} + \theta_2 \ln RGDP_{t-1} + \theta_3 \ln RER_{t-1} + \theta_4 \ln VOL_{t-1} + \omega_t \quad (4)$$

In the above equations, the symbols \ln , $REXP_t$, t , $RGDP_t$, RP_t , RER_t , VOL_t , ε_t and ω_t denote respectively, the natural logarithm, real export value, time, real GDP, relative price of exports, real exchange rate, exchange rate volatility, error term and white noise. Δ is the first difference operator, and D_t is a dummy variable representing the period of dollarization in Ecuador beginning in 2000. We use annual data from 1965 to 2011 to estimate Models I and II. The data series on Ecuador's nominal exports and its export price index, US nominal GDP and price index, domestic price index, and nominal exchange rates are taken from the International Monetary Fund's *International Financial Statistics* and the *Direction of Trade Statistics* databases (<http://elibrary-data.imf.org>).

As Table 1 reveals, the calculated Wald F-statistic is 14.408 for Model I and 10.48 for Model II, both of which are above their critical upper bound values at the one percent level. Thus cointegration exists between the dependent variable and its regressors in both models, and we reject the null hypothesis, making way for estimating the long-run and short-run partial elasticities.

Table 3: Error-Correction Model and Short-run Elasticities in Export Demand Function

Dependent variable: $\Delta \ln \text{REXP}$

EMOTIONAL INTELLIGENCE OF FINANCIAL PLANNERS IN MEDIATION

Randy Braidfoot, Ashford University
Andree C. Swanson, Ashford University

ABSTRACT

A commonality of the professions of mediation and financial planning is dealing with the emotional aspects of the client(s). It is surprising then that more formal training on management of the client's emotions has not been presented by either vocation. The four aspects of self awareness, self management, social awareness, and relationship management make up the components of Emotional Intelligence. This allows an individual to monitor his or her own emotions, the emotions of other, and to use this information to create a positive outcome. The professional Financial Planner who works in Mediation can benefit greatly from the study and mastery of Emotional Intelligence.

JEL: Z00

KEYWORDS: Emotional Intelligence, financial planners, mediation

INTRODUCTION

Emotions are a control factor determining outcome in both Financial Planning and Mediation. The environment of a mediation where two conflicting parties meet to negotiate some form of agreement (with a neutral third-party to preside as a communications facilitator) fosters a setting in which a broad range of emotions are normally exhibited. An experienced financial planner must be prepared to answer the following questions: What happens when the two different mediums combine to create a volatile situation? How does the financial professional manage this and stay in control? How can the financial professional enhance the process to create greater opportunity for a more positive outcome?

Financial issues are a main source of emotional stress. "Money evokes emotions such as stress, fantasy, irrationality, and fear" (Danford, 2012, p. 25). This financial stress is also one of the main drivers of the emotional outbursts experienced in both Financial Planning and Mediation meetings. Numerous Financial Planners are familiar with the adage of being the professional to assist in taking the emotion out of the investing process. Much research has been produced regarding the recognition and acknowledgement of an individual's emotional connection to his or her money or financial well-being (Britt, Huston, & Durband, 2010; Colfax, Rivera, & Perez, 2010). Mediation is also an environment where many times financial discussion or negotiation is the main focus, whether it be civil or family mediation, and if not, certainly an important secondary topic.

Being able to recognize and manage these emotions, from one's own viewpoint, and that of the other participants, is part of the basis of Emotional Intelligence. Emotional Intelligence is the ability to recognize, assess, and control one's own emotions and that of others (Mayer, Caruso, & Salovey, 1999; Mayer & Salovey, 1997). "Emotions can influence financial decisions in surprisingly predictable ways" (Sullivan, 2011, p. 4). Numerous studies have demonstrated how an individual with high emotional intelligence can enhance and increase the potential for positive outcomes (Cherniss, 1999).

Emotional Intelligence Defined

Emotional Intelligence (EI) was first used in an English doctoral dissertation in 1983 (Payne, 1983/1986). The term was actually derived prior though in 1966 by B Leuner in a German article titled “Emotional Intelligence and Emancipation” (translated) to describe women who, because of perceived low Emotional Intelligence, rejected their social roles (Leuner, 1966). Salovey and Mayer (1990) further developed the concept. Emotional Intelligence is the capacity to perceive emotions, assimilate emotion-related feelings, understand the information of those emotions, and manage them (Mayer et al., 1999). The ability to recognize the meanings of emotions and relationships, in addition to reasoning and problem solving on the basis of these emotions is at the core of EI (Mayer et al., 1999). A four-branch model was designed by Mayer, Caruso, and Salovey (Figure 1).

Figure 1: The Emotional Intelligence Four-Branch Model.

To understand EI, one must understand the components that form the basis of EI. Psychologists recognize the mind (or brain) as having three distinct divisions; cognition (thought), affect (which includes emotion), and motivation (Mayer & Salovey, 1997). The first area of the brain is cognition, which refers to memory, reasoning, judgment, and abstract thought. Intelligence is measured here, reflecting the ability to combine and separate concepts, judge and reason, and the ability to engage in abstract thought (Mayer & Salovey, 1997). The second area of the brain is the affective area of the mind represented by emotions including the actual emotions (anger, happiness, fear, etc.), moods, evaluations, and other states of feeling, including physical states such as being tired or energetic (Mayer & Salovey, 1997). Both heredity and learned behavior play a role in establishment and development of the individual components of cognitive and affective spheres of the brain (Mayer & Salovey, 1997). The third area of the brain is motivation. Mayer and Salovey (1997) described motivation as the biological urges or learned goal-seeking behaviors. Motivation is considered to be a secondary factor in comparison with the other components of cognition and affect with regard to EI (Mayer & Salovey, 1997).

Realizing all three components may be a part of genetics in addition to learned behavior provides for a myriad of different attitudes and intelligence. The ability to understand a concept or learn something new may be easier for one individual than for another. In the same manner, one individual may consistently be in an upbeat mood, full of energy, whereas another person may show negative emotions in addition to lacking in motivation on a consistent basis. Being able to recognize these in oneself and in others, and the ability to manage or improve these components in both one's own makeup and that of others is representative of EI. Tests are available to actually determine the level of EI an individual possesses. In the 1980s, Dr. Reuven Bar-On produced an assessment tool known as Emotional Quotient Inventory (EQ-i) to provide a quantitative measure of EI (Colfax, Rivera, & Perez, 2010). This provided a better understanding of the components making up EI measuring fifteen elements on an individual basis,

grouped into five major composites. Since then, the assessment tool has been updated to EQ-i², building on the basis of EQ-I (Ferraro, 2012).

Why Emotional Intelligence Is Important

Emotional Intelligence is essential to effectiveness in the work force. “Emotional intelligence is your ability to recognize and understand emotions in yourself and others, and your ability to use this awareness to manage your behavior and relationships” (Paterson, 2011, p. 80). Since the awareness of Daniel Goleman’s research on emotional intelligence, the willingness to look at emotional awareness has turned into a positive benefit for both individuals and organizations. “Goleman compared star performers with average ones in senior leadership, nearly 90% of the difference in their profiles was attributable to emotional intelligence skills rather than their cognitive capabilities or technical skills” (Paterson, 2011, p. 80). Numerous academic studies provide empirical evidence that improvements in EI are highly correlated with increased performance in both learning and in the workplace. Studies in both Affective Neuroscience and Biobehavioral Science demonstrate “some of the most impressive evidence for brain plasticity is emotional learning” (Davidson, Jackson, & Kalin, 2000, p. 890). In effect, with proper training one can rewire and reshape the emotional circuitry of one’s brain to maximize emotional performance. Bradberry and Greaves (2009) indicated that EI is “so critical to success that it accounts for 58% of performance in all types of jobs” and “is the single biggest predictor of performance in the workplace and the strongest driver of leadership and personal excellence” (p. 20).

Businesses and governments are now in agreement with Oscar Wilde who said, “I don't want to be at the mercy of my emotions. I want to use them, to enjoy them, and to dominate them” (Wilde, 2007, p. 228). Oscar Wilde recognized the power of emotions in his classic, *The Picture of Dorian Gray*. The United States Air Force used the EQ-i test by Bar-on to select recruiters and increased their ability to predict successful recruiters by nearly three-fold, with an immediate savings of \$3 million annually (Cherniss, 1999). Cherniss (1999) offered 19 unique examples in business (with the Air Force being one example) demonstrating the significant effect EI had within an organization.

Empathy And The Financial Planner

Empathy is the ability to reflect on one’s situation and feelings, and to show that you care. Goleman stated, “If your emotional abilities aren't in hand, if you don't have self-awareness, if you are not able to manage your distressing emotions, if you can't have empathy and have effective relationships, then no matter how smart you are, you are not going to get very far” (Hughes, 2004). The effective financial planner has the ability to demonstrate empathy through empathetic communication (Fishman, 2011). “Empathic mirroring is the ability to take in what other people are saying and feeling and then communicate that you have internalized their thoughts and feelings” (Fishman, 2011, p. 26). An example is when a manager says to a subordinate “I can see you are angry.” Empathetic mirroring acknowledges the right to feel how the subordinate feels, although it does not communicate approval of the action (McCabe, 2011).

Emotional Intelligence And Mediation

Emotional Intelligence, remarkably, has not been a major component in mediation training and practice. An environment whereby two opposing sides meet, more often than not with attorneys by their sides, to negotiate some form of agreement with an impartial, non-judgmental third-party to preside and act as negotiator between the parties creates an environment in which a broad range of emotions are normally exhibited. The discussion regarding lack of emotional recognition in mediation has been ongoing for some time. “It seems ironic that conflict, which is among the most emotion-arousing of phenomena, has been predominantly studied as though those emotions had no bearing on it” (Thomas, 1992, p. 702).

Jones and Bodtker (2001) stated four assumptions that support the use of EI in Mediation. The first assumption is that “emotion is the foundation of all conflict” (Jones & Bodtker, 2001, p. 219). The second assumption is that emotion is central in all mediation context. The third assumption is that to be maximally effective, mediators must focus on three key components of emotion in the mediation; expressive, physiological, and cognitive. The final assumption is recognition of the mediator’s role in attending to the emotional experience of both the mediator themselves in addition to the disputants in order to fully understand the implications of emotion during the mediation (Jones & Bodtker, 2001).

Lund contended that mediators need training and preparation in order to manage their emotions. Lund proposed four methods for preparing: 1) Avoid being overwhelmed when emotion is expressed, 2) Deal with their own emotional reactions to disputant’s emotions, 3) Increase sensitivity and detach themselves from the situation, and 4) Promote a realistic understanding of results (Lund, 2000).

Emotional Intelligence And The Financial Planner

Approximately 25% of the time a Financial Planner is dealing with non-planning issues such as “human drama and frailties” (Sussman & Dubofsky, 2009, p. 48). Although, EI has been correlated to increasing the business of financial planning, the emphasis for effective financial planning should be on how to increase positive relationships (Darwish, 2008). Sussman and Dubofsky (2009) and Darwish (2008) provided information that supports the need for EI training in the Financial Planning field. A client that shares his or her personal financial information, goals and dreams, may be confiding in their Financial Planner more than they would his or her doctor, priest, or therapist. Any number of financial items may trigger an emotional response from the client. The issues of providing for survivors on one’s death, the subject of divorce, or sheltering or hiding assets from a family member, the possibility of outliving one’s assets, or concern about an investment loss, all of these may trigger a display of emotional volatility.

Seventy-four percent of planners had experienced a meeting in which a client became emotionally distraught (Sussman & Dubofsky, 2009). Sussman and Dubofsky (2009) determined that 40% of respondents had no training or coursework of any kind in regard to non-financial coaching or counseling. Forty-eight percent of respondents had mediated (informally) marital discord with another 44% mediating parent-child issues (Sussman & Dubofsky, 2009). Additionally, 34% of the planners in the survey were asked by a client if they should seek a divorce (Sussman & Dubofsky, 2009). From the results of the Sussman and Dubofsky study, EI should be considered when preparing a Financial Planner for Mediation.

For Certified Financial Planner[™] practitioners, Principle 3 in the Code of Ethics states that a practitioner must maintain the knowledge and skills necessary to provide professional services competently. Competence also includes the wisdom to recognize the limitations of that knowledge and referring to another professional when necessary. As practitioners dealing with emotional issues, Financial Planners are not psychology experts nor should Financial Planners refer every client to such. Emotional recognition of the client plays a crucial role in understanding the client’s motivation and feelings about

his or her finances. One interpretation of Principle 3 is the practitioner should consider increasing their EI to be competent in dealing with clients.

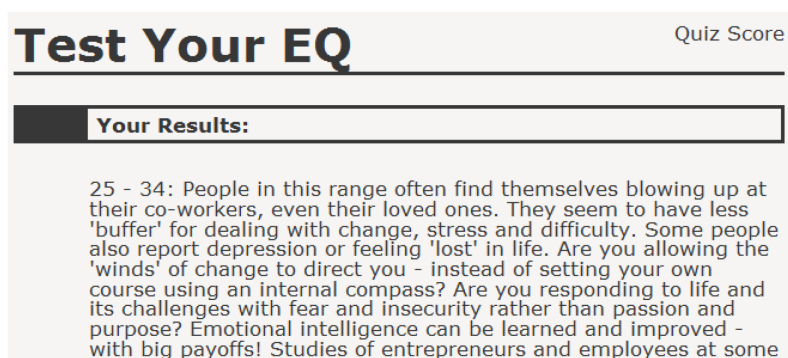

METHODS FOR INCREASING EMOTIONAL INTELLIGENCE

Bradberry and Greaves (2009) stated that one's professional success would improve if one can improve his or her emotional intelligence. "EQ is so critical to success that it accounts for 58 percent of performance in all types of jobs. It is the single biggest predictor of performance in the workplace and the strongest driver of leadership and personal excellence" (Bradberry & Greaves, 2009, pp. 20-21). People with higher EQs make more money too (Bradberry & Greaves, 2009). Finley (2008) created five techniques to increase your emotional intelligence. Based on Goleman for emotional and social competencies, Finley presented the following items for improvement:

1. Emotional self-awareness
2. Emotional management
3. Self-motivation
4. Highly empathetic
5. Relationships under management

The best method is to approach this one step at a time. Many EQ assessments exist on the Internet. A free assessment is provided by Institute for Health and Human Potential (IHHP) at <http://www.ihhp.com/?page=freeEQquiz>. You can answer a few basic questions, select submit, and then a response appears (see Figure 2).

Figure 2: Sample EQ results from IHHP Free Quiz

The next step is to select one skill at a time to work on. Evaluate what areas you may be weakest in. Perhaps start there. Most importantly seek a mentor to help you with this process. Breaking down Finley's techniques for Emotional Intelligence provides basic instructions that an individual may take advantage of to increase one's EI (Finley, 2008, pp. 20-21). Emotional self-awareness is the ability to be in touch with one's emotions. An emotionally aware individual is aware of his or her emotional state at any given time and understands when his or her feelings change and the impetus behind it.

Even if one has a command of self-awareness, he or she must also be able to self-monitor his or her emotions. This ability of emotional management allows one to manage expressive control appropriate to the situation (Gangestad & Snyder, 2000). Self-awareness and emotional management both tend to vary widely based on an individual's emotional makeup and the environment he or she was raised in. An example of emotional management is one individual reacting automatically to a situation, whereas a second person may not react but respond to the situation by choosing the appropriate response. The first individual has no control of the situation because of an automatic reaction whereas the second individual chooses the most appropriate response, and in effect, controls their response to the situation. Goleman strongly believes that meditation, not to be confused with mediation, is a way to increase self-awareness. It is interesting to note Goleman's doctoral dissertation at Harvard was on the topic of meditation; in addition he has published extensive research on meditation. Bowling and Hoffman (2000) also suggested some individuals develop greater self-awareness through yoga, meditation, or religious disciplines.

CONCLUDING COMMENTS

EI skills are equally important to a financial planner functioning as a financial specialist in support of mediation or as a planner in a financial planning session. More recognition needs to be given to the importance of EI and the impact it has on the outcome of either a mediation or financial planning session. The underlying commonality that these proceedings share is the strong emotions regarding one's personal finances. Both mediation and financial planning demand the professional be credible and empathetic toward the client. These traits can be conveyed by an individual with a high degree of Emotional Intelligence. For a financial planner or mediator then it is imperative to understand the role of EI in his or her practice and what one can do to increase his or her Emotional Intelligence.

ACCOUNTING AND FINANCIAL REPORTING SYSTEM REFORMATION IN BELARUS

Tatsiana Rybak, Ministry of Finance of the Republic of Belarus

ABSTRACT

The development of participation of the Republic of Belarus in the global economic integration gives raise to new problems of the national accounting and financial reporting system to be solved. The conceptual framework of that system development is determined in the draft Accounting and Financial Reporting Act. The author worked out recommendations on organizational, methodological, methodical and human resources management support for the process of the Belarusian accounting and financial reporting laws harmonization with the International Financial Reporting Standards.

JEL: M410

KEYWORDS: globalization, integration, Belarusian accounting and financial reporting laws, International Financial Reporting Standards application infrastructure.

INTRODUCTION

Belarus is involved in national accounting and financial reporting system harmonization with International Financial Reporting Standards (“IFRS”). Focusing on IFRS is called forth by the economic globalization tendency, as well as by strong necessity for the country’s full-scale integration to the global economic environment. The basic concepts of the national accounting and financial reporting system development are determined in the draft Accounting and Financial Reporting Act (“Act”), the first revision of which was adopted by the House of Representatives of the Belarusian National Assembly.

Creation of proper IFRS application infrastructure and institutional framework perfection might contribute to most efficient realization of the drafted system measures, which are aimed at adequate information environment to be implemented to follow the global business tendencies and processes and meet the utmost demands of the concerned users.

REGULATORY FOUNDATIONS FOR HIGH-QUALITY FINANCIAL REPORTING IN BELARUS

The draft Act implemented the provisions of the Belarusian President’s Directive No. 4 dated 31/12/2010 related to business initiative development and business promotion in Belarus, particularly stipulating IFRS integration in the accounting process and taking into consideration the laws of the Customs Union member countries. Within the framework of the regional integration, in December 2010 the Republic of Belarus ratified the Agreement on Free Capital Flow and Financial Trade Promotion and Agreement on Trade in Services and Investments between the Common Free Market Zone member countries. The Republic of Belarus committed to apply the harmonization requirements in conformity with the IFRS.

When developing the draft Act, a number of alternative considerations and suggestions have been analyzed for further development of the national accounting system. This resulted in two major streams to be followed, i.e.:

IFRS-harmonized mandatory consolidated financial reporting to be made by all parent companies of social responsibility, e.g. banks, public corporations, insurance companies; Belarusian accounting and financial reporting system development, taking into consideration the IFRS provisions. The draft Act

further stipulates for legislative initiative of IFRS implementation to be advanced. IFRS application procedure shall be determined by the Council of Ministers of the Republic of Belarus in cooperation with the National Bank of the Republic of Belarus.

For more efficient IFRS implementation, it is proposed to advance more stringent requirements to performance of socially responsible companies' chief accountants, since their professional background dominates users' confidence in financial reporting, risk assessment for investors. The draft Act stipulates for specific attestation of pretenders to the socially responsible company's chief accountant qualification. The Chartered Accountant certificates will be issued by the Ministry of Finance of the Republic of Belarus, following the successful attestation.

The draft Act provides the basis for the national accounting and financial reporting system qualitative development, focusing on reliable reporting, being user-friendly and adaptable for proper business decision-making, rather than on mere accounting process. For this purpose, the draft Act integrates the accounting and financial reporting principles (accrual, understandability, relevance, comparability, veracity, etc.) and implements a new type of regulation – national financial reporting standard.

The national financial reporting standard system would incorporate the national standards in accounting policy, accounting of assets, liabilities, income, expenses, additional explanatory information, consolidation, accounting of specific business types. The complete set of financial statements, as stipulated by the draft Act, embodies balance sheet, profit and loss statement, changes in equity statement, cash flows statement, explanatory notes. The draft Act stipulates general provisions of reporting process assessment. New assessment methods and revised approach to exchange difference reporting have been further introduced.

The draft Act provides for simpler reporting of business transactions. Any primary instrument templates (other than those mandatory by law) may be developed and approved by each company management independently. Systematic measures related to accounting and financial reporting system, as stipulated by the draft Act, aim at providing top reliability and comparability of financial information, as reported in different branches of economy.

INSTITUTIONAL FOUNDATIONS FOR HIGH-QUALITY FINANCIAL REPORTING IN BELARUS

When ratified, the new Accounting and Financial Reporting Act might require a set of related measures and decisions to be taken and effected for proper IFRS implementation in the Republic of Belarus. Let's point out the major problems to be solved.

The Belarusian accounting community has not been represented and involved in decision-making and elaboration process of international standards. This makes infeasible to react promptly and revise the national standards to comply with IFRS, as changing from time to time. This problem may be solved by closer cooperation with IFRS Committee and International Federation of Accountants and by giving way for the national policy to be announced during the international standards development and perfection process.

The Ministry of Finance of the Republic of Belarus cooperates with IFRS Foundation and World Bank experts in this concern. The Ministry of Finance is represented continuously with the Intergovernmental Working Group of Experts on International Standards of Accounting and Reporting (ISAR) of United Nations Conference on Trade and Development, as well as with the CIS Coordination Council on Accounting.

Belarus currently organizes the IFRS texts to be available in the national language. Presently, the Ministry of Finance of the Republic of Belarus deals with legal and organizational issues of agreement with IFRS Foundation for the waiver of copyright within limited territories. As far as IFRS interpretation is concerned, foreign practice demonstrates certain distortions in translated standards to be often found, inasmuch as some definitions tend to be missing in certain jurisdictions, and no adequate terminology is available. Moreover, reference to Prof. Y. Sokolov, “the major translation problems relate to proper understanding of ideological and lexicological aspects of evident and correctly translated definitions, rather than from linguistic inadequacy” (Sokolov, 2007). The problem of proper understanding of IFRS terminology is expected to be solved by specific glossary compilation and publication.

IFRS application would require a public compliance supervision system to be organized. For this purpose, a specific supervising authority should be created, as practiced in other countries, for example, German Federal Financial Supervision Authority, Financial Reporting Council in the United Kingdom, Financial Services Authority of France (Krylova, 2008). Many countries with transitional economies involved similar measures. Thus, Pakistan organized its Compliance Monitoring Section of the Securities and Exchange Commission, Turkey – Capital Markets Board (Krylova, 2008), Kazakhstan – Agency on Regulation and Supervision of the Financial Market and Financial Organizations (Duisebek, 2008). Some countries delegate the IFRS compliance control functions to stock exchanges. Thus, the Admission Division and the Sanction Commission of the SWX Swiss Exchange apply penalty to bond issuers in case of failure to comply with the financial reporting requirements (Review of practical implementation issues relating to IFRS, 2008).

IFRS-harmonized mandatory consolidated financial reporting having been introduced, stronger requirements to audit will be implemented for such reporting reliability verification. Pursuant to the draft Audit Act, the first revision of which was adopted by the House of Representatives of the Belarusian National Assembly, IFRS-based consolidated financial reporting of socially responsible companies shall be subject to mandatory audit. Audit companies dealing with such audit shall comply with extra requirements of having at least two staff auditors qualified under IFRS and International Audit Standards. For external audit quality verification, national auditors’ associations are to be engaged.

Also, economic education sets forth major problems to be solved for the Belarusian accounting and financial reporting system reformation. No centralized system for IFRS education and advanced training is currently organized in Belarus. Short-term seminars and training courses realized from time to time by audit and advisory companies fail to benefit to the problem solution. For these purposes, a wide-scale program of accounting practitioners’ advanced training is planned to be implemented.

The accounting and financial reporting system reformation would require a set of measures to be enforced for vocational accounting education perfection, i.e.: revision of higher and secondary vocational curriculums, focusing on IFRS advanced training and their practical application, publication of appropriate tutorials and teaching aids, re-training of lecturers, etc.

CONCLUSION

As a summary, the following measures related to organizational, methodical, methodological and human resources aspects to develop the Belarusian laws on accounting and financial reporting are obvious to be implemented, i.e.:

Organizational measures - cooperation with IFRS Committee and realization of the Belarusian representation for joint solving of problems related to the national accounting and financial reporting laws harmonization with IFRS; organization of IFRS texts to be continuously available in the national

language and freely accessible to the accounting community; creation of public IFRS compliance supervision system;

Methodological support – legislative requirement of IFRS application in Belarus, stipulation of accounting and financial reporting principles, new approaches to recognition, classification and assessment of reporting elements;

Methodical support – creation of a IFRS-integrated system of national accounting and financial reporting standards;

Human resources management – perfection of the existing system of accounting practitioners' training, as well as advanced training of company managers, auditors, economists, financiers.

BIOGRAPHY

Tatsiana Rybak, Ph.D., is a Head of Accounting, Financial Statements and Audit Regulation of the Ministry of Finance of the Republic of Belarus. She is also an Associate Professor at the Belarusian State Economic University. Her research focuses on evolutionary regularities and trends of accounting and financial reporting system development under external exposures. She is the author of many scientific articles in the area of accounting and financial analysis. She has co-authored books titled "Fundamentals of Financial Management" and "Accounting on IFRS basis".

USING OPTION-IMPLIED VOLATILITY TO PREDICT EARNINGS SURPRISES IN THE STOCKS OF THE DOW JONES INDUSTRIAL AVERAGE

Stephen C. Henry, SUNY Plattsburgh

ABSTRACT

In this paper, I investigate the effectiveness of option-implied volatility as a short-term predictor of earnings surprises in the 30 stocks of the Dow Jones Industrial Average. For each quarterly earnings release by the 30 DJIA firms during the period 2007Q1 through 2008Q1, I compute the implied volatility of each near-the-money put- and call- option trade occurring in the 30 days leading up to the announcement. To minimize the error in the implied volatility calculation, IV is computed based on actual CBOE option transaction records, and intraday stock price observations. By analyzing trends in the difference between put- and call-implied volatility, I investigate whether information contained in the put-call implied volatility spread can be used to predict future shocks.

INTRODUCTION

There exists a large and growing literature studying the effect of corporate earnings announcements on stock prices and trading volumes. Ball and Brown (1968), Aharony and Swary (1980), Datta and Dhillon (1993), and Kothari, Lewellen, and Warner (2006) are examples of studies that investigate the absorption of new earnings information into stock and bond prices. Less work has been done, though, examining the effect of this new information into equity option prices and trading patterns. The relative dearth of studies of this nature is somewhat surprising, given the potential impact of the findings, particularly as they relate to informed trading in options. Black (1975) was the first to suggest that informed traders will be attracted to the options market, due to the higher degree of leverage that can be employed. Since then, several authors have documented trading patterns that are consistent with this notion. One such example is Arnold, Erwin, Nail, and Nixon (2006), which documents a significant shift in trading volume from stock to options markets prior to cash tender offer announcements.

A central issue that must be addressed is whether or not new information (such as earnings surprises) should be reflected in option prices. According to the Black-Scholes option pricing model, the only unknown factor affecting an option's price is the expected volatility of the underlying stock. If this is the case, when there is no clear connection between the introduction of new information (such as an earnings surprise) and expected future volatility, there is no predictable response of the option price to the new information. Fortunately (for the purposes of this study), several authors have documented that option prices do not conform quite so strictly to the assumptions of the Black-Scholes model. Canina and Figlewski (1993) report that, in the case of OEX index options, implied volatilities are not good predictors of realized volatility. Their interpretation is that "an option's market price also impounds the net effect of the many factors that influence option supply and demand but are not in the option model." In other words, it seems that in their sample, option prices do in fact reflect the effect of new information. Their analysis does not, however, attempt to make the connection between information releases and option price effects. Their results are somewhat contradicted by those of Mayhew and Stivers (2003), who compare the effectiveness of implied volatility to various conditional heteroskedasticity models in predicting future

realized volatility. They report that "implied volatility subsumes nearly all information about future firm volatility"; however, they do not address the issue of information shocks.

Donders, Kouwenberg, and Vorst (2000) accept the premises that (a) option prices can be affected by factors such as supply and demand imbalances, and (b) that since implied volatility is positively correlated with option price, it can be used as a measure of "relative" option price. In that light, they study the effect of earnings announcements on option volume, open interest, and implied volatility. Their analysis, based on a sample of 40 options traded on the Amsterdam AEX Options Exchange, documents a significant runup in implied volatility for both calls and puts in the days leading up to the earnings announcement, but does not explore the possibility of asymmetric effects between them.

Xing, Zhang, and Zhao (2010) document a relationship between the "volatility skew", and subsequent equity returns. Skew is defined as the difference between put- and call- implied volatilities, and the authors find that "firms with the steepest volatility skews underperform those with the least pronounced volatility skews." That is, firms whose put options are expensive relative to call options tend to underperform. Xing, et al. also document that firms with the steepest volatility skews experience the worst earnings shocks in the following months, which is consistent with the presence of informed trading. While Xing, Zhang, and Zhao contribute much to the literature, their analysis is somewhat limited by the use of end-of-day option prices. Because option prices are tightly bound to the value of the underlying stock, end-of-day option quotes may not incorporate the true contemporaneous value of the stock, particularly for less-heavily traded options. This potential mismatch may introduce error in the computation of implied volatility. In this study, I address this potential shortcoming by utilizing individual option transaction prices and intraday stock quotes (+/- 10 minutes) to compute IV.

DATA AND METHODOLOGY

Data for the study, including option trades and intraday stock quotes, were provided by www.opentick.com. In order to maintain a manageable sample size, and to ensure that sufficient option volume exists, I limit the analysis to the thirty stocks included in the Dow Jones Industrial Average. The first step in the analysis is to identify the dates and actual values of quarterly earnings announcements, from 2007Q2 to 2008Q2, inclusive. Again, the sample is limited by data availability, and in order to maintain a manageable size. Quarterly earnings, along with the high, low, and consensus analyst estimates are obtained from www.businessweek.com. For each of the earnings announcements (30 firms * 5 quarters = 150 releases), I obtain from www.opentick.com intraday stock price data for the period -30 to +5 days relative to the announcement. Trading off temporal precision against data volume, I choose to use stock quotes with 10-minute intervals.

As of 30 days prior to each earnings release, I identify the two nearest-the-money (above and below) calls and puts for each firm. This results in an overall sample size of 600 option series (150 releases * 4 options). For each of these option series, a record of individual option trades (including price, trade size, volume, and open interest) is retrieved from www.opentick.com. For each option trade occurring during the sample period, I compute the Black-Scholes implied volatility based on the actual trade price, actual time to expiration, and the closing price quote from the most recent 10-minute window. Given the short-term nature of the options under consideration, the effect of varying interest rates on implied volatility would be quite small; consequently, I assume a fixed risk-free interest rate of 2% over the period for all calculations. Computations are carried out using the `GBSVolatility` function of the `RMetrics` package, inside the R statistical programming environment (Wuertz, et al 2008, R Development Core Team 2008). Dividends were ignored, which is justifiable given that it is unlikely for a dividend event to occur in the 30 days prior to an earnings announcement. Although incomplete at the time of this writing, the research thus far has turned up a few empirical regularities worthy of mention. First, it is clear that for most firms, option-implied volatility tends to be relatively stable over the period 4 weeks prior to the earnings

announcement. There is not universally a runup in implied volatility prior to the earnings event, although such a phenomenon is apparent for several firms in the sample. Second, for most firms, put- and call-implied volatilities are very nearly equal, as would be expected in an informationally efficient marketplace. Again, there are exceptions, and in several cases a noticeable difference between put and call IVs emerges either shortly before or after the earnings announcement. The statistical significance of these exceptions, and the extent to which they are correlated with earnings surprises are not yet known, but will be presented in the completed version of this paper. Regardless of the results of this particular analysis, the techniques demonstrated in this study can be applied in other contexts, to analyze the effect of any sort of economic event or information shock on options markets.

A NEW KIND OF SOCIAL ENTREPRENEURSHIP! MAM CASE STUDY

Elizabeth Robles, University of Puerto Rico

ABSTRACT

How can a “doula”, be the originator of such a creative business that combines a nonprofit organization with three profitable micro businesses and in addition, is a socially responsible organization? MAM meaning “mujeres ayudando a madres”/women helping mothers is a Puerto Rican nonprofit organization whose goal is to support women in the childbearing stage and to promote a constructive culture based on the physical and psychological health of the family. It was created by a midwife and a certified “doula”, a trained labor support person, Mrs. Vanessa Caldari. MAM pursues the doula's philosophy of personal empowerment of the mother. The mission of MAM is “to promote the rights, the education and the wellbeing of women during their pregnancy. MAM’s integrated hybrid model produces both social value and commercial revenue through a single, unified strategy.

KEYWORDS: social entrepreneurship, hybrid model, doula, MAM, social enterprise

INTRODUCTION

How can a “doula”, be the originator of such a creative business that combines a nonprofit organization with three profitable micro businesses and in addition, is a socially responsible organization?

MAM meaning “mujeres ayudando a madres”/women helping mothers is a Puerto Rican nonprofit organization whose goal is to support women in the childbearing stage and to promote a constructive culture based on the physical and psychological health of the family. It was created by a midwife and a certified “doula”, a trained labor support person, Mrs. Vanessa Caldari. Although Mrs. Caldari’s educational background is in nursing, she is a perinatal educator who works as a midwife and a doula. Through her work she saw the need of many pregnant women to have education and support through their pregnancies, especially women of limited economic resources.

Mrs. Caldari founded MAM in 2007 with the purpose of empowering mothers in their pregnancies. Officially the MAM center was open to the public in the year 2010. The idea of having a center like MAM was born from the Sisterhood of Midwives of Puerto Rico (Hermandad de Parteras de Puerto Rico (HPPR) to which Mrs. Caldari belongs and represents the Latin American and Caribbean Network for the Humanization of Labor and Birth in Puerto Rico.

MAM’S FUNCTIONS

MAM pursues the doula's philosophy of personal empowerment of the mother. The mission of MAM is “to promote the rights, the education and the wellbeing of women during their pregnancy. The purpose is to empower women during their pregnancy stages and postpartum.

MAM creates awareness in the community about the proper management of health and physiology which has shown to reduce morbidity and mortality in pregnancy, childbirth and postpartum. In addition, MAM educates and promotes family planning and parenting.

MAM channels efforts to reduce the cesarean rate, to increase the percentage of mothers who breastfeed, to create better bonding between couples during the stage of motherhood, to lower the rate of

maltreatment of children with humanitarian teachings and warm, and to assist mothers in their reintegration into society after the childbirth.

MAM sees that by raising awareness, women make decisions that support their emotional, mental and physical health of their lives. This can prevent problems such as abuse, depression, and disease in women. MAM meets the need that the community of Puerto Rico has to achieve lower rates of unnecessary cesarean operations, increase lactation, lower the number of domestic violence, lower government dependency and support low-income single mothers.

MAM is an organization that promotes the rights of the pregnant woman. MAM wants that every woman be armed with the knowledge they need to have a healthy pregnancy, childbirth and postpartum, full of positive memories.

MAM as an organization aims to educate Puerto Rico's society to see that pregnancy has the potential to be an event that positively changes the life of a woman. MAM promotes the humane care of women during their maternity.

RESEARCH ON DOULA'S BENEFITS

Throughout the literature it has been found that doula support has repeatedly decreased the length of labor, the use of pain medication, the rates of cesarean sections, and instrumental births, and has increased rates of breastfeeding and bonding.

In their study Rohwer (2011) indicated that doula support increased teen mothers knowledge of the birth process, provided unbiased and nonjudgmental support and information, gave them confidence in their ability to give birth, and encouraged mothers to be proactive in communicating with their care providers. Doula care provides the following benefits: shorter labors, reduced need for pain medication, fewer episiotomies, fewer cesarean sections, fewer operative vaginal deliveries, better mother infant interaction, improved neonatal outcomes, improved breast feeding rates, and greater maternal satisfaction (Stein, Kennell and Fulcher (2004).

According to Mottl-Santiago et al (May 2008) a hospital-based doula support program is strongly related to improved breastfeeding outcomes in an urban, multicultural setting. In addition, having doula support was significantly related to: (a) higher rates of breastfeeding intent and early initiation rates for all women, regardless of parity or provider with the exception of multiparous women with physician providers; (b) lower rates of cesarean deliveries for primiparous (first birth) women with midwife providers.

In their study, Deitrick et al (2008) found that doulas provide four kinds of support, including physical comfort, physical assistance, socio emotional support, and verbal support. Campbell et al (Sep 2007) concluded in their study that labor support by a minimally trained female friend or relative, selected by the mother-to-be, enhances the postpartum well-being of nulliparous mothers and their infants, and is a low-cost alternative to professional doulas.

Gilliland (2011) found that doula care has the potential to enhance paternal involvement with labor support and increase satisfaction of fathers and mothers with their birth experience. In addition, it may have the potential to reduce a father's stress level during the birth experience by employing a variety of techniques, thus improving the quality of his experience.

Previous randomized controlled studies in several different settings demonstrated the positive effects of continuous labor support by an experienced woman (doula) for low-income women laboring without the

support of family members (McGrath and Kennell, 2008). McGrath and Kennell, (2008) concluded that the continuous presence of a doula during labor, significantly decreased the likelihood of cesarean delivery and reduced the need for epidural analgesia for middle-class women, laboring with the support of their male partner.

SOCIAL ENTREPRENEURSHIP

Makhlouf (2011) asserts that social entrepreneurship starts with an entrepreneur who has a novel idea, an innovative product or service, a creative approach to solving a perceived problem, a new business model, and/or a previously untried approach to product or service delivery.

According to Noruzi et al (2010) social entrepreneurship refers to innovative activity with a social objective in either the for-profit area, such as in social-purpose commercial ventures or in corporate social entrepreneurship. It could also be in the nonprofit sector, or across sectors, such as hybrid structural forms which mix for-profit and nonprofit approaches. A common denominator across all definitions of social entrepreneurship is the fact that the underlying drive for social entrepreneurship is to create social value, rather than personal and shareholder wealth.

A social entrepreneurship is characterized by innovation or the creation of something new, rather than simply the replication of existing enterprises or practices. The core driver for social entrepreneurship is the social problem being addressed. The particular organizational form a social enterprise takes should be a decision based on which format would most effectively mobilize the resources needed to address that problem (Noruzi et al, 2010). Social entrepreneurship is not defined by legal form, as it can be pursued through various vehicles. Examples of social entrepreneurship can be found within or can span the nonprofit, business, or governmental sectors.

Martin and Osberg (2007) defined three components that distinguished social entrepreneurship. These components are: (1) an ability to identify "a stable but inherently unjust equilibrium that causes exclusion, marginalization, or suffering of a segment of humanity", (2) an ability to identify an opportunity in this unjust equilibrium and develop a social value proposition, and (3) willingness to take action in order to forge "a new, stable equilibrium that releases rapped potential or alleviates the suffering of the targeted group. . .and even the society at large," (Martin and Osberg, 2007, p. 2).

MAM'S MODEL

MAM offers childbirth educational seminars, doula certification courses, and midwives certification courses. It has support groups for women that had lost a child, support groups for postpartum depression, breast feeding mothers and mothers with cesarean operations. In addition, it offers educational seminars of nutrition, health and parenting. MAM does not receive money from the government or the private sector, nor any grants. The funds are raised from the certificate courses and the seminars given at the center.

MAM has the structure of being a nonprofit organization that is the umbrella of three other profit micro businesses. These micro businesses are the ones who support MAM paying the rent of the organization. The first micro business is a vegetarian restaurant called Cocobana Café owned by a young couple, Mrs. Vanessa Díaz (also a doula and a former beneficiary) and her husband Mr. Manuel Collazo. The second micro business is called Natural Mama owned by Mrs. Jennifer Rodríguez, a former beneficiary of MAM. The third microbusiness is called Paperdolls owned by Mrs. Nacha Zurinaga, also a former beneficiary of MAM.

Originally, the clients of the three micro businesses were the beneficiaries of MAM services, pregnant mothers and mothers. Now their client base is changing, attracting additional market segments such as the local community and the general public. This is the case of Cocobana Café that although it is keeping MAM's beneficiaries, it is serving the general public from the local community. The mission of the restaurant is to provide healthy food to MAM's beneficiaries. Regarding Natural Mama, the products available are baby ring slings manufactured by Mrs. Rodríguez, reusable cloth diapers, homeopathic products, and some donated articles that are sold to single mothers at a reasonable low price. The donated baby clothing is given to single mothers and mothers with no economic resources. Paperdolls sells women's apparel and accessories. None of these entrepreneurs have a formal business background or studies. In fact, only Mrs. Díaz has a bachelor degree and is in education.

The synergy around this model is that it provides the flexibility to the three entrepreneurs, to have a job and to take care of their children while in the job. Their first job is to be mothers and take care of their children and then comes the business.

According to Battilana et al (2012) MAM's business model is called a hybrid business. This is a new business model created as a result of the recession. It is innovative in creating the resources needed to pay the bills and still has a social mission.

The hybrid model would use product sales to fund its social mission, reducing dependence on donations, grants, and subsidies, as well as to scale up the organization. MAM's integrated hybrid model produces both social value and commercial revenue through a single, unified strategy.

During the last five years the increase in the number of hybrids results in part from social entrepreneurs' willingness to be less dependent on donations and subsidies, as well as from an increased interest in creating sustainable financial models in the wake of the 2007-08 financial crises (Battilana, 2012).

The leaders of hybrid businesses must make deliberate cultural decisions to keep the mission on course while still making enough money to sustain their operations (Battilana, 2012). They must identify and communicate organizational values that strike a healthy balance between commitment to both social mission and effective operations. In addition, the selection, development, and management of employees who are capable of recognizing and pursuing social and economic value are equally important.

MAM'S CHALLENGES

Social entrepreneurship is still emerging as an area for academic inquiry. Its theoretical underpinnings have not been adequately explored, and the need for contributions to theory and practice are pressing (Austin et al, 2006).

According to Makhoulf (2011) a social entrepreneurships such as MAM has to establish external relations as well as the kind of management and operational systems that would allow them to function as a viable enterprise. In addition, they have to build dedicated teams that believe in the mission, are committed to the cause, and have the skills needed to: (1) build and maintain strong relations with all the external stakeholders, (2) attract the resources required for the financial viability of the organization, and (3) assist in the development and implementation of strategic and operational plans. Those external stakeholders include: "constituents intended to benefit from the initiative (e.g. poor and marginalized people); (2) resource providers, who offer financial, technical, or political resources; (3) allies who help carry out programs; and (4) actors who are targets of programs or campaigns" (Makhoulf, 2011, p. 7).

MAM needs a well-organized structure in order to succeed in the long run. In addition, it needs a solid group of volunteers that stays in the organization for a long period of time. Actually it needs ample facilities to accommodate more clients/beneficiaries. The business women need to be trained in

management and business areas to be more effective with their selling and administrative strategies. Also, the center needs to implement promotional strategies in order to increase the clients/beneficiaries base.

For MAM much work lies ahead to continue creating social value, and maintaining it over time in a sustainable way. MAM is creating a path for others to replicate. Next year it will be created a MAM center in Colombia. All this is happening thanks to the idea of a “doula”, a midwife, Mrs. Caldari, who has a social vision of empowering mothers in their pregnancies.

BIOGRAPHY

Dr. Elizabeth Robles is a marketing professor in the Department of Management at the University of Puerto Rico. Her areas of research are consumer behavior, public relations, marketing in a noncapitalist system, fashion marketing, corporate social responsibility (CSR), and spirituality in the workplace. Dr. Robles has published her research in the Marketing News, Forum Empresarial and Inter Metro Business Journal. She can be reached at: elirobles@yahoo.com.

RISK ASSESSMENT AND CORPORATE GOVERNANCE

Peter Harris, New York Institute of Technology
Katherine Kinkela, New York Institute of Technology
Steven Shapiro, New York Institute of Technology

During 2012, the Committee of Sponsoring Organizations of the Treadway Commission (COSO) wrote a number of papers extending guidance on practical implementation of Enterprise Risk Management (ERM) in organizations. In addition, the Professional Practices Framework has been revised to include more relevant information. These changes and discussions were largely in response to corporate governance concerns, that is that the Board of Directors and Officers of the firms are actively seeking new and better ways to create effective internal controls. Risk assessment leads to more effective internal controls because risk assessment is a proactive way of identifying the interaction and potential flaws of the components within the system.

In these 2012 COSO papers, Risk Assessment was discussed as a critical component of the ERM process. The new guidance is of particular interest to companies with informal risk management processes that are eager to demonstrate adequate internal controls through establishing a uniform framework of internal controls in their organizations through ERM. One development was an expansion of the risk assessment process flow diagram. The risk assessment process flow diagram breaks the system of ERM implementation into six steps. The six steps are to identify risk, develop assessment criteria, assess risk, assess risk interactions, prioritize risks and respond to risk. Especially in the early stages of ERM implementation, the main focus of the system is on the four middle steps of the process. Developing risk assessment criteria is a process that is unique for each firm. By spending additional time thinking about proper risk assessment criteria, a proper tone is set for long range planning for the business. In assessing risk interactions, greater priority may be given to the risks that impact numerous factors of the business. This paper will critique the new guidance and suggest next steps for development.

MCDONALDIZATION FROM WEBER'S POINT OF VIEW AND ITS REFLECTIONS IN TURKISH SOCIETY

Elif Kıran, Fatih University

ABSTRACT

We are all surrounded by a fast-food style of life in this era. We have less time and more work to do compared to our lives before. Moreover, there are more options to be consumed around us as a reflection of the painstaking acceleration of consumption culture. In such a world people need to hurry, to be practical and efficient enough in order to catch the phase of life. This paper is going to analyze this McDonalds restaurant type life style in general first and then to dig into the situation in Turkish society about this realm.

JEL: Z13

KEYWORDS: Fast-food restaurant, modernity, busy lives, Weber

INTRODUCTION

Today's modern world requires people who are able to do many things at one time. That is to say, people are so busy with the happenings of the daily life that they are not able to have separate time for each of them. So, they need to do anything and everything fast which makes their life just as the ongoing work struggle in the McDonald's restaurants. According to Ritzer (1983), 'we have become a nation driven by concerns for rationality, speed, efficiency that are so well illustrated by the McDonald's style of operation. Food, packaging and service are designed to move quickly and cheaply through and out of these restaurants, giving customers the most modern experience.' Parallel to Weber's idea of bureaucracy in which he saw the society as the center of rationalization and the bureaucracy as its paradigm case, Ritzer argues that nowadays the model of rationalization is no longer bureaucracy but a fast-food restaurant. That is to say, in today's modern world what is rational is what is more efficient for this busy and stressful life style in which people are living in a kind of chaos and there is a lack of time for everything. So, life has become as a fast-food restaurant where you can have what you need at a low price and fast.

MAIN POINTS

In the fastfood world of today, Turkey is one of the countries which adopts this trend more and more everyday. The modern world teaches people how to live practically and efficiently which eases our lives. Since, it is much more different than our grandmother's time when there were not that much technology and people who are made obsessed with technology around.

According to Weber's ideal type of society, rationality of bureaucracy is a main concept. What he means by rationality of bureaucracy is that; 'bureaucracy is a rational-legal form designed to promote the rationalization of organizational tasks and goals.' Ritzer (1983) states that 'the bureaucracy is largely a creation of the modern Western world. Though earlier societies had organizational structures, they were not nearly as effective as the bureaucracy. For example, in traditional societies, officials performed their tasks on the basis of a personal loyalty to their leader. These officials were subject to personal whim rather than impersonal rules. Their offices lacked clearly defined spheres of competence, there was no clear hierarchy of positions, and officials did not have to obtain technical training to gain a position. Ultimately, the bureaucracy differs from earlier methods of organizing work because it has a formal

structure that, among other things, allows for greater efficiency. Institutionalized rules and regulations lead.' So, in the bureaucratic societies of today, there are fixed rules to obey and there is no place for being out of the norm. A citizen has to act not as a living thing but as a robot which is pre-programmed to live according to the norms and moreover if s/he happens to fail to do this, it will be almost impossible to live efficiently enough for today's standards.

After depicting a general view of what rationality in general is, one can say that in the course of world history, most of the societies has undergone a rationality process. But, Weber put forward a different kind of rationality which is called 'formal rationality'. What he means by that concept is that 'the search by people for the optimum means to a given end is shaped by rules, regulations, and larger social structures. Individuals are not left to their own devices in searching for the best means of attaining a given objective.' In other words, in today's formal rational world, there is no place left for exceptions or unpredictable ideas but there is a great struggle to obey these rules to eliminate all the unpredictable happenings which may deviate man from reaching the given aim. As a result of that view, it happens to end with a black and white society in which everyone comes up with more or less the same solutions to the objectives since individual diversity is tried to be dead by all these rules. There is no living space for the gray in the formal rational world.

There are 5 major dimensions of rationalization which Weber names as the characteristics of a rational society. Efficiency, predictability, calculability, substitution of nonhuman for human technology and control over uncertainty.

'Efficiency refers to 'the best optimum means to any given end.' (Ritzer, 1983) In today's world eating at home needs time and energy but people are out of these especially, at the end of a long and tiring day. So, eating out is the most efficient solution for them. About predictability, it talks about the similarity between most of the places and people in the society. That is to say, as a result of this globalization thing, everyone is becoming more and more similar every day. Since, people have a fast-food daily life, their life spaces are becoming the same, too. One can predict the daily life or home of a family in which father and mother works all day, just in the same way as they can predict the atmosphere and daily chores of a McDonalds restaurant. The third concept given is, calculability or quantity rather than quality which refers to giving much more value to the quantifiable measures which are easier to evaluate than the qualitative ones. This again is something that is suitable enough for the computer based fast food lives of today's people. To calculate and identify qualitative measures, it takes lots of time and effort whereas to evaluate the quantifiable ones you donot need to give that much time. Instead, you can manage it in some minutes by the help of a computer on your desk. Another aspect of rationality is that, in recent rational societies nonhuman technology has substituted the human power. In other words, everything around has become such mechanic that we are living as if surrounded by plenty of robots. This again goes back to the life style of today's man, which is based on doing more work in less time and technological devices are the servants of mankind in this struggle. The fifth and last concept is the control over uncertainties. This refers to the elimination of any uncertainties by structuring a great control system over people. This concept is in a way related to the predictability one in the way that, in both of them there is an urge to close all the gates to surprises and controlling anything and everything that may happen unexpectedly since these unexpected occurrences may prevent you from reaching to the given end.

Apart from all these five characteristics of rationalization stated above, there is one more concept that is very important in the Weberian understanding of this issue. He calls this 'iron cage of rationality'. In Weber's view, 'bureaucracies are cages in the sense that people are entrapped in them, their basic humanity denied. Weber feared most that these systems would grow more and more rational and that rational principles would come to dominate an accelerating number of sectors of society. Weber anticipated a society of people locked into a series of rational structures, who could move only from one rational system to another. Thus, people would move from rationalized educational institutions to

rationalized work places, from rationalized recreational settings to rationalized homes. Society would become nothing more than a seamless web of rationalized structures; there would be no escape.' Thus, Weber saw modern man ,who is seemingly much more free than the people of the pre-modern era, as deeply bounded to rules. So, this is nothing but the difference between appearance and reality. The feeling of freedom 'modern, rational' people have as a result of living in a high-tech society is only an illusion; in reality, they are slaves of modernity.

Parallel to that idea, in Turkish there is a saying as ' Even if you put a bird in a gold cage, it would long for its native land'. But, with one difference, here the animal is conscious of being entrapped and trying to find ways to run away. Whereas, in the case of modern man, he is not aware of this reality. The daily responsibilities of the 'formal rational' life prevents them from thinking about their being in an 'iron cage'.

DISCUSSIONS ON TURKEY'S SITUATION

If we look at how Weber's concept of rationality is reflected in Turkey, one can observe that, Turkey is a developing country which is trying to adapt itself to the trends of the modern world and in the course of this passage the aspects of rationalization are present in the modernizing Turkey, too. Although, it is not that harsh as in the western world, Turkish people are also undergoing a transformation into an efficient way of living. Everything around is programmed to be more efficient to the busy life style. Also, day by day people are becoming similar to each other as a result of following these rule of the rational society of today's Turkey. But, if it is compared to the western world, especially the USA, Turkey is still not that 'rationalized.' As a reflection of its traditional formation and still conservative point of view, Turkish society is a long way behind the USA in terms of this issue. It is true that there is a change towards being more bureaucratic ,which means to be more rationalized according to Weber, but still it keeps its 'pre-modern' or 'pre-rationalized' structure. There are several indications of that such as; for Turkish people no matter how efficient is it eating out and fast is not something very pleasant since meals have a very valuable place in Turkish culture in terms of gathering people together and strengthening ties among them. In addition to that, Turkish people are not really used to obey the rules of bureaucracy since it is a common trend for Turkish man to decide at the last moment and as a result of that habit they are always ready for surprises and unpredictable happenings. Several examples like that can be observed in Turkish daily life.

CONCLUSION

In short, one can say that Turkey is not really 'McDonaldized' yet, and at the same time not 'formally rationalized' according to Weber's understanding of rationalization. But, the trend of today implies that Turkish society will also catch up its predecessors in the way of being more rationalized.

THE IMPACTS OF SINAPI ABA TRUST, A MICROFINANCE LENDING SCHEME ON ITS CLIENTS IN GHANA

Paul A Onyina, Pentecost University College, Accra

Sean Turnell, Macquarie University, Sydney

ABSTRACT

Owing to the success of the Grameen Bank and other microfinance institutions in recent years, microfinance institutions' role as a potential policy tool in poverty alleviation has received considerable attention. Empirical evidence from existing research shows some positive results in poverty reduction from some microfinance programmes. This paper intends to add to the existing literature on the industry by evaluating the effects of microfinance on clients who have received loans from the Sinapi Aba Trust of Ghana. Our data show that old clients have received greater impacts and are more empowered from the programme than new clients, even though the latter on average receive larger volumes of credit. In this study, we construct empowerment indicators, finding that years of membership duration with the SAT lending scheme matters in empowering clients. The results show that old clients are more likely to purchase assets, expand their businesses, and spend larger amounts on their children's education than new clients.

KEYWORDS: MFIs, credit, impact, assets, income

INTRODUCTION

Following the perceived success of the Grameen Bank and other microfinance institutions (MFIs) in recent years, the role of MFIs as a potential policy device for poverty reduction has increased in many countries around the world. Empirical evidence from existing research shows some positive results from some microfinance schemes (see for example Hashemi, et. al, 1996; Pitt and Khandker, 1998; Pitt et. al, 2006; and Maldonado and Gonzales-Vega, 2008). This study evaluates the impact made by SAT in lending to poor clients in urban communities in Ghana. Data was collected between July and September 2009 from clients of SAT we found clients to depict a spirit of entrepreneurship, they have been empowered in other areas. We used the cohort approach to classify clients into two groups: old and new clients. Old clients are defined as clients that had borrowed from the SAT more than three years and new clients as less than three years with the scheme. Data analysis show that even though new clients on average receive bigger loans, we find that old clients have benefited not only in income earned, but also increases in asset purchases and in expenditure on childrens' education. Furthermore, by constructing empowerment indicators from the survey instrument similar to Hashemi et. al, (1996); and Garikipati (2008), we found that old clients of the MFI have received greater impact than new clients. They have greater benefits in areas such as asset ownership, increased expenditure on food and children's' education, improvement in business operations, economically secure and in the overall empowerment.

The primary aim of this study, in taking the debate further, was to examine the impact of a microfinance institution that uses group-based lending to clients in Ghana. Findings of the study are consistent with findings of other studies on group-based lending programmes (see, for example Pitt and Khandker, 1998; Pitt et al., 2003; Pitt et al., 2006; Maldonado and Gonzales-Vega, 2008; Amin et al., 2003; and Coleman, 2006). This study has been organized into five sections. The next section reviews relevant literature on the group lending methodology. We then details the data used for the study. Empirical results are discussed in the next session. Concluding remarks are ventured in the last.

LITERATURE REVIEW ON IMPACTS OF MFIS LENDING

In this session we briefly outline some of the finding of studies on group lending approach. The group lending approach that facilitate the provision of credit to the informal sector have proved to be efficient, lower transaction costs; and much lower default rates compared to classical banking. There abound impressive theoretical and empirical literature supporting peer lending in Stiglitz (1990), Armendáriz de Aghion and Gollier (2000), Armendáriz de Aghion and Morduch (2005); Bhole and Ogden (2010). See Pitt and Khandker (1998), Morduch (1999), Pitt et. al (2006) for findings on employment and regular income among MFI clients. Using data collected in 2000 for CRECER scheme, and 2001 for the Batallas scheme, Maldonado and Gonzales-Vega (2008) found that rural household microfinance clients who received credit for more than a year were more likely to keep their children in school than clients who had just joined the programme.

THE DESCRIPTION OF DATA

Field work for this study was undertaken in Ghana from July to September 2009 via interviews with 672 SAT borrowers from three of its branches — in Abeka, Tema and Kasoa. Clients were randomly selected during community meetings at several centres of the branches. However, in some centres, clients attended meetings at irregular intervals, so a systematic sampling method (every third client) was used. The gender composition of clients in the data is 87 percent female and 13 percent male. Finally, selection bias is a major problem that researchers encounter in impact assessment of microfinance schemes. We deal with selection bias similar to Maldonado and Gonzales-Vega (2008) by using the cohort approach.

DESCRIPTION OF VARIABLES AND EMPIRICAL RESULTS

This section investigates the impact of credit on clients using the logit model. More specifically, we construct empowerment indicators to evaluate the impact(s) of the programme on the clients. We used the logit model to estimate the effects of independent variables on the dependent variables, namely empowerment indicators and the composite empowerment. These indicators have been designed similar to the indicators used by Hashemi et. al (1996); and Garikipati (2008). There are four indicators for empowerment — namely asset ownership, expenditure on children education, improvement in business operation and being economically secured for the future. We then aggregate them to get the composite empowerment indicator.

Following Hashemi et. al (1996) and Garikipati (2008), we assigned equal weights to each component if a client satisfies a set of selected conditions; this was intended to minimize the issue of subjectivity. The outcome variables employed in our data for empowerment were reduced to dichotomous variables (a score of zero or one) for the analysis. This allowed us to use the logit regression model for our estimates (see Amemiya, 1981; Hosmer and Lemeshow, 2000). We made a cutoff point for the variables around the 25th to 35th percentile; this helped to avoid the problem of extreme outliers (Hashemi et. al, 1996; and Garikipati, 2008). We describe the variables below.

Dependent Variables: Empowerment Indicators

a-Asset Ownership (ASSETS): The definition of assets here includes property of any form that a borrower purchased after he or she joined the scheme. Clients who have purchased assets of any form were coded 1 and 0 otherwise.

b-Improvements in Business (IMPBUS): Clients who use the purchased asset for business purposes were coded 1, and 0 otherwise.

c-*Expenditure on education (EDUEXP)*: Another indicator we used is expenditure on childrens' education. We grouped schooling years into three: basic school; secondary school; and tertiary education, with the questions capturing expenditure on each education type. At the time of the survey, though public basic school had no tuition fee and required relatively small expenditures, most parents with adequate funding prefer to send their wards to private schools for better performance. A score of 1 was awarded a client with expenditure on education otherwise 0.

d) *Economic Security in Future (ECOSEC)*: Respondents rated their i) economic security and ii) future prospect on a five point scale from very high (1), high (2) to very low (5) before and after they borrowed from SAT. If economic security became better after they joined the scheme (a score of 1 or 2), compared to a pre-scheme membership situation (a score of 3, 4 or 5), then 1 point was awarded otherwise 0. We used the same criterion to award points to the clients. A respondent with a total score of three out of the five items was coded 1, and otherwise 0.

e) *Composite empowerment (EMPOWER)*: A client was classified as empowered and coded 1, if for all the (4 indicators here) he or she has a score of 3 or 4 and 0 otherwise.

Independent Variables

We used three different types of independent variables in the regression model: loan variables; client's household characteristics; and individual personal characteristics. The last two sets are control variables; they are included because such characteristics are likely to influence the empowerment indicators (Garikipati, 2008).

Programme Variables

a) *Number of years with SAT (SATDUR)*: Clients who have borrowed for over three years were classified as 'old clients', and those with less than three years as 'new clients'. 'Old clients' were coded 1, and 0 otherwise.

b) *Average loan size received by a client (AVLOAN)*: Clients average loan received was computed by dividing total loan received by number of loan(s), another independent variable.

c) *Before SAT loan (LBSAT)*: Clients who took loans from other sources before they joined the programme were coded 1, and 0 other wise.

2) Household Characteristics

1) *Head of household gender (SEXHH)*: Female household heads were coded 1 otherwise 0.

2) *Household size (HSIZE)*: The size of the household.

3) Respondent's Characteristics

1) *Respondent's age (RESAGE)*: The age of the respondent.

2) *Respondent's education (RESEDU)*: We coded respondents' education as a categorical variable. It takes the value of 1, 2, 3 and 4 (where 1 represents no schooling years, 2 represents basic schooling of up to 10 years, 3 symbolizes secondary schooling, between 10 to 13 years, and 4 corresponds to tertiary education, over 13 years of schooling).

EMPIRICAL RESULTS: EFFECTS OF CREDIT ON THE EMPOWERMENT INDICATORS

Table 1 presents the effects of the independent variables on the indicators; it reports the odds ratios, and the confidence intervals for the odds ratios. Each dependent variable estimates a separate equation.

Generally, when an odds ratio of an independent variable is greater than 1, it shows a positive relationship with the dependent variable. In contrast, an odds ratio less than 1 shows a negative relationship between the variables. Statistical significance ($p < 0.05$) is shown when 1 falls outside the confidence interval of the variable (Hashemi et. al, 1996).

* Confidence intervals

Statistical significance ($p < 0.05$) is shown when 1 falls outside the confidence intervals.

Assets Ownership (Assets)

The odds ratio for membership duration (Satdur) is 5.19 and it is statistically significant. This suggests that 'old clients' are 5.19 times more likely greater to own assets than 'new clients' in the sample. This result is similar to most findings in the literature where microfinance clients increase their asset ownership over the years (see Pitt and Khandker, 1998; Hashemi et. al, 1996; and Garikipati, 2008). It shows that old members of the scheme are 5.19 times more empowered in terms of assets ownership than new members, hence the longer the years a client borrows from the scheme, the more assets the client is likely to purchase. Again, the odds ratio of average loan received is 1.00082, and it is statistically significant. Other significant variables are average loan size, household head gender, and the age of respondents; however, the last three are negatively related.

Expenditure on Children's Education (EDEXP)

With the support of MFIs, most clients the world over spend a lot more on their children's education. This comes in two ways. Either, clients make additional expenditure on children who are already in school, or clients enrolled more children in school due to increased income. Significant variables positively related to this are membership duration, gender of household head, and household size. Pre-SAT loan and clients' age are also significant but negatively related. Central to this paper, our results show that the odds ratio for membership duration (SATDUR) is 2.43; this suggests that 'old clients' are 2.43 times more likely to spend on their children's education than 'new clients'. This is similar to what Maldonado and Gonzales-Vega (2008) found in Bolivia. Also, the odds ratio of household head is 3.07 and statistically significant. It suggests that female household heads are 3.07 times more likely to spend on their children's education than their male counterparts.

Improvement in Business (IMPBUS)

The major aim of MFIs is to help their clients move out of poverty as they give them credit to expand their economic activities. Positively related significant variables are membership duration and the education level of clients. Our results suggest that old member of the programme are 3.44 times more likely to improve upon their businesses than new members. Also, the results suggest that a client with high level of education who is an old member is more likely to improve his or her business than a low educated client.

Economic Security in Future (ECOSEF)

It is important to be economically secure in everyday day life, and we asked our clients to indicate their perception of economic security. The results indicate that average loan size, is positively related and statistically significant; whereas membership duration (SATDUR) is statistically significant but negatively related.

Composite Empowerment Indicator (EMPOWER)

With the composite empowerment, membership duration is statistically significant; the odds ratio is 3.36. This result suggests that 'old clients' are 3.36 times more empowered than 'new clients' on the overall empowerment. Average loan is also positively related and statistically significant suggesting, the importance of average loan received. On the other hand, age of the respondent is negatively related and significant. This suggests that empowerment reduces with increase in age of a client.

We used two of the methods Garikipati (2008) adopted to check the robustness of the results. First, we used the 'backward stepwise regression' to test SATDUR which starts with a full model (reported), and non-significant variables illuminated in an iterative process. We tested the fitted model when a variable is illuminated. The aim was to make sure that the model fits the data adequately. Once there are no more variables to be illuminated, the analysis is accomplished. We then used the likelihood ratio test to accept or reject the illuminated variables. The analysis indicated that the SATDUR coefficients were stable throughout the process, suggesting that our conclusion made on membership duration on the credit programme are robust. Second, we tested the significance of each of the indicators separately before we developed them. At the individual level, we found that the important variables maintained their signs and significance.

CONCLUSION

This paper set out to identify the impact of MFIs on poverty using a survey of SAT clients in Ghana as a case study. As noted earlier, there is conflicting evidence from studies on impact assessments of MFI programmes across the globe. This study set out to assess the effectiveness of SAT, a microfinance institution in Ghana, and the impact of its lending programme on the life of its clients. The paper used a survey of SAT clients as a case study. The originality and uniqueness of the study comes from the use of both qualitative and quantitative data analysis to examine the impact of the scheme on these and other variables. With the qualitative data, we used descriptive statistics of survey responses to show the impact of the lending scheme on the clients. With the quantitative analysis, we constructed empowerment indicators, which we used to assess how they affect the independent variables in the logistic model. The intention was to add to the available literature in the area. We collected primary data from the field with the help from field assistance. The constructed indicators we used as independent and dependent variables to run logistic regression to determine the effects of the independent variables on the dependent variables.

To analyze the data, the study divided clients into two groups — new clients who have been with SAT for less than three years, and old clients who have been with SAT for over three years. We found that even though ‘new clients’ on average received larger loans, it was ‘old clients’ who received greater benefits. ‘Old clients’ on average had earned higher monthly incomes than the ‘new clients’. The results of the regression suggest that membership duration in the programme is an important determinant of assets ownership, the level of spending on a child’s education, and improvements in clients’ businesses. In all these areas, old members of the programme were seen to be more likely to have received greater benefits. In this, these findings largely concur with most others in the literature in suggesting a role for MFIs in the alleviation of poverty.

We found that the provision of financial services by a SAT has improved the life of its beneficiaries in employment creation to generate regular income, spend on children’s education and increase their asset ownership. This research has provided adequate evidence in the various survey questions that we administered to suggest that ‘long-time borrowers’ became better off than those with less exposure to affordable credit. There is enough evidence to show from the findings that the provision of financial services by the Sinapi Aba Trust has helped to improve the life of its customers in Ghana. The study has detailed how clients benefited from credit provided by the institution. The success chalked up here could be a good guide, not only for Ghana, but also for the providers of financial services to the poor everywhere.

EFFECTS OF DEBT FORGIVENESS TOWARDS ECONOMIC EQUILIBRIUM: SOLUTIONS TO CRISES

Abdulla Galadari, Massachusetts Institute of Technology / Masdar Institute

ABSTRACT

This paper analyzes the impact of debt forgiveness on economic equilibrium. Since the root cause of an economic crisis is debt, eradicating the root may solve the problem. However, it does not prevent future crises from occurring. It is found that debt relief in a global scale can help reach economic equilibrium, but there are challenges to its practicality due to behavioural economics.

INTRODUCTION

Imagine someone takes a twenty year loan. The amount of that loan is beyond the total income that the person can make in twenty years. Economists and finance professionals have a terminology for this kind of loan. They call it subprime. Now imagine the whole world taking a twenty year loan beyond the global production in twenty years. It does not require an economist to determine that there is something intrinsically wrong in this equation. There also exists a technical terminology for this type of loan. It is called mass hysteria.

In the outset of any economic crisis, immediately professionals and academics attempt to find solutions. To find solutions, they instantly look into the root causes of the economic crisis. Understanding the root cause allows them to understand the underlying disease that is affecting them. As any human disease, there are two main types of treatments. There are treatments of the symptoms and there are treatments for the underlying cause. Sometimes both of those treatments simultaneously are necessary to ensure the well-being of any patient. Similarly, the economic cancer that has spread throughout the world needs to be treated for its symptoms, as well as its root underlying causes.

There have been many proposals by economists, bankers, and world leaders on solving the economic crisis. Roles of the central banks and financial regulations have been pointed out as some of the issues that need to be tackled to solve the economic crisis (Fang, Hasan, and Mester 2011). However, if any of them actually works, then the crisis would have been solved already. Many of those solutions have actually eased the disease and possibly restricted the growth and spread of this cancer, but the cancer has not been fully eradicated and there is a high risk of recurrence.

This paper proposes a very different kind of solution. It hypothesizes that the crisis remains because global institutions are indebted to each other. Each institution has to pay its creditors. In order to pay its creditors, it must first receive its money from its own debtors. Its debtors must receive from its own debtors and so forth. The chain seems to be unending creating a very vicious cycle. Every institution attempts to take away the lifeline of its debtors as its own creditors attempt to squeeze out its lifeline. This causes a very unhealthy economy. An economy where almost every institution gets its credit ratings cut, only adding to the misery that already exists in this nightmare.

Now imagine the chain is cut, bringing a halt to this vicious cycle. The cycle is like the Wheel of Samsara. As every account payable from an institution is an account receivable to another, the debt is reborn as it passes through this cycle of suffering. Imagine this wheel can stop and the chain broken, would it bring Nirvana to the economy? The only possible way for this vicious cycle of suffering to stop

is through forgiveness of debts. If every institution forgives every other, then the crisis disappears in a blink of an eye, as the chain is broken and the wheel stops. To cure the economic cancer, it would require surgical removal. Nobody would say that it is not a painful procedure, but it is a treatment and a possible cure to the global financial crisis.

HUMPTY DUMPTY'S GREAT FALL

During the Great Depression of the 1930s, governments did not intervene with the market and the economy. There were no bailouts as the ones we see today. For that reason, the economy dipped significantly. With the latest economic crisis, governments have intervened in an attempt to ease the market's freefall. The major resolutions provided by governments are threefold, financial bailouts, economic stimuli, and austerities. Taylor (2009) argues that the current economic crisis did not deteriorate simply because the US government refused to bail out Lehman Brothers, but it was the market's uncertainty and perception of when and how the government would implement bailout packages, such as that made to AIG few days later. According to Taylor, the uncertainties surrounding the Troubled Asset Relief Program (TARP) seem to have dramatically changed the market's perception on the economy.

As there are economists against government interventions, there are those for it. After all, when compared with the Great Depression, it seemed obvious that the government had to take some sort of action, unless it would not mind an economic depression. Some still argue that the government's inaction with Lehman Brothers fueled the situation. Acharya et al. (2009) do not only outline the importance of government intervention, but also provide a systematic procedure of when and how government intervention is to be implemented.

More than four years have passed since Lehman Brothers filed for bankruptcy. Not only has a domino effect occurred, but also confidence in the market was extinguished, causing a panic by the general public, which only fueled the problem even further. Iceland's three main banks, which account for all of the country's banking system failed about a month later (Danielsson 2009). For more than four years and many bailouts later, the European Union continues to struggle in controlling the economic crisis that swept the continent and the world. Struggling economies within the EU, such as Greece, Ireland, Italy, Spain, and Portugal brought a new understanding to the world of economics. They brought an understanding of how banks and sovereign risks have become interdependent on each other that they can no longer be separated, bringing in future threatening challenges to the economy of the EU (Barth, Prabhavivadhana, and Yun 2012). It is something when private institutions fail. However, when sovereign debt reaches an uneasy crisis, such as those sweeping Europe, then it becomes evident that government failures only deepen the economic separation with other members of the eurozone (Dias 2012).

Although the Asian markets experienced a delay in the effects of the global economic crisis, when compared to the US and Europe, they have recently started to feel the pressure. Noteworthy to state, Asia had its own financial crisis in the late 1990s. Consequently, its banking policies are more regulated since early 2000s from the lessons learnt of their financial crisis a decade earlier (Filardo 2011). Hence, as it recently only recovered from a financial crisis, then it is not surprising that it did not feel the great impact of the current global economic crisis. Nonetheless, that does not mean it is immune. The effect is cushioned and it lies towards the end of the domino pieces. China has a great export industry that was driven by US and European consumption in the pre-crisis era. China enjoyed a great trade surplus at the time, requiring less debt to accumulate at the time for its own growth and development. However, as demand for products have significantly been cut, then the Chinese economy would no longer grow at the same rate, and possibly bring about imbalance to the economy (Lardy 2011).

The domino pieces are only starting to gently brush over Asia. Another challenge to China has now become its unsustainable labour market, as it has reached the Lewis turning point (Cai and Du 2011).

Hence, not only is the Chinese economy getting affected by low international demand for Chinese exports, but it is also getting into economic constraints domestically.

Obviously, it seems that the domino effect of the economic crisis is still cascading down. Other issues that influence the economic crisis such as downgrading credit ratings also play a negative role in this vicious economic cycle. To offset the greater risks, it makes financing more expensive to get liquidity into economies that need it the most. Already those economies are struggling with liquidity. Downgrading the credit rating increases the interest rates on their debts making the economy sink even further. Gärtner, Griesbach, and Jung (2011) have shown that credit rating downgrades may only serve a self-fulfilling prophecy that can eventually drag healthy economies towards default.

WHO ENDS UP WITH THE MONEY?

The real situation in the economy may be simplified in few words. Every institution is indebted to others. Every institution needs to pay back its creditors, but it can only do so if its debtors pay them. The creditors themselves are indebted to other creditors and are waiting for their debtors to pay them as well. If that is the case with every institution, so who actually gets to keep the money?

The reason every institution is seeking to get paid by its debtors is such that they can pay their own creditors. Hence, the money is simply transferred from one debtor to a creditor. The creditor is also a debtor to its creditors. The money continues to be transferred from one account to another. However, where does it stop? Who ends up keeping the money at the very end of the line? Nobody keeps the money, because it is not a line, but a cycle. The money simply moves within that cycle endlessly.

If the main problem of the economic crisis is debt, then the eradication of debt from the economy solves the crisis. Since everyone is indebted to others, then everyone is part of this vicious cycle. The surgical removal of the economic cancer spreading globally is simple. Debt must be eradicated. The easiest and quickest way to eradicate debt is by forgiving the debt. Imagine everybody forgives everyone else's debts. Where would the crisis be?

Though it may seem irrational, it must be remembered that at the end nobody gets to keep the money anyways. It simply moves within the cycle endlessly. Therefore, if the debts are forgiven, then also nobody gets to keep the money. The final result is still the same. There is no money to keep by anybody. However, at least, the crisis would be solved. The crisis can be solved with a blink of an eye through the forgiveness of the debts. Instantly, the crisis ceases to exist. The chain is broken and the cycle stops. Everybody is running after money that they would not be keeping anyways. Therefore, it should not be difficult to forgive the debts, since nobody is actually keeping the money.

Many institutions are writing off bad debts. There also exists cross-national sovereign debt forgiveness of many developing nations. Therefore, this is not a strange procedure within the economy. The difference is that it needs to be done on a macrolevel. All debts need to be written off, as everyone forgives everyone else's debts.

PRACTICALITY OF DEBT FORGIVENESS

Bird and Milne (2003) argue that debt relief may not be an effective stimulus to low-income countries. They state that debt relief to low-income countries would not stimulate the nation's economic growth, because it will have little impact on future resource flows. However, the purpose of debt forgiveness as outlined in this paper is neither poverty reduction nor economic growth. The sole purpose for the proposal in this paper is to solve the crisis bringing a halt to the vicious economic cycle.

Some may argue that not all creditors are equal. There are creditors with larger deficits than others, as there are those with surplus, who would probably keep part of the money. Nonetheless, given the distress in the world economy and the interest rates, the debts do not decrease over time. When debtors default, then the creditors would anyways not receive the full money owed to them. Therefore, the end result would still be the same. Again, the only difference is that it brings the vicious cycle to a complete stop, allowing the world's economies to start afresh instead of entering a state of panic causing civil unrests that further drain nations from their resources.

Debts may cause tensions and distress within a nation. Menzies (2004) provides an interesting game theory analysis of debt forgiveness in conflict-affected countries. He shows that there is connectivity between education, health, peace, and appeasement of foreign creditors, and that they are all conflicting goals. He argues that debt forgiveness can positively influence peace, as there is less tension from appeasing foreign creditors. With the attainment of peace, there would be fewer resources wasted and more invested. Hence, even if the argument that debt forgiveness would not stimulate the economy is true, it does at least seem to indirectly have positive influence in conflict-affected poor nations. Not only that, but it would also significantly reduce the amount of expenditures on security due to civil unrest.

The indebted nation does not want to have civil unrest due to paying off its debts. Creditors of the nation also would not want to see civil unrest, because that could mean that the political pressure exerted may avoid the repayment of the debts and also as more expenditure is made towards security unnecessarily, then the less liquidity the nation would have to repay its debts.

There are Four Noble Truths for the economic crisis and the solution to the economic crisis.

1. The economy is in a crisis.
2. The origin of the economic crisis is debt.
3. The cessation of the economic crisis is attainable.
4. The path to cessation of the economic crisis is by eradicating its origin through forgiveness of debts.

Some may question the practicality of debt forgiveness. Debt relief is not an innovation. It has always existed in economics. Writing off bad debts is not something new. It has existed from the dawn of bankruptcies and defaults. It is always happening in the microlevel. Whenever defaults and bankruptcies occur in the microlevel, then bad debts are written off. The global economic crisis is due to bankruptcies and defaults in the macrolevel. Therefore, whenever they occur in the macrolevel, the bad debts need to also be written off once and for all, through universal debt forgiveness.

This idea is not new. A trend is emerging on debt forgiveness. Cline (2011) states that many observers are concluding that Greece is insolvent rather than illiquid, and in need of major debt forgiveness. The 50% write off on debt from private holders recently implemented in Greece is a form of debt forgiveness. Hence, debt forgiveness is an inevitable solution to nations struggling with the crisis.

Darvas, Pisani-Ferry, and Sapir (2011) have also argued the essentiality of debt forgiveness in the case of Greece, though they limited the forgiveness to 30% write off, based on more optimistic growth assumptions. Seck (2010) has illustrated that debt forgiveness have been effective in the past to economies with tight liquidity in sub-Saharan African nations. They show that debt forgiveness have given the nations two major advantages by removing the future costs of servicing the debts and reducing the financial uncertainty. In other words, if one of the major ingredients to an economic crisis is uncertainty and confidence level of the market, then universal debt forgiveness removes the crisis and all the catalysts that worsen it. If this has been proven to work for the best in poor nations, then it may be extrapolated to include the global community.

Gunter, Rahman, and Wodon (2008) have carefully studied the inequity of debt relief distribution among donor and recipient countries. However, their findings are based on existing conditions and

categorizations of world economies that dictate the type of debt relief and their conditions between donor, gracious creditor, and recipient countries.

Other forms of debt relief also exist, ensuring the well-being of both creditors and debtors. Switzerland established a Swiss Debt Reduction Facility (SDRF) in 1991 as a form of a debt reduction initiative (Buckley 2009). The SDRF piloted debt-for-development conversions, where debtors are required to use part of the debt forgiven as capital for development. Italy and France have implemented similar debt relief programs. Germany has a similar program, which is debt-for-nature, as part of environmental reforms in indebted countries. Norway is also a leader in debt relief programs. Norway has actually pioneered debt relief programs for illegitimate debt that is lent for irresponsible purposes that are not for the best interest of the debtors. When the US strongly argued the total cancellation of Iraqi debts to the Paris Club creditors in the aftermath of the Iraq War, France and Germany insisted that the US supports the Heavily Indebted Poor Countries (HIPC) initiatives. Buckley (2008) has illustrated that the global financial crisis may be solved through debt-for-development programs. Therefore, practicality or mechanisms already exist.

De Grauwe (2011) has brought forth evidence that imposing punishment approach for managing the economic crisis within the eurozone is detrimental to all those involved, both the creditors and debtors. With the threat of punishment comes uncertainty in the market. With uncertainty, there is lower confidence level. With lower confidence level, the crisis delves deeper into the abyss. Essentially, there needs to be room for forgiveness.

Lei, Tucker, and Vesely (2009) had done an experiment comparing debt forgiveness and debt buyback. They have shown that although debt forgiveness is an effective tool, it reduces the overall efficiency due to a paradox. Krugman (1988) and Sachs (1989) state that when a poor nation receives debt relief, it loses credibility for future loans. Thence, it would forgo profitable development projects due to the lack of resources. Nonetheless, this does not contradict this paper with the goal and aim to propose a solution for the economic crisis, and not challenges of economic growth.

Europe already has the basic mechanism in their laws for debt forgiveness programs. Since the basic ingredients for the laws and mechanisms already exist in some form, then an amendment or legislating new reforms for universal debt forgiveness is practical. Debt forgiveness has proven to be effective on its implementation with poor countries. It has been found to be practical and a factor for peace. The real argument in saving the world economic crisis today is no longer the question of the practicality of debt forgiveness, but the impracticality of not forgiving debts. Nonetheless, the main problem arises in debt forgiveness is the tendency that debtors would not learn from their mistake and would not take future responsibility in the world of economic behaviour.

CONCLUSION

As all institutions are indebted to each other, everyone is in distress. Everybody is under pressure of paying off their loans and extend their pressure to their debtors to repay their loans, such that they can pay their creditors. Everyone in the equation is both a debtor and a creditor. It is a vicious cycle on an economic wheel that continues forever. This wheel is causing a crisis. This wheel illustrates the suffering of the global economy as it stands today. Since the origin of the crisis is debt, then by removing debt, the crisis disappears instantly. The crisis exists solely due to debt. Hence, the only way out of the crisis is by removing debt. Therefore, the only solution to the crisis is the forgiveness of debts. If everybody forgives the debts of each other, then the ingredient that creates the crisis is surgically removed, curing the economic cancer in the world. However, more research is required in identifying the economic equilibrium mathematically if this concept is theoretically possible.

Since everybody is trying to get money to pay off debts, nobody ends up keeping the money anyways. Therefore, there is nothing essentially lost by forgiving debts. A universal forgiveness of debts is the only practical solution that will bring liberation to the world's economy, as the economic crisis attains Moksha and plunges into Nirvana.

THE RELATIONSHIP OF BRAND ASSOCIATION AND LOYALTY: AN EMPIRICAL STUDY FOR RETAIL BANKING IN INDIA

Dhananjay Bapat, National Institute of Bank Management, Pune, India,

ABSTRACT

The study investigates the relationship between brand association such as safe bank, quality of services, ATM services, innovative bank, complete services, well managed bank, convenient timings, deposit rates, lending rates, no hidden charges and polite staff, and loyalty for retail banking in India. The author considered primary bank as a measure of loyalty. The data for the study was collected by utilizing a short questionnaire containing a specific questions relating to brand association for a primary bank. Respondents were contacted in a bank branch in India. Chi Square analysis was used to assess the relationship between brand associations and loyalty. During the study, demographics of the respondents were also captured. Majority of respondents considered customer service as the key factor in selecting a bank. The findings indicate that there is strong relationship between brand associations such as, ATM services and convenient timing, and brand loyalty. Among demographic factors, age was found to have relationship with primary bank.

The findings offer great value to marketers. Marketers strive to achieve objective of brand loyalty from their customers. There are various brand associations that are valued by customers. It is important for a marketer to figure out the brand associations which results in brand loyalty. If the study is carried out for large sample, it will also help to know which brand associations, leading to brand loyalty, is assigned to particular customer segment. A separate study for corporate and SME customers will also offer useful insights to the bank marketer.

KEYWORDS: Brand Associations, Brand Loyalty, Primary Bank, ATM Services, Convenient Timings,

INTRODUCTION

At a time of increasing deregulation, intensifying competition and evolving customers' demands, customer loyalty for a bank is difficult to achieve. Customer loyalty is the ultimate objective for a marketer. Customers associate the brand brands for certain reasons. These can be considered as brand associations which may be in the form of unique benefits and offerings. Understanding and identifying customer's perception play an important role in bank selection. While the chain of events that leads to brand loyalty runs through all the operation of a bank, it begins with understanding how certain brand associations lead to increased loyalty. Arguably, finding relationship between brand associations and loyalty will be of great help to the marketer. Specifically, very little is known about whether there is a relationship between brand association and loyalty. Against this backdrop, the current study attempts to address fundamental questions: Is there any relationship between brand associations and loyalty? Which brand association exhibit relationship with brand loyalty?

Survey of bank customers in a bank branch in India serve as the setting of the current study that investigates these issues. Various loyalty measures have been used in different industry. Our study focuses on primary bank as it is perceived to be a loyalty measure by a customer. Banks are keen that customers consider their bank as a primary bank. Customers considering a given bank as primary bank offer lot of advantages to banks. Primary bank is not readily available in bank's database, it is captured during customer interactions. Our study attempts to capture the brand associations that are valued by

primary bank customer. The paper concludes with discussion of the results, their implications, limitation of the study and suggestions for future research.

LITERATURE REVIEW

Previous Studies have identified the benefits of customer retention to an organization (Colgate, et al 1996.; Reichheld and Sasser, 1990; Storbacka et al. 1994). Customer retention can be tracked by using different measures. One school of thought assumes that the longer the customer stays with an organization, higher is the loyalty (Reichheld and Sasser 1990). Other schools of thought give importance to the increased attention that customer provides to a service provider. One such measure is whether customer considers the bank as primary bank. In fact, consumer research reveals that consumers keep an average 3.4 financial products with the institution they consider as primary bank, compared to only 1.8 products with institutions that are considered secondary. Research indicates that consumers keep 80 percent of their total savings deposit with primary bank (McAdam and Nagarkatte 2004). This may be in the form of customer treating the bank as primary bank. Primary bank is the bank where customer conducts major transactions. There are several advantages of adopting retention strategies. Research findings also suggest that the costs of customer retention activities are less than the costs of acquiring new customers. For example, Rust and Zahorik (1993) argue that financial implications of attracting new customers may be five times as costly as keeping existing customers. Relationship is established between increased customer satisfaction and profitability, indicating that attainable increase in satisfaction dramatically improves profitability (Hallowell 1996). Research has also shown that longevity does not automatically leads to profitability (Colgate, Stewart and Kinsella, 1996; Beckett et al. 2000) indicate that in some instances, customers appear to remain loyal even though they hold less favorable views toward these service providers. Banks spend more efforts in creating brand image as there is very little differentiation that it offers to the financial products. Banks, therefore, try to create differentiation in areas that are important to customers. Clearly, there are compelling reasons for bank management to consider factors that might increase retention rates. There is substantial evidence which supports retention efforts by banks (Marple and Zimmerman 1999; Fisher 2001). Factors leading to customer retention have been investigated and researchers have identified many retention measures.

In a competitive market, brands offer scope for differentiation of the services (Parasuraman, 1997). In the long run, branding, targeting and positioning would be much more effective if the supplier had some perceptible advantage to both intermediaries and customers (Baker, 1993). Banks strive to create their basic services with additional and potential service features and value in order to create a sustainable competitive advantage (Chang, Chan, and Leck 1997). The most likely way to retain customers and improve profitability is by adding value via a strategy of differentiation while increasing margins through higher prices (Baker 1993). A positive brand image is created by marketing programme that link strong, favorable and unique associations to the brand (Keller 2006). To create the differential response, it is important that some of the strongly held brand associations are not only favorable but also unique. It is, therefore, important to identify brand associations in a given situation. Furthermore, research also indicates that financial services firms attempt to actively target consumer segments by integrating service quality, brand loyalty, and customer retention strategies (Ennew and Binks, 1996).

We look at various factors that influence customers to select a bank and these factors are considered as brand associations. In financial services, customer service plays an important factor in creating a preference for a customer. It is well documented in a study by Leeds (1992) that forty per cent of customers switched banks because of poor customer service. The study also showed that increased use of service quality measures and professional behaviour improved customer satisfaction. Customer choice for a bank depends on various other factors. A study by Erdener Kaynak, and Talha D. Harcar (2005) revealed that banks were evaluated more positively by customers in areas such as extra services offered by bank, image of the bank and convenience of the bank. Huu Phuong Ta and Kar Yin Har (2000)

indicated that undergraduates place greater emphasis on the pricing and product dimensions of bank services. Carolyn, Hill and Rakowska (1996) indicates that most important factors influencing selection of a bank are reputation, price and service. Bloemer, Ko de and Pascal (1998) investigate how image, perceived service quality, and satisfaction determine loyalty in retail banking. Laroche et al. (1976) reveals that about 90 per cent of the respondents bank at the branch nearest to either home or place of work. Convenience, in terms of location, is found to be the single most factor for selecting a bank.

Objectives of the Study

The paper attempts to identify the relationship between bank loyalty and brand associations of the primary bank, namely, safe bank, salary account, location, quality, service oriented, availability and location of ATM, innovative bank, offering complete services, well managed bank, timings, deposit and lending rates, no hidden charges and polite staff. Although there are several measures available for tracking loyalty, we considered primary bank because primary bank plays an important role in customer's perceived relationship with the bank branch. Whether a customer considers primary bank can only be obtained by asking the respondent while conducting a survey. Primary bank has been referred as important loyalty measure in literature pertaining to retail banking. The study also seeks to establish relationship between primary bank and demographic factors. The objective aims to draw implications for further research and practice.

RESEARCH METHODOLOGY

A descriptive research design, involving samples collected from the branch, was used for the study. Prior to the study, a pilot study was conducted with the bank branch for refinement. As the study was based on a survey of customers, a structured questionnaire was used as a research instrument. Demographic characteristics such as age, gender and occupation was captured for One hundred and forty respondents. During the survey, respondents were asked whether they consider the branch as a primary bank. The Likert type three point scale (3 levels-- disagree, can't say and agree) was used for capturing brand association of their primary bank Three points scale is considered suitable for multi dimensional analysis (Cooper and Schindler 2003; Aaker et al. 2002).

Sample Profile

As indicated from the following table, majority of the respondents were Students (23.6 %), followed by senior officers (18.6 %), officers (10 %) and retired (10 %).

Table 1: Occupation Breakup

	Frequency	Percent
Businessman	15	10.7
Unskilled	6	4.3
Petty Trader	6	4.3
Retired	14	10.0
Student	33	23.6
Housewife	7	5.0
Farmer	3	2.1
Self-Employed	10	7.1
Shop Owner	3	2.1
Supervisory	3	2.1
Senior Officer	26	18.6
Officer	14	10.0
Total	140	100.0

Age

As indicated from the following Table 2, majority of the respondents were in the category of age group of 20-24 (30 %), followed by 35-44 (20.7 %) and age group of 55 and above (10.7 %).

Table 2: Age Break up

Age Type	Frequency	Percent
Less than 19	15	10.7
20-24	42	30.0
25-34	23	16.4
35-44	29	20.7
45-54	6	4.3
55+	25	17.9
Total	140	100.0

Gender

As indicated in the following Table 3, male constituted 92.7 % of the total samples.

Table 3: Gender Breakup

Gender Type	Frequency	Percent
Male	130	92.9
Female	10	7.1
Total	140	100.0

Education

As indicated in the following Table 4, respondents who have passed SSC (matriculate exam) but not a graduate constituted about 43 % of the total samples, which was followed by graduate and post graduate (29 %) and professional graduate and post graduate (21 %).

Table 4: Education Breakup

Education Type	Frequency	Percent
Graduate & PG (Professional)	30	21.4
Graduate & PG	40	28.6
SSC but Not Graduate	60	42.9
Schooling 5-9	9	6.4
Schooling upto 4	1	.7
Total	140	100.0

During the study, reasons for bank selection were also captured. Based on the data analysis, it has been found that 77 % of the respondents considered service to be a prime factor in bank selection. Respondents attached lesser importance to factors such as safety (8.6 %), convenience (6.4 %) and better rates (4.3 %).

Data Analysis.

The results of the analysis are provided in Annexure-I, on which our analysis is based. The data in Annexure contains cross tabs, which relates to primary bank and brand association of a primary bank. Chi Square is conducted to ascertain whether any relationship exists between the above variables. In case there is a relationship, the findings indicate the type of relationship. The summary is tabulated with a summary of conclusions in Table 5.

Table 5: Primary Bank and Brand Associations – Chi Square Analysis

Brand Associations/ Demographic factors	Significance level at p	Conclusions (Relationship with Primary Bank)
Safe Bank	Can not be calculated	All respondents considered primary bank as safe bank irrespective of the fact whether the bank was considered as primary bank
Convenience (Location)	0.223	Relationship does not exist. Majority agreed that their primary bank offers convenience in terms of location.
Quality of Service	0.054	Relationship is not significant at 95 % confidence. It can be considered as boundary situation.
ATM Services	0.000	Relationship exists. Phi value of 0.574 is more than 0.3, we can say that the relationship is strong.
Innovative Bank	0.964	Relationship does not exist.
Complete Services	0.007	Relationship exists. As the Phi value is less than 0.3 (0.266), relationship can be considered as moderate.
Well Managed bank	0.568	Relationship does not exist. Majority of respondents agree that their primary bank is a well managed bank.
Convenient Timings	0.002	Relationship exists. The relationship can be considered as moderate at phi value of 0.30
Deposit Rates	0.109	Relationship does not exist.
Lending Rates	0.588	Relationship does not exist.
No Hidden Charges	0.589	Relationship does not exist.
Polite Staff	0.169	Relationship does not exist.
Age	0.000	Relationship Exists. The relationship can be considered as strong as phi value is 0.440.
Education	0.709	Relationship does not exist.
Occupation	0.0708	Relationship is not significant at 95 % confidence level.

The results of correlation indicate strong positive correlation between the following variable:

1. Well managed bank – Convenient location
2. Convenient timing – Convenient location
3. Complete Services-- Quality of service
4. Well managed bank- Quality of service
5. Deposit Rates- Quality of services
6. Lending rates- Quality of services
7. Innovative Bank- Complete Services
8. Innovative Bank- Well managed bank
9. Complete Services- Deposit Rate
10. Complete Services- No Hidden Charges
11. Well managed bank- Convenient timings
12. Well managed bank- Lending rates
13. Well managed bank- Polite staff
14. Well managed bank- No hidden charges
15. Deposit rates- Lending rates
16. Lending rates- Polite staff

CONCLUSIONS, MANAGERIAL IMPLICATIONS AND LIMITATIONS

Earlier studies focused on the factors governing the choice of a bank. There were varying results obtained for the bank selection factors. Our study considered a brand association which is an attribute or benefit that differentiates a brand from the competing brands. For example, certain bank brands are regarded high on trust by customers while other bank brands are regarded high on ATMs. The linkages of these brand

associations to the benefit that customers seek through purchase have been studied. A variety of brand associations were shown to moderate the effect to bank selection. Marketers, based on identification of those factors, continue to give importance to those factors that are highly valued by customers while selecting a bank. The ultimate goal of marketers is to create brand loyalty. Many measures are available for tracking brand loyalty. Our study considered primary bank because consumers give more importance to primary bank. Since information regarding primary bank is available from customers, the study captured the customers' perceptions regarding primary bank. There are numerous advantages of customers treating a given bank brand as primary bank. Customers not only keep more deposits in primary bank but they also buy more products from the primary bank. Marketers strive to ensure that higher percentage of customers treat their bank as primary bank. It is, therefore, important for marketer to relate primary bank with the brand associations that are valued by him. Our study attempts to find out whether any relationship exists between brand associations and brand loyalty in the form of primary bank. Although there are different brand associations which are valued by the customer, it is important for the marketer to figure out the brand associations that leads to increase in loyalty. Other brand associations may fulfill the necessary condition for customer's relation with the bank brand.

The study indicated that there is strong relationship between brand loyalty and brand associations such as, ATM services and convenient timing. Findings of the study indicated that more number of customers give more importance to customer service while selecting a bank. It has been observed that customers keep multiple bank accounts. With the increase in competition, this trend is pronounced. In such a situation, it is advantageous to a marketer if more and more customers treat their bank as primary bank.

Our research did not examine whether these brand associations are related to brand loyalty in other bank branches. Further coverage of the study and comparison between banks would be helpful. It is possible that based on different market segments, a particular market segment will value a given brand association in terms of brand loyalty while other market segments will signify relationship between brand associations and loyalty. Indeed, an important direction for further research is to examine the brand associations that results in brand loyalty for various customer segments. The present study was limited to retail customers who visited bank branches. There is possibility that similar study for different customer groups can add more value to banks.

HOW DOES FOREIGN DIRECT INVESTMENT AFFECT ECONOMIC GROWTH OF ARAB COUNTRIES?

Nasser Elkanj, The American University of the Middle East
Chadi Yaacoub, The American University of the Middle East
Mohamad Tararbay, The American University of the Middle East

ABSTRACT

This paper examines the growing importance of foreign direct investment (FDI) in Arab region as a source of financing for economic development. The study considers the Arab countries as sub-regional groups, Gulf countries (GCC), Arab Maghreb Union (AMU), and Arab Mashreq countries. Using panel data fixed effects; the study investigates the relationship between FDI and the economic growth in the Arab region, covering period 1991-2011. The study also investigates the channels through which it may be benefiting the economy. Our study finds that FDI have a positive effect on economic growth in Arab region. However, some other factors such as openness surpass the impact of FDI on economic growth.

JEL: F43, O11, O4

KEYWORDS: Foreign Direct Investment (FDI), Economic Growth, Sub-Arab economic group.

INTRODUCTION

Foreign Direct investment (FDI) has been studied worldwide due to its potential effects on the host economy. One of the most studied effects in development economics is the relation between economic growth and FDI. Despite the huge research, previous studies have produced conflicting evidence about this relation. For example a study by Blomstrom (1996) examined the relation between FDI and economic growth during the period 1960 to 1985 in 78 developing countries and found a significant positive impact for FDI on per capita income growth. Another study by Bashir (1998) examined FDI in MENA region (Middle East and North Africa) for the period 1970 to 1990 and found statistically a positive relation between FDI and growth. Similar results were reached by De Mello (1999) as he examined the relation between FDI and growth using both time series and panel data. Another study by Gao (2001) studies the same relation using data from all countries using a simple log linear equation with cross-country method. The study concludes a positive relation with positive significant coefficient. A study by Lensink and Morrissey (2001) used cross-section and panel data for the period 1975-1997 in Uganda and reached a positive relation between FDI and growth. Eller (2005) analysed the influence of FDI and recognized FDI as an important element in the solution of problem local capital scarcity and low productivity on the host country for less developed countries.

Some other studies have found a doubtful relation between FDI and growth. For example, a study by Fry (1992) using pooled time series cross-section during the period 1966-1988 for 16 developing countries concluded that FDI has a negative impact on savings and does not exert a significant effect on the growth rate. A study by Carkovic and Levine (2002) studied the relation between FDI and growth using data from the IMF and World Bank during the period of 1960-1995. They found that the FDI does not have a positive robust effect on economic growth. Another study by Hassan (2004) on the relation between FDI and growth for 95 developed and developing countries for the period of 1980-2001, found no significant

relation between FDI and growth. A study by Lipsey (2002) on the previous FDI studies have found that almost all studies where there is a positive relation between FDI and growth in specific periods or among specific groups cannot be universal as there are circumstances, periods and countries where FDI has insignificant relation with growth. In this paper, we will be focusing on the relationship between FDI and growth. We will question the association between FDI and economic growth in a sample of six different countries (4 countries from the GCC: UAE, Saudi Arabia, Kuwait and Qatar; 2 non GCC countries: Egypt and Morocco).

The data set we use for the empirical analysis will be a panel of annual data from 1991 to 2011 for those six countries. FDI data are obtained from UNCTAD's FDI online database.

$$g_{i,t} = \beta_0 + \beta_1(FDI_{i,t}) + \beta_2(O_{t-1}) + \beta_3(INF_t) + \beta_5(H_{t-1}) + \beta_4DUM + \varepsilon_{i,t}$$

Where g is the growth rate of per capita GDP. FDI is the foreign direct investment, O is openness, INF is inflation, H is the initial level of human capital and DUM is a dummy variable for oil producing countries. Openness of the trade is measured as the ratio of imports and exports to GDP. As for human capital, it is the average years of secondary schooling for the population above 25 years. The dummy variable is represented by 1 if the country is oil exporter and 0 if not.

Table 1: The Effect of FDI on Economic Growth

Variable	(1) Pooled	(2) Fixed Effects
Foreign Direct Investment	0.007 (1.62)	0.004 (1.57)
Openness to trade	0.0003 (3.24)	0.0005 (2.89)
Inflation	-0.016 (-4.12)	-0.007 (-2.81)
Human Capital	0.006 (2.15)	4.941 (1.62)
DUM1	0.0009 1.81	0.0004 1.63
Constant	0.125	0.154
Observations	121	121
Countries	6	6
Years	1991-2011	1991-2011
R^2	0.1844	0.2126

The main purpose behind this paper is to study the relation between FDI and growth and to test empirically this relation with data collected from six countries representing GCC, Arab Mashreq and Arab Maghreb. The empirical analysis is performed using panelled and panelled fixed that cover the period from 1991 to 2011. The results obtained in this paper conclude that FDI have positive impact on economic growth but statistically insignificant at 5 percent level. This mean that there is a link between FDI and growth but tends to be weak in those countries. The results also show that other factors such as openness to trade may have a larger effect on growth when compared to FDI.

NON-FINANCIAL CORPORATE DEBT

Vratislav Izak, University of Economics, Prague

ABSTRACT

In the paper we analyze the development of non-financial corporate debt (measured as liabilities minus shares and other equities) in the time period 1995-2010 for 17 European OECD countries (13 full-fledged market economies plus 4 postsocialist OECD members). To cater for the possibility of endogeneity of the right-hand variables we relate forward moving 2- and 3-year average of growth of real GDP per head with the contemporaneous right-hand variables. Descriptive statistics reveal that in the period the non-financial corporate debt was rising steadily. In the panel regressions (fixed effect models) the coefficients showing the impacts of this debt on GDP growth rate have had the sign minus and were highly statistically significant.

JEL : D9, H3, O4

KEYWORDS: non-financial corporate debt, economic growth, fixed effect models

INTRODUCTION

One of the hypotheses tested in the literature devoted to the development of debt is that private debt surges are recurrently antecedent to banking crises. Therefore, alongside the government indebtedness, one must take into account also the debts of private agents, especially those of households and non-financial corporations.

After the introduction, in the second section the brief literature overview is presented. The third section deals with data and descriptive statistics whereas the fourth section describes and evaluates the results of panel regressions.

LITERATURE REVIEW

The often discussed sustainability of public finances must tackle both the macroeconomic and sectoral levels. The sustainability positions of all the sectors are related to each other. See e.g. Burger (2003). According to Lequiller and Blades (2006) in national accounts a surplus run by one sector must be reflected as a deficit in one or more of the remaining sectors. Unsustainability may be shifted from governmental to another sector of the economy, e.g. household or corporate sector. Government runs the risk of indebtedness merely being „passed around“ between sectors. If this happens, indebtedness may never truly be addressed unless it is flushed out of the economy by means of a spate of bankruptcies in household and corporate sectors as described in Burger (2003) and Cecchetti, Mohanty and Zampoli (2011).

Kumar and Woo (2010), Ododekun (2001), Checherita and Rother (2010) and others explore the impact of high debt on long-run economic growth suggesting a negative impact of high debt on growth and tackling thresholds, non-linearities, endogeneity and a heap of subtle econometric problems. E.g. Checherita and Rother (2010) stress, for the 12 pooled euro-area countries, that for the debt-to-GDP ratio, turning point is roughly between 90 and 100% on average.

Having summarized the results of empirical literature we conclude that not only the indebtedness of the general government but also the debts of non-financial corporations are worth of the empirical investigation.

DATA AND DESCRIPTIVE STATISTICS

The source of data in this paper is represented mainly by detailed national accounts published regularly by OECD. Following OECD financial statistics we use 710 Financial balance sheets-consolidated and define non-financial corporate debt as liabilities minus shares, equity and financial derivatives as in SNA (2008, par. 22.104).

We have gathered data for the time period 1995-2010 for the sample of 17 european OECD countries. In the parentheses see cross identifiers used in panel analysis: Austria (AT), Belgium (BE), Germany (DE), Denmark (DK), Estonia (EE), Greece (EL), Spain (ES), Finland (FI), France (FR), Hungary (HU), Italy (IT), The Netherlands (NL), Norway (NO), Poland (PO), Portugal (PT), Sweden (SE), Slovakia (SK). According to Sala-i-Martin (1994) OECD countries converge to the same steady state because they appear to be a homogenous set of countries. Therefore using this relatively restricted cross-sectional sample helps mitigating the issue of heterogeneity with the caveat that 4 postsocialist countries exhibit still differences vis-a-vis other OECD member states in this sample.

Ratios of non-financial corporate debt on the GDP in current prices (%) reveal high indebtedness especially in Sweden, The Netherlands, Portugal and Slovakia (the mean over 100% of GDP), low indebtedness in Poland and Greece (?) and high fluctuations in Spain, Hungary, Sweden and Portugal. Looking at the development in time three facts stand out: a) long-term high indebtedness in the Netherlands (over 100% of GDP during the whole period); b) high increase in indebtedness after 2007 in the majority of OECD countries in our sample (first of all in Spain, Sweden, Denmark, Hungary, Italy and Norway); c) Slovakia as an outlier with a steady decreasing ratio.

PANEL REGRESSIONS

We write the growth regression as:

$$y_{it} = \alpha_i + \beta_{it} X_{it} + v_i + \eta_t + \varepsilon_{it} \quad (1)$$

y...growth rate of real GDP per head; α and β are regression coefficients; X_{it} is vector of independent variables (controls and debt-to-GDP ratio); ε_{it} is an unobservable error term; i, t are subscripts (country and time subscripts, respectively).

In the preferred fixed effect models (Hausman tests) α_i indicates that the intercepts of the seventeen countries may be different and we consider three cases: 1) the β_{it} are common across countries and periods; 2) the β_i coefficients are country specific; 3) the β_t coefficients are period specific. We have split the debt variable in the X_{it} into three groups (common regressors, country specific regressors and period specific regressors).

E.g. in the first case a 1 percentage point increase in debt-to- GDP ratio is associated with an approximately 7 basis point reduction in per head GDP growth rate when we use 2-year ahead averages. The coefficient is highly statistically significant ($t = -7,74$).

CONCLUSION

The basic estimation technique in this paper has been panel fixed effect models corrected for heteroscedasticity and autocorrelation. We have used also cross-section specific and period specific coefficients to gain a more profound look into the matter. The coefficients showing the impacts of corporate debt on GDP growth rate have had almost in all examined cases the sign minus and have been

highly statistically significant. In spite of the well known fact that correlation does not mean causation we conclude that in our sample and time period the increase in non-financial debt-to-GDP ratio has had a negative effect on economic growth.

BIOGRAPHY

Vratislav Izak is Professor of Public Finance at the University of Economics, Prague, Czech Republic. Previously he was employed at the Institute of Economics, Czechoslovak Academy of Science and in the Research department of the Czech National Bank. His research fields cover macroeconomics, monetary and fiscal policies. For several years he was a member of the International Institute of Public Finance.

CHANGING ROLES OF ACCOUNTANTS

Tatiana Antipova, Institute of Certified Specialists, Russia

ABSTRACT

Under the influence of globalization, an accounting professional must review its significance. One method to determine the role of accountants is to carry out their questionnaires. Based on a survey of public sector accountants and data from current accounting documents, tensions indicate that accounting practices are not necessarily in the line with declared accrual accounting norms. This paper shows the results of processing survey of government and public sector accountants in the two regions of the Russian Federation. The survey was carried on the same issues that were raised during questioning conducted by CIMA among commercial finance professionals in manufacturing, financial services, and wholesale and retail trades. The survey data in Russia compared with the survey results at the international level.

KEYWORDS: time reported, preferred recording bases, role of accountants.

INTRODUCTION

Singleton-Green points out “conventional theory and practice is ill-suited to the challenges of the modern environment, and that accounting practices and corporate behavior are inextricably connected with many allocative, distributive, social, and ecological problems of our era. From such concerns, a new literature is emerging that seeks to reformulate corporate, social, and political activity, and the theoretical and practical means by which we apprehend and affect that activity. The major decisions on accounting and its regulation are unavoidably political because they are government policy issues that affect the general welfare as well as the welfare of particular individuals and groups” (Singleton-Green B. 2010).

However, in their paper Van der Stede and Malone R. (2010) argue that accountants kept the books and assured that statutory requirements were met. Even as the role became more complex with innovative organisational models, a proliferation of regulations, and a glut of new financial instruments, the focus on the books remained. And those trends, according to which many professional accountants can manage risk at a high level of strategic management, have not yet found distribution in the area of budget accounting in Russia. It shows results of the survey are listed below. The idea of questioning was born as a result of the study materials provided by CIMA at the World Congress of Accountants in Kuala Lumpur in November 2010 (Van der Stede and Malone. 2010). CIMA has conducted an online survey in manufacturing, financial services, and wholesale and retail trade. They analyzed the results of research on the Anglo-Saxon markets (Australia, New Zealand, North America, United Kingdom) and Asia (China and India).

RESEARCH DESIGN

The survey covered 69 respondents, who were in training courses in the Russian Federation. Here are the results of the processing of questionnaires, filled with 36 respondents from Moscow and 33 respondents from the city of Arkhangelsk. In Moscow and Arkhangelsk government establishments' accountants were interviewed during December 2010.

Questionnaire is based upon the results of the survey conducted by Van der Stede and Malone (2010) in order to compare our results with the global trends. The questionnaire consists of questions on ranking the time allocation by accountants for the following activities: « accounting operations; external reporting; management accounting; management support; management information systems; other» (Van der Stede and Malone R. 2010, pg.2).

The questions were slightly changed in accordance with Russian conditions. But the bulk of the issues have not changed, and time allocation by type of activity was divided into:

- Accounting operations (processing of source documents, data loading to the computer, accounts receivables and payables, internal financial reports);
- External reporting (financial, fiscal and statistical reports, in particular, the interaction with the treasury or the credit institutions, financial risk management, including internal audit, compliance with regulations);
- Management accounting (preparation and interpretation of management accounting information, such as forecasting, budgeting, costing and cash flow management);
- Management support (identifying and analyzing strategic options, decision support, planning and tracking of key performance indicators, testing, strategic management accounting and business management);
- Management information systems (development, implementation and maintenance of management information systems);
- Other (personnel management, training and other activities).

In the questionnaire the additional questions have been added to ensure understanding of the principles and traditions of the Russian governmental accounting. It was also included two “hot” questions that reflect most discussion in the governmental accounting in Russia. The questions are: "What recording bases do you prefer?" And "Is it necessary to have value recognition criteria for the assets of the state establishments?" And also we have been interested in responses concerning the reasons of changing roles of accountants in recent years. To assess the changing role of accountants the following question has been asked in the questionnaire: «Reasons for the changing role of accountants in recent years: Legal requirements; Professional and ethical requirements of the self-regulating non-profit organizations; Requirements from employers; Other».

QUESTIONNAIRE RESULTS

The significance of each type of accounting work by state accountants is showed at Exhibit 1. Each type of work respondents scaled from 1 to 5, that corresponds to the importance of work identified in the questionnaire. As a result, the average score obtained from respondents has been calculated. In addition, the evaluation of the significance of the work was carried out from two perspectives: from the perspective of the current distribution (fact) and in terms of preferred (wish) of the distribution of the work. Comparison of the significance between the current and preferred distribution of work on five-point scale is shown at Figure 1.

Figure 1 shows that the preferences of Moscow accountants on the distribution of working hours do not differ much from the current state of affairs. According to the poll turns out that they have a job of their dreams. But during the discussible the response to this statement was either a smile or a denial. Apparently, the survey did not accurately reflect the true picture. Perhaps a survey should be conducted based upon the more explicit issues and in other settings. To do this, an in-depth study on how, where, and what questions to ask to get a picture close to reality. Comparison of the significance between the current and preferred distribution of work on five-point scale of Arkhangelsk accountants is shown at Figure 2.

Figure 1. How Arkhangelsk government accountants spend and prefer spend their time

Interest is the comparison of survey data on the actual timing of the government establishments' accountants of the two Russian cities: Moscow and Arkhangelsk. Comparing the actual distribution of working time accounting of government establishments on a scale of Moscow and Arkhangelsk Accountants shown at Figure 3.

Results of the comparison of survey data presented in Figure 3 show that the actual distribution of working time in the city of Arkhangelsk is slightly different from the actual distribution of working hours by type of work in Moscow. Perhaps more emphasis on external reporting in the city of Arkhangelsk (Arkhangelsk 4,5 vs. 3,4 in Moscow) is due to a lower degree of computerization of accounting in the peripheral regions of the Russian Federation. Accordingly, this fact is confirmed by the fact that the city of Arkhangelsk more time is required to participate in developing, implementing and maintaining systems, management information systems (1,4 in Arkhangelsk against 0,7 in Moscow).

Feature of Russian governmental accounting is that it should be organized in such a way as to cause the least possible complaints from the state financial control bodies. Therefore, the accountant's from government establishments are trying to keep a record strictly according to instructions. In addition, the respondents are accountants and government servants and on duty are bound to act within the legal framework. Accordingly, creativity or participation in strategic management is not foreseen in the existing regulations. Accountants informally during the courses and seminars of improving qualifications say that they might have something to offer for strategic planning, but only if they have a legal framework for doing it. As they continue, there is not enough time to think and to suggest. Most of the time is occupied with providing some documents, calculations, preparation and fulfilling the contracts. In addition, all information can be found at the accounts and accounting reports, but directors or managers usually do not understand accounting Figures and accountants need to translate from accounting language to business usual language. As one of the accountants say "Director doesn't understand it. He just says: I do not need your debit and credit. You write to me so that I understand where the money is". Such kind of verbal and written explanations takes a lot of time, and let no chance for the strategic thinking. And most of working time is occupied by compilation of various information, filling out certificates upon the request of the authorities, the process of contracting, procurement process. Therefore, the actual allocation of time in Russia is virtually not present in strategic management, information management and other activities.

The question "What recording bases do you prefer?" has been asked because currently in the normative regulation of the Russian budget accounting there is no concept of accrual accounting. Accrual basis in Russian governmental accounting is declared in the instructions for governmental accounting since 2006. However, in the budget legislation it has been positioned since 2010. Everyone has started to understand it by its own way. Therefore, in discussing the questionnaire results accountants said that the preferred

method is accrual base method only because it is stated in the instructions. The advantages of cash basis and recognize the majority of respondents in Arkhangelsk (55% - see Figure 5). When we asked "What recording bases do you prefer?" Moscow and Arkhagelsk government accountants responded as follows (Figure 5). That is, the majority of Moscow respondents (75%) prefer the accrual method for recognizing in accounting the revenues and expenses. A majority of Arkhangelsk respondents - cash basis (55%). The difference in survey results, probably due to the fact that author was held explanation of Archangelsk respondents about the use and benefits of the cash method before to the survey.

Question "Is it necessary to have value recognition criteria for fixed assets of state institutions?" was made because the Russian governmental accounting lacks value criteria and it is not expected to be used. This means that the fixed assets of all institutions are to be recognised with useful life of 12 months without any value criteria. That is all that is worth more than 1 kopecks (1 kopecks = 0,0002 € (to 11/12/2010)) and serves more than 12 months.

It is therefore an urgent need to introduce value criteria in order not to include in fixed assets less valuable items and then not to have problems with writing off these low-value, worn out or obsolete assets. But accountants are likely not aware that problems can be solved by writing off such a simple way - by setting the value criteria. And many of them (28% in Moscow and 12% in Arkhangelsk – see Figure 6) respond in the questionnaire as it is written in the Instruction on budget accounting - do not need the value criteria. Ranking of respondents' answers to the question about the value recognition criteria for fixed assets is shown in Figure 6. Thus, the majority of respondents (56% in Moscow against 85% in Arkhangelsk - Figure 6) - for the introduction of value recognition criteria for fixed assets. And it is also can be explained by the historical aspect. Earlier before, the budgetary institutions were using value recognition criteria in their accounting books. For example, from 2000 to 2005 there was the value criterion (Order of the Ministry of Finance of the Russian Federation of 30.12.1999 № 107n "On Approval of Instruction on accounting in budgetary establishments") in the amount of 5000 rubles. Thus, in 2000 - 2005, the fixed assets were recognized in the balance sheet if operation life of it was more than 12 months and with purchasing cost more than 5 000 rubles (5000 rub. = 122,16 € (to 11/12/2010)). Comparing the survey results in two Russian regions (Moscow and Arkhangelsk) on the assessment of the changing role of accountants (% of preferences) is presented in Figure 7.

Most respondents (58% and 67%) mentioned as the reason of the changing role of accountants the legal requirements. But the legal requirements for an accountant have not been changed for the last 14 years. Federal Law "On Accounting" was adopted in 1996 and since then has not been drastically changed. Apparently, the respondents had in mind the requirements of the Regulations for the budget accounting. Because these instructions have been changed during last 5 years for 4 times. Thus, this is probably considered as changing legislative requirements. As such the requirements to the role of accountants have not been changed. The organization of accounting in government organizations have been reformed. And in 2011 it will be again modified.

CONCLUSIONS

Russian public sector accounting has experienced dramatic reforms since year 2004 when accrual accounting was introduced by numerous new accounting instructions for the public sector organizations. These reforms were inspired by "non-local" for Russia ideas found in different international accounting standards and promoted by international organizations through different cooperative projects with the Russian federal government. The reforms were supposed to bring changes to Russian public sector making it more transparent, efficient and accountable though unveiling power of accrual accounting in illuminating use of public sectors resources. In this process, the practicing accountants were supposed to play along. However, after 8 years of reforms, Russia is still earlier in the stage of modernization of accounting practice.

The results of our questionnaire show that the role of government accountants in Russia until now is not developing in the direction of strategic management of the institution. The results also emphasize that governmental accountants remain faithful to the traditional accounting responsibilities - accounting operations, external reporting, invoice processing and so on. Even when they want to improve their competence, even then the tradition of accounting will continue to be vital and will underpin all other activities at all levels of an organization.

ABSTRACT

Value creation for customers in the form of experiences has been gaining attention remarkably. Providing quality products and services are no longer sufficient for business sustainability, for customers need to bestow upon with satisfactory experiences that they valued. Research on identifying the predictors of customer experiential value and its consequences is sparse. Hence, this paper aims to fill the void by conducting an empirical investigation on predictors of 'sport event experiential value' (SEEV) and in turn, assessing its impacts on total experience and loyalty. Distribution of the survey instrument at the vicinity of the Formula 1 Sepang International Circuit resulted in 225 usable feedbacks. Structural equation modeling procedure was employed to test the hypothesized linkages in the proposed model. Evidence established that all the hypothesized linkages were supported. Implications for future research directions and sporting events organizers were discussed.

KEYWORDS: experiential value, Formula 1, involvement and sport orientation

INTRODUCTION

In today's commoditized economy, marketers realized that products, prices, people and technology are becomingly similar. A potentially significant alternative strategy that could attract consumers' attention must go beyond a product's functional features, benefits and quality and offer instead, a customer experience. It is predicted that customer experience is the next competitive battleground for business success and unsurprisingly, it has been described as the next business tsunami (Colin and Ivens, 2005). Indeed, it has not only emerged as one of the hottest topics amongst top management, but is also becoming an uppermost-prioritized research area in accordance with the customer-orientation philosophy (Mascarenhas, Kesavan and Bernacchi, 2006). Although Pine and Gilmore first introduced the concept in 1998, customer experience has eventually played a prime role in determining the winners and losers in years to come. However, identifying factors that determine the experience that customer value most and in turn its consequences, remains one of today's key challenging and critical management issues. Colin and Ivens (2005) postulate that customer experience comprises of two elements: physical and emotional aspects and research have unveiled that emotions are the one often being disregarded in the business practices. Recent study has found that these emotions are one of the key differentiators to evoke customers' attention (Mascarenhas et al., 2006). Regardless of the fact that customers' experience plays a critical role in many contemporary discussions among business practitioners and academics scholar, there has been conspicuously few empirical investigations on this emerging concept with notably exception of the seminal work by Mathwick et al., (2006). Against this backdrop, this paper attempts to fill this void with an empirical examination on the core predictors of Sport Event Experiential Value (hereafter called SEEV) and its impacts on total experience and in turn spectators' loyalty. In order to accomplish this objective, valid and reliable multidimensional measures have to be established and validated as suggested by Churchill (1979), Gerbing and Anderson (1988) and Robert (2004). Ultimately, the research's primary

goal is to develop and validate a plausible model that could be characterized as having statistical and explanatory power to exemplify the factors that determine the focal construct, SEEV and subsequently predict its consequences within a motor sport event environment.

The motor sport event environment in this context refers to the prestigious world of Formula 1 (hereafter called F1). This event has the ability to stimulate feelings of excitement, which rush the adrenals of the spectators. The industry analysts from Formula Money, Deloitte Sports Business Group, a Britain based sports business specialist reported that F1's global revenues stood at US\$3.9 billion. This has made F1 the world's highest revenue-generating sports event of the year (StarBizweek, 2009). The amount comprised of commercial rights' revenues such as race sponsorship, corporate hospitality and broadcasts fees; team revenues which include sponsorships and contributions from partners and owners and circuit revenues from ticket sales and sponsorships. The benefits of F1 are abundant and are not only confined to track revenues. In fact, hosting F1 event has also contributed generously to a country's tourism and hospitality sector. Malaysia is second in Asia after Japan to have a F1 track and has remained a value for money destination for many Europeans, who made up the bulk of international audiences at F1 PETRONAS Malaysian Grand Prix (Mahalingam, 2009). F1 is currently the third most watched live sporting event, second to Olympics and the World Cup.

In view of the significance of the research context, the proposed research model is considered novel as it attempts to explore the predictors of SEEV and in turn, its effect on spectators' total experience and ultimately spectators' loyalty. This study contributes to this stream of research by investigating two paths: SEEV–Spectators' Total Experience and Spectators' Total Experience – Spectators' Loyalty which have been overlooked in prior research. The research model and hypothesized linkages are graphically represented in Figure 1.

Figure 1: The Research Model and Hypothesized Linkages

CONCEPTUALIZATION OF CONSTRUCTS AND HYPOTHESES

This section highlights the relevant literature in relation to sport involvement, sport orientation, sport event experiential value (SEEV), spectators' total experience and spectators' loyalty. Examining and synthesizing gaps within the literature review subsequently lead toward the conceptualization of these identified constructs and development of hypotheses as discussed below:

Sport Involvement

Peter and Olsen (1987) assert that the level of involvement is an important determinant of experiential value within an individual's behavior. Research has indicated that highly involved consumers of sport tend to consume sport activities through event attendance more than those who are not as involved (Stone, 1984). Furthermore, evidence exists that many individuals attending action-sporting events tend to be involved with action sports (Bennett and McColl-Kennedy, 2005). Involvement is said to reflect the degree to which people devote themselves to an activity or event (Peter and Olson, (1987). Building from the existing literature, this study extended the multi-dimensional view of the most commonly used instrument that has been adapted from consumer involvement profile (CIP) scale developed by Havitz and Mannel (2005). They suggest CIP comprises of three dimensions: attraction, centrality and self-expression, which have been shown to be consistently applicable and reliably measured within leisure settings.

Sport Orientation

In the multi-billion dollar sports industry, event organizations must incessantly assess how to meet or exceed consumer orientation and experience (Kang and James, 2004). Sport orientation is defined by Pons, Murali and Nyeck (2005) and Wann (1995) as an individual's specific motives or inherent predisposition toward attending or participating in sporting events. Manifestation of sport orientation could be reflected through the spectators' behaviors. In related literatures on the concept of sport orientation, it is often conjectured to be closely associated with enduring involvement (Pons et al., 2005). For example, an individual might participate in a sporting event for the purpose of group affiliation; which is viewed in marketing literature as the core driver in explaining 'high levels of fan involvement (Wann, 1995). Additionally, Pons et al., (2005) conjecture that the common behavior, sign and values will be shared and displayed conspicuously among the group members not only based on the choice of sport event selected, but also exhibited through the evaluation of their experiences derived from the sport events. Most prior studies in this research strand focused on sport orientation from the perspective of athletes, with notable exception of Greenwell, Fink and Pastore (2002), who examined the impact of goal orientation on the satisfaction of sport event from the lenses of the spectators. Recently, Pons et al. (2005) developed a reliable instrument to measure the concept of orientation towards sporting event (OSE). They unveiled that OSE consist of three core dimensions, which are sensation, cognition and socialization seeking orientation towards sport event. Since then, it was noted that no study has adapted or adopted their scale to validate its generalizability in other sport events or test its applicability within the cross-nation context. What more to integrate OSE in a research framework in the mega-sporting event, such as F1 Grand Prix, which has racing circuits in nineteen countries. Following the above rationale, it inspires the authors to propose the following hypothesis:

H1: Sport involvement has a positive effect on sport orientation.

Sport Event Experiential Value (SEEV)

Sheth, Newman and Gross [18] have indicated that values driving individuals' consumption behaviour has been attributed to functional, conditional, social, emotional and epistemic utility. Customers of today are seeking more value, choices, and subsequently, richer customer experience. In retailing, recent empirical research findings by Keng, Huang, Zheng and Hsu (2007) and Mathwick et al., (2002) have highlighted on the critical role of service experience. They suggest that retailers should focus on creating theatrical retailing environment involving fun, excitement and entertainment, as well as encouraging shoppers to engage actively in the retailing activities. In sports marketing, such an experiential value concept developed by Holbrook (1994) is being applied, and it relates to personal interaction and physical environmental encounters with the sport event environment as a means of explaining customer loyalty. Furthermore, Holbrook and Hirschman (1982) point out the significant role of the multi-sensory,

imaginary, and emotional aspects of consumption experience in advancing the knowledge of consumer behavior. Accordingly, Wakefield and Blodgett (1999) assert that tangible physical environment plays a pivotal role in generating excitement in sport event settings and excitement in turn, influences spectator loyalty. In this research context, sport event experiential value (SEEV) reflects the means through which spectators evaluate the level of service provided by event organizers, atmospherics condition in the vicinity of the circuit, entertainment value derived from the event and enjoyment experienced when interacting with other spectators during the event itself. Bitner and Brown (2000) claim that level of experience value might influence customer satisfaction, and loyalty. Following the above, it is plausible to put forward the next two hypotheses as identified below:

H2: Sport involvement has a positive effect on sport event experiential value.

H3: Sports orientation has a positive influence on sport event experiential value.

Spectators' Total Experience (STE)

Total customer experiences are the key driver in generating lasting customer loyalty in today's businesses (Mascarenhas et al., 2006). In sports marketing, this can be translated into the overall experiences of spectators upon attending any sports-related events. Spectators' total experience is conceptualized as fulfilling physical and emotional experience when spectators interact with event organizer. The positive experience might influence spectators' loyalty (Mascarenhas et al., 2006). Russell and Pratt (1980) assert that emotions consist of two independent dimensions: pleasure and arousal. Pleasure refers to the level at which a person feels well, happy or content in a situation, while arousal refers to the extent to which a person feels stimulated and active. Past research by Mano and Oliver (1993), Westbrook, (1987) and Westbrook and Oliver (1991) accentuate the established relationship between pleasure and arousal when attending the event. It was unravelled that the more pleasure the subjects experienced during the event, the higher will be their loyalty. Hence, we postulate that:

H4: SEEV has a positive effect on spectators' total experience

Spectators' Loyalty

Jacoby and Chestnut (1978) suggest that defining loyalty based on repeated buying behaviour is unwise. In marketing, customer loyalty is often associated with a brand (Mascarenhas et al., 2006). According to their perspective, a brand conceptually refers to a name, term, sign or symbol, or design, or a combination of both, which are intended to identify and differentiate the goods or services of one seller from those of competitors. In addition, Kotler (1973) states that acquiring brand loyalty would give sellers more competitive protection and greater control in devising and planning marketing programs. Oliver (1999) on the other hand, agrees that a customer's loyalty must be measured further by analyzing his or her beliefs, affects, and experience. In this research context, loyalty is seen as behavioural in nature as distinguished by Chaudari and Holbrook (2001). Behavioral loyalty reflects loyalty in terms of revealed purchase and usage behavior that is normally based on customer satisfaction and measured by past purchasing of one's brand and/or competing brand (Mascarenhas et al., 2006). Hence, in sports marketing, loyalty may be determined by spectators' probable inclination towards the provider or event organizers, prompting the authors to postulate the following hypotheses:

H5: SEEV has a positive influence on spectators' sport loyalty.

H6: Spectators' total experience has a positive effect on sport loyalty.

RESEACH METHODOLOGY

350 questionnaires forms were distributed to F1 sports spectators during Formula 1 PETRONAS Malaysian Grand Prix 2010 at Sepang International Circuit in Malaysia. Data collection was personally

administered by researchers by intercepting potential respondents within the circuit's vicinity. During this exercise, the researchers approached respondents to illicit interest in survey participation and explained the research objectives. The researchers remained in the vicinity until respondents had completed the survey and interact with them only at a time where and if any minor clarification was needed. Respondents were given approximately fifteen minutes to complete it. Upon completion, the respondents were given souvenirs as a token of appreciation of their voluntary participations in the study. This data collection technique has resulted in 225 usable survey questionnaires for data analyses. A seven-point Likert scale has been employed for all the measures used in the study except demographics profile and travel behavior sections. The measures were mainly adapted from previous research such as Keng et al., (2007), Mathwick et al., (2002) and Pons et al., (2005). The data were initially assessed to detect outliers and normality then descriptive analyses were performed. Subsequently, data were analyzed to determine the goodness of data in terms of reliability and validity by following guidelines offered by Anderson and Gerbing (1988) and Gerbing and Anderson (1988).

RESULTS

Demographics Profile of Respondents

Table 1 presents the profile of respondents, 74.2 percent were male, the majority of which fall in the age category of 21 to 40 years (83.1 percent). Interestingly, high proportion of the sample comprises of international spectators (66.2 percent) of which 39% were European, and 77.4 percent has attained tertiary education.

Exploratory Factor Analysis (EFA)

Three exploratory factor analyses (EFA) were conducted separately on SEEV (Table 2), Sport Orientation (Table 3) and Sport Involvement, Spectators' Total Experience, and Spectators' Loyalty (Table 4). The EFA used principal components extraction with varimax rotation. It is the most commonly used analytical technique for reducing a large item pool to a more manageable set. It has been recognized to be a valuable preliminary analysis when no sufficient theory is available to establish the underlying dimensions of a specific construct (Sharma, 1996).

Table 1: Respondents' Demographic Profile

Variable	Description	Frequency	Percentage
Gender	Male	167	74.2%
	Female	58	25.8%
Age	< 20 years old	15	6.7%
	21 – 30 years old	117	52.0%
	31 – 40 years old	70	31.1%
	41 – 50 years old	21	9.3%
	51 – 60 years old	2	0.9%
Highest Academic Achievement	High School	51	22.7%
	Undergraduate	121	53.8%
	Post graduate	53	23.6%
Nationality	Malaysian	76	33.8%
	ASEAN (Indonesian, Brunei, Singapore and Thailand)	31	13.8%
	European	58	25.8%
	North & South America	13	5.8%
	Africa	12	5.3%
	Australia/New Zealand	12	
	Far East (China /Japan/Korea)	5.3%	
	Taiwan)	23	10.2%

Table II shows the results of EFA for SEEV. In assessing the initial factor structure of SEEV, all the 32 items were analyzed using EFA. It displays the result for both Bartlett test of sphericity (χ^2 of 4520.82, $df = 231$ at $p = 0.001$) and the Kaiser-Mayer-Olkin measure of sampling adequacy ($KMO = 0.94$). This indicates that there are sufficient inter-item correlations with the data for performing factor analysis. Sharma (1996) suggests that the cut-off level for the KMO statistic should be greater than 0.8, but a value of 0.6 is tolerable. A six-factor solution was extracted; however, this initial purification exercise resulted in the deletion of 10 items on the basis of failing to fulfill the above mentioned criteria. In summary, the results reveal that SEEV construct comprises of six factors, which are labeled as esteem, entertainment, economy (customers' return on investment), social, service and aesthetics.

Table 2: Final Exploratory Factor Analysis for Sport Event Experiential Value (SEEV)

Sport Event Experiential Value Items	F1	F2	F3	F4	F5	F6
1. The F1 circuit is aesthetically appealing		0.73				
2. The motor exhibition displays products attractively		0.82				
3. The signage and electronic board at F1 Grand Prix is visually eye-catching		0.73				
4. The layout design of the F1 circuit makes it easy to get around		0.65				
5. Overall, the atmosphere at F1 Grand Prix circuit is stimulating		0.61				
6. F1 provides great entertainment			0.69			
7. F1 is a fun way to spend time			0.73			
8. Attending F1 is fun			0.82			
9. When I think of F1, I think of excellence event			0.73			
10. F1 Grand Prix staff are responsive on request						0.72
11. F1 Grand Prix at staff are knowledgeable						0.69
12. F1 event is an opportunity to make friends with people who share the same interest					0.67	
13. Attending F1 with my friend or family is a bonding experience					0.75	
14. I got my money's worth for attending F1				0.67		
15. I am happy with F1 price ticket				0.84		
16. Overall I feel F1 ticket is of a good economic value				0.80		
17. The thrill of F1 performance "gets me away from it all"	0.67					
18. The excitement of F1 makes me forget my problems	0.70					
19. My friend would think highly of me if I attend F1 event	0.79					
20. My social status will be enhanced when I attend F1 event	0.76					
21. F1 is a prestigious event	0.61					
22. I feel proud attending F1 event	0.67					

Table 3 demonstrates the results of the second EFA. Two factors emerged from 14 items, which contravene expected outcome of three factors. It was noted that all items (4) to represent the third expected factor which is social seeking sport orientation did not converge into the third factor and the items fall into sensation factor with high cross loading with cognition seeking orientation. The result reveals that the KMO statistic of sampling adequacy was 0.87. However, this initial purification exercise resulted in the deletion of eight items on the basis of high cross-loadings (greater than 0.40) on multiple factors. This result implies that sport orientation comprises of two factor structures, which are sensation seeking and cognition seeking.

Table 3: Final Exploratory Factor Analysis for Sport Orientation

Sport Orientation Items	Sensation Seeking	Cognition Seeking
1. attending sport event is real pleasure	0.81	
2. always excited when going to this sport event	0.90	
3. always enthusiastic when thinking about attending this event	0.86	
4. attending this sport event, I feel part of the event	0.80	
5. happy when I can attend this event	0.78	
6. consider myself as a motor sport expert		0.82
7. can talk about tactic and strategies like a professional		0.87
8. I know very little about motor sports		0.70

Table 4 depicts the third EFA results, which illustrates that there is three factor-structure emerged from these three constructs: sport involvement, spectators' total experience and spectators' loyalty, totaling 25 items. The result reveals an adequate sampling adequacy based on the KMO statistical value of 0.95. The initial purification exercise resulted in the deletion of 1 item in sport loyalty construct on the basis of high cross loadings (greater than 0.40) on multiple factors.

Confirmatory Factor Analysis

As argued by Gerbing and Anderson (1988) item-total correlation, alpha coefficient and exploratory factor analysis procedures could not ensure unidimensionality of measures, which is viewed as an important requirement of valid measurement. They strongly recommend that a more rigorous statistical procedure be employed to refine and confirm the factor structure generated from the initial EFA. Confirmatory factor analysis (CFA) has been proposed as an analytical tool to ascertain unidimensionality of measures (Gerbing and Anderson, 1988).

Table 4: Final Exploratory Factor Analysis for Sport Involvement, Spectators Total Experience and Spectators Loyalty

Measurement Items	Sport Involvement	Spectators Total Experience	Spectator Loyalty
1. interested in F1	0.70		
2. involvement with F1 is high	0.83		
3. expert in F1	0.82		
4. strong supporter of F1	0.85		
5. enjoy following coverage of F1	0.77		
6. well-informed about F1	0.83		
7. F1 matters to me a lot	0.89		
8. enjoy discussing F1	0.86		
9. unhappy-happy		0.70	
10. unenjoyable-enjoyable		0.74	
11. unsatisfactory-satisfactory		0.76	
12. dull-fascinating		0.77	
13. not fun-fun		0.77	
14. boring-interesting		0.79	
15. unpleasant-pleasant		0.83	
16. terrible-delighted		0.85	
17. monotonous-sensational		0.83	
18. calm-excited		0.78	
19. unarousal-arousal		0.78	
20. relaxed-stimulated		0.73	
21. not safe-safe		0.72	
22. come again to F1 PETRONAS Grand Prix in the future			0.75
23. recommend F1 PETRONAS Grand Prix to friends/relatives			0.75
24. desire to attend F1 Petronas Grand Prix event again in future			0.75
25. F1 PETRONAS Grand Prix is my first preference			0.66

Hence, in line with this suggestion, all the resulting measures derived from EFA were validated using a CFA analytic procedure by employing the AMOS 18 analytical program. In order to achieve an acceptable ratio of observations to estimate parameters, it proved necessary to run three separate measurement models; the fit indices suggest that these models fit the data well. The first measurement model consists of SEEV construct of six-factor solution. The results of the first measurement model are as follows: the fit statistics were $\chi^2 = 468.64$, $df = 194$, $\chi^2/df = 2.41$, $p < 0.001$; RMR = 0.079; IFI = 0.94; CFI = 0.94; and RMSEA = 0.08. All indicators loaded heavily on the construct and have t -values greater than

13.95 and all standardized coefficient are greater than 0.50. The second measurement model comprises of sport orientation construct with two-factor structure. The fit statistics were $\chi^2 = 21.16$, $df = 12$, $\chi^2/df = 1.76$, $p < .048$; RMR = 0.08; IFI = 0.99; CFI = 0.99; and RMSEA = 0.06. Items loaded heavily on their posited constructs and have t -values greater than 7.35 and all standardized coefficient are greater than 0.50. The third measurement model comprises of Sport Involvement, Spectators' Total Experience and Spectators' Loyalty.

The fit statistics were $\chi^2 = 327.25$, $df = 235$, $\chi^2/df = 1.39$, $p < 0.001$; RMR = 0.07; IFI = 0.98; CFI = 0.98; and RMSEA = 0.04). Items loaded heavily on their posited constructs and have t -values greater than 8.23 and all standardised coefficient are greater than 0.50. In essence, all the items in the three measurement models have achieved convergent validity. The widely accepted cut off value for factor loading is when the t -values are greater than ± 1.96 or ± 2.58 at 0.05 or 0.01 levels respectively and standardized factor loading of 0.5 and above as recommended by Anderson and Gerbing (1988). Construct validity was assessed in terms of convergent and discriminant validity. Convergent validity is established through high correlations between the measure of interest and other measures that are supposedly measuring the same concept (Aaker, Kumar and Day, 2007). The critical ratio (t -value) of the items in the three measurement models were ± 1.96 or ± 2.58 at 0.05 or 0.01 levels respectively and standardized factor loading of 0.5 and above. Thus, the convergent validity of the constructs was upheld (Anderson and Gerbing, 1988). Alternatively, discriminant validity can also be established through low correlations between the constructs and it is evident, when the correlation between factors was lower than 0.80 (Klein, 2005) and (Yanamandram and White, 2006). Discriminant validity is achieved as the correlation coefficients ranging from 0.53 to 0.71. For a rigorous test of discriminant validity according to Fornell and Larcker (1981), the AVE of each construct was computed and found to be greater than the squared correlation between the construct and any other constructs in the model. A complementary assessment of discriminant validity was conducted to determine whether confidence interval of (± 2 standard errors) around the correlation estimated for each pair of constructs includes 1 (Anderson and Gerbing, 1988). The result illustrates that this criteria has been achieved satisfactorily. In conclusion, it is reasonable to claim that all the measures used in the study possess adequate psychometric properties.

Table 5 presents the summarized results of measurement models, which include correlation matrix, mean value, Cronbach's alpha, composite reliability and Average Variance Extracted (AVE). Construct reliability was also assessed by estimating the AVE, which reflects the overall amount of variance captured by the latent construct and Composite Reliability (CR). CR reflects the internal consistency of the construct indicators, while AVE reflects the amount of variance captured by the construct indicators (Hair, Babin and Anderson, 2010). All CR scores ranging from 0.85 – 0.93, were much higher than the recommended cut-off point of 0.7 (Olorunniwo, Hsu and Udo, 2006). Thus, each of the factors reliably measured its respective constructs. The AVE scores ranged from 0.60 to 0.72, exceeding the recommended cut-off point of 0.5 (Fornell and Larcker, 1981). It is important to note that Cronbach's alpha, the customary index of reliability was assessed after unidimensionality of a measure has been established; this was in line with the suggestion proposed by Anderson and Gerbing (1988). A commonly used threshold value of 0.70 (Nunnally and Bernstein, 1994) was used; however (Hair, Anderson and Black, 1998) suggest that values slightly below 0.70 are acceptable if the research is regarded as exploratory.

Structural Model Analysis

Subsequently, structural equation modeling (SEM) was utilized to test the six hypothesized relationships among the constructs postulated in the proposed model (Figure 1). Because of sample size constraints, composite means were constructed for all the scales and these indices were used as new variables in data set (Settoon, Bennett and Liden, 1996). As recommended by MacKenzie and Lutz's (1989), for latent

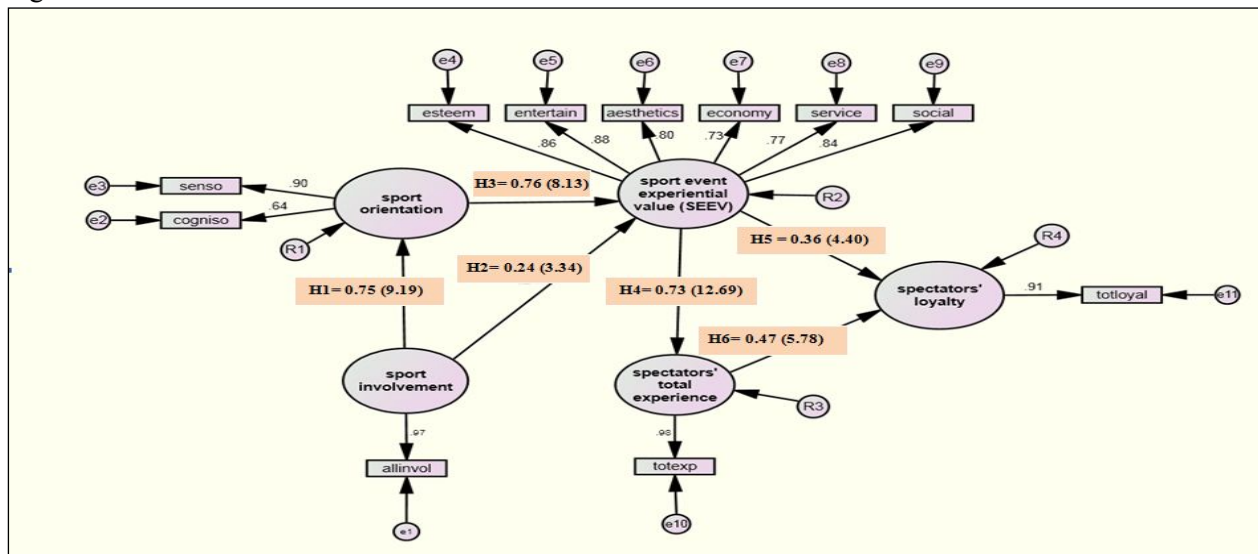

construct with one dimension, its loading (lamda) is fixed to be the square root of its reliability, and the error term is set at one minus the construct reliability. Figure 2 demonstrates the estimated standardized path coefficients and critical ratio (in parenthesis) for the hypothesized links.

Table 5: Correlation matrix, squared correlation, Average Variance Extract, Mean Value, Square Multiple Correlation, Cronbach's Alpha and Composite Reliability

Construct	F1	F2	F3	F4	F5	Mean Score	Standard Deviation	Cronbach's Alpha	Composite Reliability
Sport Involvement (F1)	0.60					4.94	1.28	0.90	0.93
Sport Orientation (F2)	0.70	0.65				4.98	1.03	0.93	0.86
Sport Event Experiential Value (F3)	(0.49) ^a 0.71	0.70 (0.49) ^a	0.66			5.09	0.96	0.92	0.91
Spectators' Total Experience (F4)	0.55 (0.30) ^a	0.63 (0.40) ^a	0.71 (0.50) ^a	0.68		5.59	1.00	0.96	0.90
Spectators' Loyalty (F5)	0.54 (0.29) ^a	0.53 (0.28) ^a	0.63 (0.40) ^a	0.66 (0.44) ^a	0.72	5.40	0.99	0.84	0.85

Note: ^aSquared Correlation is presented in parenthesis, Average Variance Extracted (AVE) is presented on the diagonal axis

Figure 2: Path Relations and Parameter Estimates of the Research Model

The structural model has a significant χ^2 value ($\chi^2 = 58.30$, $df = 32$, $\chi^2/df = 1.82$, $p < 0.003$), indicating inadequate fit of the data with the hypothesized model. This is to be expected as in practice this statistic is very sensitive to sample size (Klein, 2005) and (Ullman, 2006). Hence, the other fit indices were employed (GFI = 0.96; RMR = 0.03; AGFI = 0.91; CFI = 0.99; IFI = 0.99; NFI = 0.97; RMSEA = 0.06) suggest that the model fits the data satisfactorily. Therefore, the study's objective to establish a plausible model that has statistical and explanatory power which could permit confident interpretation of results was thus successful. Results of the tested hypotheses are reported in Table 6.

CONCLUSION

The result in Table 6 demonstrates that all the hypothesized linkages were supported. It delineates a few key implications such as sport involvement has a significant effect on sport orientation (H1) and in turn,

sport involvement has a positive influence on SEEV (H2). The findings confirm that sport orientation has significant positive effect on SEEV (H3). Thus, the results established that sport involvement and sport orientation are significant predictors of SEEV, and consequently, spectators' total experience (H4) and spectators' loyalty (H5) are outcomes of SEEV. Importantly, this study reveals that SEEV could directly influence spectators' loyalty towards F1 PETRONAS Grand Prix (see H5); although spectators' loyalty could also be realized via spectators' total experience (see H6). However, spectators' total experience has a greater impact on their loyalty as compared to SEEV. Overall, the finding of the study accentuates that F1 management stands to gain by placing extra emphasis on enhancing SEEV, as it has a direct positive significant impact on spectators' total experience, and ultimately sport loyalty. Thus, motor sport organizers and other related sector such as hospitality and Tourism Board could gain competitive advantage and above all business sustainability by devoting resources in enhancing and fulfilling their spectators' expected experiential value, which should be congruent with their sport orientation and underlying motives of attending the sporting events. Moreover, identifying the predictors of SEEV would enable event managers to create a wonderful and memorable experience, which is critical and perhaps would provide an effective competitive weapon in the face of intense competitions from other sport events. It seems reasonable to speculate that spectators that had a memorable and great experience will ultimately increase their loyalty towards F1 Grand Prix the sporting event. Undoubtedly, sport events are no longer merely offering good sport. Today mega-event such as F1 becoming major revenue generating tool which entails spillover effect to local and regional economic development (Mahalingam, 2009). Therefore, it is vital that organizers attract and drawn in as many spectators as possible in order to gain maximum economic impact.

Table 6: Results of Tested Hypotheses

	Hypothesized Path	Standardized Coefficient	Construct Reliability (t-value)	Results
H1	Sport Involvement — Sport Orientation	0.75	9.19	Supported
H2	Sport Involvement — Sport Event Experiential Value	0.24	3.34	Supported
H3	Sport Orientation — Sport Event Experiential Value	0.76	8.13	Supported
H4	Sport Event Experiential Value — Spectators' Total Experience	0.73	12.69	Supported
H5	Sport Event Experiential Value — Spectators' Loyalty	0.36	4.40	Supported
H6	Spectators' Total Experience — Spectators' Loyalty	0.47	5.78	Supported

A major criticism of the study concerns external validity as the respondents were not selected based on random sampling, but rather on convenient sampling. This limitation thus may not be an accurate representation of the spectators of F1. However, it is conceivable to speculate that those who were at the vicinity of F1 circuit during the qualifying and final race days could be somehow have the interest and experience required by this study. On this argument, the results and interpretations might be generalizable, specifically in the context of motor sport events. In fact, Ferber (1977) suggests that there is no place for probability samples in basic or applied consumer research. A second pertinent weakness concerns the cross-sectional research design used. Longitudinal research is required to capture the dynamic nature of customer post-consumption behavior. Nevertheless, efforts to test the present model through sagacious longitudinal research would require an enormous amount of sustained cooperation by consumers serving as key informants over time. Sample attrition through time could be considerable. The limitations of the present research provide opportunities for further research direction. It may be fruitful for future research to replicate and validate all or parts of the current model, in order to determine the robustness of the findings in other sporting event settings. Apparently, comparative cross-national studies are essential in order to examine the generalizability of the model. This research direction appears to be potentially fertile because F1 is a global motor sport event; hosted in nineteen countries with extensive global audiences. In addition, the evidence of the plausibility of the two important links—SEEV to spectators' total experience and SEEV to spectators' loyalty—would require validation in other sport

events. It is also deemed particularly important that future study be undertaken to extend the present model by integrating other pertinent constructs in sporting events such as identity salience and motivation.

ACKNOWLEDGMENT

The authors would like to thank The Ministry of Higher Education of Malaysia (MOHE) for providing the Fundamental Research Grant Scheme (FRGS) and Universiti Teknologi MARA for assistance and facilitating this research.

COMPARISONS OF SOFT DEBT FINANCING PROBLEMS IN CHINA AND KOREA

Sunghwan Kim, Kyungpook National University

Jin Tan, Kyungpook National University

Yurim Lee, Kyungpook National University

ABSTRACT

Using a combined panel data of Chinese and Korean non-financial firms from 2000 to 2007, we study the effects of governments' influence on the banking sector in their decision making, and other financial and non-financial traits of firms in the two countries on the borrowing behaviors of firms. We specifically test whether there are so-called soft budget constraint (SBC) problems in China, where banks are supposed to be under the guidance of the central government for the welfare of the people at the expenses of profits and efficiency of firms, compared with the case of Korea. For this, we estimate default risks of firms and compare the effects of default risks and other factors on bank financing of firms in two countries. We find that while firms in Korea known to have experienced SBC before the financial crisis occurred in late 1997 have been under hard budget constraints since year 2000, and that those in China are exposed to SBC problems. The results support our theoretical studies about the effects of reputation of lenders on SBC in a centralized and decentralized economy in toughening budget constraints. We also have found that factors affecting bank financing in China and Korea are quite different. Most strikingly, Chinese firms with better cash flows from operation obtain more bank loans, while such Korean firms resort less to bank financing. In addition, while Korean firms paying higher interest rates finance more loans from banks, while such Chinese banks finance less from banks. This might imply that for firms in Korea and China might have different sources of financing in the times of high interest rates or in the case of high risk premium asked.

INTRODUCTION

In the transitional economies like Russia and China which put higher priorities on welfares of their people than more market-based economies do, their governments are more likely to bail out firms or banks due to political reasons at the expenses of economic efficiency. According to Kornai (1979, 1980), a socialistic economy might experience an inherent problem of soft budget constraint (SBC hereinafter) due to political reasons. However, the key problem of soft budget constraint may exist even in the market economies where banks cannot stop from bailing out unprofitable firms due to some other reasons, economic or non-economic. For examples of micro-level cases in market economies, we have seen such bailouts of banks like S&Ls and AIG and corporations like GM and Chrysler. Alexeev and Kim (2008) showed, based on firm level data, that a severe soft budget constraint problem existed in Korea nationwide before its financial crisis in 1997 and claimed that it could be a cause of the crisis. Since national economies and firms that are softly budgeted for short term whitewash treatments can end up with the collapse of the national economy and defaults of firms respectively in the long run, by not observing financial disciplines strictly, the concept of soft debt financing problems is of critical importance with respect to governance system of a national economy and banking system as well as capital budgeting of a firm. According to Alexeev and Kim (2008), most studies on this topic have

focused on the existence and severity of such problems in the transitional economies. Our study on this topic is different from our previous work in many ways. First, we formally test the existence of soft budget constraint in China for the first time. Second, we formally test the existence of soft budget constraint in Korea, using quite different approach adopted by Alexeev and Kim (2008). Third, eventually we first test the existence and severity of soft budget constraint in the centralized economy and decentralized economy with firm level data in two types of countries with a sufficiently long horizon enough to measure them in the long run, as assumed in the theory models. This study proceeds as follows. In Section III, we introduce data set and estimate a baseline default model, and then formally test out hypotheses on SBC with firm data of China and Korea following literature review in Section III. In Section IV, we summarize test results and conclude our study.

LITERATURE REVIEW

According to Janos Kornai (1980, 1986), an enterprise or any organization is said to have a soft budget constraint when it expects to be bailed out in case of financial distress. The concept of SBC originally developed by Kornai (1979, 1980) was modeled in a game-theoretic framework by Dewatripont and Maskin (1995). Dewatripont and Maskin (1995) pointed out that the fundamental reason for the soft budget constraint problem is the inability of rescuers to commit to no bailout *ex ante*. Majumdar (1998) studied soft debt financing problems in state-owned enterprises. The relationship between the availability of investment funds and the profitability of firms is studied by Grosfeld and Roland (1997), and Lizal and Svejnar (2002). They all find that the relationship is negative, because firms use funds for investments inefficiently for survival rather than for restructuring. Using data on industrial firms in the Czech Republic, Lizal and Svejnar (2002) study investment behaviors of firms depending on their ownership structure, and find that large state-owned and private firms operate under SBC, given a large volume of nonperforming bank loans to firms and their high rate of investments. Maskin and Xu (2001) and Kornai et al. (2003) provide detailed surveys and references on SBC. The latter source surveys both empirical and theoretical literature. They report that most of previous studies are theoretical. While most of empirical studies are to determine the level of soft debt financing problems in the economies in transition, Alexeev and Kim (2008) represent the only published study of soft debt financing problems in a market economy, outside of the economies in transition. Alexeev and Kim (2008) claim that Korea firms were like firms in economies in transition like China in that it suffered a widespread phenomenon of soft budget constraint (SBC) before the financial crisis in late 1990s. However, they did not prove whether firms in economies in transition like China actually suffer a widespread phenomenon of soft budget constraint (SBC). While there are some empirical studies in soft debt financing problems, the most important topic has been its effects on the profitability of firms. Among theoretical papers, Huang and Xu (1999) construct a model that demonstrates how the SBC could have led to a crisis in Korea. Furthermore most theoretical studies on the soft budget constraint are to prove the existence and inefficiency of the phenomena, just like empirical ones are for the same purpose in the economies on transition. We in this study examine whether there exists a soft budget constraint problem in the People's Republic of China (China, herein after), and compare the severity and effects with those of Korea. In doing so, we actually empirically test on main propositions claimed by Alexeev and Kim (2009). Specifically, we test (1) whether the soft budget problems exists in an economy in transition with the case of China, (2) whether the soft budget problems exists in a market economy, (3) whether the competition among banks in the banking sector can reduce the severity of soft debt financing problems, if any, (4) and whether the inefficiency of soft debt financing problems could be a problem in the economies in terms of quality of firms.

DATA AND EMPIRICAL TESTS

Data

We use a combined dataset of Chinese and Korean non-financial firms. For Chinese firms, we use RESSET/DB for Chinese firm data. For Korean firms, we use the database provided by Korea Information Services, called KIS-VALUE for Korean firms. We use an unbalanced panel dataset of annual data from 2000 to 2007. Accounting data, the number of employees, the date of establishment, shareholder's ownerships and market values are obtained directly from the respective dataset. All other ratios variables are calculated for our study based on the definitions provided in Table 1. We use previous year data to avoid endogeneity problem between year-end values and periodic data. Since not all the variables are available for all firms in the dataset, the numbers of observations are not same across regressions. Firms are reported as defaulted in the year when they filed for bankruptcy or went bankrupt or out-of-operation, or rejected loans from banks to avoid bankruptcy. Firms merged with or acquired by other firms are not included as defaulted firms as long as they actually have never defaulted prior to the mergers and acquisitions. Since the Chinese banking system (China: dummy variable) is more or less owned and controlled directly by the Chinese government and indirectly by the government owned firms, it seems to suffer more from soft debt financing problems, thus less likely to default bad quality firms. We expect a negative relationship between government ownership (Govt_SH) and banks' ownership (Bank_SH), and default risks for firms, especially in the case of Chinese firms in the existence of soft debt financing problems, vice versa. Another important bank governance issue is the role of foreign ownership (Fgn_SH). We expect negative effect of foreign ownership, in that foreigners are less subject to moral hazards, non-economic decision makings. Thus, we study the effects of ownership, such as the ownership of the government (Govt_SH), foreigners (Fgn_SH), the owner (First_SH) and the banks (Bank_SH). We also include many other factors to see and control for their effects on soft debt financing problems as shown in Table 1. Largest shareholders (First_SH) are supposed to decrease agency costs and induce higher profitability of banks (EATR).

Table 1: Variables and Descriptions

Default : 1 if the Firm is Defaulted during the Year, 0 otherwise
China(Dummy) : 1 if a Firm is a Chinese Firm, 0 otherwise
Govt_SH : Percentage of Government Ownership
First_SH : Percentage of the First Shareholder's Ownership
Fgn_SH : Percentage of Foreign Shareholder's Ownership
Bank_SH : Percentage of Banks' Ownership
Age : The age of the firm (calculated from the date of establishment)
Tobin_q : Market Value/(Market Value + Total Debt)
Ln_Asset : Ln(Total Asset)
Employee : the Number of Employees
Debt_Asset_R : Total Debt/Total Asset
BLR : Bank Loan/Total Asset
Fixed_R : (Fixed Asset+Investment Asset)/Total Asset
EATR : Return on Assets = (Earnings after Taxes) _t /(Total Asset) _{t-1}
OCFR : (Net Cash Flows from Operation) _t /(Total Asset) _{t-1}
RER : Retained Earnings/Total Asset
Sales_R : (Sales) _t /(Total Asset) _{t-1}
Invest_R : (Investment) _t /(Total Asset) _{t-1}
Interest_R : (Interest Expenses) _t /(Total Debt) _{t-1}

Note: Dates are same for the nominator(s) and the denominator(s), unless specified.

The ownership of foreign investors (Fgn_SH) can also play an important role in corporate governance of banks because the ownership of foreigners might reflect that the management of the firms are subject to global standards in operation, accounting and financial information. The different governance systems in

two countries might result in different policies in financial decision making of banks to firms. Firms with more stable and clear governance systems will be less likely to default and more likely to have softer bank financing. The number of employees (Employee) of a firm is expected to have some relationship with soft debt financing problems in China. We also include some other factors such as the age (Age) of firms since their establishments, retained earnings to total asset ratio (RER), fixed assets plus investment assets to total assets ratio (Fixed_R), investment to asset ratio (Investment_R), interest expenses to debts ratio (Interest_R), bank loans to assets ratio (BLR), debt to asset ratio (Debt_Asset_R), and Tobin q (Market Value/(Market Value + Total Debt)).

Table 2: Summary Statistics of Variables for Chinese and Korean Firms

Variables	China			Korea		
	Obs	Mean	Std.	Obs	Mean	Std.
Default	5096	0.062	0.242	4298	0.015	0.120
Age	5096	7.786	4.144	4298	29.982	14.997

Fgn_SH	5096	0.002	0.023	4298	0.052	0.126
Bank_SH	5096	0.005	0.015	4298	0.049	0.084
Employee	5096	3527	5940	4298	877	3674
Total_Asset	5096	3.010	7.660	4298	558.3	3382
Debt_Asset_R	5096	0.474	0.178	4298	0.423	0.291
Fixed_R	5096	0.457	0.165	4298	0.533	0.182
Sales_R	5096	0.850	0.593	4298	0.798	0.615
EATR	5096	0.036	0.082	4298	0.015	0.279
RER	5096	0.046	0.040	4298	0.168	0.205
Tobin_q	5096	0.681	0.331	4298	0.307	0.285
BLR	5096	0.751	0.343	4298	0.325	0.239
Invest_R	5096	0.111	0.163	4298	0.466	0.744
Interest_R	5096	0.059	0.057	4298	0.039	0.031

Note: 1. Some observations with outliers are not included for calculations of means.

2. Total assets are in billions in their currencies (Yuan and Won for China and Korea respectively).

We expect the likelihood of default is higher for a firm with a higher debt ratio or lower owners' equity ratio. For factors representing efficiency in sales, we introduce the turnover ratio (Sales_R). We also introduce interest expenses (Interest_R) to reflect risk premium due to high risks. Due to the monopolistic financial market structure, we may expect Chinese firms pay higher interest rates (Interest_R) for loans, compared with Korean firms. In Table 2, we provide summary statistics of some variables used in this study for firms in two countries. As expected, we can see differences in averages and standard deviations of most variables between the two countries, possibly due to significant differences in financial market system, corporate governance and business environment. The profitability ratio measured by earnings after taxes divided by total assets (EATR), age (Age), firm size measured by the number of employees (Employee), total assets (Total_Asset), and many other ratios like fixed ratios (Fixed_R), Tobin q (Tobin_q), etc. We will discuss the differences in more details later with formal group mean test statistics. Table 3 shows pair-wise correlation coefficients for most variables used in the study for the two countries, combined and separately for each country. As in the case of most other studies, most variables representing the financial status and performances of banks are more or less closely correlated with each other. For Chinese firms, the ownership of the Chinese government (Govt_SH) has a positive relationship with the number of employees (Employee), total assets (Total_Asset), turnover ratio (Sales_R) and

profitability (EATR) and a negative relationship with leverage ratio (Debt_Asset_R) with statistical significance.

Note: 1. Coefficients are statistically significant at 10%, 5% and 1% level for *, ** and *** respectively.

2. P-values are for two-tailed tests.

On the contrary, the ownership of the Korean government (Govt_SH) has a positive relationship with turnover ratios (Sales_R), profitability (EATR), leverage ratio (Debt_Asset_R) and fixed ratios (Fixed_R), but a negative relationship with bank loan ratio (BLR) with statistical significance.

While the number of employees (Employee) and total assets for Korean firms do not show any relationships with statistical significance, except a positive relationship between the two variables (Employee and Total_Asset), Chinese firms show close relationship of the two variables with other variables used in the study. Leverage ratio (Debt_Asset_R) and interest rate (Interest_R) also show strong correlations with other variables. We here skip further explanations of the table for simplicity. Such high correlations among variables require us to pay more attention to multicollinearity among explanatory variables in setting up models and testing to acquire reliable results. In Table 4, we report the test results for group mean differences assuming unequal variances between groups. We can see group means of variables for Chinese and Korean firms are statistically different. As we have seen before, Chinese firms are younger, higher in leverage ratio (Debt_Asset_R), more bank loans (BLR), more investments (Invest_R), higher profitability (EATR) and more workers per firm (Employee) than Korean firms. They are owned more by the government (Govt_SH) and controlled by the largest shareholder (First_SH), less by foreign investors (Fgn_SH) and banks (Bank_SH) than Korean firms. They are better in sales

efficiency (Sales_R) with less illiquid assets (Fixed_R) and have retained their earnings less (RER) yet than Korean firms while their relative market values (Tobin-q) are higher, suggesting their growth potentials valued by the investors in the stock market are better. In Table 5, we report the number of firms that defaulted in both countries year by year. From the table, we can see that there is not much difference in the number of defaults in China and Korea.

Table 4: Mean Comparison Tests between Chinese and Korean Firms

Variable	China		Korea		Difference (A-B)	p_value
	Obs	Mean(A)	Obs	Mean(B)		
Age	5096	7.786	4298	29.982	-22.197	0.000

Total	4,659	73	1.6%	4,298	83	1.9%

Default Models

In order to test the existence of SBC for defaulted firms, we have to consider both risks and risk premium of the loans to say whether the firm was softly budgeted or not. While it is not possible for banks to know in advance whether a firm will default or when it will default, we can presume that a bank will predict the probability of a borrower's default to determine whether to provide funds or to determine interest rates or any other terms in their loan contracts. Together with interest rate they charge, the related risks will be taken into consideration before they provide loans. Very low quality firms expected to default in a short horizon due to poor performances and/or risky capital structure are expected to be denied not only additional loans but also rolling existing loans over in a market without SBC problems. As in Alexeev and Kim (2008), we would conclude that a firm is softly budgeted if it gets additional loans from banks even at a higher default risk after considering higher risk premium. In order to determine whether banks provide funds to firms with high default risks, we have to estimate corporate default risks by finding out determinants of corporate defaults. Following Altman (1968), and Alexeev and Kim (2008), we develop a discriminant analysis using probit or logit models for default prediction. For this, we select 335 defaulted Korean firms by the end of year 2007 and 335 firms surviving by the end of year 2007. In order to avoid

endogenous SBC problems in the dataset, we use randomly selected non-defaulted firm data from year 2000 to year 2007. The basic model for estimating default risks of firms is specified in the following multivariate probit/logit model:

$$\text{Default}_{i,t} = \beta' X_{i,t} + \varepsilon_{i,t} \quad (1)$$

where the dependent variable, $\text{Default}_{i,t}$, indicates whether a firm i defaulted in t , where all independent variables used in the model as listed in Table 6, are denoted by $X_{i,t}$, and where $\varepsilon_{i,t}$ denotes error terms. We assume in this specification that the default risk of a firm can be estimated with information available in the prior year.

Table 6: Default Prediction Models and Their Predictability

Variable	Model I		Model II		Model III		Model IV	
	Coefficient	p-value	Coefficient	p-value	Coefficient	p-value	Coefficient	p-value

Sales_R	-0.408***	(0.000)	-0.575***	(0.000)	-1.178***	(0.000)	-1.199***	(0.000)
EATR			-0.285*	(0.095)	-0.638**	(0.028)	-0.630**	(0.033)
EBIDTAR	-2.215**	(0.033)						
Tobin_q	-1.434***	(0.000)	-1.593***	(0.000)	-2.910***	(0.000)	-2.856***	(0.000)
RER	-1.693***	(0.004)	-1.744***	(0.003)	-2.885**	(0.012)	-2.768**	(0.014)
Constant	2.219	(0.128)	2.220	(0.115)	5.154*	(0.052)	6.132***	(0.000)
Observations	670		670		670		670	
Pseudo R-sq:	0.6306		0.6377		0.6451		0.6439	
P(right Default)	92.20%		94.90%		92.50%		91.90%	

Note: 1. Dependent variable is DEFAULT, dummy variable; 1 if the firm is defaulted, 0 otherwise.

2. Coefficients are statistically significant at 10%, 5% and 1% level for *, ** and *** respectively.

3. P-values are for two-tailed tests.

We report default prediction models in Table 6. Model I and II are probit models while Model III and IV are logit models. We can see that F values are very large for p-values equal to 0.0000 and R^2 values are not poor for all models. We can also recognize that coefficients and p-values are pretty much stable across models, implying that the models and coefficients are robust for probit and logit models and for models with some other variables. They predict defaults for actually defaulted firms with accuracy of 0.9 or above. We select Model II for the baseline model to use in the following sections, based on predictability of models for actually defaulted firms. Unlike Alexeev and Kim (2008), we do not use a variable for chaebol firms and other variables that might affect the default risks, because we apply the model for Chinese firms whose dataset does not contain such variables. In this sense, the predictability of the models in this study is lower and models might suffer some misspecification problems. The estimated results are more or less same as expected.

Comparisons of Soft Budget Constraint

In this section, we formally test whether the Chinese firms get more loans compared with Korean firms, after controlling for interest premium (Interest_R), government ownership (Govt_SH) effects, etc. For

this, we set up a model to estimate the effects of various key factors on firms' bank loan financing (BLR) using the following general regression

$$BLR_{i,t} = \alpha + \beta' X_{i,t} + \text{China} \cdot \beta' X_{i,t} + u_i + \varepsilon_{i,t} \quad (2)$$

where the dependent variable, $BLR_{i,t}$, indicates the ratio of bank loans to total assets of firm i for the year t as defined in Table 1; all independent variables used in the model as listed in Table 1, are denoted by a vector $X_{i,t}$, and another vector of interactive terms $\text{China} \cdot X_{i,t}$; $\varepsilon_{i,t}$ denotes error terms; and u_i denotes group specific error terms. The interactive terms with China (dummy variables) are introduced to investigate all additional effects of Chinese firms in each of the variables in the models. The model assumes that individual firm specific constant terms as randomly distributed across firms while the fixed effects model assumes that there are differences in constant for banks and parametric shifts of the regression function. The results of random effects models for the panel data are provided in Table 7. Since R^2 values of the random effects models are 0.6295, 0.6164 and 0.3728 and p-values for F statistics are 0.000 for all random effects models, we may accept the models as appropriate ones.

Table 7: Bank Loans and High Risk Firms in China and Korea

Variable	All		Korea		China

Note: 1. Dependent variable is DEFAULT, dummy variable; 1 if the firm is defaulted, 0 otherwise.

2. Coefficients are statistically significant at 10%, 5% and 1% level for *, ** and *** respectively.

3. P-values are for two-tailed tests.

From Table 7, we can see that there are many differences in factors affecting loans from banks. For Korean firms after the Financial crisis in late 1990s, the budget constraints hardened as we can see in the model for high risk firms (High_Risk), without any statistical significance, while high risk Chinese firms with expected default risk of 0.9 or above experience SBC problems.

The result implies that the higher the default risks of firms, the more debts they can finance from banks. From models for Korean firms, we can see that firms with more loans from banks in the previous year (BLR(t-1)) and those paying higher interest payments (Interest_R) obtain more loans from banks, while firms with more cash flows from operation (OCFR) and higher market values relative to book values (Tobin_q) obtain less bank loans with statistical significance. However, Chinese firms with higher risks (High_Risk) and more fixed assets like land, building, equipments and investment in other firms (Fixed_R) and more cash flows from operation (OCFR) as well as more loans in the previous year (BLR(t-1)) lead to more bank loans, while firms with higher market values relative to book values

(Tobin_q) and those paying more interest expenses (Interest_R) obtain less bank loans, the last one with statistical significance of p-value 0.083 for two tailed tests. From the pooled dataset for two countries, we could verify the effects of factors for Korean firms as in the case of separate dataset for Korean firms. For Chinese firms, we can see the marginal effect of factors on their bank loans from the interactive terms with country dummy (China): positive marginal effects of the country (China), high risk firms (China·High_Risk), fixed ratio (China·Fixed_R) and cash flow from operation (China·OCFR); negative marginal effects of interest rate (China·Interest_R) and current loans (BLR(t-1)). The results suggest that high risk Korean firms do not experience SBC that existed before its financial crisis in late 1990s any more in our sample period of 2000-2007, while such Chinese firms experience SBC. Therefore, we can also conclude that Chinese banks mostly owned by the Chinese government or controlled through governmental firms are softly budgeting high risk firms in China.

CONCLUSION

In this study we have studied the existence of SBC, or supporting poorly performing high risk firms in an economy in transition through bank loans, using a combined panel data of Chinese and Korean firms listed on the stock markets from 2000 to 2007. We have focused on SBC in China in comparison with Korea, which is alleged to experience a severe SBC before its financial crisis occurred in 1997 and harden the budget constraint. This study, following the inaugural study of Kim (2003) and Alexeev and Kim (2008) on SBC in a market economy at a national level for firms publicly owned and traded, showed that there exists a SBC in the Chinese banking sector for publicly owned firms for the first time and that the budget constraint in an economy in transition is much softer than that in the market economy with the examples of the two countries, China and Korea. The results support the theoretical studies by Kim (2003), Alexeev and Kim (2004) and Kim (2009) about the effects of reputation of lenders, competition, and their strategic decision making on SBC in a centralized and decentralized economy in toughening budget constraints. We also have found that factors affecting bank financing in China and Korea are quite different. Most strikingly, Chinese firms with better cash flows from operation obtain more bank loans, while such Korean firms resort less to bank financing. In addition, while Korean firms paying higher interest rates finance more loans from banks, while such Chinese banks finance less from banks. This might imply that for firms in Korea and China might have different sources of financing in the times of high interest rates or in the case of high risk premium asked. We may extend our study on SBC for firms not listed on the stock exchanges or for governmental firms in a market economy and transitional economy. We can also focus on the causes of SBC in such countries like high unemployment, political reasons, etc.

THE APPLICATION OF WTP AND WTA IN SUPPORTING PUBLIC SCHOOLS

Mingsiang Chen, Tamkang University

ABSTRACT

The cost and benefit of various services and goods in public sector cannot be measured directly in terms of dollars. The willingness to pay principle (WTP) and the willingness to accept principle (WTA) are methods commonly used to assess the cost and benefit of these services or goods. This paper addresses the usage of these principles in the realm of public education, to be more specific, how the principles applied to measure the extent to which people are willing to support their local school. There are two types of issues involved here: diffuse support and specific support. The former regards how much people are willing to pay to contribute to local schools. The latter regards how much people are willing to contribute to the local schools their children attend. The major objective of this paper is to present a conceptual framework for the systemic analysis of residents' support for their public schools.

KEYWORDS: willingness to pay principle (WTP), willingness to accept principle (WTA), program evaluation, cost-benefit analysis, public education (school)

INTRODUCTION

The systemic evaluation of public programs becomes more and more critical in the area of public policy. This is so because people are more effectively awareness since almost all governments around the world today are facing serious deficit crises. People seek to understand the costs and benefits of various public programs and demand their government make the best use of taxes collected from them. Nonetheless, the inherent characteristics of public sector render the ineffectiveness of evaluation techniques that are quite common in terms of private enterprise. The evaluation of public programs is not as easy as those found in the private sector in that there is no competition for the services provided by public programs and that people usually need not pay for receiving the services. That is, people pay inadequate attention to the costs of public programs as well as the effectiveness thereof. The evaluation of public programs' costs and benefits, thus, is vital nowadays. However, related analytical tools in this regards are limited since public services are not easily to be evaluated in terms of dollars. The concept of willingness to pay (WTP) and the concept of willingness to accept (WTA) are commonly used to evaluate the economic values of public programs or services. Their application in real situations is, nonetheless, subject to many technical and practical issues.

All individuals are rational and seek to maximize utilities regarding their economic and consuming choices. Children's schooling is a product that parents need and purchase in a market in which local governments, by means of collecting taxes from residents, provide and support. Public schooling is one of the policy area in which residents in general, parents in particular, care significantly in that their children's education depends on it as well as they are responsive for the costs. Local residents' decisions of supporting their school districts can and should be analyzed in terms of costs and benefits (Treasure Board of Canada Secretariat, 2007). It is the intention of this presentation to addresses the usefulness of the WTA and the WTP in evaluating residents' support for public school' i.e., how far they are willing to go for local public schools.

LITERATURE REVIEW

The application of the WTP and the WTA requires empirical data and there are several ways to gather such data (Breidert et al., 2006). In addition, there is good and important difference between the WTP and the WTA, each revealing different reasoning and relying on different set of variables (Ahlheim, 2000). The usage of the WTP and the WTA in public policy requires a few technical arrangements (APAC, VHS, 2001). Several Canadian governmental guides provide, in this sense, good insights (Treasure Board of Canada Secretariat, 2002, 2007).

METHODOLOGY

Rational choice perhaps is, in the arena of public administration, the theory that closes to the “grand” theory. Under the assumption of rational choice, everyone acts according to his or her rational motivation, i.e., self-interested or seeking maximized utility. It is in this capacity that the WTP and the WTA are applicable to public policy. However, the usage of the two principles in the area of public policy takes more efforts in that usually public programs are not easily measured in terms of dollars and that, even when the measuring is possible, there is an emphasis of public goodness or civic duty, which requires special treatment. The method to this end is to distinguish support into two types: one emphasizes the self-interest side and the other the public or civic-duty side. It is expected that the WTA and the WTP work differently in different context.

In order to make the task simply, it is not avoidable to make a few assumptions. First, there are different types of support and each type stresses different functions. The most useful typology is the distinction between diffuse support and specific support. Second, everything being equal, specific support is a stronger motivation than diffuse support. The logic behind this assumption is obvious that people feel stronger when personal interest is at stake. Thirdly, there will be no specific support when residents do not have children (at the ages of attending school) of their own. Specific support means, by definition, that people support something when they get rewards from their action of support. In case of education, the fact that one has children attending local schools constitutes the foundation for their support.

ANALYSIS AND DISCUSSION

There are, basically, two types of support: diffuse support and specific support. The former refers to the kind of support disregard of one’s actual rewards from the program or policy at stake; the latter to the kind of support based on whether or not one benefit from the program or policy at stake. In the arena of public education, diffuse support means that residents support their public schools even though they do not have children or their children do not attend local schools. Specific support means that residents support their public schools when their children currently enroll local public schools. This presentation is intended to provide a conceptual framework by employing the WTA and the WTP to measure residents’ diffuse and specific support for their local schools.

The WTA and the WTP are, in the area public policy, two concepts widely used to define and measure economic value of something or some services, which cannot be measured directly in terms of dollars. The WTP refers to the maximum number of dollars that a person is willing to give up all other goods and services in order to get something. The WTA refers to the minimum number of dollars that a person is willing to sacrifice all other goods and services in order to avoid something undesirable. Different from the WTA, the WTP is constrained by one’s wealth, i.e., if one desires something strong enough, the maximum amount of money he can pay is his whole wealth. On the other hand, the willingness to accept payment in order to swallow the loss of one’s most precious item would be an extremely high amount of money, perhaps approaching infinity. These two concepts are especially useful in measuring the economic values of those “things” which cannot be measured directly in terms of dollars such as services (education, public safety, law and order, etc.), concepts (well-being, economic development, democracy, etc.), state

of mind (spiritual suffering, happiness, extent of torment, etc.) Nonetheless, the WTA and the WTP are just concepts; their application in real situation is subject to further discussion.

One simplest way to estimate one's amount of WTP or WTA is survey, asking people how much they are willing to pay or willing to accept in a hypothetical situation. Although this is the common practices, the task of estimation will be simplified greatly if models, specifically designed for specific policy areas, can be formulated. To be more detailed, any specific public policy displays unique characters and contains aboriginal theories showing certain cause-effect relations which, in turn, indicate possible independent variables as well as common interfering variables. With this information, researchers are able to pinpoint whom serve as the better subjects of survey and to screen the samples so as to minimize the appearance of interfering variables. It is, then, the task of this paper to identify the key variables regarding residents' support of public schools and to formulate a proper model thereof.

How can we model residents' support of public school? One good start is to investigate into the meanings and details of support. The basic taxonomy in this regard is, as stated earlier, the so-called diffuse support and specific support. Diffuse support does not, by definition, directly link to personal utility, whereas specific support directly refers to personal utility. Based on the rational assumption, residents may or may not, depending on their utility function, support their local public schools. Although different factors involved in diffuse support and specific support respectively, there is one common factor operating in the two types of supports, i.e., personal income. It is highly likely that people tend to support local public schools more if they are wealthier and, all other things being equal, are less willing to support local public schools when they are not so well to do.

As to diffuse support, personal direct consideration is minimized in that one's decision of supporting local schools does not rely on one's personal interest in this regard. Factors involved in diffuse support include personal conviction, safety in neighborhood, the goodness of the nation, etc. Personal conviction means that one convinces that education is important and is the right thing to support public education. The reason for this kind of convictions is, however, irrelevant, may it be previous experience, occupation, ideology, or no precise cause at all. What matters is the existence of the conviction that public education is important and one should support it financially. The factor "safety in neighborhood" refers to the notion that better schools make better young men who contribute to good neighborhood. Although the factor originates from one's ego-interest, it mainly links to the community as a whole and thus falls into the category of diffuse support. Some people may deem that contributing to local schools is something for the goodness of the nation and is part of civic responsibility. Affected by these factors, people develop their diffuse support for local schools even in the absence of their direct personal interest at stake.

As to specific support, personal interest is, by definition, at stake. One develops this kind of support when it serves one's ego-interest. Factors such as whether or not one has children, the extent to which parents care about their children's education, the availability and costs of alternative private schools, etc. First, the fact that whether or not residents have children is crucial in developing their attitude toward local education system. It is very hard, if not impossible, for residents without any child of their own to forge certain extent of specific support. Second, having their own children alone is not sufficient for parents to develop a positive attitude toward local schools if they do not care much about their children's education. In order for parents to aggressively support local schools, parents need to allocate a portion of their incomes to their children's education and this cannot be realized without a strong conviction on the part of parents that education is important for their children. Thirdly, the availability and costs of alternative private schools directly affects parents' decision of letting their children attend local public schools. Parents are unlikely to, even in the presence of the above two factors, develop a sense of specific support if there is a good private school with a reasonable price. These three factors affect residents' specific support for local public schools.

The WTP operates in terms of maximizing personal costs vis-à-vis benefits resulting from a certain decision of acquiring something desirable. In the case of public education system, residents decide to support the public schools only when the utilities of the good public schools exceed the maximum costs they are inclined to pay. The WTA operates in terms of minimizing personal costs vis-à-vis benefits resulting from a certain decision of avoiding something undesirable. In the case of public education system, residents decide not to support the public schools only when the minimum benefits they are inclined to give up exceed the utilities of avoiding bad public schools. The above implications is not accurate at all in that it does not make distinction between diffuse support and specific support. The reason for such a distinction is that the two types of support function differently and are affected by different sets of variables, as stated before. In the following section, the two types of support are analyzed separately in the context of the WTP and the WTA.

As far as diffuse support is concerned, the variables involved are personal conviction, safety in neighborhood, and the goodness of the nation. People usually are not highly motivated by these factors and are not willing to pay much, even in the presence of these factors, to support local public schools. That is to say, the WTP is not effective to estimate the extent of diffuse support. To bring the factor of personal income into consideration, the scenario does not change in a fundamental way. People are unlikely to develop a sense of diffuse support for local education simply because they are rich. Moreover, the extent of diffuse support will not change, in the absence of personal conviction, safety in neighborhood, and the goodness of the nation, followed by the change of personal income. The fact that someone is rich or not may play only a marginal role in shaping his or her inclination of diffuse support. On the other hand, people are likely to figure out whether or not they feel obliged to support local schools generally in a negative manner, i.e., people will ask themselves this question: "If things turn out to be really bad, how much is it going to cost me?" It is in this manner that individuals are inclined, in the presence of personal conviction, community safety, and the goodness of the public, to assess their extent of diffuse support for local public schools. To the extreme situation, such as imminent local riot resulting from bad schools, the willingness to accept payment in order to swallow the loss of one's life and home can perhaps approach infinity. The WTA is, thus, a better approach to understand residents' diffuse support for local schools.

As far as specific support is concerned, the variables involved are whether or not one has children, the extent to which parents care about their children's education, and the availability and costs of alternative private schools. People response to, when personal interest is at stake, the question of giving out something more directly and clearly. A sharp comparison between the maximum number of dollars that a person is willing to pay and the utility of getting something or some service is likely to take place when the person has a personal and positive tie to that something or some service since he or she feels strongly about wanting that something or some service. Under such a sharp comparison, the person can judge whether or not the utility exceeds what he or she is willing to pay and, based on the judgment, the person is able to make the decision. The WTP operate better in this sense. In addition, the factor of personal income plays a critical role here. It is impossible for parents, no matter how much they value their children's education, to pay more than their wealth for the support of local public schools, i.e., parents' choice is constrained by their wealth. Such an observation is consistent with the WTP. On the contrary, people usually are unlikely to make a sound decision, in the context of specific support, in a negative manner, i.e., "what I need to give up in order to avoid losing that something or some service," is not very useful in helping people make a sound decision. It is, thus, the WTP functions better in estimating specific support. The WTP is, thus, a better approach to understand residents' specific support for local schools.

CONCLUSION

The term “support” is an operative one; a further investigation is needed before we can address the issue of residents’ support for local schools. Our investigation shows that different set of variables operates in the context of diffuse support and specific support. The variables operate in specific support are such as whether or not one has children, the extent to which parents care about their children's education, and the availability and costs of alternative private schools. The variables operate in diffuse support are such as the personal conviction, safety in neighborhood, and the goodness of the nation. In addition to these variables, there is one common variable operates in both cases, i.e., personal income. Although the factor of personal income operates in both diffuse support and specific support, the significance differs substantially⁴⁶⁴. It affects the extent of diffuse support marginally and specific support substantially. As to the other variables, different set of variables function differently in case of diffuse support and specific support which, in turn, renders the finding that the WTA works better in measuring diffuse support and the WTP works better in specific support.

ASSESSING FACTORS DRIVING INTERNET USAGE AMONG SMEs IN GHANA; A CASE STUDY OF SMEs IN KUMASI

Kwabena Obiri-Yeboah, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana
Eliezer Ofori Odei-Lartey, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana

ABSTRACT

The Internet has revolutionized, and continues to significantly affect, the way business is carried out globally. As businesses of all sizes align ICT to its processes to achieve operational excellence while reducing cost using the internet has become even more critical than ever. This empirical study was conducted to assess factors that drive the usage of Internet as part of the business operations of SMEs. A quantitative approach was mainly used to analyze variables. Data for the study was collected through interviews and observational visits which were analyzed to examine internet usage in association with other explanatory variables including the use of mobile phones and televisions. Service-related businesses were more likely to use Internet for business operations than manufacturing or retailing SMEs. However, the number of years of experience in internet usage had a strong association with SMEs that did. Results also indicated that SMEs studied were gradually progressing towards the use of sophisticated technologies in business, and although respondents asserted to the benefits derived from the use of the Internet in business, replacing conventional media with internet services was unlikely. Issues about cost, slow access speed and customer communication preferences were major Internet usage challenges that needed to be addressed. Also awareness should be created on the potential economic benefits the internet could yield to SMEs.

INTRODUCTION

The Internet represents one of the most successful examples of sustained investment and commitment to research and development in information infrastructure. A survey conducted in Ghana by Frempong and Essegbey (2006) on the use of ICT indicated that despite the wide availability of internet service and relatively high literacy rate among the owners of SMEs only a few of them (7%) used the internet for business activities in the Ghanaian economy. The issue that immediately rises is that if it is neither a question of literacy nor the availability of the service, then what other factors drive internet usage patterns in Ghana?

One determinant, well noted in literature is the proliferation of devious individuals who wish to exploit the Internet for their own selfish interests. This type of conduct has made sincere users vulnerable to a host of possible attacks that compromise the confidentiality, integrity, and availability of information that they exchange through the Internet. As a result of such illicit activities, people tend to lose trust on the security of doing business in the Internet and thus, forego its huge potential for business and other socially desirable uses. The cost of adoption has also been regarded as an important factor in the adoption and use of the Internet (Young, 2001). Generally, the higher the costs associated with adopting the innovation, the slower the pace of usage expansion is likely to be.

Another factor according to Mohammad (2009) is that small businesses in Malaysia tend to avoid internet usage in their business because it is perceived as complex to use. This problem was also attributed to the lack of skills amongst employees in using the internet for business. Mohammed also indicated that the benefits perceived by the small businesses from internet usage were vestigial and hence the low adoption of this technology. But do these factors apply within the Ghanaian context?

Although extensive research literature exists on the usage of the internet in supporting competitiveness of SMEs, there is still the need for a deeper understanding of the factors that either promote or inhibit the adoption and usage of this facility by SMEs within specific contexts. The need for this study is therefore for two main reasons. First, most of the empirical research studies available about determinants of Internet usage for business activities were conducted in other countries and on larger formal companies. Secondly, identifying the major driving factors of internet usage among SMEs will provide appropriate information to these businesses to make informed choices and consequently promote internet usage as part of their business operations.

LITERATURE REVIEW

According to (Ion & Andreea, 2008), the Internet has become a driving force for development and innovation in many countries with millions of businesses connected to it worldwide. This assertion is supported by a study conducted in 2008 which indicated that 68% of large companies in Albania made use of online ordering facilities (Sevrani & Bahiti, 2008). Earlier statistics by Dixon, et al., (2002) also depicted that 63% of all UK SMEs were connected to the Internet in 2001 with 540,000 SMEs trading online. In this study, Dixon further indicated that over half of SMEs (57%) attributed broadband to improved profits and two thirds to lowering the cost base. A more recent study on Canadian manufacturing establishments drawn from Statistics Canada's Business Register, for instance, showed a greater usage of advance ICT among those that recorded higher productivity (OECD, 2004). This suggests that the Internet is indeed changing the way business is done in these economies. Thus, it is making commercial activities more effective, making more information available for decision making, and producing more results, faster. The Internet is also known to offer new ways of displaying results, such as real-time financial systems that can be accessed from just about anywhere (Alam & Noor, 2009). Such access to both computer power and business information have provided the platform for customers and suppliers to find answers to questions they could only imagine a few years ago.

Literature point out some of the benefits the internet accrues to the business world ((Dixon, Thompson, & McAllister, 2002); (OECD, 2004); (Sevrani & Bahiti, 2008); (Ilavarasan & Levy, 2010)). These benefits are categorized into operational tactical and strategic benefits as Illustrated by Ion & Andreea, (2008).

DATA AND METHODOLOGY

A comparative case study was employed to examine the research problem within the context of the locations chosen. For this reason there is little assurance on how representative the results of this study would be to all SMEs in Kumasi. Selected areas from the Kumasi metropolis were targeted for the study. Information about the number of SMEs available at these target areas were received from the sub-metros and the Kumasi Metropolitan Assembly (KMA) itself. The total population figures received corresponded with the SMEs which had registered with these institutional bodies.

Primary data for the study was collected through interviews and observational visits. Interactions with each of the respondents under study consisted of a mix of closed-ended and open-ended survey questions. A questionnaire was designed for this purpose with numerical codes assigned to alternative responses where appropriate. This study was not designed to directly examine internet usage effects on revenue, productivity or cost. Instead, the study was limited to the assessment of the characteristics and internet usage behaviors, and linked them to the decision to use internet as part of business operations. For this reason, questions for the interview examined attitudes, opinions and organizational practices rather than financial indices. The close ended questions were dominantly used to receive responses concerning the characteristics of the businesses as well as the attitudes, behaviors and opinions of the respondents towards the use of the Internet. Data on respondent reactions and suggestions were collected using semi-structured, open ended questions.

The questionnaires were either self-administered or interviewer-administered depending on the preference of the respondent. Self-administered questionnaires were physically delivered to and collected from the intended respondent to reduce possibilities of contamination and unknown biases. Also, the reliability of the questions was assessed mainly through the alternative form approach. Other approaches such as the test re-test were used but sparingly to avoid possibilities of irritating a respondent by repeating questions. The targeted groups for the interviews were the managers and owners of the businesses since literature suggests that the decisions of these groups in such establishments invariably have major impacts on the operational behaviors of other employees (Abor & Quartey, 2010).

EMPIRICAL RESULTS

Socio-Demographic Characteristics of Respondents: The socio-demographic characteristics of respondents from selected key areas of SME operations were gathered. The sex distribution of respondents was analyzed and it showed that majority (57.5%) of SME operators were males. The age distribution of respondents was found to be mainly between ages twenty-six to forty-five (26 - 45), with most of the respondents within the (36 – 40) age group. Responses from the study also indicated that a larger percentage of respondents of the study area (71%) had at least secondary level formal education. The difference between those who had attained up to the secondary level and those who had tertiary level education was marginal for the study area. Apart from the non-responses (11.1%), all respondents indicated that they had attained at least secondary level formal education whilst about five percent (4.6%) had no educational background. More than two-thirds (71.6%) of respondents that managed the SMEs in Kumasi were owners. However, SMEs in education related fields like finance, ICT, training, and engineering had a fairly balanced distribution between owner managers and others who were employed as managers were observed. It was also realized during the survey that most of the respondents categorized as managers had family relations with the actual owners.

Exposure to ICT Use Responses on the level of exposure of the respondents to ICT in general were analyzed on three (3) variables; mobile phones, computers and the Internet. This analysis was not limited to the usage of these media for business. A large number of respondents in Kumasi (92.5%) owned and used mobile phones. With respect to the use of computers, a significant number of respondents at the central business district (45.4%) could not use a computer. Negative responses on computer usage at Ayeduase (near KNUST) were however lower (22.2%). According to the survey 55% of respondents knew how to use the Internet.

Knowledge About The Internet: Responses were received on the knowledge of respondents about the internet. Responses were analyzed from two perspectives; the respondent's awareness of the internet and the respondent's perception about the Internet. Responses received indicated that a large number of respondents had heard about the internet 94%. However, five (5) of the respondents indicated that it was the first time they were hearing about the internet. The Internet as a medium for communicating was the dominant perception in Kumasi. This was followed by the perception of the internet as a tool for research and learning. Eight (8) respondents described the internet as a facility for online business transactions such as payments and purchasing whilst an equal number of respondents (8) also described the internet as a place for advertising and finding new products. One peculiar response was the description of the internet as a facility for the youth. Others (8) also viewed it as a place for social rather than business intentions.

Adoption of the Internet in Business: Data was analyzed from the entire sample size and subsequently scaled down to reflect responses from one hundred and forty (140) respondents from Adum and seventeen (17) from Ayeduase (those who used the internet but not necessarily for business activities) to examine the extent to which the respondents had integrated internet usage with their business activities. Included in

the findings were responses on the hindrance to internet adoption for businesses. Out of the total respondents from Adum, 27.1% used Internet services in their businesses whereas Ayeduase results indicated that 55.6% of respondents used the internet for business operations. Focusing on those who had experience in the use of the internet, 59.3% of 140 respondents from Adum used the internet in their business activities whilst 40.7% did not. On the other hand 88.2% of respondents at Ayeduase used the internet for business purposes. Only one respondent had not adopted the internet for use in business operations.

Based on the results of the study, 89% of respondents at Adum indicated that slow access speed was a hindrance to the use of internet for business. The issue of cost was also pointed out by 77.2% of respondents at Adum. The distance between the respondent and the location of the service was a challenge to a few 15.8%.

Factors Driving the Usage Of Internet In Business: Responses on how the internet is used in business were paired against the characteristics of the respondents to determine the relationship between these factors and the usage of the internet for business purposes. The characteristics considered for this study was based on findings from literature about the common factors that influence internet adoption (Taylor, Zhu, Dekkers, & Marshall, 2003). These factors were the age, education, business type, and experience in the usage of the internet. With respect to experience, three variables were considered; the length of usage of the internet; the frequency of usage of the internet; and the time spent per week in using the internet. The strength of the associations was also subjected to the Pearson's Chi-square test to find their p-values. A univariate logistic regression model was also used on responses from ADUM to predict the probability of the occurrence of the relationships.

Table 14: Age Groupings And E – Business Adoption

Age Groupings	BUSINESS USE											
	ADUM (N=306)						AY (N=27)					
	Yes		No		N/A		Yes		No		N/A	
	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)
18 – 25 yrs	6	85.7	1	14.3	0	0.0	3	100.0	0	0.0	0	0.0
26 – 35 yrs	33	48.5	13	19.1	22	32.4	7	50.0	1	7.1	6	42.9
36 – 40 yrs	25	22.7	33	30.0	52	47.3	3	75.0	0	0.0	1	25.0
41 – 45 yrs	16	23.5	12	17.7	40	58.8	1	50.0	0	0.0	1	0.0
46 – 55 yrs	3	7.0	3	7.0	37	86.0	1	100.0	0	0.0	0	0.0
56 – 60 yrs	0	0.0	0	0.0	5	100.0	0	-	0	-	0	-
Above 60 yrs	0	0.0	0	0.0	3	100.0	0	0.0	0	-	0	-
Missing	0	0.0	0	0.0	2	0.0	0	0.0	0	0.0	3	100.0
Pearson's Chi square	p-value <0.001						p-value=0.542					

However the possible influence of several variables on this predictive model should be noted. A logit model was also developed for age groupings on the use of Internet in businesses. The p-values reported for respondents from Adum were less than 0.001 whilst a p-value of 0.542 resulted for observations at

Ayeduae. From the logistic regression table (Table 15), the Odds Ratio on the true population for those aged 46 – 55 years, at a confidence interval of 95% was between 0.001 and 0.14 with a p-value less than 0.001.

Table 1: Adum Univariate Logistic Regression For Table 14

ADUM			
Age Groupings	Odds Ratio	(95% Conf. Interval)	P - value
18 – 25 yrs	1		
26 – 35 yrs	0.15	(0.02 – 1.38)	0.095
36 – 40 yrs	0.05	(0.01 – 0.43)	0.006
41 – 45 yrs	0.05	(0.01 – 0.46)	0.008
46 – 55 yrs	0.01	(0.001 – 0.14)	<0.001

Results from responses received on the association between educational level of respondents and their use of internet in business are presented in Table 16. Due to the very few observations for education against internet use in business, a logit model was not developed. However, the p-value derived from the cross-tabulation was less than 0.001 for respondents from Adum and 0.056 for responses from Ayeduae.

Table 2: Educational Level E – Business Adoption

BUSINESS USE													
Education Level		ADUM (N=306)						AY (N=27)					
		Yes		No		N/A		Yes		No		N/A	
		n	(%)	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)
	None	0	0.0	2	14.3	12	85.7	0	-	0	-	0	-
	Primary	0	0.0	0	0.0	74	100.0	0	-	0	-	0	-
	Secondary	17	15.9	28	26.2	62	57.9	4	40.0	1	10.0	5	50.0
	Tertiary	66	64.1	31	30.1	6	5.8	11	78.6	0	0.0	3	21.4
	Missing	0	0.0	1	12.5	7	87.5	0	0.0	0	0.0	3	100.0
Pearson's Chi square		p-value <0.001						p-value=0.056					

As shown on Table 17, the p-value of the relationships established between the type of business and the use of internet for business purposes was 0.001 for responses received from Adum and 0.027 for that from Ayeduae. Following the Odds Ratio, for each manufacturing SMEs that used internet for businesses, there was likely to be 1.15 more retail SMEs that were also using Internet in business and 3.27 more service-related SMEs. If the true population of SMEs at Adum was considered, at a confidence interval of 95%, the Odds Ratio for retail SMEs would lie between 0.41 and 3.24 with a p-value of 0.787 while the Odds Ratio for service-related SMEs would lie between 1.02 and 10.45 with a p-value of 0.045.

Table 3: Business Types And E – Business Adoption

BUSINESS USE												
Business type	ADUM (N=306)						AY (N=27)					
	Yes		No		N/A		Yes		No		N/A	
	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)
Manufacturing	5	21.7	0	0.0	18	78.3	0	-	0	-	0	-
Retailing	58	24.3	58	24.3	123	51.5	2	28.6	0	0.0	5	71.4
Service	20	47.6	4	9.5	18	42.9	13	76.5	1	5.9	3	17.6
Missing	0	0.0	0	0.0	2	100.0	0	0.0	0	0.0	3	100.0
Pearson's Chi square		p-value =0.001					p-value=0.027					

Table 4: Adum Univariate Logistic Regression For Table 17

		ADUM		
Business Type		Odds Ratio	(95% Conf. Interval)	P - value
	Manufacturing	1		
	Retailing	1.15	(0.41 – 3.24)	0.787
	Service	3.27	(1.02 – 10.45)	0.045

As shown on table 19, the p-value from a cross-tabulation between frequency of use and internet usage in business was less than 0.001 for both study areas. Also the Odds Ratio for Adum observations was 0.06 for those who used the internet 2 – 3 times a week.

The p-value for the association between the amount of time and the use of internet for business purposes was 0.001 for responses received from both Adum and Ayeduase. If the true population of SMEs at Adum was considered, at a confidence interval of 95%, the Odds Ratio for respondents who spent over 20 hours of their time on the internet would be between 2.99 and 44.75 with a p-value less than 0.001.

CONCLUSION

Results on the respondents' perceptions of what the internet was all about were relevant in confirming their awareness of the internet. In all, the internet was predominantly considered as a communication media. A significant number of respondents also regarded it as a tool for research and learning.

From the analysis, years of experience in Internet usage had a considerable influence on decisions to make the Internet part of business operations. Thus SMEs operators that had more years of experience in the use of the Internet were more likely to use it in their business activities.

Results from the study, indicated strong associations between the frequency of internet use and the use of internet in business as well as time spent and its use for business. The causation however was possibly in reverse. Thus, SMEs that used the internet frequently or spent more time on the Internet may be due to the fact that they were using it for business purposes.

Majority of respondents who use it in business employ it as a means of communication. This usage corresponded with the dominant description of what the internet was perceived to be. It was therefore expected that the internet services for communication and search would be predominantly patronized. As anticipated, the email and search engines were highly patronized. It was also interesting to realize the number of respondents that owned personal websites, the functional level of the website was however not examined. Nevertheless, this suggested a progressive adoption of more sophisticated tools by these SMEs. An illustration of a possible adoption pattern based on the model by Sevrani, et al (2008) is illustrated in Figure 13.

From the analysis, majority SMEs studied that had integrated internet into their business activities had become highly dependent on it. The high number of respondents that realized new products and improved their product quality through Internet usage substantiated the usefulness of the Internet for new product search. The least benefit was the ability of SMEs to increase their customer base and to decrease the use of conventional media; this may be attributed to the low level of trust by many of Internet information related to business. Cost and access speed were the main setbacks in e-business. Despite the challenges, a good proportion of business users were fully satisfied with the e-business.

Table 19: Frequency of Internet Use And E – Business Adoption

Frequency of Use	BUSINESS USE											
	ADUM (N=306)						AY (N=27)					
	Yes		No		N/A		Yes		No		N/A	
	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)	n	(%)
Daily	69	85.2	12	14.8	0	0.0	12	92.3	0	0.0	1	7.7
2 – 3 Times a week	14	24.6	43	75.4	0	0.0	1	50.0	1	50.0	0	0.0
2 – 3 Times a month	0	0.0	7	100.0	0	0.0	1	100.0	0	0.0	0	0.0
Once in a month	0	-	0	-	0	-	1	100.0	0	0.0	0	0.0
Missing	0	0.0	0	0.0	161	100.0	0	0.0	0	0.0	10	100.0
Pearson's Chi square	p-value <0.001						p-value<0.001					

To conclude, the main objective for this study was to assess the factors driving Internet usage for business among SMEs in Ghana. This study was based on the perception of SME operators. The demographic and business characteristics of the SMEs studied were determined and information was tapped from responses to achieve specific objectives set out for the study. From the results, a large number of respondents at both study areas are familiar with mobile phones. This number however decreases with responses to the use of computers and the internet. Secondly, results suggest that access to internet facilities is not a critical challenge. Strong associations are identified between factors such as age, education and usage experience, and the pattern of Internet usage in business operations. Also, it is realized from the results that the SMEs are gradually progressing towards the use of sophisticated technologies in business. Finally, although respondents asserted to the benefits derived from the use of the Internet in business, replacing conventional media with internet services is unlikely.

ABSTRACT

The concepts of ‘sharing’ Economy and Collaborative Consumption are gaining popularity in the business world due to internet based products and services. The widespread use and virtue of one of the extensions of collaborative consumption is collaborative education is discussed with some useful application. The main purpose is to show the existing and future potentialities of collaborative education, and how it would pave a pathway to effectively promote Yunus Social Business (YSB). Studies have shown the effectiveness and usefulness of present models of collaborative education and in order to further promote YSB, collaborative education model is indeed holding the key. The paper suggested that the enrichment of the online portal – the Yunus and Youth tube (YYtube)– with the concepts of collaborative education will be an appealing platform from where YSB can be taught to aspiring young minds of the future.

JEL: I23 - Higher Education and Research Institutions; I25 - Education and Economic Development

KEYWORDS: Collaborative Consumption, Collaborative Lifestyle, Collaborative Education, Yunus Social Business, Sharing Economy, Online Education

INTRODUCTION

The concept of Collaborative Consumption (CE) has been prevailing in the economy over decades. It started to popularize with the concept of sharing private jet to sharing luxurious holiday resorts/apartments, a concept to share luxurious products or services. Due to higher price of luxurious assets, this concept of sharing or collaborative consumption provided opportunity to many customers to avail those products and services by sharing access and ownership (Wali et al., 2012). In recent times, there has been substantial increase in the popularity of the concept of ‘sharing’ Economy. It can be further described by peer to peer sharing of goods and services over economic community, sharing of used DVDs, cars, or even a drilling machine through an internet ‘neighbor.’

In addition, this concept has been brought into lime light in front of business world again by Rachel Botsman in TedTalks, and also by the book ‘What’s Mine is Yours: The Rise of Collaborative Consumption’ (Botsman and Rogers, 2010). Diverse array of products and services are gaining popularity for sharing day by day, starting from simple concept of DVD and Audio CD sharing through many websites all around the world, to the sharing of houses, home appliances and electronics and cars (Wali et al., 2012). Eventually, this concept started to spread in education arena as across the world 200 million young people leave school without the skills they need to prosper in life (UNESCO, 2012). This paper has highlighted some ongoing collaborative education models and proposed to develop similar models for the spread of YSB concept.

RISE OF THE CONCEPT OF 'SHARING' ECONOMY

In most of the households, there are many possessions that have never been used more than once or twice in its entire product life. Some of the belongings are not even part of daily use, for example a lawnmower or a drill machine (Botsman and Rogers, 2010). These commodities hardly add any value in storing up or displaying. On the other hand, there are many household items that may require use of these commodities. In reality, requirement is not for the commodities, but the usage of that products or services. Buying these commodities and storing up most of the product life can be termed as under-utilization of resources. The theory of collaborative consumption addresses this problem by sharing resources between parties who are in need, thus ensuring maximum utilization of resources (Botsman and Rogers, 2010).

Car or ride sharing is a popular example of collaborative consumptions. On average, a car owner parks the car more than 60% of its lifetime at the parking shed (Shaheen et al., 2012). This finding have urged many companies to develop car sharing initiatives, which range from the simple ride shares, for example ZipCar and the rideshareonline, where people advertise over internet portals regarding destination of journey and the route intend to take, and then offer seats so that anyone interested can take the ride. Similarly, professional car sharing companies buy cars and then advertise over internet for sharing use to different destinations. This concept is successful in different parts of the world where people are more inclined towards driving to work, as it has not only led to economical benefits of better cost advantage per mile per person by sharing the cost. It has also led to benefits of maximization of usage and reduction in carbon emission levels (Shaheen et al., 2012).

The basic concept of collaborative consumption is the 'dematerialization' of resources, which spells out that people look for access to goods and skills rather than ownership (Sacks, 2011). This fact is further emphasized and suggested the emerging need of 'access' over the need of 'ownership' (White, 2011; and Young, 2011). This move from '*ownership*' to '*access*' have made the concepts of collaborative consumption along with the new businesses and portals that have sprung with it, a growing sensation in the economy.

According to Botsman and Rogers, 2010, this sharing economy can be divided into three forms:

1. Renting and sharing of products, for example – drill machines and cars,
2. Re-ownership of a product (selling of second hand DVDs), also termed as the Mesh economy, where product life-cycle is extended and other people can enjoy the service benefits of a product after the user has his or her share of utilization.
3. Collaborative lifestyle – this is the highest form of sharing, where people share their intellectual assets and skills as and when necessary and this is the form of sharing further discussed in this paper in collaboration with education.

Trust is the most of important factor of this 'sharing' economy. The model of collaborative consumption is based on the pillar of trust and many studies have highlighted this same fact (Sacks, 2011; White, 2011; Young, 2011 and Shaheen et al., 2012). Collaborative consumption is only possible for consumers and households to share goods and skills if they can trust the party they are sharing with and they are convinced of the return they are going to receive. In this regard, Botsman and Rogers (2010), and White (2011) have suggested the concept of online social accountability and online statements of how trustworthy a person can be. This can be measured by details like how many successful on time deliveries has been made by a person in eBay or Amazon, or how was the quality of the product sold, did it match with the description and image posted in the website or not. Different studies have shown that due to the widespread use of internet and the social media, along with e-commerce sites, the level of trustworthiness of a buyer and supplier can be measured to a good extent (Botsman and Rogers, 2010; White, 2011).

COLLABORATIVE LIFESTYLE – PAVING THE PATH TO COLLABORATIVE EDUCATION

The concept collaborative lifestyle is the sharing of intellectual assets and skills over the economy. This form of sharing has a very profound implication and its applicability is made very much feasible by the present high speed internet portals all around the globe. In the advent of the 2020s, a good portion of the world is connected via internet and benefits of internet services can be understood in different parts of the world. The technological advancement lowered cost structure, investment and operating costs and collaborative business also started to take advantages out of it. As a result, more and more organizations started to come up with different array of products and services (Young, 2011; Shaheen *et al.*, 2012; Rachel and Botsman, 2010).

One in every five young people in developing countries need second chance for education to gain skills for work (UNESCO, 2012). One of the factors for leaving education is that the cost of education has risen over times and some form of education has gone out of reach for certain groups of people. For example, let us consider the case for a young business executive or a regular student from a country where main language is not English, plans for a Master's degree from a good business school that requires GMAT score. The learner can get into some assistance courses that has professional teaching instructions for appearing GMAT examination but often it would be difficult to spare time on a regular basis for these courses, or it could be out of reach due to course fees. So what are the options? The answer can be simply provided by visiting the Khan Academy's website (Khan 2012), looking up for the GMAT preparation videos, and download a GMAT official preparation guide from the official GMAT website and practice at a time convenient for her. The student will have the support at home and can avail the lecture at convenient time. Any student or learner can enjoy the same benefit from any part of the world.

In another case, a young executive or innovator wants to perform better by exhibiting good business awareness, passing up strong and stimulating new ideas. Although some of these qualities require practical experience, others require learning recent business practices that have been appreciated by the business world. Given workload, yet again, most of the time it is feasible. So what are the options to have all the new business updates in one platform? The innovator can log in to TedTalks website, look for themes in business that are relevant to areas of interest. Watching some of the videos that are given by very outstanding speakers and movers and shakers of the business world will help to get the desired edge in the concerned business sector.

Both these examples require further education. The easiest option is to log into websites dedicated in developing the skill base of the users through the sharing of skills of intellectuals who has accomplishment in their own fields. This is the concept of Collaborative Education – to have a portal where people can share their educational expertise. People with experience, knowledge and qualification will share learning with the people in need. It can be free, on payment basis or both. This will benefit those who will be sharing in terms of building up their network, profiles and images in the community. We have just introduced two websites as examples to collaborative education, but in effect there are many websites and portals around the world which act in the same way, maybe not by sharing videos, but by information through text and presentation.

A similar example of one such platform is common among many university students, who use cloud computing facilities to share subject specific lectures and tutorials with students from other disciplines. The ease of access to these cloud storage websites (DropBox and Microsoft SkyDrive) makes this sharing and collaboration of education a very simple matter. Whenever a student needs to learn something specific which may not be directly related to the classes, need to do log into these sharing portals and look for the course materials that may help him or her learn the concept. Although sharing of lectures started in

informal ways, today there have been emergences of websites providing interactive lectures by instructors in the World's best universities and also sponsored and controlled by them to maintain a very high quality of instruction.

Three such appropriate examples are Coursera, EDX and Udemy, all of which are sponsored by and instructions provided by the very top ranking universities of the world and it is free of cost. Everyone can log into these sites and look for particular courses to enrich own skill base. The future of the education will be in collaborative education of young aspiring individuals all around the world. They may also go through tests and exams that they need to learn conveniently and cost effectively.

The collaborative education not only addresses the problem of cost of education but also has the added advantage of convenience and distance learning. It is true that only the presentation files and the course materials are not good enough to recreate the classroom learning situation but with the help of multimedia, there are now interactive and non interactive videos that are shared across internet which provide closest to classroom experience. This form of education is already being popularized by the websites already mentioned in this section along with the increase in popularity in AudioBooks and Podcasts from iTunes stores, which serve the very same purpose.

BUILDING A PLATFORM FOR COLLABORATIVE EDUCATION (CE) ON YUNUS SOCIAL BUSINESS (YSB)

The concept of Yunus Social Business has gained popularity for solving a recurring problem in the society with the help of the daily operations of the business. Success is measured in terms of addressing the problem rather than maximizing profit. Investors will only get back the initial investment and profit would be reinvested for future expansion (Yunus, 2010). YSB and collaborative consumption stem more or less from the same root – there are people in the economy with commodities who can and want to contribute services; there are people in the economy who are in need of those services (Yunus et al., 2010). Both these ideas lean heavily on the effective sharing of information and the use of a good information medium, notably the internet (Palmer et al., 2012). Given this similar core, the 'sharing' economy can be used as a new platform to promote Yunus Social Business.

It has been observed from experiences in teaching social businesses that the traditional classroom approach is effective to ignite the idea of the socially responsible business practices (Wali, 2012). The concept of Yunus social business is far more effective than other business concepts due to the fact that Social Business offers the growth of investments made by the concerned parties as well as aiding in the development of the society (McCann, 2011). Proper and effective means of teaching social business requires the exposure to the real scenarios of bottom of the pyramid people (BoP), and other highly underdeveloped areas to give the students/learners an idea of how social business can help in the development of the society and this is where the usefulness of collaborative education comes into play (Wali, 2012).

Although it may be possible for the students/learners in the underdeveloped countries to grasp the concept of YSB, due to the ease of their exposure to the needs of the society and BoP people, it may be challenging for the students/learners of the highly developed countries to get a clear and interactive picture of the benefits that can be contributed by YSB. Whereas, this segment can significantly contribute by thinking outside the box approach only if they can get the exposure of BoP society and market. They can develop social business in this arena by addressing social issues from that particular community. The model of 'YY (Yunus & Youth) tube,' can be a leading example in this arena. While YY tube gets access to talks of Professor Yunus in different events, they can make it available for all interested learners across the world to view those talks. Besides, some universities and institutions are offering courses on SB as

well. However, those courses are not in reach of most of the learners. Apart for 'YYtube' website, online courses or lectures can be developed in collaboration with universities, academic institutions, above stated websites or even with some new websites.

If we could build up an interactive internet based platform where the concepts YSB will be explained by its pioneers as well as shown how those have been implemented and helped local population to develop, then not only the platform will give hands on exposure to students/learners who are interested in it but also will show the world the real effectiveness of YSB. In addition, due to the fact that this platform is global, the knowledge, experiences and exposure can be shared at a global level. So, due to the practical nature of the Yunus Social Business education, the concept of collaborative education can help to create a very good platform for YSB. One day, it might even possible that a collaborative education service is developed with the YSB model where profit would be reinvested for further development. Premier fees would be charged to solvent collaborative education users to cross subsidize the cost of other users or educational institutions.

CONCLUSION

This paper has proposed a new integration of the concept of collaborative consumption principles in education sector to show how it can be as effective as a form of collaborative education which will not only act in reducing the cost of education through sharing but make it more interactive, interesting and convenient. The use of the collaborative education concept is developed to create platform for teaching YSB. This paper only proposes the usefulness that can be gained in developing a platform for sharing the knowledge and experiences of YSB to aid in the learning of its concepts. There are further research scopes in both evaluating this proposal and also in working to create a more detailed platform in line with this proposal.

UNDERSTANDING THE B-SHARE DISCOUNTS: EXCHANGE RISK IN CHINESE STOCK MARKET

Mo Zhang, Hanken School of Economics

ABSTRACT

This study investigates the impact of the exchange risk on B-share discount by developing an estimation model to decompose the valuation differential into two components, the difference between the expectation of future exchange rate and spot exchange rate and the difference between A- and B-shares' expected returns, which both contain the exchange risk. The empirical tests explore that USD and HKD real exchange rates do matters for the B-share markets in SHSE and SZSE on the market level, however, CNY real exchange rate does not affect the A-shares' expected returns in both stock exchanges. But when moving down to the industry level, the exposures to USD and HKD exchange risk become less obvious. Although it is hard to detect the clear pattern of impacts of real exchange rates on B-share discounts through A- and B-share expected returns, it is quite easy to find the effects of the Changes of exchange rates CNY/USD and CNY/HKD on B-share discounts. Based on this study, if the investors expect strong CNY in the future, then the B-share discounts will decline.

INTRODUCTION

As the largest emerging economy in the world, interests in Chinese equity markets have grown rapidly in recent years. Since investors seek higher returns and international diversification, a flood of foreign capital has come into the Chinese financial markets. For the “stability” reason, Chinese government imposes different restrictions on establishing separate classes of shares for domestic investors and for foreign investors. The Chinese equity market is characterized by the existence of multiple classes of shares: for domestic shares (A-shares), there are three major categories with a strict segmentation: state shares held by central or local government or solely state-owned enterprises, legal entity shares held by other enterprises, the foreign partners of incorporated joint ventures and non-bank financial institutions, and tradable publicly owned shares held by individual investors. State and legal entity shares are prohibited from trading. Only the last category can be freely traded in the stock exchange. A limited number of listed companies issuing A-shares for domestic investors also issue B-shares for attracting international capital. The two groups of shareholders have the identical cash flow rights and voting rights as well as obligations, except that A-shares are denominated by Chinese Yuan (hereafter CNY), while B shares trading in Shanghai Stock Exchange (SHSE) are denominated by U.S dollar (hereafter USD) and those trading in Shenzhen Stock Exchange (SZSE) by HK dollar (hereafter HKD). The law of one price (LOP) is violated in such kind of segmented markets. Bailey (1994) firstly found the large price discounts of Chinese B-shares relative to A-shares. However, in stock markets with the similar structure, the foreign class shares commonly command significant price premia instead of discounts.

Since February 2001, the Chinese government opened up the B-share market to domestic investors. On November 2002, the China Securities Regulatory Commission and the people's Bank of China (PBOC) introduced the Qualified Foreign Institutional Investor (QFII) to trade Chinese A-shares. There was a substantial decline of B-share discounts after the lifting of restrictions on foreign ownership in Chinese stock market, but surprisingly the B-share discounts do not fade away. Due to the complex market structure and various monetary controls, the Chinese B-share price discounts are hard to be explained and remain a puzzle (Bailey, Chunag and Kang 1999), which makes the topic interesting. Most studies explain B-share discounts by different risk levels, information asymmetry or market liquidity, but they cannot get the consensus.

The most obvious difference between A- and B-shares is the currency denominations. The exchange rate can affect both ex ante and ex post returns. In one way, the B-share holders receive the dividends by CNY, while the stock price is denominated by USD or HKD. When they evaluate the stock, they need to convert CNY denominating dividends into USD or HKD. So the exchange rate change will affect the stock price. Besides that, by Adler and Dumas (1983, 1984) and Solnik (1983), asset trading with prices quoted in a particular currency in a country has exchange risk associated with random domestic currency movements. Domestic investors and listed companies have no efficient way to hedge their currency risk perfectly, which probably makes the currency risk as a systemic risk in Chinese stock market. By this way, the stocks denominated by USD, HKD or CNY probably load different currency risks.

Before July 2005 China adopted a de-facto fixed exchange rate system, under which the exchange rate was pegged to the USD and seriously regulated by the government. There was no variation of CNY exchange rate, so it is impossible to study the effect of CNY exchange risk on the B-share discounts. This paper aims to study how the exchange risk affects the remaining B-share discounts after the lifting of restrictions on foreign ownership and foreign exchange deregulation in China. This paper just investigates whether exchange risk has the impact on B-share discounts, but does not claims that exchange risk is the only or main influence of B-share discounts. This study contributes in following aspects. Firstly, study the relation between exchange risk and Chinese B-share discounts, which has not been sufficiently studied. Secondly, unlike most previous studies, this paper test an international asset pricing model that might account for differences in shareholders' expected returns, and then use different betas to explain the B-share discounts.

LITERATURE REVIEW

Over decades, researchers have tried to explain the price disparity appearing in segmented markets in various ways. Previous studies explained the B-share discounts mainly by information asymmetry. B-shareholders have better accounting information which gives them some advantage (Bao and Chow, 1999). However, Chakravarty, Sarkar and Wu (1998) argue that even though B-shareholders have better accounting information, they have less other information because of language barriers and culture differences, etc. Lee, Rui and Wu (2008) recheck this issue after ownership deregulation and find that "there is no asymmetric information between investors in the two markets". Therefore, information asymmetry is not the sole reason to explain the all these differences.

Illiquidity effect is another explanation of B-share discounts. Amihud and Mendelson (1986) explain that investors ask for higher expected returns on relatively illiquid shares to compensate for increased trading costs.

As the third explanation, risk differentials hypothesis is based on the fact that Chinese markets are highly speculative and full of domestic investors who are highly risk tolerant and focus on short-run returns. However, foreign investors have relatively higher degree of risk-aversion. Sun and Tong (2000) find a positive relationship between B-share discount and risk levels. In contrast with previous studies, Chen, Lee and Rui (2001) fail to find significant evidence supporting the differential risk hypothesis.

Instead of risk consideration, some researchers study the price parity from the supply and demand view. Gordon and Li (1999) propose that Chinese investors suffer from strict legal restrictions, which keep them away from diversifying their portfolios globally. Facing to limit investment opportunities and insufficient stock supply, domestic investors push up A-share prices, leading to B-share discount. However, the argument above is contradictory to international asset pricing model. Eun and Janakiraman (1986) developed asset pricing models under a specific form of barrier to international investment and pointed that the shares owned by foreign investors should be traded at a price premium relative to the corresponding shares owned by domestic investors. They argued that since foreign investors can invest

globally, they can diversify the specific country risk and ask for lower risk compensation. In this sense, foreign investors require lower expected returns and pay price premium, which is opposite to the supply and demand explanation.

To sum up, the explanations for the B-share price discounts are not conclusive, and mainly focus on the problems brought by market segmentation. Along with the gradually financial deregulation in China, especially in exchange rate regime, the degree and impact of market segmentation are changing. However, there are only a few articles analyzing the impact of the absence of restriction since 2001 on the B-share discount and only one paper studying the effect of exchange rate system reform. Due to the data limitation, all the papers above fail to discuss the effect of exchange risk on B-share discount. Until 2005, exchange rate system reform gives Bae, Li and Shi (2009) the chance to examine the topic. They show that under a more flexible exchange rate system, investors' attitude toward exchange risk contributes to the increase of B-share discount. Because investors expect CNY long-run appreciation, they are willing to hold the CNY assets rather than USD assets. Although they check the influence of more floating exchange rate system, the sample period is too short, from June 9, 2005 to August 31, 2005, to be reliable. More studies on the relation between exchange risk and B-share discounts are needed.

METHODOLOGY

Data

The primary data set consists of weekly stock returns on six industry portfolios in SHSE and four industry portfolios in SZSE. The whole sample period is from Feb. 2001 to Sep. 2011. The pre-reform sample period starts from Feb. 2001 to Jul. 2005, but only post-reform sample (Jul. 2005 to Sep. 2011) is used to do the multivariate regressions, since this study focuses on how exchange risk affects the B-share price discounts after exchange rate reform (start from Jul.2005).

The weekly Chinese A- and B- share prices, Chinese stock index data and the forward exchange rates of USD/CNY from the NDF market were retrieved from Bloomberg database. The global stock index data (ACWI) are provided by Morgan Stanley Capital International research centre. The major currency index (MCI) is available from the U.S. Federal Reserve. The exchange rates of USD/CNY and HKD/CNY follow the official exchange rate.

Model

The B-share price difference is defined as the logarithmic ratio of the B-share price converted to CNY over the A-share price

$$D_{i,t} = \ln \left(\frac{PB_{i,t} X_{M,t/CNY}}{PA_{i,t}} \right) \quad (1)$$

Where $PA_{i,t}$ and $PB_{i,t}$ are the spot price of A- and the corresponding B- share for company i ; $X_{M,t/CNY}$ is the spot exchange rate of CNY against currency M . The equation (1) can be decomposed as follow.

$$D_{i,t} \approx \ln \left(\frac{E_t(X_{CNY/M,t+s})}{X_{CNY/M,t}} \right) + \gamma(E_t(r_{Ai}) - E_t(r_{Bi})) + \varepsilon_t \quad (2)$$

Where $E_t(X_{CNY/M,t+s})$ is the expectation of CNY exchange rate against currency M at time $t+s$. From equation (2), we can see that mathematically B-share price discount is broken down into

two parts: one affected by exchange rate of CNY against foreign currency M, the other affected by the expected returns of A- and B-shares. Equation (2) demonstrates that theoretically exchange risk may affect the B-share discount in two ways. It will affect the price disparity directly, which can enlarge or narrow down the price parity by CNY appreciation or depreciation. It can also affect the return process. These two effects could be opposite and cancel out each other. So probably the exchange risk affects the B-share discount by two directions, but cannot be observed directly from the change of discount magnitude.

This study firstly investigates the impacts of the return and volatility of exchange rate exposure on the weekly stock returns.

$$E_t(r_{A,it}) - r_f = \alpha_i + \beta_{ADMi}^n(R_{At,n} - R_{ft}) + \beta_{AIMi}^n(R_{ACWI,t} - R_f) + \beta_{X1i}^n R_{CNY/BKT,t} + \beta_{X2i}^n R_{CNY/BKT,t}^2 \quad (3)$$

$$E_t(r_{B,it}) - r_f = \alpha_i + \beta_{BDMi}^n(R_{Bt,n} - R_{ft}) + \beta_{BIMi}^n(R_{ACWI,t} - R_f) + \beta_{X3i}^n R_{M/BKT,t} + \beta_{X4i}^n R_{M/BKT,t}^2 \quad (4)$$

Then generate the expected returns of A- and B-shares by estimated betas, using it as the independent variables in the discount regression. The discount model is based on the equation (2).

$$D_{it}^n = C_i^n + \gamma_{1i}^n E_t(r_{A,it}) - \gamma_{2i}^n E_t(r_{B,it}) + \gamma_{3i}^n \ln \left(\frac{E_t(X_{CNY/M,t+s})}{X_{CNY/M,t}} \right) + \varepsilon_t^n \quad (5)$$

$$D_{it}^n = C_i^n + \gamma_{1i}^n E_t(r_{A,it}) - \gamma_{2i}^n E_t(r_{B,it}) + \theta_{1i}^n R_{CNY/M,t} + \theta_{2i}^n R_{CNY/M,t-1} + \theta_{3i}^n R_{CNY/M,t-2} + \theta_{4i}^n R_{CNY/M,t-3} + \theta_{5i}^n R_{CNY/M,t-4} + \varepsilon_t^n \quad (6)$$

The theoretical model restricts the coefficients of the expected return of A- and B-share to be identical and the coefficient of $\ln \left(\frac{E_t(X_{CNY/M,t+s})}{X_{CNY/M,t}} \right)$ to be one. Here the author looses this restrictions and test whether the coefficients of the expected return of A- and B-share are identical or not, since probably one market has more impacts on the B-share discounts than the other. The empirical model also check whether the coefficient of $\ln \left(\frac{E_t(X_{CNY/M,t+s})}{X_{CNY/M,t}} \right)$ to be one. The non-deliverable forwards (hereafter NDF) of USD/CNY can be used as the expectation on USD/CNY exchange rate at time t+s, naturally generated by market. However, there is no available NDF data of HKD/CNY. For robustness check and regression in SZSE, the author uses spot and lagged exchange rate to represent the expectation of exchange rate.

RESULTS AND DISCUSSIONS

Table 1 shows that in SHSE the A-share market is integrated in the global market with market beta 0.2279 at the 0.01 significant level. But A-share market in SHSE does not exhibit any type of residual exposure to exchange rate risk. Unlike the A-share market, B-share market in SHSE behaves differently. The coefficient of the global market is not statistically significant, showing that B-share market does not integrated into the global market, which is unexpected. The coefficient of the return of USD exchange rate against the major currency index is 0.6033 at the 0.1 significant level.

R^2	0.0717	0.0745/0.0739	0.0382	0.1025

This table shows the A- and B-share's exposures to the exchange risk of the denominating currencies on the market level. $r_{SHAindex}$, $r_{SZAindex}$, $r_{SHBindex}$, $r_{SZBindex}$ indicate the returns of A- and B-share index in SHSE and SZSE. r_{acwi} is the return of the global index constructed by Morgan Stanley. $r_{CNY/BKT}$, $r_{USD/BKT}$, $r_{HKD/BKT}$ are the returns of real exchange rates of CNY, USD and HKD. r_f , r_{tbill} are the Chinese and U.S. risk free rate. ***, ** and * indicate significance at the 1, 5 and 10 percent levels respectively.

It indicates that if the USD depreciates, then the B-share investors will expect lower returns on the B-shares. The exposure to the variance of the exchange rate return is negative (-0.2052) at the 0.05 significant level. Similar with SHSE, the global market beta of A-shares is positive (0.1671) and significantly different from zero at the 0.1 significant level. The currency risk betas are still not statistically significant. For the B-share market, unlike SHSE, the null hypothesis (at less than the 0.05 level) that the global market beta is equal to zero is rejected. The exposure to the return of exchange rate HKD/BKT is insignificantly different from zero, but the exposure to the volatility of exchange rate returns is negative and statistically significant.

In order to test whether the exposures of each industry is the same, table 2 provides the results of the industry portfolio exposures to exchange risk for SHSE and SZSE separately. All in all, it is very hard to find the residual exposure to exchange risk on the industry level, even for B-shares, which is contradict with the results found on the market level. But still some industry portfolios have significant residual exposures to the first-moment or the second moment of exchange rate. When the domestic market risk is included, the global market betas become less significant in some industries. Furthermore, all the industry portfolios with significant global market betas are negatively related to global equity market, meaning that when the global market goes down, the Chinese stock market tends to act reversely.

These regressions estimate the international asset pricing model by weekly data over the time period July 22, 2005 to September 30, 2011 for industry portfolios in SHSE and SZSE respectively. r_i is the industry return, r_{Aindex} is the A-share market return, r_{Bindex} is the B-share market return. r_{acwi} is the global market return. $r_{CNY/BKT}$, $r_{USD/BKT}$, $r_{HKD/BKT}$ are the returns of real exchange rates of CNY, USD and HKD. r_f , r_{tbill} are the Chinese and U.S. risk free rate. ***, ** and * indicate significance at the 1, 5 and 10 percent levels respectively.

This table shows the impacts of the change of CNY exchange rate against USD and A-and B-shares' expected returns on the B-share discounts. D_i is the B-share discount of each industry portfolio. E_{r_A} and E_{r_B} indicate the A- and B-shares' expected return of each industry portfolio. $\ln\left(\frac{E_t(X_{CNY/USD,t+s})}{X_{CNY/USD,t}}\right)$ indicates the difference between the expected CNY exchange rate and the spot CNY exchange rate against USD.

Panel A of table 3 gives the results of the short-run impact of CNY/USD on the B-share discounts. The coefficients of the log difference between the expected exchange rate and spot exchange rate for all 6 industries are positive and significantly different from zero at less than 0.05 level. In a short word, if CNY is expected to appreciate, then the B-share discounts will become smaller. In addition, inconsistent with the theoretical model, the A- and B-share's expected returns generated by the previous regressions do not significantly affect the B-share discounts. The long-run results are similar as the short-run (table 3, panel B).

Since HKD is pegged on USD, the results in SZSE are supposed to be the same as ones in SHSE. Unexpectedly, table 4 shows that 2 out of 4 expected returns of the B-share portfolios have the significant impacts on the B-share discounts, while there is no A-share expected returns affecting the B-share discounts. The changes of CNY/HKD exchange rate have less obvious impacts on the B-share discounts in SZSE with lower significant level, especially for transportation industry which is not influenced by the change of the exchange rate CNY/HKD at all.

However, both short-run and long-run models for SHSE and SZSE contain significant constant, indicating that there are still some elements affecting the B-share discounts. Since this study's purpose is only about discovering the relation between exchange risk and B-share discounts, here does not discuss the other possible reasons.

Table 4. Regression results of the discount model in SZSE

Model	$D_{manufacture}$	$D_{real\ estate}$	$D_{transportation}$	D_{other}
Constant	-0.7204*** (-71.9911)	-0.6499*** (-62.7973)	-0.5677*** (-40.4273)	-0.7701*** (-66.0146)

$R_{\frac{CNY}{HKD}}^t$	5.0114 (1.3256)	4.6380 (1.1867)	-1.8616 (0.3510)	5.9360 (-1.3461)
$R_{\frac{CNY}{HKD}}^{t-1}$	7.5088** (1.9651)	6.9197* (1.7500)	0.1135 (-0.0212)	9.7857** (-2.1998)
$R_{\frac{CNY}{HKD}}^{t-2}$	8.4790** (2.1768)	7.3858* (1.8302)	2.3373 (-0.4262)	10.4448** (-2.3051)
$R_{\frac{CNY}{HKD}}^{t-3}$	7.6629** (2.2460)	8.2859** (2.3442)	5.7665 (-1.2003)	9.2531** (-2.3287)
$R_{\frac{CNY}{HKD}}^{t-4}$	4.4384 (1.3052)	4.8283 (1.3706)	2.5936 (-0.5423)	4.5449 (-1.1486)
R^2	0.0838	0.0899	0.0272	0.1061

This table shows the impacts of the change of CNY exchange rate against HKD and A-and B-shares' expected returns on the B-share discounts. D_i is the B-share discount of each industry portfolio. E_{r_A} and E_{r_B} indicate the A- and B-shares' expected return of each industry portfolio. $R_{\frac{CNY}{HKD}}^t$ indicates the change of CNY exchange rate against HKD.

CONCLUSION

This study investigates the impact of the exchange risk on B-share discount by developing an estimation model to decompose the valuation differential into two components, the difference between the expectation of future exchange rate and spot exchange rate and the difference between A- and B-shares' expected returns, which both contain the exchange risk. The empirical tests explore that USD and HKD real exchange rates do matters for the B-share markets in SHSE and SZSE on the market level, however, CNY real exchange rate does not affect the A-shares' expected returns in both stock exchanges. The results indicate that if USD appreciates, B-shares' expected return will increase. Since USD appreciation makes Chinese exports more competitive but increases the import costs for Chinese companies, one possible explanation for this result is that most companies issuing B-shares are import oriental instead of export oriental. It somehow makes sense because the companies issue B-share for raising foreign currencies in the strictly currency-controlling period, indicating that they are lack of foreign currency to import goods from other countries. The market index regressions also show that higher USD and HKD real exchange rate volatility will decrease the B-share expected return. The result is contrary to Zhang & Li's study (2002), which states that there only exists interrelation between CNY exchange rate and Chinese A-share market, but cannot find such a relation between CNY exchange rate and Chinese B-share market. But when moving down to the industry level, the exposures to USD and HKD exchange risk become less obvious, unlike the results on the aggregate market level. Although it is hard to detect the clear pattern of impacts of real exchange rates on B-share discounts through A- and B-share expected returns, it is quite easy to find the effects of the Changes of exchange rates CNY/USD and CNY/HKD on B-share discounts. Based on this analysis, if the investors expect strong CNY in the future, then the B-share discounts will decline. This conclusion is confirmed by the long-run and short-run period results in both stock exchanges.

Recently there are many hot discussions on CNY internationalization. The Chinese government is trying to promote the exchange rate reform and turn CNY a global one. In addition, according to the Hong Kong Monetary Authority, CNY cross-border trade conducted through Hong Kong reached Rmb1.9tn (\$300bn) in 2011. Thus the exchange market and stock market should be co-integrated more in the future. The exchange risk will associate more closely with the B-share discounts. Since the Chinese government has

the concern on the consolidation of A- and B-share markets, it is meaningful for the policy maker to understand how the exchange risk affects the B-share discounts.

THE BETA-INDEX AND BETA-MOBILITY IDEA AND EMPIRICS

Nasser Elkanj, The American University of the Middle East
Mohamad Tarabay, The American University of the Middle East
Chadi Yaacoub, The American University of the Middle East

ABSTRACT

In this paper we will evaluate and measure the risk of conflict for an individual country, which is linked to international tensions (see Abolfathi, 1978 for the concept): in other words, how to measure to what extent local conflict in a country is driven by international tension/ global factors. We provide a basic theoretical analysis of a new index, what we call a beta index, of conflicts driven by international tension. The beta index is argued to capture the global roots of local conflicts. We then offer an empirical foundation to the beta index by calculating the beta values for 92 nations. We also examine the inter-temporal movement of the beta index of these 92 nations to explore how international tensions traverse over time from one region to another. In order to do that we introduce a new concept, beta mobility, that is akin to the measures of income mobility in the context of income distribution.

JEL: D74, Q34, G12

KEYWORDS: Beta Index, Beta Mobility, Conflicts, International Tension.

INTRODUCTION

In recent years economics has turned its attention to the explanation of conflicts. Some interesting microeconomic models have been developed, yet there are still gaps that motivate current research. The main aim of this paper is to understand how to evaluate and measure the risk of conflict for an individual country, which is linked to international tensions (see Abolfathi, 1978 for the concept): in other words, how to measure to what extent local conflict in a country is driven by international tension/ global factors. For modelling's sake, we propose the following:

Assumption 1: Conflicts in a country/ region are created and undertaken by a group of local agents. It is like organising a terror attack. Thus, conflict in our model is akin to terrorist attacks and armed insurgency on a local/ regional target. We call the group a terror group.

Assumption 2: We assume that there is a national/ regional government that tries to prevent this local conflict either by enforcing existing law, or by offering economic incentives. We call the law enforcement authority the law maker.

The above two assumptions can be sustained from the standard model of an arms race between nations as expounded and developed by Intriligator and Britto (1985). Instead of a terror group and a law maker, they have two nations engaged in conflict.

Assumption 3: We take the technology of a terror attack as given. We also assume the technology of law enforcement as given.

Assumption 4: We assume that the terror group needs both financial resources and technological and logistic resources in order to carry out the terror strike, or conflict. The terror group depends on an international group/ country/ organisation for these resources. In a similar vein, the lawmaker needs

resources, technology and information that they can raise locally in part, and receive in part from an international group/ country/ organisation.

Assumption 5: The world is split into two or more rival groups, and for each nation/ region the terror group and law makers receive help from distinct rival groups consisting of many agents, or decision-makers. The spilt of a nation into rival groups (terrorist groups and law enforcers) is partly a product of international tension, or international rivalry.

Assumption 6: For ease of handling, we focus only on the decisions by rival (international) groups to fund terrorist activities. We do not model the funding of the law maker, which we take as a datum.

Thus, in our model there are many decentralised decision-makers at the global level who belong to rival groups and sponsor a set of terrorist activities with the ultimate end of reducing the influence of their rival group. The other group's members behave in a similar vein. It is like a re-enactment of the Cold War, which relies on of continuing international tension between rival global players/ groups.

At the micro level, for each decision-maker the question is how to allocate their resources, or assets, to alternative terrorist groups located in different nations across the globe. The goal for these decision-makers is to get a return from any terror attack sponsored by them. The cost is the resource cost as well as the risk of losing/ wasting scarce resources, either because the terror attack is foiled by the relevant law maker, or because the local agents divert the resources for their personal use — the classic case of moral hazard.

Our model therefore portrays conflicts as the following: there are several production units of terror attacks in each country of our world. The funding, logistics and technology are provided by global financiers (or players) who are the relevant decision-makers in our model. Actual conflicts are carried out by foot soldiers — mostly as terror attacks or open insurgencies. These terror attacks can range from a simple demonstration to actual warfare. The higher the casualties from an attack, the greater are the return for the global financiers/ decision-makers.

The main proposal of this paper is to posit conflicts as a product of continuing international chasms, splits and differences of political and social ideologies in our modern world. Thus we argue that conflicts are, to some extent, driven by international tension, or global, ideological and geo-political factors. Notwithstanding global influence, local factors such as income inequality, income growth or lack of it, and political institutions can and do exacerbate conflicts.

This paper starts with a basic theoretical analysis of a new index, which we call beta index, of conflicts driven by international tension. We offer the beta values of 92 nations for which we have data from 1970–2004. Then we examine the inter-temporal movement of the beta index of these 92 nations to explore how international tension traversed time from one region to another. In order to do that we introduce a new concept of beta mobility akin to the measures of income mobility in the context of income distribution. We reach a conclusion that the role of international tension has not changed much in determining local/ country-specific conflicts, subject to the limitations of the proposed measures.

ACCOUNTING AND FINANCIAL REPORTING SYSTEM REFORMATION IN BELARUS

Tatsiana Rybak, Ministry of Finance of the Republic of Belarus

ABSTRACT

The development of participation of the Republic of Belarus in the global economic integration gives raise to new problems of the national accounting and financial reporting system to be solved. The conceptual framework of that system development is determined in the draft Accounting and Financial Reporting Act. The author worked out recommendations on organizational, methodological, methodical and human resources management support for the process of the Belarusian accounting and financial reporting laws harmonization with the International Financial Reporting Standards.

JEL: M410

KEYWORDS: globalization, integration, Belarusian accounting and financial reporting laws, International Financial Reporting Standards application infrastructure.

INTRODUCTION

Belarus is involved in national accounting and financial reporting system harmonization with International Financial Reporting Standards (“IFRS”). Focusing on IFRS is called forth by the economic globalization tendency, as well as by strong necessity for the country’s full-scale integration to the global economic environment.

The basic concepts of the national accounting and financial reporting system development are determined in the draft Accounting and Financial Reporting Act (“Act”), the first revision of which was adopted by the House of Representatives of the Belarusian National Assembly.

Creation of proper IFRS application infrastructure and institutional framework perfection might contribute to most efficient realization of the drafted system measures, which are aimed at adequate information environment to be implemented to follow the global business tendencies and processes and meet the utmost demands of the concerned users.

REGULATORY FOUNDATIONS FOR HIGH-QUALITY FINANCIAL REPORTING IN BELARUS

The draft Act implemented the provisions of the Belarusian President’s Directive No. 4 dated 31/12/2010 related to business initiative development and business promotion in Belarus, particularly stipulating IFRS integration in the accounting process and taking into consideration the laws of the Customs Union member countries. Within the framework of the regional integration, in December 2010 the Republic of Belarus ratified the Agreement on Free Capital Flow and Financial Trade Promotion and Agreement on Trade in Services and Investments between the Common Free Market Zone member countries. The Republic of Belarus committed to apply the harmonization requirements in conformity with the IFRS.

When developing the draft Act, a number of alternative considerations and suggestions have been analyzed for further development of the national accounting system. This resulted in two major streams to be followed, i.e.:

IFRS-harmonized mandatory consolidated financial reporting to be made by all parent companies of social responsibility, e.g. banks, public corporations, insurance companies;

Belarusian accounting and financial reporting system development, taking into consideration the IFRS provisions.

The draft Act further stipulates for legislative initiative of IFRS implementation to be advanced. IFRS application procedure shall be determined by the Council of Ministers of the Republic of Belarus in cooperation with the National Bank of the Republic of Belarus.

For more efficient IFRS implementation, it is proposed to advance more stringent requirements to performance of socially responsible companies' chief accountants, since their professional background dominates users' confidence in financial reporting, risk assessment for investors. The draft Act stipulates for specific attestation of pretenders to the socially responsible company's chief accountant qualification. The Chartered Accountant certificates will be issued by the Ministry of Finance of the Republic of Belarus, following the successful attestation.

The draft Act provides the basis for the national accounting and financial reporting system qualitative development, focusing on reliable reporting, being user-friendly and adaptable for proper business decision-making, rather than on mere accounting process. For this purpose, the draft Act integrates the accounting and financial reporting principles (accrual, understandability, relevance, comparability, veracity, etc.) and implements a new type of regulation – national financial reporting standard.

The national financial reporting standard system would incorporate the national standards in accounting policy, accounting of assets, liabilities, income, expenses, additional explanatory information, consolidation, accounting of specific business types.

The complete set of financial statements, as stipulated by the draft Act, embodies balance sheet, profit and loss statement, changes in equity statement, cash flows statement, explanatory notes.

The draft Act stipulates general provisions of reporting process assessment. New assessment methods and revised approach to exchange difference reporting have been further introduced.

The draft Act provides for simpler reporting of business transactions. Any primary instrument templates (other than those mandatory by law) may be developed and approved by each company management independently.

Systematic measures related to accounting and financial reporting system, as stipulated by the draft Act, aim at providing top reliability and comparability of financial information, as reported in different branches of economy.

INSTITUTIONAL FOUNDATIONS FOR HIGH-QUALITY FINANCIAL REPORTING IN BELARUS

When ratified, the new Accounting and Financial Reporting Act might require a set of related measures and decisions to be taken and effected for proper IFRS implementation in the Republic of Belarus. Let's point out the major problems to be solved.

The Belarusian accounting community has not been represented and involved in decision-making and elaboration process of international standards. This makes infeasible to react promptly and revise the national standards to comply with IFRS, as changing from time to time. This problem may be solved by closer cooperation with IFRS Committee and International Federation of Accountants and by giving way for the national policy to be announced during the international standards development and perfection process.

The Ministry of Finance of the Republic of Belarus cooperates with IFRS Foundation and World Bank experts in this concern. The Ministry of Finance is represented continuously with the Intergovernmental Working Group of Experts on International Standards of Accounting and Reporting (ISAR) of United Nations Conference on Trade and Development, as well as with the CIS Coordination Council on Accounting.

Belarus currently organizes the IFRS texts to be available in the national language. Presently, the Ministry of Finance of the Republic of Belarus deals with legal and organizational issues of agreement with IFRS Foundation for the waiver of copyright within limited territories. As far as IFRS interpretation is concerned, foreign practice demonstrates certain distortions in translated standards to be often found, inasmuch as some definitions trend to be missing in certain jurisdictions, and no adequate terminology is available. Moreover, reference to Prof. Y. Sokolov, “the major translation problems relate to proper understanding of ideological and lexicological aspects of evident and correctly translated definitions, rather than from linguistic inadequacy” (Sokolov, 2007). The problem of proper understanding of IFRS terminology is expected to be solved by specific glossary compilation and publication.

IFRS application would require a public compliance supervision system to be organized. For this purpose, a specific supervising authority should be created, as practiced in other countries, for example, German Federal Financial Supervision Authority, Financial Reporting Council in the United Kingdom, Financial Services Authority of France (Krylova, 2008). Many countries with transitional economies involved similar measures. Thus, Pakistan organized its Compliance Monitoring Section of the Securities and Exchange Commission, Turkey – Capital Markets Board (Krylova, 2008), Kazakhstan – Agency on Regulation and Supervision of the Financial Market and Financial Organizations (Duissebek, 2008). Some countries delegate the IFRS compliance control functions to stock exchanges. Thus, the Admission Division and the Sanction Commission of the SWX Swiss Exchange apply penalty to bond issuers in case of failure to comply with the financial reporting requirements (Review of practical implementation issues relating to IFRS, 2008).

IFRS-harmonized mandatory consolidated financial reporting having been introduced, stronger requirements to audit will be implemented for such reporting reliability verification. Pursuant to the draft Audit Act, the first revision of which was adopted by the House of Representatives of the Belarusian National Assembly, IFRS-based consolidated financial reporting of socially responsible companies shall be subject to mandatory audit. Audit companies dealing with such audit shall comply with extra requirements of having at least two staff auditors qualified under IFRS and International Audit Standards. For external audit quality verification, national auditors’ associations are to be engaged.

Also, economic education sets forth major problems to be solved for the Belarusian accounting and financial reporting system reformation. No centralized system for IFRS education and advanced training is currently organized in Belarus. Short-term seminars and training courses realized from time to time by audit and advisory companies fail to benefit to the problem solution. For these purposes, a wide-scale program of accounting practitioners’ advanced training is planned to be implemented.

The accounting and financial reporting system reformation would require a set of measures to be enforced for vocational accounting education perfection, i.e.: revision of higher and secondary vocational curriculums, focusing on IFRS advanced training and their practical application, publication of appropriate tutorials and teaching aids, re-training of lecturers, etc.

CONCLUSION

As a summary, the following measures related to organizational, methodical, methodological and human resources aspects to develop the Belarusian laws on accounting and financial reporting are obvious to be implemented, i.e.:

- organizational measures - cooperation with IFRS Committee and realization of the Belarusian representation for joint solving of problems related to the national accounting and financial reporting laws harmonization with IFRS; organization of IFRS texts to be continuously available in the national language and freely accessible to the accounting community; creation of public IFRS compliance supervision system;
- methodological support – legislative requirement of IFRS application in Belarus, stipulation of accounting and financial reporting principles, new approaches to recognition, classification and assessment of reporting elements;
- methodical support – creation of a IFRS-integrated system of national accounting and financial reporting standards;
- human resources management – perfection of the existing system of accounting practitioners' training, as well as advanced training of company managers, auditors, economists, financiers.

THE OPTIMAL DIVIDEND YIELD RANGE: THE CASE OF EUROPE AND SPAIN DURING THE PERIOD 2000-2009

M. Teresa Corzo Santamaría, Universidad Pontificia de Comillas
M^a Dolores Lagoa Varela, Universidade da Coruña

RESUMEN

Using monthly data during the period 2000-2009 for 163 European and Spanish companies, we show a clear, non-linear relationship between dividend yields and total stock returns earned by stockholders. This relationship is an inverted, U-shaped relationship in the sense that stocks within a specific range of Dividend Yield (DY) have superior returns and are the only ones with positive average returns throughout our sample period. We also find that stocks within a portfolio with superior and positive returns are the ones that show lower risk when risk is measured by the portfolio's average standard deviation. The relationship between DY and risk exhibit a U shape. Our results contradict the Miller and Modigliani (1961) irrelevance theorem and reveal the existence of an optimal dividend yield policy. These relationships persist when we relate current DYs with returns and risks one month, three months, six months, and one year ahead, especially in the case of Spanish companies. Our ten-year sample includes a period with financial market downturns and recoveries, which helps reduce biased results related to bull or bear markets. Additionally, we found that the nonlinear relationship between DY and risk, and DY and returns, cannot be explained by different market capitalizations.

JEL: G11, G15.

KEYWORDS: Dividend Policy, Portfolio Management, Trading Strategies

INTRODUCTION AND RELATED LITERATURE

This paper addresses a fundamental question in corporate finance: is the value of shareholders' wealth affected by a firm's dividend policy? Since Miller and Modigliani (1961, herein MM) and Black (1976) published their seminal papers, dividends have been a very fruitful field of study. The irrelevance theorem of MM indicates that all dividend policies are equally optimal and that investment policy alone determines stockholder wealth in frictionless markets.

Following Allen and Michaely (2003), we echo that understanding dividend policy is important not only because of the amount of money involved and the repeated nature of the decision but also because payout policy is closely related to and interacts with most firms' financial and investment decisions.

This paper's results allow us to reject the hypothesis of independence between dividend yield (DY) and the total return earned by stockholders. A nonlinear relationship exists between both variables, which shows that the dividend payout policy is at an optimal level (proxied in this work by the DY). These empirical results line up with the hypothesis that payout policy influences investment decisions, which supports the works by DeAngelo and DeAngelo (2006 and 2007, herein DD). DD (2006) refute the MM proposition and show that it affects dividend policy matters and stockholders' wealth, which are not only determined by investment policy.

In addition to the relationship between DY and returns, we test the hypothesis of independence between DY and risk and find evidence contrary to it.

Our work shows a clear, short-term relationship between DY and stock returns. For two sample sets--the 50 European blue-chip companies and a group of the 113 most liquid Spanish companies listed--we find an inverted, U-shaped, contemporaneous relationship between return and DY. In the case of the Spanish companies, this relationship persists when relating current DY with returns one month, three months, six months and one year ahead.

To our knowledge, this paper is the first to document the existence of an optimal level of dividend yields with a ten-year sample for two different markets and to find that the return achieved at this optimal level is inversely related to the portfolios' risk profile when measured by sigma.

The European and Spanish markets are particularly useful for studying DY and dividend strategies because little research on either dividend or investors' behavior in response to the release of new information contained in the dividends exists. Existing studies in the Spanish and European stock market focus mainly on the dividend policy rather than on dividends as an investment strategy tool. Additionally, other published papers focus mainly on the relationship between DY and profitability, without analyzing the relationship among other variables we analyze in our work (e.g., risk).

Our results for these two samples are likely transferable to other countries, particularly those where firms pay regular dividends; these same hypotheses can be tested and this model can serve as an important reference when setting out portfolios based upon DY.

METHODOLOGY

We analyze two companies' samples from the European and Spanish markets. The study covers ten years, from January 2000 until December 2009. This ten-year sample includes a period with financial market downturns (i.e., 2000, 2001, 2002, 2008) and recoveries (i.e., 2003, 2004, 2005, 2006), and this fact helps to reduce biases in the results related to bull or bear markets. During this time period, we calculate monthly company dividend yields (DY), returns, total risk (standard deviation of returns, or sigma) and capitalization.

The monthly stock returns (r_t) studied in our sample reveal these data's non-normal behavior. We reject normality for the European and Spanish return data. We have also estimated a risk measure for every company (σ_t) at each month's end. This measure reflects the company's total risk during month t , and it has been calculated as the standard deviation of the company's daily returns during the previous three months. DY_t , at the end of month t , have been calculated using the sum of dividends paid during the previous twelve months ($t, t-1, \dots, t-11$) and dividing this amount by the current month end adjusted closing price (p_t).

Using DY as a proxy for the payout policy, we state our first hypothesis:

H₁: There is independence between r_t and D_t/P_t , and the payout policy does not affect investors' wealth.

We can also say that if r_t is independent of the dividend policy, then the risk level borne by the stockholder, measured as the returns' standard deviation (σ_t), will also be independent of the payout policy and will only depend on the investment policy. We state our second hypothesis:

H₂: There is independence between the risk, σ_t and D_t/P_t , and the payout policy does not affect investors' risk.

To test these hypotheses, we construct a portfolio series ranked according to DY and evaluate whether enough statistical evidence exists to support the independence hypotheses. We rank our monthly

observations according to DY. After sorting all assets according to DY, we eliminate the assets with DY over ten percent ; with the remaining assets, six portfolios are created. Portfolio #1 is created from the assets with DY equal to 0, portfolio #2 is created from the assets with DYs between (0-2%], portfolio #3 is created from the assets with DYs between (2%-4%], portfolio #4 is created from the assets with DYs between (4%-6%], portfolio #5 is created from the assets with DYs between (6%-8%] and portfolio #6 is created from the assets with DYs between (8%-10%]. Choosing these six portfolios represents a balance between the tractability and clarity of exposition reasons and the need to identify groups with enough difference (according to DY) among them.

Every month for each portfolio, we calculated the following variables: average return, average volatility and average capitalization. We completed the same process for both European and Spanish markets. We collected a total of 720 (120×6) portfolio observations for each market. The relationship between the DY_t of a given portfolio and its return can be viewed as a short-term predictive relationship because, for each month t , the DY_t is calculated with data coming from the previous twelve months ($t, t-1, t-2, \dots, t-11$), and the total return is calculated with the current end-month t data. We will demonstrate there is a nonlinear relationship between DY and returns and a nonlinear relationship between DY and risk; we test statistical and economic significance of these relationships in the next section.

EMPIRICAL RESULTS

European Stock Market

Our results show that the relationship between DY_t and r_t is nonlinear. It follows an inverted U-shape figure.

Figure 1: European portfolios average return, risk and capitalization. Data has been standardized for ease of comparability.

In figure 1, we can graphically appreciate the relationships between DY and returns, DY and risk and DY and capitalization. We do not observe any difference in the portfolios according to market capitalization. It seems that the relationship between DY_t and σ_t follows a U-shaped relationship, meaning that the portfolios with less risk are in the middle range of DYs and are those with higher returns. To test the statistical significance of these relationships, we examine the means equality for the six portfolios.

Finally, to further assess the relationship between DY and returns, DY and sigma, and DY and capitalization, we construct three contingency tables. We find we can reject the hypothesis of independence in two cases (returns and sigma), but DY is independent of market capitalization.

Spanish Stock Market

To verify the robustness of the previous results, we performed a same study using a sample of 113 Spanish firms. We first check the mean and variance equality for the six portfolios comprised by Spanish firms (see Table 2).

Table 1: European portfolios`test.

	Portfolios' Returns		Portfolios' Sigmas		Portfolios' Cap	
	Statistic	P-value	Statistic	P-value	Statistic	P-value
Test for the equality of group variances						
Levene's test	26,715	0.000	16,686	0.000	18,165	0.000
Brown Forsythe test	6,622	0.000	5,236	0.000	12,735	0.000

Before we compare means, we calculate the Levene's test and the Brown-Forsythe test. Both tests are used to test if the six portfolios have equal variances. Table 1 shows the estimation results and the corresponding p-values. With these results, we can reject the null hypothesis of homogeneity of variances in the case of portfolios' return and portfolios' sigma, but not in the capitalization case. In the capitalization case, we can accept means equality for the six portfolios, indicating that there is statistical independence between DY and capitalization.

Table 2: Spanish portfolios`test.

	Portfolios' Returns		Portfolios' Sigmas		Portfolios' Cap	
	Statistic	P-value	Statistic	P-value	Statistic	P-value
Test for the equality of group variances						
Levene's test	33,453	0.000	56,837	0.000	171,600	0.000
Brown Forsythe test	11.94	0.000	123,448	0.000	53,618	0.000
Test for the equality of group means						
Welch's t test	13,725	0.000	102,808	0.000	74,464	0.000

We first calculate the Levene's test and the Brown-Forsythe test to study if the six portfolios have equal variances. Table 2 shows the estimation results and the corresponding p-values. With the results of table 2, we can reject in every case the null hypothesis of homogeneity of variances and of means equality.

Figure 2: Spanish portfolios average return, risk and capitalization. Data has been standardized for ease of comparability.

Again, the inverted U-shaped relationship between DY and total returns emerges, and again the U-shaped relationship between DY and risk shows up. In this sample, differences can be observed in relation to market cap. Portfolios with stocks not paying DYs are the ones with lower market caps.

The contingency tables lead us to reject the hypotheses of independence between DY and returns (H_1), DY and sigma (H_2), and DY and market cap. These results indicate that DYs provide information about the risk-return characteristics of stocks and that DYs give significant information.

A closer look at the optimal dividend yield range.

Here, we examine more closely the optimal interval that emerged from our previous analysis. Investors should pick stocks with DYs in the (0%-4%] range and should maintain their investments away from stocks with other DYs. However, this is a wide range, so we should divide it into four portfolios with a variation of 1% DY and test whether we can narrow our selection.

Table 3: Average Return and Standard Deviation for the European and Spanish Samples considering the (0%-4%] DY range.

	European sample	Port #1 DY(0%-1%]	Port #2 DY(1%-2%]	Port #3 DY(2%-3%]	Port #4 DY(3%-4%]
N		420	1162	1373	1133
Average Return		0.0053	0.0058	0.0032	0.0027
N		420	1155	1350	1088
Average Standard Dev		0.3772	0.2981	0.2842	0.3200
	Spanish Sample				
N		1,026	2,135	2,136	1,534
Average Return		0.0161	0.0113	0.0085	0.0051
N		1,022	2,138	2,139	1,518
Average Standard Dev		0.3166	0.2977	0.2797	0.2861

We can observe that the four portfolios have positive average returns and also that they maintain a low risk profile, always lower than the other portfolios' risk profiles. Portfolios composed by stocks in the (2%-3%] DY range are, for both samples, the ones with lower risk, while the range with higher returns have DYs between (0%-2%], again for both markets.

The independence tests show that, although the results for the four portfolios are very similar, we can reject the hypothesis of equality of group variances and group means. In the case of the risk study, we can reject the hypothesis of independence between DY and risk, for both samples, so the results for the (2%-3%] interval are very robust.

Nevertheless, in the returns study, we can accept the hypothesis of independence between DY and returns, so the average returns are very similar across the (0%-4%] interval.

CONCLUDING REMARKS

Similar to Baker and Wurgler (2004), we conclude that dividends matter to shareholders. In this way, our results support the point in DD (2006) that payout policy is important and contradict the argument in MM that only investment policy matters.

In this work, we test two hypotheses: the hypothesis of independence between DY and the total return earned by stockholders (H_1), and the hypothesis of independence between DY and the risk borne by stockholders (H_2). Our findings show that DY and total stock returns are not independent (H_1) and that this relationship is, in the short term, a non-linear, inverted-U relationship. Independent risk and DY (H_2) are also not independent and exhibit a U-shaped relationship.

For two samples--the 50 companies in the Eurostoxx50 and 113 Spanish companies-- over the past 10 years, this work shows an inverted, U-shaped relationship between DY and returns, past 10 years this work shows an inverted, U-shaped relationship between DY and returns, revealing an optimal DY level when considering shareholders' total returns. We find an optimal DY range in the sense that portfolios constructed with stocks paying dividends in these levels are the ones attaining superior returns. For both samples, this DY interval is (0%-4%]. These portfolios also do not have high risk, so return is not the compensation for risk; to the contrary, they exhibit the lowest risk levels. The results are statistically significant and they are not specific to a declining or an advancing market because the sample period covers both.

We find that the U-shaped, contemporaneous relationship between DY and risk is maintained when relating the current DY with the risk one month, three months, six months and one year ahead, indicating the short-term, predictive value of DY. The short-term, predictive power of DY in relation to returns is confirmed in the Spanish case for up to one year; however, in the European case, the predictive power is limited to one month ahead.

These results contradict the semi-strong form of the Efficient Market Hypothesis and are more in line with alternative explanations such as the behavioral finance findings of Hodrick (1992), Jiang and Lee (2007) and Nieto (2010).

TOURIST PERCEPTIONS REGARDING SERVICE AT RECREATIONAL PARKS IN THE STATE OF QUINTANA ROO

Lucila Zárraga Cano, Universidad del Caribe
Gabriela Aracelly Solís González, Universidad del Caribe
Joe Holland, Universidad del Caribe

ABSTRACT

This research focuses on tourist parks, which have attracted enormous attention for their business potential, as well as their attractiveness to tourists who visit the state of Quintana Roo, offering as they do a variety of products and services that meet the needs of all market segments. In this sense, the present research aims to understand and assess the perceptions of tourists visiting Quintana Roo in light of the “model of the flower of service,” and its applicability to recreational parks like Xcaret, Xel-Ha and Xplor. The study is a descriptive cross, using factor analysis with which to detect complementary, value added services, as well as factors which significantly impact the perception of visitors, so as to advance development of new marketing strategies.

JEL: M3,M31, M39

KEYWORDS: Marketing Services, Flower of Service, Perception, Recreational Park.

INTRODUCTION

This increasing incidence of visitors to Quintana Roo suggests that tourism service providers have reliable information which enables them to measure tourists' perception of services offered; continuously improve processes and competency of staff providing services; assess the level of value added, in tangibles and intangibles, acquired by the visitor; assess the degree of loyalty that can be created, and the motivation to encourage others to live the experience of purchasing the services; and finally, to create various marketing strategies to improve indicators of competitiveness of the organizations.

Among the wide range of tourist services in Quintana Roo, one encounters high level hotel infrastructure; a diversity of regional, national and international restaurants; travel agencies; transportation of all types, their including a world-class airport; and, various recreation centers. The latter are better known as recreational parks, which are characterized as tourist, social and entertainment areas. They represent an ideal choice for tourists who want to experience the fullest possible destination for their visit, and are geared to those who want to enjoy their favorite activities during their vacation. The entertainment offered by these parks can be oriented to a single concept, or a gamut of attractions; and, in both cases, with all services included in the cost of entry to the site, or by additional payment for access to products and services offered on the territory.

Experiences Xcaret is a 100% Mexican owned group, dedicated to entertainment resorts. This company has over 25 years experience operating in Quintana Roo and Yucatan. Xcaret Experiences Group has three business units which have become a benchmark in the state: Xcaret, Xel-Ha and Xplor. These three parks receive a quarter (25.41%) of the tourists visiting the state of Quintana Roo (Xcaret experiencias, 2012).

These recreational parks offer different services, aimed at different market segments. Xcaret Experiences Group has won awards because their business model has made them more competitive.

In short, the objective of this research is to ascertain and assess the perception of complementary services for tourists visiting Xcaret, Xel-Ha and Xplor; to identify both strengths and weaknesses so that sensible marketing strategies that encourage these parks to become more competitive can be generated.

The content of this article incorporate literature, data analysis and methodology in a descriptive approach to multivariate techniques, results and conclusions, as well as limitations and research directions.

LITERATURE REVIEW

In this section, the authors review three major constructs as follows: tourism and marketing services, perception of value, and the flower of services. Each of these constructs was measured in this research design.

Tourism and Marketing Services

Jimenez (2005) mentions that to talk about tourism is to talk about a complex issue requiring a multi-disciplinary approach that improves the formal study design. Tourism can have reference to marketing, business, management, psychology, sociology, history, etc. (Gunn, 1994). Integrating these in a study of tourism from the point of view of recreation was challenging the idea prevailed that each discipline stands alone (Ziporovich, 2004).

In this study marketing is viewed as the activity, set of institutions, and processes for creating, communicating, delivering and exchanging offering that have value for customers, clients, partners, and society at large (AMA, 2012).

Services are economic activities that create value and provide benefits to customers, in specific times and places, as a result of producing a desired change in (or for) the recipient of the service (Lovelock, Reynoso, D'Andrea and Huete, 2004). The characteristics of services are that they are intangible, heterogeneous, and simultaneously produced and consumed (Zeithmal, Bitner and Gremler, 2009).

Services marketing may be referred to as a system of action that seeks the best way to satisfy needs and wants through exchange of a generally intangible satisfier for one of tangible value, in a mutually beneficial manner (Saldaña and Cervantes, 2000). Academic interest in service marketing arose primarily in the early eighties (Berry and Parasuraman, 1993).

Perception of value

An important aspect in the marketing of services is perception, the process by which people select, organize and interpret stimuli into a meaningful and coherent whole. Perception is how you see the world (Lamb, Hair and McDaniel, 2011). Companies should recognize the importance of the keys, or signals, that create customer value, identifying the important attributes and then designing signals which communicate these attributes.

The development of a map of service requires the identification of key activities involved in the production and provision of services (Shostack, 1992), through which are carried out a series of actions based on specific inputs by which the clients live their experience.

Model Flower of Service

The maps constitute an excellent way to understand the totality of the service experience. In this case they are divided into two components, those services that facilitate the provision, or form essential parts of it; and those that increase the value of services to customers (Lovelock, et al 2004).

The eight groups that form the petals are called the flower of service in which ways can be sought to increase the perceived value, and make customer interactions with the organization easier.

Of the eight petals that make up the flower of service, care should be taken with four of them; they are contact, hospitality, care, and special cases, since these elements generate value to customers. The other items, information, handling requests, billing and payment, provide the service.

Speaking of the “information” petal, customers need relevant information, directions to specific points hours of operation, prices, directions for use, warnings, conditions of sale, reservation confirmations, etc.

The “contact” petal implies a level of communication that can inquire about customer requirements and develop an appropriate solution; the consultations envisioned consist of immediate counseling by trained staff answering the question, “what do you recommend?”

“Handling requests”, concerns customers ready to buy then accepting the request, placing orders and making reservations. This process should be polite, fast and accurate. The key is to minimize the time and effort required of both the company and the customer. An example is reservations.

“Hospitality” should reflect the pleasure of welcoming customers requesting the service. This can increase or decrease the level of customer satisfaction. Some examples of hospitality are the greeting, transportation, food and beverage, security, etc.

“Care” considers that during a visit, customers often need help with their personal items, such as child care, pet care, vehicle parking, luggage management, etc.

“Special cases” is for services that do not fall within the normal service provision, such as supplying infant needs, special dietary requirements, and assisting those with disabilities; handling complaints and suggestions, dealing with refunds, and repair of defective goods.

“Billing” is a common element of service. It must be agile, stimulating faster payment: some examples are statements, invoices for individual transactions and announcements of the amount payable.

“Payment” is the exchange of money for service. Some companies accept payment by credit and debit card, using phone or internet. Other alternatives include chips, vouchers, coupons and tickets paid in advance.

DATA AND METHODOLOGY

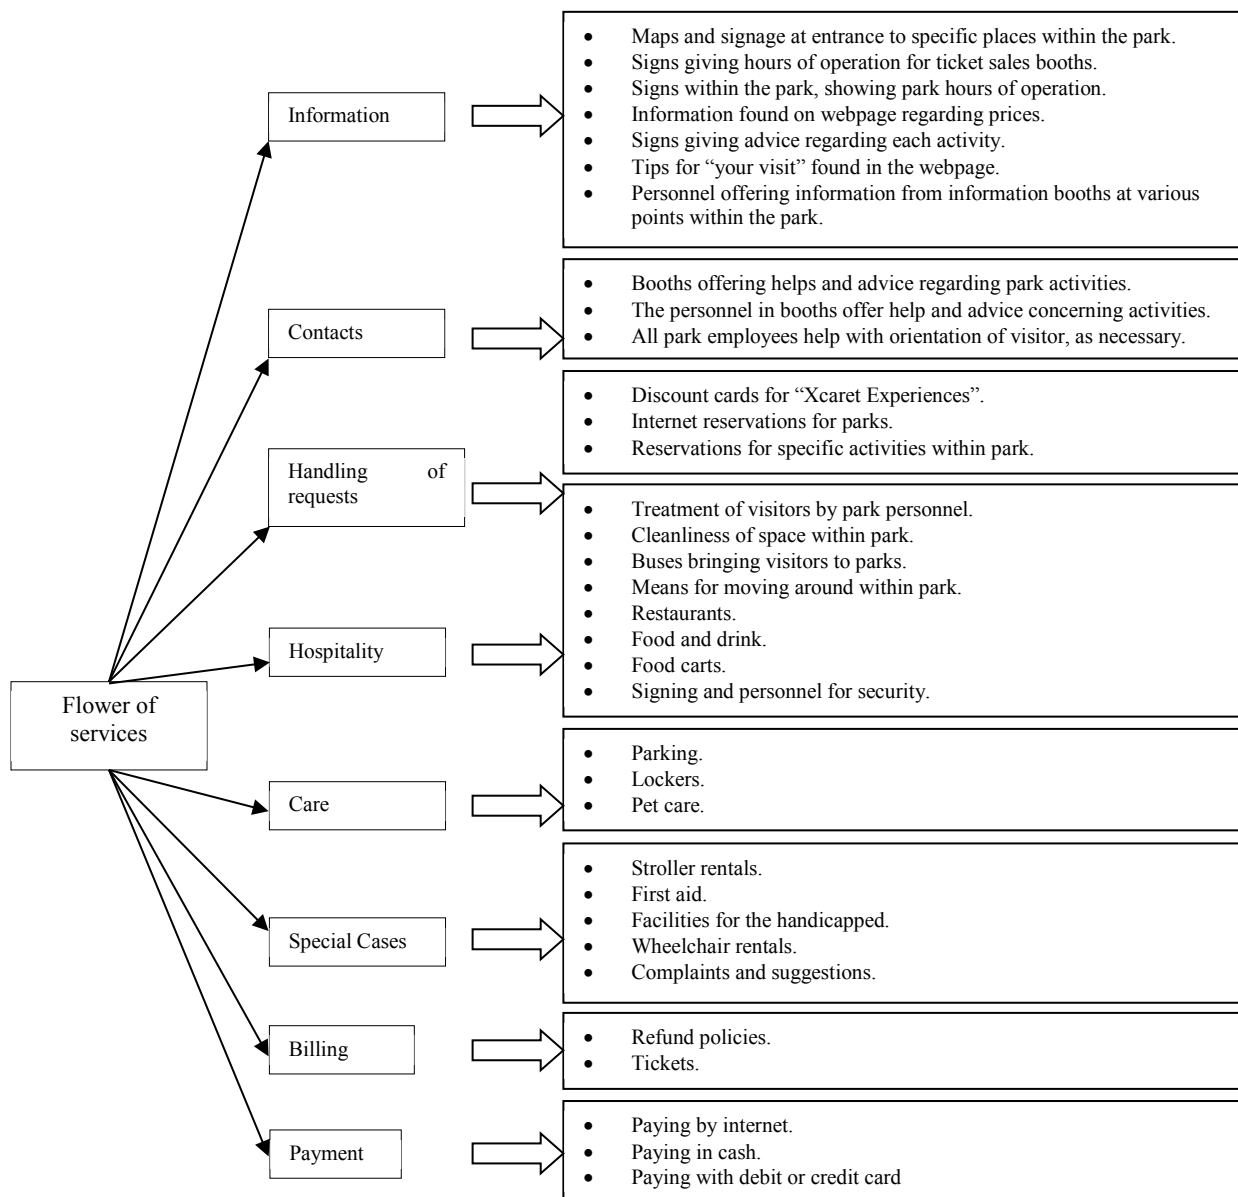

In developing the research design, it was determined that the type of methodology is conclusive and descriptive, since the data is pure and generates structures; and, is transversal owing to the fact that data was collected only once. The investigation was conducted by questionnaire, consisting of a series of written questions to which subjects responded (Malhotra, 2008).

The size of the sample was applied to an infinite population since there is an annual influx of visitors among the three parks of 1, 994.929 visitors. The sample obtained was 123, resulting in a margin of error of 9%.

Data collection was carried out with the support of social service students during the month of October 2012: the study sample was limited to those who visited any of the three parks: Xcaret, Xel-Ha and Xplor.

The data collection instrument meets the criteria of validity and reliability. The model of flower service has eight factors that reveal general variables of the three parks which can fluctuate, and whose variation is susceptible to measurement or observation (Hernandez, Fernandez and Baptista, 2010). The type of variable used is reflective, as shown in Figure 2.

Figure 2: Variables in the model of flower of service, tailored to recreational parks

Source: Adapted from flower model for recreational parks service.

The instrument used has content validity as it complies with the degree to which the measurement represents the concept or the measured variable (Bohrnstedt, 1976). The content domain of the variables is defined based on the literature. Also the theoretical empirical model underlying the construct, the eight petals of the flower model of service, includes three stages (Carmines and Zeller, 1991).

1. The theoretical relation of the concepts is established
2. Concepts are correlated by means of factor analysis.
3. Empirical evidence is interpreted according to the level at which the validity of the construct is clarified.

The confidence level of the data collection instrument is the degree to which it produces consistent and coherent results (Hernandez Fernandez and Bautista, 2010). The Cronbach alpha coefficient, a measure of internal consistency was applied, and yielded a result of 0.829.

The data analysis was done using factor analysis, a technique used to simplify the many complex relationships that can exist between a set of observed variables (Pérez, 2006).

RESULTS

Characteristics of sample: 100% of respondents had visited at least one park in 2012; 49.6% were male, and 50.4% female; the mean age was 25.35 years.

To test the relevance of the factorial analysis, mediation by Kaiser-Meyer-Olkin (KMO) was performed, comparing the magnitude of the observed correlation coefficients with the magnitude of partial correlation coefficients, yielding 0.766, which indicates the relevance of this analysis.

According to this analysis, the factors with highest reliability are as follow:

Special case: in this block we found that for the visitor important aspects of supplementary services related to first aid, which is associated with the recreational activities offered in the parks. Also, as part of the culture of fairness, variables highlight facilities for the disabled, and wheelchair rental. This block closely relates to variables such as reimbursement policies, and payment for services, which are both associated with the efficiency of operational procedures.

Information: this factor is related to aspects of communication that the visitors receive during their stay in the park.

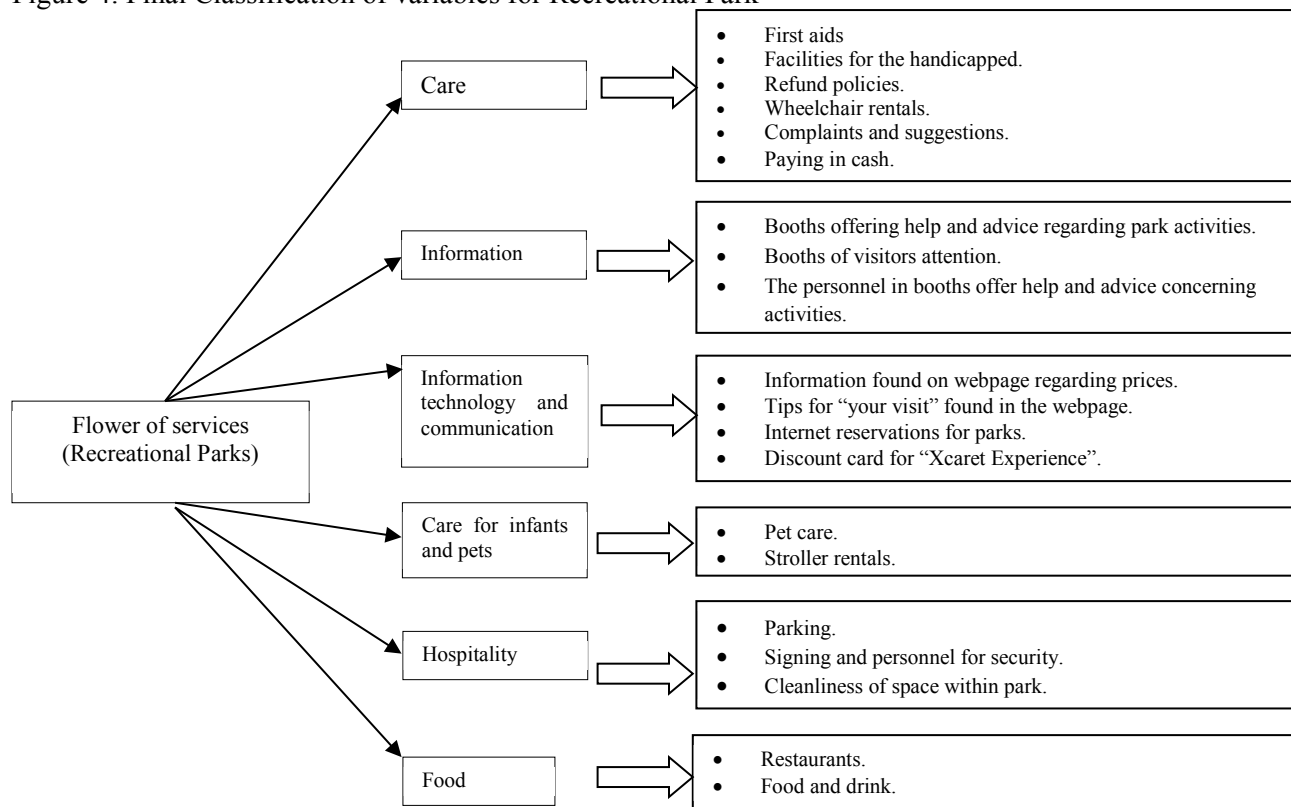

Information Technology and Communication: use of the internet via the website, for pricing, use tips and reservations for different services, are important to tourist, as shown in this block.

Care for Infants and Pets: this block shows the visitor's interest in the care of children, or pets.

Hospitality: is an important factor because it relates to perceptions of cleanliness and safety.

Food: the importance for visitors to have variety of restaurant services for consumption of food and beverages appears in this block

Figure 4: Final Classification of variables for Recreational Park

Source: Authors.

CONCLUSIONS

After analysis of the results it can be deduced that the extra services that establish the flower service model varies depends on the company's turnover. For recreational parks Xcaret, Xel-Ha and Xplor it was noted that additional service variables regrouped in to the six most significant factors for the visitor, which are: care; information; information technology and communication; care for infants and pets; entertainment; and food.

These factors are essential for the visitor because they are aligned parallel to the substantive services offered by parks, and the degree of involvement generates a higher added value. To continue to ensure the best cost benefit for the customer, the six factors require constant evaluation to measure the different perceptions; identify the most significant gaps, and improve responses, driving innovation on supplementary services to improve experiences, and create new ones; continue to analyze each of the variables directly related to human capital specifically affecting the accreditation of training and competition to improve quality of service; and, create spaces suitable for the care of people with disabilities, infants and pets, as these groups represent a new market segment increasingly frequent these places.

With these six factors, marketing strategies can be developed to help the promotion and creation of value for the visitor and generate significant competitive advantages.

LIMITATIONS AND RESEARCH DIRECTIONS

Within the limitations of the study is that the vast majority of the surveyed visitors were local, and are thought to have a different perception than tourists from elsewhere. This exploratory study was directed generally to the three most profitable parks of the Xcaret Experiences group; however, it is believed that further research should be conducted in a form individual to each of the parks. Another limitation is lack of theory about recreational tourism services: so this research provides insight into this largely unexplored field in Quintana Roo.

This study generates a desire for continued research on the perception of the visitor. The next research could focus on visitors who come for the first time to the park, and continue contributing to the generation of recreational studies to help establish the model of the flower of service as applied to recreational services.

AUDITOR'S CLIENT ACCEPTANCE AND CONTINUANCE DECISIONS: A RESEARCH NOTE

Mohamed Drira, University of New Brunswick

ABSTRACT

This paper investigates the theoretical perspectives used in the extant auditing literature to study client acceptance and continuance decisions (CACD). Firstly, the paper identifies and discusses the single client approach. Secondly, the audit firm portfolio management perspective is introduced and analyzed. Finally, the apparent incommensurability of the two approaches is discussed and the foundation for a general theory of the CACD is presented.

JEL: M42

KEYWORDS: Audit engagement, client acceptance and continuance decisions, audit firm portfolio management, auditor-client relationship.

INTRODUCTION

Client acceptance and continuance decisions (CACD) are critical and complex decisions which have significant economic implications for audit firms, their clients, and individual auditors (Johnstone and Bedard, 2004). For public companies or clients, auditors' CACD may have important consequences, such as stock price rises following client acceptance or retention and stock price declines following auditor resignation (Beneish et al., 2005). On the supply side, CACD are considered by professionals and academics as the most important decisions in audit practice (Gendron, 2001; Johnstone and Bedard, 2003). They are frequent and recurrent decisions, which automatically precede any audit engagement. In addition, CACD is critical to the advancement of the auditor's professional career as well as the composition of the audit firm's portfolio of clients and its profitability. Moreover, CACD represent a critical phase in the audit process (IFAC, 2010). A careful and extensive assessment of the client at the pre-engagement stage contributes to a better planning and performance of the audit engagement, thereby reducing audit costs and errors.

Considering the key role of the CACD stage in the audit process, building a theory of CACD is an important task that would benefit auditing scholars and practitioners as well. It is also a critical step for developing a unified theory of external auditing. In the academic literature, two different perspectives have been used to study the CACD: the single-client and the clients-portfolio perspectives. Under the first perspective, which is by far the dominant approach in the extant literature, the auditor considers only client-specific factors when making a client acceptance decision (CAD) or a client continuance decision (CCD) regardless of the potential impact of his decision outcome on the audit firm clients-portfolio. The second approach, also called the audit firm portfolio management perspective, considers the set of the audit engagements relating the auditor and his clients as a portfolio that the audit firm has to purposefully manage. Under this approach, each audit engagement between the auditor and the client is considered within a broader perspective where the CACD drivers are closely related and contribute actively to the overall performance of the audit firm.

In our view, these two approaches if taken separately provide limited insights on the CACD. This study discussed the apparent incommensurability of the two perspectives to set the foundations for a general theory of the CACD. The remaining of the paper is organized as follows. First, the single-client and the

clients-portfolio perspectives are discussed. Then, the foundation of a general theory of CACD is developed. Finally, a brief conclusion is provided.

EXISTING THEORIES: SINGLE CLIENT APPROACH

The first approach arises from examining CACD prior papers though not explicitly identified and studied in the extant literature. In fact, most of the previous audit studies examined CACD, also called auditor or audit engagement decisions under this approach, on a single client basis and overlooked any audit firm clients' portfolio dimension. This approach implicitly assumes that the auditor considers only client-specific factors when assessing the audit engagement risk-reward trade-off, regardless of the potential impact of his ultimate CACD on the audit firm portfolio of clients. For example, before accepting or rejecting a new audit client, the auditor will certainly assess the client's riskiness, on an individual basis. However, the auditor will not consider the potential impact of the acceptance of the client on the overall riskiness of the audit firm clients-portfolio.

The main limitation of the single client perspective lies in the fact that it considers the acceptance decision, the resignation decision, and the retention decision, as totally separate decisions. In point of fact, very few prior studies have addressed more than one decision concurrently (e.g. Beneish et al, 2005, Johnstone and Bedard, 2004). However, the three "apparently" different decisions are closely related. For instance, the retention and the resignation decisions are the sides of the same coin. During the client continuance decision process, the auditor either accepts to audit the client for a subsequent year (retention) or not (resignation). Moreover, the retention decision is generally considered as a "mechanical" replication of the client acceptance decision (Colbert, 1996; Goldwasser, 1988), i.e., the auditor decides to continue the engagement for an additional year whenever the client continues to meet the acceptance criteria. Accordingly, a more comprehensive perspective which can integrate the three auditor engagement decisions in a global decision process relating acceptance, retention, and resignation, would improve our ability to study the similarities, differences, and interactions between the three engagement decisions. This will certainly improve scholars and practitioners comprehension of the most important stage of financial statements auditing.

EXISTING THEORIES: CLIENTS-PORTFOLIO APPROACH

The second approach, called the "clients' portfolio perspective" or the "audit firm portfolio management perspective", considers the set of the audit engagements relating the auditor and his audit clients as a portfolio that the audit firm purposefully manages. This approach introduced more than twenty years ago by two seminal auditing scholars (Simunic and Stein, 1990) and adopted subsequently by other researchers (e.g. Johnstone and Bedard, 2004, 2005) is still embryonic and consists of transposing the portfolio theory in finance to the audit context. According to Simunic and Stein (1990) "the riskiness of an audit engagement is properly defined and measured within a portfolio context" since the outcome of every client acceptance or continuance decision has an impact on the riskiness of the audit firm clients' portfolio en bloc (Huss and Jacobs, 1991). Similar to portfolio optimization in finance, auditors deal with the selection and management of optimal portfolios of clients. Consequently, each audit engagement needs to be considered within a broader slant, where the CACD (also called audit firm portfolio management decisions under this approach) drivers are closely interrelated and contribute actively to the overall performance of the audit firm.

The AFPM perspective provides an integrative framework in which the acceptance, retention, and resignation decisions are interrelated since each decision affects the composition of the audit portfolio of clients. However, as argued by Johnstone and Bedard (2004), the unconditional transfer of portfolio theory from finance to auditing is marred with several difficulties. First, the composition of the audit firm portfolio is the result of both the auditor's decision to accept or retain clients and the clients' decisions to

hire the auditor. On the contrary, the composition of the investor's stock portfolio is the result of his unilateral investment decisions. Second, estimating the return and the standard deviation of the market is critical in the financial portfolio theory. However, estimating these parameters for all audit firms' portfolios of clients would not be practically possible. Third, many audit clients, even large ones, are not publicly traded. Finally and most importantly, the maximum loss a stock portfolio holder can experience is limited to his initial investment, whereas, the auditor's loss may be far higher than the original audit investment (e.g., Arthur Andersen failure because of on single client "Enron"). These theoretical issues may explain why this innovative and interesting approach never took off despite the fact that, in practice, auditors are used to think of their clients as a portfolio, especially before the scandals of the beginning of the century (see Bell et al, 2002). This raises the following questions: is the audit firm portfolio management perspective useless and irrelevant? Were practitioners completely wrong when they decided to use this approach for many years?

FOUNDATIONS FOR A GENERAL THEORY OF CACD

Although the portfolio approach may not be directly applicable in the audit firm context, we believe that it provides an essential complement to the more widely used single client approach. In fact, when dealing with the CACD, both the single client specific factors and the audit firm portfolio attributes should be considered. Obviously, client's characteristics are fundamental for the assessment of the riskiness and the profitability of an audit engagement. At the same time, we think that the characteristics of the audit firm clients-portfolio should not be totally ignored. The single and the portfolio perspectives are complementary and a successful CACD theory should be a mix of both approaches. This raises an important question that has been overlooked by auditing scholars for decades: how the two approaches can be practically integrated in the same framework?

Contrary to portfolio theory in finance, we deem that the portfolio approach cannot be used in external auditing to reduce the riskiness of the audit firm client-portfolio by the mechanism of diversification. More specifically, the impact of a particular client on the audit firm portfolio riskiness and profitability cannot be used as an acceptance/retention criterion, especially in the current audit market characterized by growing litigation risk and where an audit firm may collapse following the failure of one single audit engagement (e.g., the audit engagement of Arthur Andersen with Enron). To be accepted or retained, the client should therefore meet the acceptance/retention criteria on a single basis. If the client is not acceptable using the single based approach, then he should be rejected even if he fits well into the audit firm clients-portfolio, i.e., even if the auditor can reduce the audit costs associated with the engagement and obtain an acceptable risk-reward trade-off for the audit because the client matches the audit firm targeted clientele. Accordingly, the single client perspective should remain the fundamental approach for CACD as it depicts not only the most fundamental and significant decision factors, but also due to a "catastrophic" risk which may arise from a single client.

A common error among practitioners consisted in using the portfolio approach to distinguish between acceptable and not-acceptable clients. This practice has been, undoubtedly, one of the causes of the audit scandals at the beginning of the century and the ensuing dramatic increase of auditor litigation risk. Prior studies documented that accepting highly risky client has been the main reason behind the major auditing scandals (Ethridge et al., 2007). However, auditing literature did not extensively investigate why audit firms did so at the first place. Some scholars argue that audit firms' greed is the source of all the problems (Toffler, 2003). While this argument cannot be completely discarded, it is worthwhile to note that all major audit firms, especially Big N, have been accustomed to use well developed and complex expert systems to assist engagement partners in their CACD (e.g., KRisk by KPMG and FRisk by PricewaterhouseCoopers). In addition, audit quality controls such as peer reviews are well developed in these audit firms which limits perverse effects of greed (Bedard et al., 2008). Surprisingly, some CACD expert systems include audit firm portfolio factors though these systems are used on a single client basis

(Bell et al., 2002). This suggests that besides greed, a myopic decision making process may have contributed to making highly risky clients looking acceptable. How is it possible, then, to integrate the audit firm portfolio approach in a general theory of CACD if the single client perspective has to be the fundamental CACD approach? How can the audit firm portfolio perspective complement the single client approach?

Our argument is as follows. An acceptable client who meets the acceptance/retention criteria on a single basis would indeed be more attractive to the audit firm if he also enhances the profitability of the audit firm portfolio and/or reduces its riskiness. For example, a client who fits audit firm's targeted clientele can increase the overall profitability of the audit firm through reduced audit costs and/or decrease its riskiness through higher quality audits and lower litigation risk (Shu, 2000). Therefore, the portfolio approach can be used to rank acceptable clients based on the impact of their addition to the audit firm portfolio on its overall profitability and/or riskiness. Ranking acceptable clients is of big practical interest. It responds to a problem regularly faced by auditors as they have to deal with audit firms' limited resources and the resulting impossibility to accept all clients interested in hiring the audit firm. To improve auditors' decisions, the CACD making process should therefore benefit from the portfolio approach and involve factors related to the audit firm portfolio besides individual client's factors. A successful theory of CACD needs to integrate the single and the portfolio approaches in a unifying framework where the single perspective identifies the set of acceptable audit clients while the audit firm portfolio approach ranks them.

CONCLUSION

This study identifies two “poles apart” approaches for auditor's client acceptance and continuance decisions in the extant auditing literature. Under the single client perspective, the auditor considers client specific factors only during the initial auditing stage, omitting any possible impact of his decision on the audit firm clients-portfolio. The audit firm portfolio approach is an alternative perspective which considers audit firm's clients as a portfolio that the audit firm has to purposefully manage. The two approaches have always been considered as incommensurable. This paper argues that the two perspectives are rather complementary and that a successful CACD theory should be a mix of both approaches. It also shows how they can be integrated in a general CACD theory. Future research needs to revisit the client and audit firm attributes used by auditors during the CACD stage on the light of this new integrative approach. A deeper understanding of the single client and the portfolio perspectives as well as their places, relative importance, and interactions within the auditor's CACD making process is also worth to pursue.

SEDNA BOATS: A SEARCH FOR UNRECORDED LIABILITIES AUDIT SIMULATION

Mohamed Drira, University of New Brunswick
Nicolas Martot, Ernest & Young

ABSTRACT

This teaching case simulates an audit engagement in which students are prompted to perform a procedure of search for unrecorded liabilities. The project aims at helping students understand the purpose of the procedures of search for unrecorded liabilities and identify related management assertions and audit objectives. More specifically, students are asked to describe a procedure of search for unrecorded liabilities and then implement it. This includes the following steps: (1) selecting material items, (2) finding documents they need to test sampled items, (3) identifying potential unrecorded liabilities and ensuring that they are properly recorded, and finally (4) preparing audit documentation summarizing their findings.

JEL: M42

KEYWORDS: Unrecorded liabilities, management assertions, audit procedures, audit documentation, audit program, misstatements.

INTRODUCTION

Rob is a junior auditor in the Montreal office of a Big 4 CPA firm. He has been hired few months ago right after he successfully finished a BBA in Accounting. Today, he is starting a new audit engagement under the supervision of John who is one of the most experienced audit managers in the office. Rob arrived at the client's premises a couple of hours ago where he first met all the other members of the engagement team and also met with the Sedna Boats management's representative. Now, it is time to get started.

THE CASE

John: "Rob, did you ever heard about "searching for unrecorded liabilities"?"

Rob: "Yes. I remember that we had a brief session on this topic during the training week I have attended after joining the firm, but I never had the opportunity to perform this procedure."

John: "Perfect. So, what do you know about the search for unrecorded liabilities?"

Rob: "A search for unrecorded liabilities aims at verifying that all auditee's liabilities as of the end of the year are properly recorded in the statement of financial position. As external auditors, ensuring that the amounts of liabilities reported by the company are accurate is part of our responsibilities towards financial statements' users. For instance, capital providers need complete information on liabilities to assess company's liquidity and solvency.

Basically, the issue with liabilities is quite simple. According to accrual basis accounting, expenses, along with corresponding liabilities, should be recorded when they are incurred, irrespective of payment date. Since recorded expenses have a direct impact on the net income, it is important to ensure their proper recognition is done. If all incurred expenditures are not recorded in the appropriate accounting period,

then net income will be overstated and the corresponding liabilities will be understated (Albrecht, Stice, Stice, Swain, 2010). In order to test for unrecorded liabilities, one can select a sample of cash disbursements occurring after the end of the accounting period, determine whether or not each sample item relates to a liability pertaining to the year under audit, and finally ensure that the corresponding liability has been properly recorded at the statement of financial position date.”

John: “I think that you know the main purpose of a search for unrecorded liabilities. Remember that unrecorded liabilities may be due to inadvertent errors or also intentional manipulation by managers. Identifying unrecorded liabilities is therefore a way to detect a potentially hidden risk of business failure (Harvey and Lusch, 1999)”.

John continues: “I have asked Sedna Boats managers to provide us with different documents including invoices, cheques, the subsidiary ledger of accounts payable, and the journal of cash disbursements that occurred during the first month following the end of the accounting period. Using these documents, I want you to perform a search for unrecorded liabilities. In addition to the procedure you described earlier (looking at subsequent disbursements), other procedures could be used, which are: (1) examine significant invoices that pertain to the year under audit but that were processed after the end of the accounting period and not paid as of today. This procedure enables you to verify that all liabilities pertaining to the year under audit have been properly recorded; (2) examine unprocessed invoices and unmatched purchase orders for items that should be accrued in the period under audit to make sure that whenever the goods or services were received on or before the statement of financial position date, the corresponding liabilities have been accurately recorded; (3) review cut-offs of purchases in order to check that liabilities related to the audit period have been recorded in the appropriate period; (4) inquire the client about any significant unrecorded liabilities she might be aware of.

First, I will ask you to identify the most suitable procedure to search for unrecorded liabilities in view of the documents provided by our audit client. Afterwards, I need you to select a sample of transactions, using the appropriate documents, in order to perform your audit procedure. As to the sample, our estimation shows that all transactions exceeding \$20,000 should be reviewed. Generally, every time you observe that the liability is not properly recorded while pertaining to the year under audit, you’ve got an unrecorded liability case. Nevertheless, I decided to set the tolerable misstatement here at \$12,000. This means that only unrecorded liabilities that exceed this amount should be pointed out and adjusted. Finally, you have to document your work and summarize the findings. I will ask you to fill in a memorandum that I will hand out later. First, fill in the fields on the client’s name, your name, the date, the nature of the procedure, the management assertions you will be challenging, the tolerable misstatement, and the objective of the procedure. Then, describe the procedure you performed and indicate your findings and conclusions for each sample item.”

John concludes: “I think you are ready to begin the search now. I will provide you everything you need to start your work. Do you have any question or comment?” Rob answers: “I have no questions for now. I think that everything is quite clear to me and I am ready to start right away.”

INSTRUCTIONS

1. Choose the appropriate audit procedure to search for unrecorded liabilities and implement it.
2. As you perform the audit procedure, complete the memorandum requested by the audit manager and summarize all your findings in this document. You are expected to:
 - Identify the nature of the procedure and the management assertions tested with this procedure.

- Give an opinion on each entry as well as an overall conclusion after you complete the entire procedure (including a proposition of audit adjustment if necessary). Make sure that the conclusion is stated in terms of the objective that you set in your memorandum.

THE FINANCIAL IMPACT OF MARKETING AND R&D INTEGRATION: EVIDENCE FROM KOREA

Sohyoun Shin, Eastern Washington University

ABSTRACT

The marketing/R&D interface and its role in improving various aspects of organizational performance have been extensively studied during past years, since its importance in new product development process as well as in new product development success was emphasized in early 1990. However, most studies have been conducted in well-established industrialized nations, e.g., US, leaving emerging regions unexplored. To provide a guideline to the organizations in transforming countries, and further to generalize the impact of integration between marketing and R&D on the organizational performance, 250 Korean companies have been surveyed on their levels of their cooperation between marketing and R&D, and firm performance. The statistic data analysis has been conducted by utilizing multiple regressions in the IBM SPSS V17. The results confirm that the marketing/R&D interface increases firm performance in terms of customer satisfaction, adaptability, and profitability ($\beta = 0.56$, $t = 11.11$, $p < 0.00$; $\beta = 0.54$, $t = 10.58$, $p < 0.00$; $\beta = 0.36$, $t = 6.31$, $p < 0.00$ in order). In additions, strategic organizational cultures such as customer orientation and technology orientation effectively drive higher collaboration between marketing and R&D linking to affirmative firm level returns. Interestingly, technology orientation has been proven to be the more effective driver than customer orientation on the integration ($\beta = 0.44$ vs. $\beta = 0.28$; $p < 0.00$). While marketing/R&D integration has been found to partially mediate both strategic orientations and firm performance, the direct impacts of two orientations on firm performance has been observed. Refer Table 1 and Table 2 for the test results. In conclusion, this study re-confirms the research findings in the studies undertaken in developed countries and provides valuable strategic implications to corporations in transitioning economies regarding how to allocate their limited resources to maximize their impacts on organizational returns.

THE OPTIMAL DIVIDEND YIELD RANGE: THE CASE OF EUROPE AND SPAIN DURING THE PERIOD 2000-2009

M. Teresa Corzo Santamaría, Universidad Pontificia de Comillas
M^a Dolores Lagoa Varela, Universidade da Coruña

RESUMEN

Using monthly data during the period 2000-2009 for 163 European and Spanish companies, we show a clear, non-linear relationship between dividend yields and total stock returns earned by stockholders. This relationship is an inverted, U-shaped relationship in the sense that stocks within a specific range of Dividend Yield (DY) have superior returns and are the only ones with positive average returns throughout our sample period. We also find that stocks within a portfolio with superior and positive returns are the ones that show lower risk when risk is measured by the portfolio's average standard deviation. The relationship between DY and risk exhibit a U shape. Our results contradict the Miller and Modigliani (1961) irrelevance theorem and reveal the existence of an optimal dividend yield policy. These relationships persist when we relate current DYs with returns and risks one month, three months, six months, and one year ahead, especially in the case of Spanish companies. Our ten-year sample includes a period with financial market downturns and recoveries, which helps reduce biased results related to bull or bear markets. Additionally, we found that the nonlinear relationship between DY and risk, and DY and returns, cannot be explained by different market capitalizations.

INTRODUCTION AND RELATED LITERATURE

This paper addresses a fundamental question in corporate finance: is the value of shareholders' wealth affected by a firm's dividend policy? Since Miller and Modigliani (1961, herein MM) and Black (1976) published their seminal papers, dividends have been a very fruitful field of study. The irrelevance theorem of MM indicates that all dividend policies are equally optimal and that investment policy alone determines stockholder wealth in frictionless markets.

Following Allen and Michaely (2003), we echo that understanding dividend policy is important not only because of the amount of money involved and the repeated nature of the decision but also because payout policy is closely related to and interacts with most firms' financial and investment decisions.

This paper's results allow us to reject the hypothesis of independence between dividend yield (DY) and the total return earned by stockholders. A nonlinear relationship exists between both variables, which shows that the dividend payout policy is at an optimal level (proxied in this work by the DY). These empirical results line up with the hypothesis that payout policy influences investment decisions, which supports the works by DeAngelo and DeAngelo (2006 and 2007, herein DD). DD (2006) refute the MM proposition and show that it affects dividend policy matters and stockholders' wealth, which are not only determined by investment policy.

In addition to the relationship between DY and returns, we test the hypothesis of independence between DY and risk and find evidence contrary to it.

Our work shows a clear, short-term relationship between DY and stock returns. For two sample sets--the 50 European blue-chip companies and a group of the 113 most liquid Spanish companies listed--we find an inverted, U-shaped, contemporaneous relationship between return and DY. In the case of the Spanish companies, this relationship persists when relating current DY with returns one month, three months, six months and one year ahead.

To our knowledge, this paper is the first to document the existence of an optimal level of dividend yields with a ten-year sample for two different markets and to find that the return achieved at this optimal level is inversely related to the portfolios' risk profile when measured by sigma.

The European (García-Borbolla and Larran (2005) study the factors affecting firms that pay dividends and conclude, excluding Spain and the UK, that where company size has a positive influence upon dividend distribution volume, dividends are used more strategically to reduce information asymmetries about future company earnings, rather than to reduce agency costs). and Spanish markets are particularly useful for studying DY and dividend strategies because little research on either dividend or investors' behavior in response to the release of new information contained in the dividends exists (González Rodríguez (1995) analyzes dividend announcements' effects on the stock market value of firms trading at Madrid's Stock Exchange and observes that the price reaction is larger for stocks with high dividend yields. Fonseca (1997) shows a positive relationship between dividend taxation and the share price response of announcements of changes in dividends, and Espitia and Ruiz (1996) point out that, in the Spanish Equity Market, ex-dividend prices, on average, fall less than the dividend amount). Existing studies in the Spanish and European stock market focus mainly on the dividend policy rather than on dividends as an investment strategy tool. Additionally, other published papers focus mainly on the relationship between DY and profitability, without analyzing the relationship among other variables we analyze in our work (e.g., risk).

Our results for these two samples are likely transferable to other countries, particularly those where firms pay regular dividends; these same hypotheses can be tested and this model can serve as an important reference when setting out portfolios based upon DY.

METHODOLOGY

We analyze two companies' samples from the European and Spanish markets. The study covers ten years, from January 2000 until December 2009. This ten-year sample includes a period with financial market downturns (i.e., 2000, 2001, 2002, 2008) and recoveries (i.e., 2003, 2004, 2005, 2006), and this fact helps to reduce biases in the results related to bull or bear markets. During this time period, we calculate monthly company dividend yields (DY), returns, total risk (standard deviation of returns, or sigma) and capitalization.

The monthly stock returns (r_t) studied in our sample reveal these data's non-normal behavior. We reject normality for the European and Spanish return data. We have also estimated a risk measure for every company (σ_t) at each month's end. This measure reflects the company's total risk during month t , and it has been calculated as the standard deviation of the company's daily returns during the previous three months. DY_t , at the end of month t , have been calculated using the sum of dividends paid during the previous twelve months ($t, t-1, \dots, t-11$) and dividing this amount by the current month end adjusted closing price (p_t).

Using DY as a proxy for the payout policy, we state our first hypothesis:

H_1 : There is independence between r_t and D_t/P_t , and the payout policy does not affect investors' wealth.

We can also say that if r_t is independent of the dividend policy, then the risk level borne by the stockholder, measured as the returns' standard deviation (σ_t), will also be independent of the payout policy and will only depend on the investment policy. We state our second hypothesis:

H₂: There is independence between the risk, σ_t and D_t/P_t , and the payout policy does not affect investors' risk.

To test these hypotheses, we construct a portfolio series ranked according to DY and evaluate whether enough statistical evidence exists to support the independence hypotheses. We rank our monthly observations according to DY. After sorting all assets according to DY, we eliminate the assets with DY over ten percent; with the remaining assets, six portfolios are created. Portfolio #1 is created from the assets with DY equal to 0, portfolio #2 is created from the assets with DYs between (0-2%], portfolio #3 is created from the assets with DYs between (2%-4%], portfolio #4 is created from the assets with DYs between (4%-6%], portfolio #5 is created from the assets with DYs between (6%-8%] and portfolio #6 is created from the assets with DYs between (8%-10%]. Choosing these six portfolios represents a balance between the tractability and clarity of exposition reasons and the need to identify groups with enough difference (according to DY) among them.

Every month for each portfolio, we calculated the following variables: average return, average volatility and average capitalization. We completed the same process for both European and Spanish markets. We collected a total of 720 (120×6) portfolio observations for each market.

The relationship between the DY_t of a given portfolio and its return can be viewed as a short-term predictive relationship because, for each month t , the DY_t is calculated with data coming from the previous twelve months ($t, t-1, t-2, \dots, t-11$), and the total return is calculated with the current end-month t data. We will demonstrate there is a nonlinear relationship between DY and returns and a nonlinear relationship between DY and risk; we test statistical and economic significance of these relationships in the next section.

EMPIRICAL RESULTS

European Stock Market

Our results show that the relationship between DY_t and r_t is nonlinear. It follows an inverted U-shape figure.

Finally, to further assess the relationship between DY and returns, DY and sigma, and DY and capitalization, we construct three contingency tables. We find we can reject the hypothesis of independence in two cases (returns and sigma), but DY is independent of market capitalization.

Spanish Stock Market

To verify the robustness of the previous results, we performed a same study using a sample of 113 Spanish firms. We first check the mean and variance equality for the six portfolios comprised by Spanish firms (see Table 2).

Figure 1: European portfolios average return, risk and capitalization. Data has been standardized for ease of comparability.

In figure 1, we can graphically appreciate the relationships between DY and returns, DY and risk and DY and capitalization. We do not observe any difference in the portfolios according to market capitalization. It seems that the relationship between DYt and σ_t follows a U-shaped relationship, meaning that the portfolios with less risk are in the middle range of DYs and are those with higher returns. To test the statistical significance of these relationships, we examine the means equality for the six portfolios.

Table 1: European portfolios' test.

	Portfolios' Returns		Portfolios' Sigmas		Portfolios' Cap	
	Statistic	P-value	Statistic	P-value	Statistic	P-value
Test for the equality of group variances						
Levene's test	26.715	0.000	16.686	0.000	18.165	0.000
Brown Forsythe test	6.622	0.000	5.236	0.000	12.735	0.000
Test for the equality of group means						
Welch's t test	7.405	0.000	5.315	0.000	17.102	0.000

Before we compare means, we calculate the Levene's test and the Brown-Forsythe test. Both tests are used to test if the six portfolios have equal variances. Table 1 shows the estimation results and the corresponding p-values. With these results, we can reject the null hypothesis of homogeneity of variances in the case of portfolios' return and portfolios' sigma, but not in the capitalization case. In the capitalization case, we can accept means equality for the six portfolios, indicating that there is statistical independence between DY and capitalization.

Table 2: Spanish portfolios' test.

	Portfolios' Returns		Portfolios' Sigmas		Portfolios' Cap	
	Statistic	P-value	Statistic	P-value	Statistic	P-value
Test for the equality of group variances						
Levene's test	33.453	0.000	56.837	0.000	171.600	0.000
Brown Forsythe test	11.94	0.000	123.448	0.000	53.618	0.000
Test for the equality of group means						
Welch's t test	13.725	0.000	102.808	0.000	74.464	0.000

We first calculate the Levene's test and the Brown-Forsythe test to study if the six portfolios have equal variances. Table 2 shows the estimation results and the corresponding p-values. With the results of table 2, we can reject in every case the null hypothesis of homogeneity of variances and of means equality.

Figure 2: Spanish portfolios average return, risk and capitalization. Data has been standardized for ease of comparability.

Again, the inverted U-shaped relationship between DY and total returns emerges, and again the U-shaped relationship between DY and risk shows up. In this sample, differences can be observed in relation to market cap. Portfolios with stocks not paying DYs are the ones with lower market caps.

The contingency tables lead us to reject the hypotheses of independence between DY and returns (H1), DY and sigma (H2), and DY and market cap. These results indicate that DYs provide information about the risk-return characteristics of stocks and that DYs give significant information.

A closer look at the optimal dividend yield range.

Here, we examine more closely the optimal interval that emerged from our previous analysis. Investors should pick stocks with DYs in the (0%-4%] range and should maintain their investments away from stocks with other DYs. However, this is a wide range, so we should divide it into four portfolios with a variation of 1% DY and test whether we can narrow our selection.

Table 3: Average Return and Standard Deviation for the European and Spanish Samples considering the (0%-4%] DY range.

European sample	Port #1 DY(0%-1%]	Port #2 DY(1%-2%]	Port #3 DY(2%-3%]	Port #4 DY(3%-4%]
N	420	1162	1373	1133
Average Return	0,0053	0,0058	0,0032	0,0027
N	420	1155	1350	1088
Average Standard Dev	0,3772	0,2981	0,2842	0,3200
Spanish Sample				
N	1.026	2.135	2.136	1.534
Average Return	0,0161	0,0113	0,0085	0,0051
N	1.022	2.138	2.139	1.518
Average Standard Dev	0,3166	0,2977	0,2797	0,2861

We can observe that the four portfolios have positive average returns and also that they maintain a low risk profile, always lower than the other portfolios' risk profiles. Portfolios composed by stocks in the (2%-3%] DY range are, for both samples, the ones with lower risk, while the range with higher returns have DYs between (0%-2%], again for both markets.

The independence tests show that, although the results for the four portfolios are very similar, we can reject the hypothesis of equality of group variances and group means. In the case of the risk study, we can reject the hypothesis of independence between DY and risk, for both samples, so the results for the (2%-3%] interval are very robust.

Nevertheless, in the returns study, we can accept the hypothesis of independence between DY and returns, so the average returns are very similar across the (0%-4%] interval.

CONCLUDING REMARKS

Similar to Baker and Wurgler (2004), we conclude that dividends matter to shareholders. In this way, our results support the point in DD (2006) that payout policy is important and contradict the argument in MM that only investment policy matters.

In this work, we test two hypotheses: the hypothesis of independence between DY and the total return earned by stockholders (H1), and the hypothesis of independence between DY and the risk borne by stockholders (H2). Our findings show that DY and total stock returns are not independent (H1) and that this relationship is, in the short term, a non-linear, inverted-U relationship. Independent risk and DY (H2) are also not independent and exhibit a U-shaped relationship.

For two samples--the 50 companies in the Eurostoxx50 and 113 Spanish companies-- over the past 10 years, this work shows an inverted, U-shaped relationship between DY and returns, past 10 years this work shows an inverted, U-shaped relationship between DY and returns, revealing an optimal DY level when considering shareholders' total returns. We find an optimal DY range in the sense that portfolios constructed with stocks paying dividends in these levels are the ones attaining superior returns. For both samples, this DY interval is (0%-4%]. These portfolios also do not have high risk, so return is not the compensation for risk; to the contrary, they exhibit the lowest risk levels. The results are statistically significant and they are not specific to a declining or an advancing market because the sample period covers both.

We find that the U-shaped, contemporaneous relationship between DY and risk is maintained when relating the current DY with the risk one month, three months, six months and one year ahead, indicating the short-term, predictive value of DY. The short-term, predictive power of DY in relation to returns is confirmed in the Spanish case for up to one year; however, in the European case, the predictive power is limited to one month ahead.

These results contradict the semi-strong form of the Efficient Market Hypothesis and are more in line with alternative explanations such as the behavioral finance findings of Hodrick (1992), Jiang and Lee (2007) and Nieto (2010).

VARIABLES QUE INFLUIRÍAN EN LA GESTIÓN ORIENTADA AL VALOR DEL CLIENTE Y EL DESEMPEÑO ORGANIZACIONAL

Leslier Valenzuela, Universidad de Chile

Francisco Villegas, Universidad de Chile

RESUMEN

Hoy es fundamental una gestión orientada al mercado para que los negocios triunfen. Esto porque los negocios están inmerso en un entorno globalizado y altamente competitivo. Muchas empresas monitorean el mercado (clientes, prospectos, competencia, proveedores, etc.) local y globalmente, para obtener y analizar información esencial y, generar conocimiento para responder proactivamente con soluciones viables y creativas. El objetivo es rentabilizar y fidelizar las relaciones con sus grupos de interés, especialmente, con sus clientes. Esta investigación contribuye con el diseño de un modelo conformado de una serie de constructos confiables y validados en estudios previos (Orientación al Valor del Cliente (OVC), Cultura Organizacional Orientada al Mercado (COOM), Valor de Marca (VM) y Ética Empresarial (EE)) para explicar cómo podrían influir sobre el desempeño organizacional (DO). Las hipótesis han sido testeadas con las respuestas de 327 ejecutivos de mandos medio y alto en distintos sectores empresariales en Chile. Los análisis exploratorios validan los constructos y los análisis confirmatorios señalan que las variables y sub-modelos son significativos. El estudio reveló que estas variables influirían en el desempeño organizacional.

PALABRAS CLAVE: Orientación al mercado, orientación al valor del cliente, valor de marca, ética empresarial y desempeño organizacional.

VARIABLES THAT WOULD INFLUENCE ON CUSTOMER ORIENTED MANAGEMENT AND ORGANIZATIONAL PERFORMANCE

ABSTRACT

Today it is fundamental to have Market-oriented management in order for businesses to succeed. This is because businesses are immersed in a globalized and highly competitive environment. Many companies monitor the market (customers, prospects, competitors, suppliers, etc) locally and globally, to obtain and analyze essential information and, generate knowledge to proactively respond with viable and creative solutions. The objective is to capitalize and retain relationships with its interest groups, especially, with their customers. This research contributes with the design of a model consisting of a series of reliable constructs and validated in previous studies (Customer Value Orientation (CVO), Market-Oriented Organizational Culture (MOOC) Brand Value (BV) and Business Ethics (BE) to explain how they would influence on organizational performance (OP). The hypotheses were tested with the responses of 327 executives of medium and high positions in various business sectors in Chile. The exploratory analyzes validate the constructs and the confirmatory analyzes indicate that the variables and sub-models are significant. The study revealed that these variables would influence organizational performance.

KEYWORDS: Market orientation, customer value orientation, brand equity, business ethics and organizational performance.

INTRODUCCIÓN

Estudios avalan que la orientación al mercado (OM) y al valor del cliente (OVC) ayuda a las empresas a alcanzar un crecimiento de sus ventas sustentable en el tiempo (Macintosh, 2007; Jaramillo y Grisaffe, 2009). Esto puede atribuirse a que estas empresas establecen políticas y prácticas que permitan descubrir las necesidades y anticiparse a los requerimientos de sus clientes, y además, los asesoran en las decisiones de compra para que perciban mayor valor en el intercambio. El valor (definido como “*la evaluación global del consumidor sobre la utilidad de un producto, basado en las percepciones de lo que se ha recibido y lo que se ha dado*” (Zeithaml, et al., 1988)) es un antecedente importante para la satisfacción, la repetición de las compras, y las referencias positivas del boca a oído (Palmatier et al., 2007).

Asimismo, los clientes perciben mayor valor cuando los beneficios recibidos por el intercambio exceden su costo. Por ejemplo una mejor percepción de la relación calidad-precio ayuda a que los clientes permanezcan leales. Por consiguiente, las empresas deberían dirigir sus esfuerzos de marketing y ventas a incrementar la percepción de valor de sus productos, servicios y marca, puesto que es crucial para la sobrevivencia y crecimiento de sus negocios. Una experiencia positiva, a lo largo de la relación cliente-empresa, ayuda a aumentar el valor del tiempo de vida de los clientes (*Customer Lifetime Value, CLV*) (Kumar, Venkatesan y Reinartz, 2008). Acorde a Gupta y Lehman (2003) el CLV es “*el valor presente de todos los futuros beneficios generados desde los clientes*”, y por tanto, esta métrica permite identificar a los clientes rentables y distribuir los recursos acorde al valor que dichos clientes aportan al negocio (Kumar et al., 2006). Por ende el CLV es una herramienta útil para los gerentes de marketing y ventas, quienes se ven obligados a demostrar que sus acciones aumentan la tasa de retención de clientes rentables, los flujos de ingresos generados desde los mismos, y que esa rentabilidad será sostenible en el largo plazo. Existen estudios que señalan que una mejor comprensión del cliente provoca cambios positivos en la gestión del portfolio (Niraj et al., 2001; Reinartz et al., 2005) y en los resultados de ventas (Jaramillo y Grisaffe, 2009). Y para detectar nuevas oportunidades de mercado es fundamental el establecimiento de relaciones de cooperación con diferentes agentes clave del entorno (Deeds y Rothaermel, 2003), es decir, un enfoque de gestión con visión de equipo que busca co-generar valor entre todos los grupos de interés o *stakeholders*.

El propósito de esta investigación es identificar en primer lugar cómo la experiencia de la fuerza de ventas, el nivel de capacitación y la satisfacción laboral con algunos de sus antecedentes tales como: involucramiento en el trabajo, ambigüedad de rol y políticas de incentivos podrían influir en el grado de orientación al valor del cliente por parte de los vendedores. En segundo lugar identificar cómo estas variables: orientación al valor del cliente por parte de la fuerza de venta, cultura organizacional orientada al mercado, valor de la marca y ética empresarial influirían en el desempeño organizacional. Este estudio contribuye con la propuesta de un modelo constituido por una serie de constructos fiables y provee evidencia empírica, desde una investigación aplicada a 327 ejecutivos de jefatura media-alta y alta de distintas empresas en Chile que gestionan sus negocios a escala global. Mayoritariamente, las empresas pertenecen al sector servicios, el cual tiene un alto impacto en el desarrollo económico y social de los países.

REVISIÓN DE LA LITERATURA E HIPÓTESIS

Williams y Wiener (1990) señalan que cualquier fuerza que impulse al vendedor a dar énfasis en las ganancias de corto plazo influirá de forma negativa en las ventas de largo plazo como resultado del bajo nivel de orientación al cliente. Por tanto para incrementar las ventas es fundamental contar con un equipo que acompañe al cliente, lo asesore, escuche sus inquietudes, formule soluciones y busque alternativas para obtener beneficios (Hernández, 2009). En definitiva, obtener ingresos de ventas que impacten los resultados organizacionales es factible si los esfuerzos apuntan a establecer relaciones rentables y fieles con los clientes.

Acorde al estudio cuantitativo de Storbacka, Polsa y Sääksjärvi (2011) la necesidad de contribuir con un modelo de ventas que incorpore la selección de los segmentos apropiados, definición de procesos, roles de ventas, y prácticas relacionadas con la gestión comercial es crucial como herramienta para mantener relaciones de largo plazo, crear valor y mejorar los rendimientos. El modelo propuesto en esta investigación (Ver figura 1) destaca el rol fundamental del equipo comercial y de la cultura organizacional para gestionar las relaciones con clientes en función del valor y la creación de un buen servicio, así como el valor de la marca y el nivel ético empresarial, que en su conjunto llevarían a un mejor desempeño organizacional. De las relaciones propuestas en el modelo se derivan las hipótesis del estudio:

H1: El grado de *Orientación al Valor del Cliente por parte de la Fuerza de Ventas (OVCFV)* influye significativamente en los *Desempeño Organizacional (DO)*. De acuerdo a la evidencia teórica y práctica de la literatura el grado de OVC por parte del equipo comercial dependería de: a) *Satisfacción laboral favorable*, comprendida como "*una función de la relación percibida entre lo que uno quiere de un trabajo y lo que se percibe es ofrecido*" (Stanton, Buskirk y Spiro, 1997) y por tanto, involucra todas las características propias del trabajo y su ambiente, el cual los vendedores pueden encontrar gratificante y satisfactorio. En la medida que el grado de satisfacción sea mayor, el compromiso con la organización y con el cliente será mayor (Ugboro y Obeng, 2004), b) *Nivel de Capacitación*, existe evidencia empírica que demuestra que es un factor relevante y que influye en el grado de orientación al valor del cliente (Harris, Mowen y Brown, 2005) y c) *Experiencia de la Fuerza de Ventas*, ya que la mayor experiencia en ventas, aumentaría el grado de OVC (Frank y Park, 2006). De esta manera se deduce la siguiente hipótesis H1.1 con sus respectivas sub-hipótesis H1.1a, H1.1b, H1.1c.

H1.1: El nivel de *Satisfacción Laboral (SL)* influye significativamente en el grado de *Orientación al Valor del Cliente por parte de la Fuerza de Ventas (OVCFV)* El grado de SL podría depender a su vez del involucramiento o grado en que los individuos se identifican psicológicamente con su trabajo (Darden, Mckee y Hampton, 1993). Rabinowitz y Hall (1977) proponen un modelo donde el involucramiento en el trabajo se compone de un enfoque disposicional (actitud del empleado hacia su trabajo), un enfoque situacional (entorno laboral) y un enfoque que es el resultado de la interacción disposicional y situacional (efecto en el empleo). Para esta investigación el énfasis en el involucramiento en el trabajo (IT) está puesto en la disposición que el empleado posea, como un factor determinante en la calidad de servicio entregado al cliente y la buena gestión de ventas. Basado en diferentes estudios se puede observar la relación significativa entre el involucramiento que tenga una persona con su trabajo y el esfuerzo para alcanzar sus objetivos laborales y desafíos de la compañía (Brown, 1998), el ausentismo (Wegge, Schmidt, Parkes y Van Dick, 2007), el grado de aburrimiento, participación y satisfacción laboral (Behruz, Ghader y Hasan, 2011) y la orientación al valor del cliente que posea la organización (Durson y Kilic, 2011). La evidencia presentada sobre las relaciones que tiene el involucramiento laboral, permiten formular la siguiente hipótesis: H1.1.a: El *Involucramiento en el Trabajo (IT)* influye significativamente en el nivel de *Satisfacción Laboral (SL)* de la fuerza de ventas.

Asimismo, poner atención a la Ambigüedad (Conflicto) de Rol (ACR) es fundamental, ya que comprende todos los roles individuales o múltiples al que se enfrentan los individuos, y que no son claramente

comunicados en términos de conductas (actividades, tareas o prioridades) y niveles de rendimiento deseados (cómo se juzga el desempeño) (Kahn, Wolfe, Quinn, Snoek y Rosenthal, 1964). Según Breaugh y Colihan (1994) la ACR posee tres aspectos clave: los métodos de trabajo, la programación y los criterios de desempeño que afectan a la satisfacción laboral. En este sentido, las causas de la percepción de ACR provienen de diferentes orígenes y por ende, las formas de superarlo también son distintas (Keller, 1975). Así lo demuestran un sinnúmero de investigaciones que relacionan la ACR con la satisfacción (Cooke y Rousseau, 1984), participación, rendimiento, tensión e intenciones de abandono laboral (Singh, 1998), esfuerzo del vendedor (Brown y Peterson, 1994), como componente del stress del cargo y que afecta a la satisfacción laboral (Usahawanitchakit, 2008) e influyendo de manera significativa y directa sobre la orientación al cliente con negativas consecuencias en el desempeño de la organización (Durson y Kilic, 2011). Como consecuencia de estos estudios previos se formula la siguiente hipótesis H1.1.b: La *Ambigüedad (Conflicto) de Rol (ACR)*, influye significativamente en el nivel de *Satisfacción Laboral (SL) de la fuerza de ventas*.

La evidencia empírica apoya la importancia de la existencia de Políticas de Incentivos (PI) en las organizaciones en cualquiera de sus formas o manifestaciones. Las formas más frecuentes de incentivo son: comisiones, bonificaciones, beneficios y los incentivos no monetarios (Viejo, 2001). Milkovich y Newman (1996) señalan que la retribución de los empleados juega un papel fundamental en la relación empresa-empleado, pudiendo ser la fuente de buenos resultados por parte de la fuerza de venta. Sin embargo, el efecto en la rentabilidad se obtiene solo cuando la política de retribuciones es constante y a largo plazo (Carlson, Upton y Reaman, 2006). La literatura muestra un sinnúmero de estudios que relacionan las PI con el desempeño (King-Kauanui y Ashley-Cotleur, 2006), con una baja rotación de personal y un aumento en la productividad de ventas (Huselid, 1995), con mejores actitudes y comportamientos de los empleados (Milkovich y Newman, 1996), con el cambio positivo de comportamiento de los vendedores aun en momentos críticos de las empresas (Murphy, 2004). Y que las PI deben combinarse entre incentivos monetarios y no monetarios para afectar la motivación intrínseca (King-Kauanui y Ashley-Cotleur, 2006; Carlson, Upton y Reaman, 2006), que representan a veces una inversión más grande que los montos destinados a publicidad (Zoltners, Lorimer y Prabhakant, 2006) y generalmente, son mayores en aquellos agentes adversos al riesgo (Lo, Ghosh y LaFontaine, 2011). Por consiguiente, la PI se convierte en un factor clave en la gestión de venta, dado que es el *output* que recibe el vendedor por su desempeño y por ende, afecta su productividad. Así se plantea la siguiente hipótesis H1.1.c: La *Política de Incentivos (PI)*, influye significativamente en el nivel de *Satisfacción Laboral (SL) percibida por la fuerza de ventas*.

La segunda variable que influiría en la OVCFV es la Experiencia de la Fuerza de Ventas, referida como la trayectoria que el individuo tiene realizando tareas en el área de gestión de ventas. Investigaciones de Venakatachalam y Reddy (1996) indican que la antigüedad o permanencia en un empleo no tiene efecto sobre la Satisfacción Laboral, pero demuestran un impacto significativo sobre la participación y disposición que se tiene en el trabajo. Skirbekk (2003) señala que el impacto de la Experiencia Laboral es directo sobre el potencial de productividad. Así surge la siguiente hipótesis de la investigación H1.2: La *Experiencia de la Fuerza de Ventas (EFV)* influye significativamente en el grado de *Orientación al Valor del Cliente por parte de la Fuerza de Ventas (OVCFV)*.

Como tercera variable influyente en el grado de OVCFV está el nivel de capacitación, ya que estudios realizados en diferentes partes del mundo como: Asia (Boselie, Hesselink, Paauwe y Wiele, 2001); Estados Unidos, Europa (Hoque, 1999) y África (Ghebregiorgis y Karsten 2007) demuestran el impacto positivo de aquellas empresas que incorporan la capacitación como parte de las políticas de la compañía versus otras que no. Longenecker (2010) y Martin (2010) aseguran que un buen nivel de capacitación permite motivar a los empleados para que aumenten su productividad en el trabajo. Basada en la evidencia presentada, surge la siguiente hipótesis de la investigación H1.3: El *Nivel de Capacitación (NC)*

influye significativamente en el grado de *Orientación al Valor del Cliente por parte de la Fuerza de Ventas (OVCFV)*.

El siguiente constructo es la Cultura Organizacional Orientada al Mercado (COOM) comprendida como un conjunto de valores y actitudes compartidos en toda la organización, a partir de los cuales se trata de estimular la creación de un valor superior para los clientes (Day, 1994). La importancia de la inserción de esta variable en el modelo es entregada por diferentes autores que indican beneficios como: preferencia del cliente y fuerte lealtad a la marca (Reichheld y Sasser, 1990); beneficios de largo plazo (Narver y Slater, 1995); capacidad de creación de un valor superior para el cliente que aumenta la preferencia, conseguir niveles deseados de crecimiento y participación de mercado (Homburg y Pflesser, 2000), generación de inteligencia de mercado (Kohli y Jaworski, 1990), una gestión basada en relaciones estables y duraderas con los agentes con los que interactúa y por lo tanto, representa el recurso más importante para obtener una ventaja competitiva sostenible (Kumar, Subramanian y Yauger, 1998). Acorde a Kumar, Jones, Venkatesan y Leone (2011) el impacto de la COOM sobre el DO (ventas, rentabilidad) dependerá del grado de orientación al cliente, competencia y coordinación interfuncional (Narver y Slater, 1995), del momento de la adopción de esta filosofía de gestión orientada al mercado (adopción temprana, intermedia o tardía) y de los factores del ambiente (intensidad de la competencia, turbulencia tecnológica, tipo de industria y factores de la compañía). De estos fundamentos teóricos se deriva la siguiente hipótesis H2 y sub-hipótesis H2a, H2b, y H2c del estudio: H2: La *Cultura Organizacional Orientada al Mercado (COOM)* que posea la empresa influye significativamente en el *Desempeño Organizacional (DO)*. H2.a: A mayor nivel de *Orientación a la Competencia (OC)* que posea la empresa, mayor será el nivel de *Cultura Organizacional orientada al Mercado (COOM)*. H2.b: A mayor nivel de *Coordinación Interfuncional (CI)* que posea la empresa, mayor será el nivel de *Cultura Organizacional orientada al Mercado (COOM)*. H2.c: A mayor nivel de *Orientación al Valor del Cliente (OVC)* que posea la compañía, mayor será el nivel de *Cultura Organizacional orientada al Mercado (COOM)*.

Relacionado al Valor de Marca (VM), definida como “*el conjunto de asociaciones y comportamientos de los consumidores, miembros del canal y empresas relacionadas que permiten a la marca ganar mayor volumen y mayores márgenes a los que obtendría sin el nombre, otorgándole una fuerte, sostenible y diferenciada ventaja sobre sus competidores*” (Marketing Science Institute, 2000), su importancia yace en que las marcas pueden funcionar como indicador de atributos de búsqueda, de uso y de calidad, y como propiciador de lealtad (Nadelsticher, 1997). Según Olavarrieta (2002) para ser valoradas las marcas es crucial que despierten en los clientes el deseo de tenerlas y cuando hacen menos posible a los consumidores probar alternativas; éstas generan un sentido de lealtad. Además, agrega que una predisposición psicológica positiva hacia la marca deberá trasladarse en una compra reiterada del producto o servicio que ofrece la parte vendedora. Asimismo, Escobar (2000) señala que la marca informa a los compradores que existe un respaldo, un responsable por la reputación de ésta y por el cumplimiento de las promesas que hace, a quien puede consultar ante dudas respecto al desempeño del producto o servicio. Esto permite reducir la preocupación por las consecuencias de la decisión de comprar y la incertidumbre que tendrá al usar un producto (disminución de percepción de riesgo). Un estudio empírico realizado por Fuentes, Luque, Montoro y Cañadas (2004) muestra que existe una relación causal positiva y significativa entre el valor de las marcas y la lealtad de los consumidores, por lo que las empresas pueden realizar actividades que potencien su valor y generen una comunicación efectiva boca-oído de los consumidores leales. De lo anterior se deriva la siguiente hipótesis del estudio H3: El *Valor de la Marca (VM)* que posee la empresa, impacta significativamente en el *Desempeño Organizacional (DO)*.

El último constructo propuesto en el modelo es Ética Empresarial (EE) comprendida como “*una norma por la cual todos los empleados de una empresa pueden saber lo que se espera de ellos y que todos sus miembros tomen decisiones a partir de un conjunto de valores compartidos*” (Sullivan, 2009). Este concepto va más allá de la existencia de un código ético en la organización, ya que según Chonko y Hunt

(2000) los códigos de ética, por sí solos, no son eficaces en la reducción de comportamientos no éticos. Sin embargo, parece que la existencia de códigos, cuando se combina con otras actividades, pueden tener un impacto sobre la ética de una organización. Estudios muestran que mientras más orientados al cliente están los agentes, serán menos propensos a participar en actividades poco éticas y viceversa (Howe, Douglas y Hardigree, 1994). Valenzuela, Mulki y Jaramillo (2010) indican que los incentivos especiales que implementen las empresas tendrán un impacto positivo en la lealtad de los clientes, solo cuando éstos consideren que la empresa opera con un alto nivel de ética. Asimismo, Vitell y Paolillo (2004) establecen también una positiva relación entre los valores éticos corporativos, la importancia de la ética y responsabilidad social percibida en el logro de las metas organizacionales. En el modelo propuesto se pretende identificar la influencia de las acciones éticas de la empresa y de su equipo comercial en el desempeño organizacional. Para ello es formulada la siguiente hipótesis: H4: El nivel de *Ética Empresarial (EE)* que posea una determinada organización influye significativamente en el *Desempeño Organizacional (DO)*.

METODOLOGIA

Para la obtención de los datos se aplicó una encuesta auto-administrada de diseño transversal simple durante Noviembre y Diciembre de 2011. El cuestionario fue aplicado a 327 empleados que ocupan cargos de jefatura media-alta y alta en empresas de Chile (principalmente sector servicios: financieros, *retail* y consultorías). Los encuestados son en su mayoría hombres (79%) con un rango de edad entre 25-34 años (34,6%) y 35-44 años (48,9%). El 98% posee nivel de educación universitaria completa y llevan 5 años o más (50%) en sus cargos. El canal usado para aplicar el cuestionario fue mayoritariamente online (262= 80%) y vía presencial (65= 20%). El procedimiento de muestreo es no probabilístico por juicio. La escala usada es tipo Likert de 7 puntos (1= Totalmente en desacuerdo y 7= Totalmente de acuerdo). Los criterios utilizados para examinar la unidimensionalidad, validez convergente y fiabilidad de los constructos fueron: Kayser-Meyer-Olkin mayor que 0,6, Eigenvalue mayor que 1, el Test de Esfericidad de Bartlett menor que 0,5, cargas factoriales mayores a 0,7, y Alpha de Cronbach mayor que 0,7. Para medir la consistencia de las variables del modelo se usó un análisis factorial confirmatorio (AFC) usando AMOS 19.0.

RESULTADOS

A partir de los análisis realizados es posible observar que todas las variables seleccionadas en todos los casos presentan una carga factorial importante (sobre 0,6), lo cual representa una alta correlación de los ítems con su variable latente. Además todos los constructos evidencian una alta fiabilidad y validez con los valores de Alpha de Cronbach y KMO respectivamente (OC: 0,839/0,787, CI: 0,887/0,833, COOM: 0,85/0,838, OVC: 0,918/0,906, EE: 0,908/0,91, VM: 0,942/0,905, NC: 0,88/0,842, PI: 0,817/0,858, EFV: 0,861/0,803, SL: 0,907/0,855, ACR: 0,767/0,89, IT: 0,848/0,786 y DO: 0,733/0,802). Los resultados de los AFC son satisfactorios, ya que el factor de normalización estandarizado de todas las cargas fueron superior a 0,7 y significativa en $\alpha = 0.01$. Asimismo los índices de ajuste absoluto, incremental, parsimonia y fiabilidad compuesta son satisfactorios para todos los constructos y sub-modelos usados en el modelo propuesto (GOVC: 0,879/0,726/0,76, SL: 0,863/0,772/0,72, COOM: 0,874/0,752/0,8, VM: 0,914/0,683/0,83, EE: 0,864/0,706/0,73). La variable más explicativa en términos de ajuste absoluto e incremental ha sido el constructo valor de la marca con resultados sobre 0,9 en todos los indicadores. Los resultados obtenidos en el estudio permitieron determinar la asociación de las variables del modelo y corroborar las hipótesis de investigación.

CONCLUSIONES

Trabajar a nivel estratégico y táctico para mejorar el nivel de satisfacción laboral, específicamente en las áreas de marketing y ventas se torna fundamental para aumentar el valor de la cartera de clientes. Por

ende, la gerencia debería preocuparse por aspectos fundamentales como eliminar la ambigüedad de rol para que su equipo de venta tenga certeza sobre los resultados a lograr, sus prioridades, ponderaciones, consecuencias que estos provocan sobre ellos, cómo serán evaluados y compensados, etc. Para ello es necesario trabajar en los procedimientos y programación del trabajo, los criterios de desempeño y las políticas de incentivos. Para contar con un sistema de incentivos efectivo es primordial que las organizaciones conozcan sus propias características, cambios relevantes en su entorno, y las preferencias y comportamientos de compra de sus clientes. Las políticas de incentivos son decisivas para favorecer la percepción de satisfacción laboral e influir positivamente en la motivación intrínseca de los empleados, mediante formas monetarias y no monetarias. Del mismo modo, las organizaciones deberían poner mayor énfasis en su gestión a las acciones que faciliten un mayor involucramiento del equipo de ventas y marketing, puesto que son éstos los que podrían influir en los comportamientos de compra y grado de lealtad de los clientes. La idea es generar mayor sentido de pertenencia, motivación, retroalimentación, comunicación, actitud proactiva para facilitar la consecución de los objetivos. Asimismo, la experiencia generada en el equipo comercial no solo es importante para realizar transacciones; sino también para aumentar la recomendación de los clientes (boca-oído o valor de referencia) y el reconocimiento de la empresa o marca. Y bajo este contexto invertir en capacitación que ayude a la permanencia de los buenos empleados, al desarrollo de habilidades y competencias que mejoran la comunicación y gestión con los clientes podrían influir positivamente en una mayor productividad. Las personas se forman una impresión de la empresa no solo por sus productos y su infraestructura, la atención del personal es un elemento importante en la percepción que se crean los clientes sobre la empresa o marca. Y en este sentido, los vendedores son la cara visible de la organización, una mala atención puede provocar que un cliente no tenga interés de recompra, hable mal de la empresa, se convierta en un cliente terrorista (boca-oído negativo, desprestigia a la marca) y opte por la competencia.

Del mismo modo, la ética empresarial es otro aspecto que podría generar percepciones favorables o negativas en los clientes. Generalmente, los directores de ventas y los vendedores están expuestos a resolver dilemas éticos. Los primeros se exponen al contratar, fijar cuotas de ventas, valorar al personal y a otras tareas propias de su gestión. Los vendedores, por su parte, asumen la responsabilidad de la generación de ingresos para la empresa, hacen frente a problemas que exigen soluciones únicas y usualmente, su valoración, está sujeta a logros inmediatos, que pueden llevar a soluciones a corto plazo para los clientes, y que no siempre, provocan beneficios mutuos. Por último es fundamental que la organización monitoree sistemáticamente el mercado y a la competencia para obtener información esencial que le permita a través de su análisis extraer conclusiones relevantes sobre sus mercados y clientes. Así la empresa podrá implementar acciones estratégicas proactivas y eficientes, basadas en el conocimiento, para crear propuestas de valor y soluciones superiores. Esto traerá probablemente compras repetidas con el proveedor, desarrollo de clientes, referencias positivas de boca-oído y valor de marca.

AGRADECIMIENTOS

Los autores reconocen y agradecen el apoyo financiero de Fondecyt de Chile, ya que este estudio es una parte de la investigación desarrollada en el proyecto Fondecyt N° 11100163.

RESUMEN

En este trabajo, se presenta evidencias de cómo los líderes cambian de paradigmas y van construyendo el capital social (CS) necesario para la consolidación de clusters": Caso SC-Muebles y Decoración de Jalisco, México; del cambio de una cultura empresarial individualista a la conformación de redes de colaboración y trabajo en equipo. Se hace uso de la investigación participativa, apoyada por la metodología casuística, se lleva a cabo un comparativo de otros clusters del mismo giro localizados en Italia y Alemania.

PALABRAS CLAVE: Liderazgo, capital social, clúster

LEADERSHIP AND SOCIAL CAPITAL, AXES TO CONSOLIDATE A CLUSTER: SC-FURNITURE IN JALISCO, MÉXICO

ABSTRACT

In this paper, we present how leaders change paradigms and they are building the social capital necessary for the consolidation of clusters "Case C-furniture Jalisco", Mexico; The change of corporate culture shaping individualistic to collaborative networks and teamwork. It makes use of participatory research, supported by the case casuist methodology and made a comparison of other clusters in the same line located in Italy and Germany.

L: 29

INTRODUCCIÓN

Este trabajo da cuenta del capital social del sector muebles de Jalisco y de sus líderes, al cambiar un paradigma de organización y trabajo individual al grupal. El papel que han jugado los líderes, así como la fase de consolidación tanto del clúster como de su capital social. Se presenta el resultado y avance de investigación participativa con los principales actores y clúster de muebles del estado de Jalisco. En la revisión de la literatura se plantean las teorías del capital social, tanto individual, como colectivo con el alcance de redes, confianza y la importancia que reviste para el clúster que se tenga un capital social solido. En el apartado de metodología utilizada se presenta los instrumentos metodológicos y el periodo de la investigación así como las variables analizadas. La forma como se hace el diagnóstico del clúster. El papel que han jugado los líderes en el sector en el lapso de cinco años, así como la alta rotación de los mismos y el estatus actual. En los resultados de la investigación, se hace un análisis de las variables de capital social y liderazgo con una visión global, el consenso según los participantes en un grupo focal, así como algunos extractos de las entrevistas semiestructurada aplicada a los líderes sobre el impacto de su liderazgo. Finalmente se presentan las conclusiones, las limitaciones del estudio y las nuevas veredas de investigación surgidas de la investigación y una propuesta de perfil del líder para construir el CS.

MARCO TEÓRICO

Las variables de estudio son: liderazgo, clúster, capital social, desde el campo científico social, administrativo y económico, el cual, se enfoca en el estudio del CS desarrollado en los clúster sustentados con redes de colaboración, ya que las ciencias sociales estudian el comportamiento, manifestaciones, actividades de las personas y sus estilos de liderazgo. Liderazgo y capital social El liderazgo es la acción que hace el líder, y que puede considerarse como un proceso, un comportamiento o capacidad. Hay diferentes definiciones y alcances, en este caso se toman en cuenta para efectos de la construcción del CS en un clúster, la de (Valenzuela, 2007) *"El liderazgo es la capacidad de desarrollar y comunicar una visión a un grupo de personas que harán que la visión se logre"*; y la de Richards & (Engel, 2005) *"El liderazgo es la articulación de visiones, que encarna los valores y la creación de un entorno en el que las cosas se puede lograr"*. Es lo que se requiere en el clúster.

El líder asume ciertos estilos de liderazgo, el que han adoptado algunos líderes del sector SC Mueblero y Decoración de Jalisco, es el liderazgo distribuido como lo menciona Longo, (2008), por ser el más indicado para generar la innovación tanto en el proceso de producción como en la forma de liderar y conformar el CS. En tanto, el liderazgo transformador es utilizado para generar visiones comunes, cambiar paradigmas de acuerdo a los cuatro pilares en que se sustenta: Desarrollo más humano, libertad personal y una predisposición hacia lo colectivo. Aspira a elevar los valores y necesidades de sus colaboradores para su realización personal y en lo laboral.

El colaborador aspira a alcanzar metas que vayan más allá de las expectativas tradicionales. Romper con el individualismo, dando pie a relaciones de mayor cooperación. El liderazgo y el capital social, se convierten en herramientas para el desarrollo sostenible, como lo proponen (Ribeiro & Vila, 2005) y Prieto & Fabelo, (2009). Longo, (2008) refiere que "el liderazgo se convierte en un asunto de florecimiento de habilidades y destrezas adquiridas en un proceso de aprendizaje social", donde cada líder tiene un capital individual que logra conjuntar y unir en uno colectivo, logran formar redes de colaboración, tanto personales como institucionalizada. El clúster resultado del capital social y la acción del líder Los clúster en los países desarrollados se han convertido en una herramienta de desarrollo económico, las iniciativas de agrupación eran asociadas a las economías avanzadas, con proyectos de agrupaciones de desarrollo basadas cada vez más popular en las economías desde la década de 1990. Paradigma que en México los líderes de diferentes sectores han promovido; en Jalisco a finales de los 90's se inició. Para efectos de este estudio asumimos el alcance de clúster que define Garnica, (2004) como *"un conjunto de vínculos e interdependencias entre diversos actores (empresas, universidades e instituciones puente) que se involucran en la cadena de valor dedicada a producir bienes, servicios y procesos de innovación"*. Para que este fenómeno se dé primero deben existir líderes y actores que sean capaces de construir el capital social necesario para la consolidación del clúster. (Macías, 2002), definió a los clusters como conjuntos de empresas en un territorio, que compiten y se apoyan entre sí en una entidad socio territorial que se caracteriza por la presencia activa, tanto de una comunidad de personas como de un conjunto de empresas en una zona territorial determinada. Fenómeno que se da ampliamente en el sector de muebles, caso de este estudio.

El Capital Social Como Plataforma Del Clúster

Los clusters han sido analizados por los sociólogos y teóricos de la organización enfatizando la importancia de incorporar las redes sociales y el capital social que lo sustenta. El capital social, lo han definido a finales del siglo XX como la ciencias del desarrollo, conformado por el grado de confianza existente entre los actores sociales de una sociedad, las normas practicadas de comportamiento cívico y el nivel de asociatividad (Kliksberg, 2002).

La CEPAL, (2003:13) define el capital social como “el conjunto de relaciones sociales caracterizadas por actitudes de confianza, comportamientos de cooperación y reciprocidad. Se trata, del recurso de las personas, los grupos y las colectividades en una relación social, en las redes de asociatividad de grupos”. Mientras que Casanueva, Castro, & Galán, (2009:40) definen el capital social “como una red de relaciones que posee una organización o individuo, la cual le proporciona valor al permitirle el acceso a los recursos que están incrustados en la red”. Casanueva, Castro, & Galán, (2010) concuerdan con CEPAL en relación al capital social, visto como “una red de relaciones que posee una organización (o individuo), la cual le proporciona valor al permitirle el acceso a los recursos que están integrados en la red”. Las redes de negocio según Contreras, López, & Molina, (2011:4) se encuentran conformadas por una dirección de colegas u socios, clientes, proveedores, transportistas, distribuidores y contactos en las universidades, centros de investigación, firmas y asesorías. Bourdieu, (1980) define al capital social como “el conjunto de recursos que están ligados a la posesión de una red sostenible de relaciones más o menos institucionalizadas, de intercomunicaciones; en otras palabras, que estén ligadas a la pertenencia a un grupo, como conjunto de agentes que no están dados con propiedades comunes, pero están unidos por vínculos permanentes y útiles”. En cambio Ostrom, (2003:160) clasifica el capital social con una visión minimalista “el acceso de las personas a redes personales favorables”, lo desarrolla cada individuo en relación a los contactos o amigos que puede encontrar a su alrededor, el cual este capital social se desarrolla a veces a costa de los demás.

Existe mucha literatura del capital social, lo cual nos lleva a entender que tiene varios alcances desde el punto antropológico y económico. Resulta difícil encontrar teóricos con una sola visión, algunos retoman el concepto, como un recurso estructurado dentro de una red o grupo social del que se obtienen beneficios en su mayor parte. Otros lo asumen como un conjunto de valores, en los cuales describen la vida diaria de las personas en la familia y la organización empresarial, la mayoría coincide que sustentan el desarrollo de grupos, en este caso de un clúster, donde se destaca como elemento esencial, la confianza, cooperación y una visión común. Ver figura uno donde se visualiza el CS como el pilar fundamental para generar cooperación.

Enfoque de CS con el capital humano: Por lo tanto, son dos variables elementales CS y capital humano (CH) para que se de la colaboración exitosa. Coleman, (1988:97), refiere que el “capital social en la creación de capital humano facilita ciertas acciones de los actores, ya sean personas o empresas los actores dentro de la estructura, puede ser factor clave para la determinación de tareas o actividades dentro de una grupo social”.

La confianza como esencia del capital social: El CS lo establecen como el grado de confianza entre los actores sociales de una sociedad, las normas de comportamiento cívico practicadas que caracterizan a la misma, cuando alcanza altos niveles de asociatividad, indica que es una sociedad con capacidad para actuar cooperativamente, armar redes, concertaciones, sinergias de todo orden en su interior, citado en (Contreras, López, & Molina, 2011:1). Autores que han trabajado el tema (Madrigal, Arechavala, & Madrigal, 2012) (Putnam, 1995); (Ostrom, 2003), (Lechner, 1999) y (Morales, Sanabria, & Arias, 2010) La confianza juega un papel importante en el ámbito competitivo en los sectores productivos, ya que esta, es un valor de las relaciones sociales que permite emprender, trabajar y desarrollarse en conjunto. “Las disposiciones necesarias en el valor competitividad tienen que ver con representaciones de una realidad adversa, de recursos (entre ellos tiempo), un escenario o un campo social, disposiciones a “jugar” en determinadas condiciones y tener disposiciones a pro-accionar y reaccionar ante las configuraciones del campo” (Contreras, López, & Ríos, 2011).

Beneficios y sustentabilidad del clúster y establecimiento de redes: El capital social es la determinación del comportamiento, rendimiento y desarrollo de las empresas. Yamamura, (2008) y Casanueva, Castro, & Galán, (2010) refieren que existen cada vez más evidencias de que el rendimiento empresarial está influenciado por determinadas características de las redes inter-organizativas en las cuales incluyen los

tipos de relaciones que se producen en determinadas redes, basándose en la confianza y cooperación que a la vez fortalece el capital social, así como las características de los actores que conforman el clúster.

Figura1: El capital humano como el pilar para formar un capital social, para la colaboración en la organización

METODOLOGÍA

Se determinó utilizar la investigación aplicada, exploratoria, bibliográfica y casuística por considerar cada institución que forma un caso de estudio al igual el líder que está al frente del clúster. Para la comparativa de los clúster en el mundo se analizó la estructura de los más exitosos de otros países como Italia y Alemania, así como el modelo del clúster de la industria mueblera de Jalisco, México Apoyados por los instrumentos de investigación como: el cuestionarios, guías de entrevista semiestructurada aplicadas a informantes claves: cuatro responsables del clúster, tres actores de gobierno, tres empresarios y tres presidentes de asociaciones. Se organizó un grupo focal de 17 personas, integrado por los principales actores del clúster; directores de CS Muebles, representantes de las asociaciones y gobierno (AFAMJAL, CAREINTRA y SEPROE entre otros), entre otros, así como fabricantes del sector mueblero y decoración del estado de Jalisco, con la finalidad de conocer, realizar un diagnóstico del clúster, además de la identificación del capital social, las sugerencias para la articulación y consolidación del mismo. A estos actores se aplicó un cuestionario interactivo y a la vez ellos plantearon la propuesta.

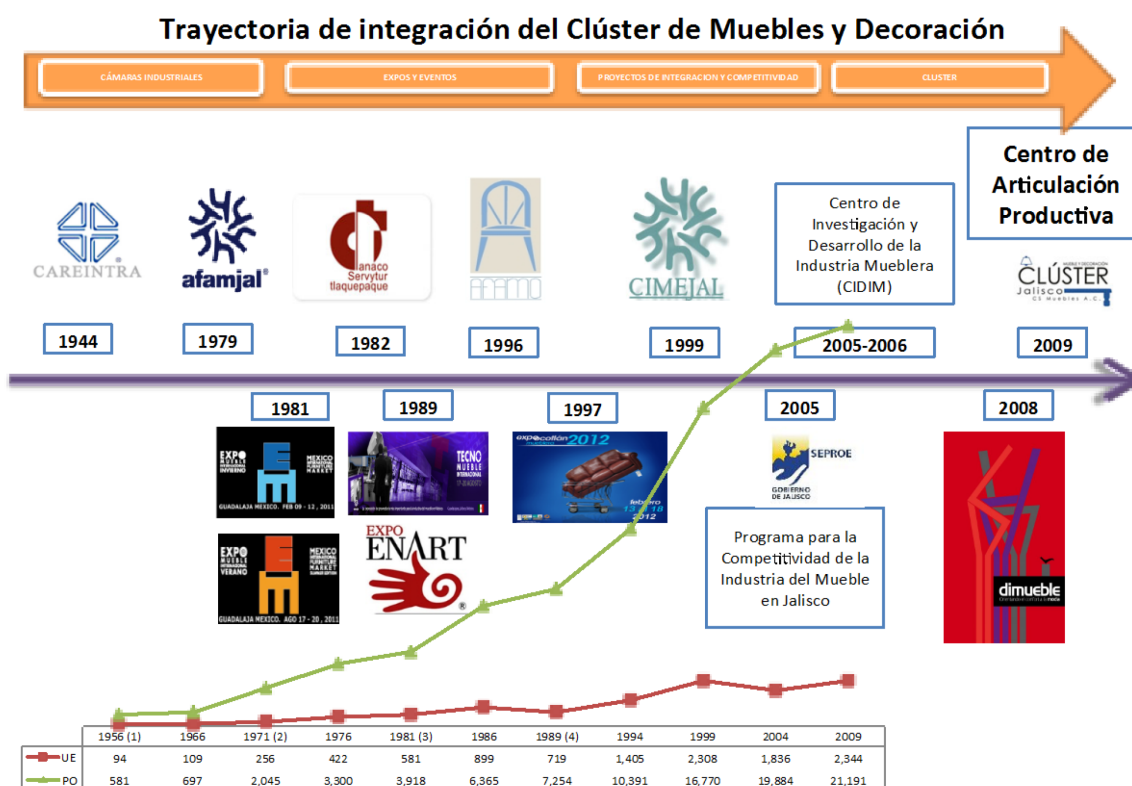

RESULTADOS

El capital social está relacionado con los procesos de aprendizaje que interactúa dentro de las organizaciones, convirtiéndose en el motor del desarrollo, dando como resultado el impulso económico de las industrias. El clúster mueblero y la decoración del estado de Jalisco, se encuentra en la fase de sensibilización y construcción del capital social necesario para que se dé la cooperación y trabajo en conjunto, entre las organizaciones que lo conforman, así como, con los proveedores, además de las instancias que intervienen en la cadena productiva. En la figura dos, hemos descrito la evolución del sector desde 1944 hasta el 2009, cuando se constituye el CS Muebles y decoración del estado de Jalisco, (ver figura 2).

De las grandes fortalezas del sector de muebles es el crecimiento que se identifica tanto en personal ocupado como el número de empresas. En 2004 de 1,836 se incrementa en el 2009 a 2,344, con un incremento del 22 por ciento. Así mismo sectores, empresarios que han sido considerados a trabajar con y como clúster, como es el caso de los transportistas, proveedores, textil y herrajes entre otros. Ante este

fenómeno los líderes de muebles y la decoración en el estado Jalisco han estado trabajando en la creación del clúster. El cual, está integrado por la Secretaría de Promoción Económica (SEPROE), La Camara Regional de la Industria Regional de Transformación (CAREINTRA), La Asociación de Fabricantes de Muebles de Jalisco (AFAMJAL), Cámara Nacional de Comercio, Servytur de Tlaquepaque (CANACO), Asociación de Fabricación de Muebles de Ocotlán (AFAMO), Camara de la Industria Mueblera (CIMEJAL), mesas de trabajo con universidades (UdeG, ITESO, Tec de Monterrey e UTEG), además de la Fundación Mexicana para la Innovación y Tránsito de Tecnología en la Pequeña y Mediana Empresa (FUNTEC), el clúster es liderado por CS Muebles y la decoración.

Figura 2: CS Muebles y decoración.

Aprendizaje del capital social de otros países

¿Qué se aprender de los clúster consolidados de otros países? Alemania e Italia son dos países con desarrollos en el sector muebles, al haber implementado estrategias para la conformación de clúster. En el caso de la industria mueblera de Italia estaba concentrada por distritos industriales, los cuales en los años cincuentas pasaron de ser artesanales a ser un sector industrializado (Parrilli, 2008). Lo anterior condujo un desarrollo significativo, mediante la incorporación de maquinaria, asistencia técnica, perfilarse a nuevos mercados y consolidarse como clúster. Los clúster de Italia son reconocidos a nivel mundial por la evolución y desarrollo que han logrado mediante la innovación e implementación de nuevos procesos de aprendizaje, diseño, automatización en procesos computarizado, implantación de nuevos materiales, adaptación a nuevos estándares, uso de tecnología en la venta y comercialización de productos por medio de online, etc. En cambio el clúster de la industria de mueblera de Alemania, se caracteriza por su

modelo basado en la industrialización del sector, (Bermúdez, 2003). Apoyado por el gran desarrollo tecnológico que ha logrado en las últimas décadas en la fabricación de maquinaria y equipo para la transformación de la madera.

El Clúster de Alemania se caracteriza por estar conformada por empresas grandes, las cuales superan el número de 112 personas por empresa y su principal línea de producción es la fabricación de muebles de cocina, con más de 172 trabajadores por empresa. Las fortalezas de los clúster se pueden apreciar en la tabla uno:

Tabla 1: Análisis comparativo de los clúster Italia, Alemania y Jalisco México

Clúster italiano	Clúster Alemán	Clúster SC Muebles Jalisco/México
Un sistema territorial delimitado	Alta tecnología en el sector	Conglomerado empresarial
Una comunidad de personas	Empresas claves del sector:	Incipiente innovación en tecnología
Empresas PYMES especializadas	Empresas de apoyo	Diseño y calidad
Calidad de los recursos humanos	Escuelas	Sector artesanal
Actores institucionales	Gobierno	Indicios de desarrollo en innovación del diseño
Proveedores, (Competencia y cooperación)	Dinámica del mercado internacional	Mercado interno
Clientes	Diseño e innovación:	No integración de la cadena productiva
Recurso humano calificado.	Capital social consolidado	Bajo nivel de capital social
La comunidad apoya al clúster	Visión común	En proceso de consolidación
Visión común	Grandes empresas	Pymes

Fuente: Elaboración propia, 2012.

Tres variables que puede aprender de los clusters italiano y alemán: formar su recurso humano calificado, innovación y tecnología, vinculación con la universidad, gobierno, empresa y consolidar su capital social con una visión común. ¿Qué Opinan Los Líderes Sobre Su Capital Social? Los líderes y actores del clúster tanto gobierno, asociaciones y fabricantes están conscientes de lo que ha limitado el desarrollo del clúster, es la nula cultura de integración representado por el 40%, como segundo factor es la falta cooperación y compromiso entre los actores teniendo un 34% y por último, la falta de información y comunicación entre los integrantes del clúster. Lo cual se deduce que son barreras para el CS (ver figura 3).

Figura 3: Factores que limitan el desarrollo del clúster

Fuente: (Madrigal Torres, y otros, 2012).

Para fortalecer e incrementar la confianza entre los integrantes que conforman el clúster, la participación activa y relación directa entre los sectores (gobierno, asociaciones y fabricantes) es esencial para la construcción de lazos de confianza, así como la difusión y apoyo, para la implementación de buenas prácticas en el sector, un porcentaje considerable dijo, que la difusión del clúster sería una estrategia para crear confianza, (ver figura 4).

Figura 4: Acciones y estrategias para incrementar la confianza

Fuente: Resultados del grupo focal, (2012).

Los principales problemas que manifiesta el clúster en primer lugar es la falta de trabajo en equipo, cooperación e integración del sector muelero, en segundo es la falta de implementación de innovación y diseño e integración de empresas de apoyo (proveeduría), en tercero, nula integración de una visión en común, así como también un bajo nivel de cultura empresarial y desconocimiento en materia de comercialización por parte de los fabricantes. El capital social sin duda es un factor importante en el desarrollo de los clúster, (Barba, 2011) para desarrollar y construir el capital social, un elemento que puede ayudar a fortalecer el capital social es mediante la participación de los actores y proximidad en sus diversas dimensiones físicas, económica, social, cultural y tecnológica. El líder es el que debe desarrollar esta fase del CS. Para lo cual describimos los fenómenos y retos de movilidad de líderes o responsables del clúster. Alta rotación de personal directivo del clúster, así como perfil de los directivos y débil liderazgo en el sector, (ver tabla 2).

Tabla 2: Líderes de clúster periodo de gestión y sus logros 2009-2012

Nombre	Periodo	Perfil/ escolaridad	Logros
Alfonso Padilla	2009	Empresario	Precursor y líder empresarial
Armando Elizalde Lozano	2010	Economista, consultor y asesor	Estrategias en marcha
Martin López Ramírez	2011	Empresario	Expo las Vegas
Yadira Reynoso Ayala	2012	Consultora y analista	Capacitación y socialización

Fuente: Elaboración propia, investigación 2012.

Periodos muy cortos de gestión en las cámaras empresariales. 2 años no coinciden los cambios. Una política no clara y consolidada del sector gobierno en lo relacionado al fomento y desarrollo de clúster. Así como, la alta rotación de los responsables del clúster. Por lo anterior, algunos de los líderes han cambiado de paradigma y en junio del 2012, AFAMJAL asumió el liderazgo del clúster, el cual ha emprendido acciones de socialización, generación de confianza en un proceso de educación, reeducación y aprendizaje constante que tiene que venir a la par con un programa de capacitación, formación y de estímulos fiscales, programas de innovación y tecnología. Además, se ha invitado a otros actores ligados en la cadena productiva del mueble que se sumen en los trabajos del clúster y estos son:

1. Los productores de madera y la política de gobierno para fomentar las plantaciones de madera nativa y madera no nativa.
2. Los transportistas

3. Los insumos y troqueles
4. Los diseñadores de equipo y tecnología para la fabricación de muebles
5. Los comerciantes.
6. Las universidades, donde se encuentra el capital humanos especializado.

Ideas que comparten y sus fortalezas Al cuestionar a los actores del cluster, mencionan que lo que comparten en común con un 41% es competitividad empresarial y con un 28% desconfianzas, 20% posicionamiento de mercados. Lo anterior refleja que los empresarios estan concientes que se tiene que trabajar en mejorar su competitividad en equipo y generar confianza, para se competitivos en otros mercados.

Figura 5: Ideas que comparte los integrantes el clúster de muebles de construir CS

Fuente. Elaboración propia, investigación actores 2012

Acciones Y Estrategias Para Incrementar La Confianza

Al cuestionar a los actores ¿Qué acciones propone para incrementar en el corto plazo la confianza de los empresarios en el proyecto de clúster encabezado por CS Muebles? En primer instancia proponen con un 49 por ciento la participación de todos los actores. Lo cual refleja la sencibilidad que tienen de la importancia del trabajo en equipo. Ante los resultados de la investigación y análisis de la literatura se propone que el primer paso para el éxito de un cluster es la construcción de su capital social y la construcción de una visión en común da como resultados los vinculos de cooperación e integración que sustente el cluster.

CONCLUSIONES

Sin duda el capital social juega un papel importante en el desarrollo de las empresas, organizaciones y conformación de clúster. Para Alburquerque, (2006), el aprendizaje regional mediante el capital social y la confianza en las redes entre empresas, son cruciales el contexto social y cultural tanto de la infraestructura de investigación como de la red de relaciones entre empresas y actores territoriales, el desarrollo del capital social favorece a la innovación mediante las relaciones de cooperación en los actores que participan en los clusters, en cambio para Jung & Garbarino, (2006), las relaciones sociales y movilidad del recurso humano genera una mayor transferencia de conocimientos, dando la oportunidad al desarrollo a las aglomeraciones empresariales y formación de clúster. Fenomeno que se esta generando en este cluster estudiado. Lo que ha limitado el desarrollo del clúster mueblero y la decoración del estado de Jalisco, es esta integrado por varias asociaciones y se trabajo en consolidar el cluster, descuidando la construcción primero del CS, necesario y con ello la formulación de una visión clara en común y de continuidad por parte de los actores claves. Para fortalecer el capital social del clúster se tienen trabajos incipientes de colaboración en conjunto en un mismo objetivo o un plan de desarrollo que integre tanto a el gobierno, organizaciones empresariales y (universidades, generadoras de conocimiento y recurso humano calificado) logrando el fortalecimiento del capital social.

Se identifica que el clúster de muebles, que existe un frágil capital humano y social, ya que a la respuesta de ellos mismos sus problemas se sustentan en que hay individualismo, desconfianza, comportamientos individualistas y protagonismo así como una ausencia de liderazgo integrador y transformador, que sea capaz de transformar las debilidades en fortalezas. Fenómeno que no se ha podido consolidar el clúster entre otras tres variables que es: alta rotación de los directivos del clúster, la estructura organizacional que propusieron, el protagonismo de los actores y sobre todo la cultura empresarial prevaleciente.

Ante la evolución y los trabajos realizados desde hace más de una década en la meta de integrarse y cooperación mediante una estructura de clúster y consolidación de la cadena productiva. Se han identificado grandes fortalezas de cada una de las instituciones; pero trabajando en forma aislada, a partir de agosto eligieron un nuevo líder con experiencia y que ha sido representante de tres de las cuatro asociaciones muebлерas del estado de Jalisco. Propuesta y sugerencia Liderazgo para conformar el capital social de un clúster apoyados por la teoría de Andersson, Hansson, Schwaag-Serger, & Sörvik, (2004) hemos construido el perfil del líder para la planeación, puesta en marcha de un clúster así como las competencias y fases que tendrá que desarrollar el líder para conformar el capital social. Requisitos: En primera instancia el líder tiene que ser un personaje aceptado, con autoridad legítima, amplio conocimiento del sector, capaz de ser independiente a los intereses individuales y genere consensos e intereses generales y una visión en común. Habilidades interpersonales: Ser un facilitador, genere consensos, negociación y comunicación, analista, reflexivo, generador de recursos y asegurar los existentes.

Cualidades: sentido de servicio, paciente, respeto a las estructuras, incluyente

Conocimientos: Técnicos, de negocio, de mercado y sea visionario

Administrador: Proactivo, retador, deseos de superación, tenga jerarquía y autoridad, poder, sea sensible e insensible.

FUNCIONES

1. Construir el capital social. Conocer la cultura y el sector para empezar a generar confianza, lograr y alimentar la confianza del equipo.
2. Desarrollar vínculos. Auditar las competencias, tanto de producción como de mercado, establecer visión común y evaluar constantemente.
3. Definir estrategias y visión. Definir las estrategias y visión, así como las acciones, evaluar resultados, metodologías y establecer redes de cooperación.
4. Poner en marcha el clúster.

Estas son las acciones elementales para construir un clúster. El fenómeno que se dio en CS Muebles y decoración, fueron primero constituyeron el clúster, se han enfrentado al fenómeno de la cultura individualista y no una visión en común en esta fase se encuentran en la conformación y unificación de su capital social, partiendo del individual para sumarlo como equipo y consolidarlo.

EMPRESARIOS PYMES A TRAVÉS DE SUS NARRACIONES: ESTILOS PROPIOS Y ESPECIFICIDADES

Natacha Gentile, Universidad Nacional de Mar del Plata

Fabiola Baltar, Universidad Nacional de Mar del Plata

RESUMEN

El propósito de este trabajo es identificar y caracterizar perfiles de empresarios PYMES utilizando el enfoque de las narraciones y obteniendo información a través de entrevistas en profundidad. Lo que se busca con esto es comprender las especificidades del proceso de toma de decisiones de este tipo de empresarios, de manera de entender qué factores influyen en su estilo de decisión y cómo inciden estos modelos decisorios en el desempeño de la organización y en el desarrollo de ventajas competitivas sostenibles en el largo plazo. Se espera que los resultados del trabajo resulten de utilidad para el diseño de políticas de fomento al desarrollo empresarial y para el sector de la Pequeña y Mediana Empresa, teniendo en cuenta rasgos personalísimos de quienes las conducen.

PALABRAS CLAVES: empresarios pymes – narraciones – decisiones estratégicas

SME ENTREPRENEURS THROUGH STORIES: THEIR OWN IDIOSYNCRATIC STYLES

ABSTRACT

The purpose of this paper is to identify and characterize entrepreneurs' profiles in SMEs using narratives and information obtained through interviews. The aim of the study is to understand the specificities of the decision making process in this type of business. We tend to identify which factors influence their decision style and how these models affect firm's performance and the development of sustainable competitive advantages in the long term. We expect to generate useful results for the design of policies to promote SMEs, taking account of the personal traits of those who lead them.

KEYWORDS: SME entrepreneurs - stories - strategic decisions

INTRODUCCIÓN

Desde hace varios años ya no se discute ni en nuestro país ni el resto de los países de la región el rol estratégico que pueden cumplir las empresas pymes -Pequeñas y Medianas Empresas- tanto como generadores de empleo a partir de la actividad que desarrollan, como promotoras de procesos económicos-productivos complejos, asociados entre otras cosas a la reindustrialización local y a la mayor integración productiva regional. Este protagonismo no resulta menor, en el sentido de que a través del mismo no solo importantes colectivos sociales que no logran insertarse en unidades productivas mayores, pueden acceder a los ingresos necesarios para su supervivencia material, sino porque en lo fundamental, el mismo [el protagonismo de las pymes] bien puede encausarse hacia una contribución no menor en términos de diversificación productiva de la región que podría derivar en aumentos de competitividad de la economía. Aumentos nada despreciables en el capitalismo ultra-competitivo, global, interconectado e

informativa en que vivimos, lo que además podría derivar en inserciones laborales de mayor calidad en oposición a la proliferación de empleos precarios -en conjunto de las economías- de las últimas décadas.

Sin embargo entre este rol genérico e ideal que podrían o deberían asumir las pymes y el rol que efectivamente están llevando adelante en los espacios locales, existe una brecha. Brecha que muchas veces aparece difusa al no diferenciar afirmaciones normativas del tipo “*qué deberían ser las pymes*” versus positivas vinculadas a afirmaciones tales como: “*que son realmente en la práctica este tipo de empresas*” y en lo fundamental, al no centrar los diagnósticos preliminares al diseño de políticas en reconocer las especificidades y complejidades que atraviesan, no ya la abstracción que significa una unidad productiva, sino las involucradas en el ser, sentir y actuar de quien las conduce: el empresario pyme, artífice, promotor y hacedor de un engranaje al que llamamos empresa.

Bajo este marco y adhiriendo a la idea de que la política pública bien planificada no solo debe reconocer y considerar el desempeño de las empresas pymes en la práctica, sino en lo fundamental debe pensarse en clave de reconocer al empresario en tanto decisor de la empresa, como un sujeto social cargado de subjetividades y condicionado además por un contexto económico, social, político y cultural que lo atraviesa y circunda, el propósito de este trabajo es contribuir a identificar y caracterizar perfiles de empresarios pymes utilizando el enfoque de las narraciones y obteniendo información a través de entrevistas en profundidad, a fin de comenzar a comprender las especificidades del proceso de toma de decisiones de este tipo de empresarios, de manera de entender qué factores influyen en su estilo de decisión y cómo inciden estos modelos decisorios en el desempeño de la organización y en el desarrollo de ventajas competitivas sostenibles en el largo plazo.

Así, a través de este procedimiento se espera una aproximación diferente a la comprensión del fenómeno de los empresarios pymes y las empresas pymes, al incursionar en el mismo no ya a través de caracterizaciones de las empresas, sino a través de interpretar y empezar a comprender quiénes son sus decisores, esto es, quiénes son los que en última instancia crean, gestionan y le dan vida a este tipo de empresas. De esta manera es que esperamos que los resultados del trabajo resulten de utilidad para repensar el diseño de políticas de fomento al desarrollo empresarial a nivel local y para el sector de la Pequeña y Mediana Empresa, teniendo en cuenta rasgos personalísimos de quienes las conducen.

REVISIÓN DE LA LITERATURA

Toma De Decisiones En Empresas Pymes: Revisión Teórica

Sostener escenarios competitivos requiere competencias que faciliten la toma de decisiones adecuadas para enfrentar incertidumbres y generar desafíos. Es por ello que en el ámbito de la dirección estratégica cada vez más se destaca la importancia de las decisiones empresariales como elementos claves para el desarrollo competitivo de las empresas (Druker, 2002; Mintzberg y Waters, 1990). En este marco, entendemos que una decisión estratégica tiene que ver con “la elección intencional o respuesta programada acerca de asuntos que materialmente afectan las perspectivas de supervivencia, bienestar y naturaleza de las organizaciones” (Schoemaker, 1993: 107).

En línea con esto la literatura que aborda la conceptualización del proceso de decisión plantea la existencia de tres enfoques tradicionales en torno al tema: el racional, el accional y el interpretativo. Así a través del *enfoque racional* se interpreta que las decisiones empresariales son intencionalmente ejecutadas y son la base de la estrategia organizacional, más allá de lo cual también se acepta la existencia de una racionalidad limitada en los agentes decisores (Simon, 1957), a la vez que se señala como principal crítica a esta escuela, que termina atribuyendo una relación directa entre racionalidad en la toma de decisiones y acción. Esto último, es abiertamente criticado desde el *enfoque orientado a la acción*, enfoque que considera que las acciones estratégicas no necesariamente responden a elecciones racionales. Así, autores

como Mintzberg y Waters (1990) sugieren que las organizaciones deben verse como generadoras de acción y que estas acciones estratégicas son creadas previamente a las decisiones que las fundamentan.

En línea con lo anterior, es importante destacar que tampoco el enfoque orientado a la acción reconoce que cada decisión tiene implícita una intención, una búsqueda y una percepción subjetiva de la realidad, cosa que sí aparece considerado en el tercer enfoque utilizado para comprender el proceso de decisión, que es el *enfoque interpretativo* (Laroche, 1995). Esta última perspectiva, sí considera que las decisiones deben ser entendidas como representaciones sociales que reproducen estructuras cognitivas vinculadas a la imagen de la realidad que poseen sus miembros, las cuales dependen directamente del contexto donde han sido sociabilizados (Giddens, 1991).

Asimismo, y más allá de las diferencias que pueden encontrarse entre los enfoques antes paneados, destacamos una crítica general hecha a las tres perspectivas, y es que en todos los casos la literatura que las contiene ha centrado la discusión en el análisis de las decisiones adoptadas dentro de grandes empresas y/corporaciones [particularmente de países desarrollados], dirigidas la mayoría de las veces por gerentes profesionales. Esta cuestión, sin dudas ignora peculiaridades que se presentan en las empresas pequeñas y medianas dirigidas por emprendedores (Gibcus et al. 2004; Papadakis et al., 1998; Brouthers, 1998; Beattie, 1999; Gilmore y Carson, 2000) e ignora también una cuestión no menor en nuestra opinión: las derivaciones y connotaciones que suponen para una empresa estar anclada en países periféricos con proyectos políticos-estratégicos particulares. La realidad es otra.

En línea con esto, destacamos el planteo que realiza Gibcus (2004) quien sostiene que estas teorías pensadas y generadas para grandes empresas [de países centrales] pueden reflejar erróneamente la realidad de las Pymes [locales] en el sentido que: 1) las Pymes tienden a tomar decisiones menos racionales; 2) las pymes enfrentan entornos más hostiles e inciertos, y 3) los empresarios de las Pymes suelen tener características particulares que influyen en el proceso de decisión que los diferencian de los gerentes profesionales. Así, conocer estas particularidades facilita la discusión en torno a cómo [potenciar un empresario pyme, y cómo] diseñar una “empresa inteligente” (Quinn, 1992) capaz de generar información en tiempo real y estructuras de soporte para la eficiencia en la toma de decisiones.

De ahí que, perfilar las características de quien decide dentro de la empresa, cómo elabora su estrategia y el tipo de decisiones que adopta sigue siendo un aspecto fundamental para el diseño de estas estructuras de soporte, procurando maximizar el rendimiento de la empresa tanto en su configuración interna como en el entorno competitivo que enfrenta. En cuanto a los atributos del decididor y como primera aproximación a los mismos, destacamos la importancia de reconocer variables demográficas y variables actitudinales. Respecto a las variables demográficas, distintos estudios han analizado los atributos sociodemográficos integrándolos a la denominada perspectiva teórica de “mandos superiores” (Hambrick y Manson, 1984). Desde esta teoría, los decididores, basan sus elecciones en sus experiencias idiosincráticas, valores y disposición que están directamente relacionadas con características sociodemográficas como, por ejemplo, el género (Klenke, 1996; Powell y Ansic, 1997), la edad (Okun, 1976; Johnson, 1990) el nivel educativo o la trayectoria profesional (Huffman, 1974).

Respecto a las variables actitudinales, adoptamos el análisis propuesto por Gibcus et al (2004) que, basado en la literatura, establece que para elaborar una taxonomía de decisores en las Pymes es necesario utilizar y/o considerar las siguientes dimensiones: 1) la frecuencia decisoria; 2) el grado de independencia en la toma de decisiones; 3) el grado de autoconfianza (Levander y Raccuia, 2001); 4) la ambición y motivación; 5) la estrategia de búsqueda de información; 6) las alternativas evaluadas antes de tomar la decisión (Brouthers et al. 1998); 7) la propensión al riesgo (Knight, 1921); 8) la presencia de problemas o cuellos de botella en el proceso decisorio (Gibcus y van Hoesel, 2004), y 9) la situación económica (Dess et al. 1997). Finalmente y para comenzar a cerrar esta parte de revisión teórica y empírica, queremos destacar que, tanto los atributos que definen al sujeto decisor como al modelo de decisión que sustenta la

organización inciden directamente en el desempeño y estrategias que definen la trayectoria de la empresa. Las profundas transformaciones en el entorno de las empresas han alterado profundamente las fuentes de generación de ventajas competitivas y ante las nuevas demandas los empresarios y por ende sus empresas se verán forzadas a replantear su lógica de inserción en los mercados y a encarar profundos procesos de cambio que generen las necesarias transformaciones en su lógica de funcionamiento interno y en la manera en que toman sus decisiones. De esta realidad, deben tomar nota las políticas públicas.

METODOLOGÍA

Para este trabajo hemos utilizado el enfoque narrativo en virtud de nuestro interés por acercarnos, a través del relato de las decisiones empresarias, a la comprensión de las especificidades y complejidades que atraviesan el ser, sentir y actuar de quien las conduce: el empresario pyme. A su vez en el trabajo se decidió utilizar la técnica de la entrevista en profundidad, por cuanto el uso de la misma permitió obtener información intensiva, holística, contextualizada y personal sobre cómo se toman decisiones y cómo se actúa en este tipo de empresas. Las personas entrevistadas fueron en total 10, todas ellas a cargo de pequeñas y medianas empresas dedicadas a diferentes actividades representativas de la estructura productiva del partido de Gral. Pueyrredon - Argentina, una localidad de algo más de 500.000 habitantes, tal como se detalla a continuación:

- 1: elaboración y venta de productos alimenticios.
- 2: distribuidora de materiales eléctricos y telecomunicaciones.
- 3: de servicios gastronómicos y de restauración.
- 4: de servicio de planificación y organización de eventos.
- 5: servicios de esparcimiento y recreación.
- 6: venta de libros y servicios afines.
- 7: fabricación, distribución y venta de diluyentes.
- 8: servicios de publicidad.
- 9: producción agropecuaria.
- 10: servicios inmobiliaria.

La selección de la muestra tuvo en cuenta la heterogeneidad de casos (sectores, perfiles empresariales y género). Asimismo, el tamaño de la muestra quedó determinado a partir de la saturación teórica de las categorías. En cuanto al análisis de los resultados una vez realizadas las transcripciones de las entrevistas (todas fueron grabadas) procedimos a leer en insistidas oportunidades las mismas buscando identificar aspectos diferenciales y semejantes que permitieran reagrupar relatos con alguna lógica analítica que surgiera de lo manifestado por los entrevistados. En lo que sigue proponemos recuperar palabras, decires y sentires expresados por diferentes empresarios pymes y que son los que se presentan comillados y en bastardilla.

RESULTADOS

Perfiles Decisorios Y Decisiones Estratégicas

A partir del análisis de la información obtenida en las entrevistas en profundidad pudimos corroborar luego de una lectura interpretativa detallada la existencia de siluetas decisorias heterogéneas y en particular pudimos identificar dos perfiles claramente contrapuestos entre los empresarios PYMES que decidimos caracterizar y presentar de manera explícita a continuación: el “Empresario que piensa y actúa estratégicamente” -EE- y el “Empresario que decide y actúa anclado en el corto plazo” -ECP-. Así y en líneas generales podemos decir que:

El primero de estos empresarios -el EE- se caracteriza por un perfil decisorio que combina racionalidad y “olfato” en las decisiones con un claro sentido profesional de dirección integral del negocio, destacándose de manera categórica en su propio decir la importancia de la toma de decisiones orientada hacia resultados estratégicos, sobre la base de reconocer de manera pormenorizada los múltiples factores internos y externos que condicionan el conjunto de decisiones empresarias, tanto como sus entretreídos y nudos críticos que son interpretadas [por el empresario y su equipo de apoyo que a veces son profesionales u operarios con experiencia en diferentes áreas] como cuestiones que deben ser resueltas en favor de objetivos estratégicos de largo plazo.

En tanto que el segundo tipo de empresario o segunda categorización, -el ECP- da cuenta de un empresariado cuyo perfil decisorio se erige de manera casi opuesta al anterior en el sentido que quienes se cobijan bajo este rótulo son empresarios que plantean que el accionar de la empresa y en consecuencia las decisiones que ellos toman son más bien menos elaboradas, instantáneas y de corto plazo y se hayan fuertemente influenciadas por lo que la experiencia propia del empresario junto a lo que a veces aportan los empleados, más lo que a dice el cliente y lo que es la competencia, sin evidenciar casi en ningún caso, un conocimiento que explicita un cabal conocimiento de rasgos concretos de los mismos, desconociendo u omitiendo de manera notoria otros elementos internos y externos que condicionan el negocio y las decisiones. En lo que sigue caracterizamos utilizando el enfoque de la narrativa ambos perfiles.

Empresarios Que Piensan Y Actúan Estratégicamente

Los empresarios que agrupamos bajo este rótulo son empresarios que piensan y actúan estratégicamente en el sentido que, para ellos, decidir tiene que ver de manera directa con *"orientar todo el accionar de la empresa hacia un objetivo estratégico"*. Así, reconocen de manera explícita que el desempeño de la empresa depende de una adecuada secuencia *"de decisiones estratégicas"*. En tal sentido, hablamos de empresarios que diferencian claramente las decisiones operativas de las decisiones estratégica y que valoran la buena decisión a partir de una visión integral de los impactos de la misma:

“Me parece que una buena decisión es una decisión donde uno alcanza el objetivo fijado y a su vez no genera un ruido en el entorno, o sea no genere un ruido negativo con mis clientes, ni con mis proveedores ni con mi personal, me parece que incluso puede uno potenciarlo y mejorar la relación con ellos tomando una buena decisión” *“me doy cuenta si la decisión que tomo es buena y mala, es midiéndola, básicamente es eso la repercusión que generó, el comentario de la gente que tenemos relacionada dentro de la empresa, los mandos medios, el directorio.”* En línea con esto, las decisiones de peso que toman estos empresarios las toman considerando información calificada y buscan minimizar el margen de error o incertidumbre: *“las decisiones importantes donde la consecuencia de esa decisión tiene un efecto importante dentro de la empresa uno lo que tiene que evaluar es la información con la que cuenta y en el caso de que la información sea escueta uno se demora hasta conseguir la mayor cantidad de datos posibles para elaborar una decisión correcta. Uno trata de tomar una decisión con certeza básicamente y no con riesgo o incertidumbre”* *“uno cuando toma una decisión sabe que hay un porcentaje de error y trata de minimizarlo lo más posible.”* Y para reducir la incertidumbre es que se apoyan en información que pueden obtener de referentes que trabajan en la misma empresa.

En línea con esto, hay una valoración por la participación de empleados en determinado tipo de decisiones y si bien hay una impronta y manejo personal en las mismas se reconoce que cuando es necesario se delegan: *“A mí me parece, que es muy importante tomar las decisiones con ellos, depende también las decisiones que hay que tomar, yo soy de la idea que hay que hacerlos participe de la mayoría de las decisiones, para que lo sientan como algo propio y lo puedan defender.”* Dado que se entiende que de esa manera se encauza mejor la acción y en consecuencia el logro de los objetivos empresarios: *“Si vos tomas una decisión solo y no los participas, después ellos sin querer o a veces queriendo te lo pueden boicotear, en cambio si uno la presenta, ve los distintos pensamientos, las distintas ópticas de cada uno y*

llega a un consenso, que le sirva a la empresa, siempre la prioridad es el beneficio de la empresa. Me parece que esta bueno porque cada uno lo tiene como propio y también lo defiende dentro de la empresa.” Así, hablamos de empresarios que ante la emergencia de una determinada problemática actúa indagando en quienes ellos reconocen que tienen más y mejor información en las diferentes áreas de la empresa: “para nosotros es muy importante apoyarnos en las distintas áreas en la toma de decisiones.

Un ejemplo de eso es que hoy la empresa esta dividida en 3 divisiones especializas. Esto quiere decir que cada división tiene gente idónea capacitada en su área” que es la que brinda información específica en caso de presentarse problemas. A la vez también reconocen que para algunas decisiones recurren al asesoramiento externo, muchas veces asesoramiento profesional específico asociado a nudos críticos que se identifican en las diferentes áreas de la empresa: “Es muy importante [el asesoramiento externo] porque obviamente uno no sabe de todo y hay personas que se dedican, que estudian y que están buscando siempre cuáles son las alternativas, las variables y las nuevas tendencias de mercado, las nuevas herramientas que hay disponible. Uno tiene que relacionarse con esos profesionales para que a uno lo orienten y bueno ellos conocen cuáles son las mejores prácticas, nosotros no nos podemos poner a invertir tiempo y un montón de trabajo en algo que no sabemos”.

Se percibe en ellos un conocimiento del contexto de la empresa elevado y preciso, y que se nutre además de múltiples fuentes. Llama la atención también que este tipo de empresarios mantienen y sostienen una relación estrecha con cámaras empresarias dado que entienden que la información que de allí se recibe es clave para contribuir a entender el mercado y hacer previsiones: “Para nosotros es clave estar relacionados con estas entidades [cámaras], para saber cuáles son las decisiones que se están tomando (...) [en el sector en general] para ver cómo esas decisiones van a repercutir en nuestro día a día nuestro trabajo y las ventas.” En línea con lo anterior es que puede aseverarse que “siempre” buscan información para pensar y resolver un problema y además sus decisiones se basan en información integral de áreas internas y/o referentes de la empresa y/o se recaba externamente. A la vez, también propician vínculos con otras empresas del sector para obtener información y también beneficios: “Mirá nosotros a la hora de tomar decisiones, nos ha venido muy bien integrar un grupo empresario. (...) nos hemos unido y uno de los temas que se empezó a ver era que todos le comprábamos a los mismos proveedores y podíamos llegar a utilizar nuestro poder de compra de manera unificada y para poder acceder en el mercado a descuentos diferenciales, lo que se llama pool de compras.”

Finalmente en relación a las decisiones por áreas de la empresa, los empresarios que piensan y actúan estratégicamente trasladan las cualidades y rasgos anteriores a las diferentes áreas. Así por ejemplo, las decisiones del área comercial se plantean a fin de diferenciar a los clientes, además de pensarse e implementarse diferentes tipos de estrategias y medios para llegar al cliente. Las decisiones de área financiera llevan implícita una preocupación particular y un conocimiento explícito acerca de los riesgos financieros que deben minimizarse y esto se deriva de asociar la política de proveedores con políticas de clientes. Del mismo modo las decisiones del área recursos humanos conllevan exigencias técnicas para tomar personal a la vez que se llevan adelante capacitaciones permanentes al personal, valorándose a partir del impacto se cree generan en la empresa. Finalmente, del discurso de estos empresarios se desprende la vital importancia dada a tener empleados motivados y que defiendan la empresa, dado que se interpreta que eso repercute en el desempeño de la misma. Por último en cuanto a las decisiones en el área de producción también se piensan y ejecutan considerando múltiples determinantes sobre la base de “implementar políticas para reducir stocks y hacer eficientes los pedidos”

Empresarios Que Deciden Y Actúan Anclados En El Corto Plazo

En oposición directa al empresario antes descripto, encontramos la figura del empresario que decide y actúa sin una perspectiva ni de futuro ni mucho menos estratégicamente, dado que se halla anclado en el corto plazo y en una visión carente de complejidad de su negocio. Para este perfil alternativo de

empresario, decidir tiene que ver con una cuestión diaria en el sentido que: *“las cosas funcionen todos los días”* Reconociéndose que el desempeño de la empresa depende *“de las decisiones que se toman en el día a día”*. En línea con esto, se trata de empresarios que no piensan a largo plazo *“En realidad hoy en día lo que puedes hacer es trabajar y ver que es lo que puede llegar a pasar mes a mes, pero no a largo plazo”* y que además no diferencian las decisiones operativas de las decisiones estratégicas, sino que la diferenciación de las decisiones la hacen por otras cuestiones tales como áreas o épocas del año:

“hay diferentes decisiones....sobre recursos humanos o aspectos laborales, financieras” “todos los días uno toma decisiones distintas, depende del día, de la época del mes, hay un montón de factores”. Asociado a lo anterior, se plantea que las decisiones de peso que toman estos empresarios las toman con información limitada, vinculada a pareceres propios y a la opinión de algún empleado: *“Por lo general cuestiones de tiempo o respuestas rápidas es en base a lo que yo sé, digamos.”* Evaluándose las buenas decisiones por el menor tiempo que llevan: *“Y lo mejor sería tomar la mejor decisión en el menor tiempo posible pero todos sabemos que tomar una buena decisión implica de una buena evaluación y tiempo. Lo ideal sería tener la experiencia necesaria para poder responder rápido frente a situaciones.”*

Lo anterior implica hablar y pensar en empresarios que ante la emergencia de una determinada problemática actúa motivado por la rapidez *“Por lo general ahí trato de tomar la decisión lo más rápido posible”* y en base a la intuición personal o su propia experiencia, lo que implica resolver problemas *“basado en lo que me parece y en lo que sé hacer”* *“En realidad sí, me baso mucho en la información que tengo yo y en la experiencias, quizás no sea un buen punto de partida, a veces tendría que consultar más”*. A la vez que reconocen que el asesoramiento externo al que recurren es limitado: *“solo del Contador de la empresa”* o bien plantean la información que se recibe de proveedores *“Bueno los proveedores que te dan información de productos nuevos, de costos nuevos”* resultando también que, fuera de esto no consideran como posibilidad ningún otro tipo de asesoramiento profesional dado que se cree que eso sería factible para negocios más grandes: *“En este momento no [contamos con otro asesoramiento externo más que el Contador], yo sé que necesitamos de ese asesoramiento pero creo que en este momento todavía no llegamos a esa etapa de abrirnos hacia lo que es el mercado más amplio”* *“profesionales como el contador que trabaja con nosotros, él nos da información de cosas nuevas que pasan o aumentos o impuestos nuevos y esas cosas.”*

Se percibe en ellos un conocimiento del contexto de la empresa limitado y con ciertas vaguedades: se menciona como cuestiones negativas para el desarrollo del negocio generalidades vinculadas con la falta de previsibilidad política, económica y social sin poder hacer precisiones más concretas al respecto y sin poder precisar condicionantes más directos a la operatoria del negocio. A diferencia del perfil anterior, aquí no hay ningún tipo de relación con cámaras empresarias si tampoco ningún tipo de integración ni vertical ni horizontal con otras empresas. En línea con lo planteado es que puede aseverarse que *“nunca”* buscan información para pensar y resolver un problema, y además sus decisiones son personales y no se delegan: *“En general todas corren por mi cuenta, al ser poco personal creo no tener necesidad de delegar, pero en caso de ausencias mías o lo que sea, confío (...) [en algunos empleados] y sería el primero al que recurriría.”* A la vez para tomar cierto tipo de decisiones se basan en información limitada vinculada a pareceres propios y a la opinión de algún empleado, destacándose una combinación de informalidad en el manejo y confianza por ser pocos: *“Y nosotros nos manejamos bastante informalmente, creemos que hay una confianza alta al ser pocos nos conocemos, y creo que hay un apoyo buen de parte de todos para que la empresa prospera porque nos va a beneficiar a todos.”*

Finalmente en relación a las decisiones por áreas se destaca que las mismas son entendidas por este tipo de empresario de manera simplificada: las decisiones del área comercial se asocian a *“la aparición de un nuevo producto, que se prueba, a ver si gusta a otras personas”*. No haciendo ningún tipo de referencia a estrategias comerciales ni reconociéndose medios para llegar al cliente al que solo se lo escucha cuando va al negocio. A su vez, las decisiones del área financiera se refieren a conseguir información sobre

préstamos sin poder darse mayores precisiones sobre el destino concreto que podría darse a los mismos. En relación al área de recursos humanos no hay políticas explícitas de búsqueda ni de formación y solo se pretende que el personal esté bien presentable y cumpla bien con su trabajo: “*Se busca gente que tenga buena atención y modales*”. Finalmente con relación al área de producción se comenta que las decisiones son de tipo informal “*por prueba y error*”, a la vez que se realizan consultas a otros empleados en algunas situaciones que “*si funciona bárbaro y si no, no*”.

CONCLUSIONES

El desarrollo antes expuesto apunta en lo fundamental a fomentar un acercamiento al empresario PYME, a partir de reconocer a través de su propio relato, lo que son ciertas especificidades personales a la hora de tomar decisiones: cómo piensa, cómo siente, cómo opina acerca de las decisiones que toma en su empresa, lo que implica reconocerlos tanto en su integridad y extensión como en sus limitaciones más expresas. A su vez, en el caso particular de los perfiles antes descritos si bien reconocemos que representan dos extremos de un espectro con matices, también creemos que su particular consideración contribuye a interpretar de manera más acabada parte de las heterogeneidades propias del empresariado que conduce las pequeñas y medianas empresas, y en lo fundamental, dan elementos sustantivos a la hora de pensar en el diseño de políticas para empresarios PYMES en el sentido que, no todos los empresarios PYME y por ende sus empresas están en condiciones de contribuir a la mayor competitividad de la economía, pero sí todos ellos de una u otra forma, son fuente de ingresos para sus dueños y son claves en la generación de puestos de trabajo para terceros. De esta manera y para cerrar, en el mundo interconectado, global e hiper-competitivo que vivimos, es necesario potenciar ambos tipos de empresarios, ya sea que se piense en la competitividad del país, ya sea que se piense en el bienestar individual de las personas que trabajan en estas empresas. Aludir a estas diferencias es un primer paso, en un camino de sinceramiento hacia lo que es y representa el sector, que en última instancia nos va a beneficiar a todos.

RESUMEN

Este trabajo ha sido enfocado al tema de la sucesión en las pequeñas empresas familiares del sector servicios en su primera generación. Todo parte de una variable dependiente, la sucesión y de tres variables independientes, compromiso, legalidad y miedo a la muerte. De esta forma se analiza de qué manera afectan al proceso de la sucesión administrativa y la forma en que los tres modelos teóricos (teoría de los sistemas, teoría de la agencia y la teoría de recursos y capacidades de las empresas familiares) ayudan a guiar el camino más confiable, certero y preciso para el fundador de la organización en su respectiva toma de decisiones para la planeación de la sucesión administrativa. La metodología utilizada en este trabajo fue a través de la aplicación de un análisis factorial de componentes principales para determinar la variable dependiente e independiente. La comprobación de las hipótesis planteadas se realizó a través de un análisis de regresión. El resultado obtenido muestra la influencia positiva de las variables independientes legalidad y miedo a la muerte. Sin embargo, se ha obtenido una relación no significativa con la variable independiente compromiso.

PALABRAS CLAVE: Empresa familiar, sucesión, compromiso, legalidad.

ABSTRACT

This work is focused on the topic of succession in small family businesses on the service sector in the first generation. There is one dependent variable, succession; and three independent variables, commitment, legality and fear of death. Thus, it's analyzed in which way these variables affect the process of administrative succession and the way that the three theoretical models (Systems theory, Agency theory and the family businesses resources and abilities theory) help guide the most reliable, accurate and precise path to the founder of the organization in his or her respective decision-making to the planning of administrative succession. The methodology in this work was through the application of a factorial analysis of the main components to determinate the dependent and independent variables. The testing of the hypotheses was done through a regression analysis. The result shows a positive influence of the independent variables "legality" and "fear of death". However, it's been obtained a non-significant relation with the independent variable "commitment".

KEY WORDS: Family businesses, succession, commitment, legality.

INTRODUCCIÓN

La sucesión en la empresa familiar es un proceso planeación y administración de toda una vida, en la cual forman parte factores que van de la mano para el éxito mismo de la empresa (Aronoff, McClure y Ward, 2005). Dentro de esos factores se menciona que los hijos, desde temprana edad, deben conocer el negocio, fomentar el trabajo en equipo entre la familia posible sucesora, tener una seguridad financiera y establecer un adecuado plan patrimonial. En este trabajo se lleva a cabo un análisis detallado de tres de las teorías que estudian a las empresas familiares, las cuales son: la teoría de los sistemas donde explica Davis y

Lansberg (1983), que debe haber un correcto funcionamiento entre tres factores: familia, propiedad y dirección. La teoría de la agencia de acuerdo a Schulze, Lubatkin, Dino y Buchholtz (2001), se ha utilizado para criticar a las empresas familiares que tienen una organización estructural de las más costosas que se hayan visto hoy en día. Y la teoría de recursos y capacidades de las empresas (Wernelfelt, 1984), donde su principal característica es, que cualquier empresa familiar, debe analizarse internamente el recurso humano con el que se cuenta antes de proceder a cualquier solución externa aprovechando su ventaja competitiva desarrollada a través de los años.

Planteamiento Del Problema

En la mayoría de las familias el tema de la sucesión es muy complicado. Su buena planeación nos da como resultado el perdurar en el mercado, contar con una seguridad financiera personal y ser equitativo con los familiares futuros de la empresa. Una vez decidido de qué manera se va a transferir la propiedad, el fundador deberá saber qué criterio tomar para la distribución de la propiedad. De acuerdo a Carlock y Ward (2001), nos indican que el problema de la sucesión deriva en el momento que el patriarca o fundador fallece o simplemente desea ser relevado del mando. De acuerdo a Kets de Vries (1993), el 70% de los negocios familiares cierran al pasar a la segunda generación y el 90 % a la tercera generación.

Actualmente, el proceso de sucesión en las empresas familiares es un tema relevante debido a que el origen de las empresas son las familias. Al mismo tiempo son parte importante de cualquier economía mundial. Un ejemplo claro, en Estados Unidos de Norte América son responsables del 50% del Producto Interno Bruto (PIB) y de casi la mitad de fuentes de empleo generadas a nivel nacional (Rosenblatt et al; 1990; Weigel, 1992; Gersick et al; 1997) citados por Belausteguigoitia, (2004). No se diga en México y el resto del continente americano donde aún es mucho mayor.

Preguntas De Investigación

Planteado el problema, se mencionan las preguntas de investigación:

- ¿Existe algún tipo de planeación en el proceso de sucesión de la empresa familiar?
- ¿Es el primogénito de la familia siempre el futuro representante de la empresa?
- ¿Están preparadas las empresas familiares para una sucesión?

El objetivo general de esta investigación es: determinar si en las empresas familiares existe un plan de sucesión administrativa. Y como objetivos específicos se plantean: Identificar las pequeñas empresas familiares que constituyan el objeto de estudio. Conocer si el primogénito sería el sustituto como sucesor principal. Determinar si existe miedo al plan de sucesión por temor al tema de la muerte.

Hipótesis

Las hipótesis formuladas serán un vínculo de unión entre el objetivo general, problema y las preguntas de investigación, donde todas ellas tendrán una relación directa y concisa con el tema a investigar (Hernández Sampieri, Fernández Collado y Baptista Lucio, 2010). Se partirá de las siguientes hipótesis de investigación:

H1. El compromiso que se tiene por parte de la familia del propietario de la empresa influirá positivamente en la planeación de la sucesión.

H2. El conocer y cumplir con los aspectos legales e impositivos de la empresa familiar ayuda a llevar a cabo una sucesión administrativa con menos riesgo de fallar.

H3. El miedo a la muerte es un factor que no influye directamente en la no realización de un plan de sucesión de empresas familiares.

Variable Dependiente Sucesión.

El acto sucesorio es un conjunto de actos preventivos que tiene como finalidad establecer un plan mediante el cual un negocio pueda transitar con el menor riesgo patrimonial posible, durante la eventual sustitución de un liderazgo personal, mejorando sus posibilidades de continuidad a través de generaciones y su operación adecuada (Muller et al. 2005).

Variables Independientes.

1. Compromisos. De acuerdo a la Real Academia Española (2011) se entiende por compromiso cuando se tiene una obligación contraída.
2. Legalidad. Al hablar de legalidad es cuando existe un sistema de leyes el cual debe ser cumplido y al mismo tiempo aprueba y castiga acciones, sucesos o eventos (Baca Olamendi, 2000).
3. Miedo. Perturbación angustiosa del ánimo por un riesgo, daño real, imaginario y recelo o aprensión que alguien tiene de que le suceda algo contrario a lo que desea (Real Academia Española 2011).

Justificación

Dentro de la sucesión se debe saber quién es la persona más idónea para que continúe con el rol de trabajo, quién la va representar cuando su fundador ya no esté o simplemente decida dejar en manos de alguien más la dirección del negocio. Además, de acuerdo a Koontz, O'Donnell y Weihrich (1998), en la sucesión debe existir una planeación sucesoria de tal manera que se tenga previsto qué hacer. Es importante mencionar que existen empresas longevas en el mundo, las cuáles han tenido muchos problemas de sucesión, sin embargo se han sabido adaptar a los cambios, teniendo una visión a largo plazo, pero sobre todo saben trabajar en equipo con un mismo tipo de cultura e ideales firmes. La sucesión es un tema el cual se debe investigar y analizar, para poder conocer cómo han trabajado durante cientos de años muchas empresas y de una u otra forma tratar de orientar al empresario familiar de Tecmán, Colima México, para que su continuidad prevalezca en un futuro.

Marco Teórico

La organización en las empresas familiares De las características principales de una empresa familiar es que el fundador es la persona que hace de todo, cobra, vende, compra, limpia, lleva la contabilidad, y un sin número de actividades que debe llevar a cabo, ya sea en una empresa de servicios o de producción. Al mismo tiempo, la toma de decisiones es muy centralizada, no hay políticas de recursos humanos, no existen conocimientos teóricos empresariales, carecen sistemas de control administrativo, por mencionar algunas (Fuentes Ramírez, 2007). Todas estas características hacen que una transición de administración sea difícil de lograr, pero no imposible. Debido a este tipo de problemas de rasgos empresariales, personalista y poco profesional, este ambiente descrito anteriormente es ocasionado por tres causas principalmente:

Falta de diseño en su estructura organizacional

Falta de diseño de responsabilidades

Falta de diseño en la metodología de trabajo.

Es necesario mencionar que debido al concepto mismo de integrantes de la empresa familiar, ésta contiene ciertas ventajas competitivas basadas en los recursos intangibles ante el resto de organizaciones existentes en la sociedad. De acuerdo a Poza, (2005), las ventajas competitivas más importantes que las empresas familiares tienen se pueden mencionar: Existe una mayor sinergia de responsabilidades. Una relación más estrecha y comprometedora entre proveedores y clientes Mayor rapidez en la toma de decisiones, ya que los involucrados son familia. Rapidez en la transferencia de conocimientos y habilidades de una generación a otra. Una empresa pequeña de servicios, de acuerdo a la Secretaría de Economía del Gobierno Federal (2011), nos indica que es aquella que cuenta desde 11 hasta 50 trabajadores para los servicios y de 11 a 100 en la manufactura (Tabla 1). Por el tipo de ciudad que es Tecomán, las pequeñas empresas familiares podrán dedicarse al giro de los servicios, manufactura y agricultura.

Tabla 1: Clasificación de las empresas en México

Tamaño de la empresa por número de empleados	Micro	Pequeña	Mediana	Grande
Manufactura	1-10	11-100	101-250	Más de 250
Comercio y servicios	1-10	11-50	51-100	Más de 100

Fuente: <http://www.economia.gob.mx/>

De acuerdo a la Secretaría de Economía del Gobierno Federal (2011), la pequeña empresa ocupa un 2.7% de las unidades económicas a nivel nacional, mientras que la micro ocupa el 97%. El resto lo obtiene la mediana con un .2% y la grande con el 1%. De esta forma, el municipio es el reflejo de la nación entera (Tabla 2). De esta manera la muestra son las pequeñas empresas familiares dedicadas al giro de comercio y servicios en la ciudad de Tecomán, Colima, México.

Tabla 2: Universo empresarial en México

Empresa	% Unidad económica	Personal ocupado	% PIB
Micro	97.0	47 %	31
Pequeña	2.7	20 %	26
Mediana	0.2	11 %	12
Grande	0.1	22 %	31

Fuente: <http://www.economia.gob.mx>

Los modelos teóricos de las perspectivas sobre las empresas familiares a estudiar son los siguientes:

Teoría de los sistemas: Según explica Davis y Lansberg (1983), es de los primeros modelos donde se ha llevado a cabo una investigación detallada del comportamiento de tres partes o subsistemas que forman un todo.

Teoría de la agencia: De acuerdo a Schulze, Lubatkin, Dino y Buchholtz (2001), la teoría de la agencia se ha utilizado para criticar que las empresas familiares tienen una organización estructural de las más costosas que se hayan visto en las empresas de hoy en día.

Teoría de recursos y capacidades de las empresas: Esta teoría surgió como una ventaja competitiva y fue creada por Wernelfelt (1984). Indica que la principal ventaja competitiva de cualquier empresa, se centra en los recursos y capacidades del personal al interior de la misma. Por ello, se recomienda que antes de buscar alguna solución por fuera de la empresa a cualquier problema que se pueda presentar, se debe hacer un análisis interno exhaustivo.

Perfiles de sucesores exitosos: De las decisiones más difíciles que el director general o fundador debe realizar al momento de la sucesión, es saber a quién se le va a transmitir la dirección para que lleve la administración del negocio, por lo menos por una generación más Poza, 2005).

Plan de sucesión administrativo y estilos de retiros: Muller et al., (2005), explican que la planeación de la sucesión administrativa significa el conocer y saber aplicar el conjunto de medidas personales, operativas y jurídicas que tiene como finalidad lograr la transición sucesoria. Sin embargo, es un hecho desafortunado de las empresas familiares que aproximadamente menos de un 5% de los directivos que planearon su sucesión, realmente salen del negocio después de haberse establecido un plazo de retiro y transferencia del poder.

El compromiso de la familia: Rosenblatt (1977), define el compromiso como la intención declarada o inferida de un individuo de mantener una relación con otro sujeto. El compromiso puede ser lo deseado personalmente o posiblemente lo obligado externamente (Kanter, 1972). La unión familiar así como el compromiso es un nexo común que cualquier empresa familiar debe tener, de tal manera que evolucionen y crezcan con éxito a través de las generaciones siguientes.

Aspectos legales a considerar: Los aspectos legales a tomar en cuenta en el proceso de la sucesión administrativa, será primeramente, saber bajo qué tipo de figura legal se encuentra registrada la empresa. De acuerdo a Muller et al. (2005), el testamento es parte complementaria del acto de sucesión, ya que éste se apoya de la voluntad en vida de una persona para destinar sus bienes y derechos de su propiedad o titularidad a favor de otra u otras. El miedo a la muerte. La tercera variable que se analiza en esta investigación es el miedo a la muerte. El hablar de la muerte es un tema bastante amplio y a la vez muy complejo, debido a que es un tema que debe ser analizado bajo cuatro perspectivas: biológica, social, legal y religiosa (Hernández Arellano, 2006).

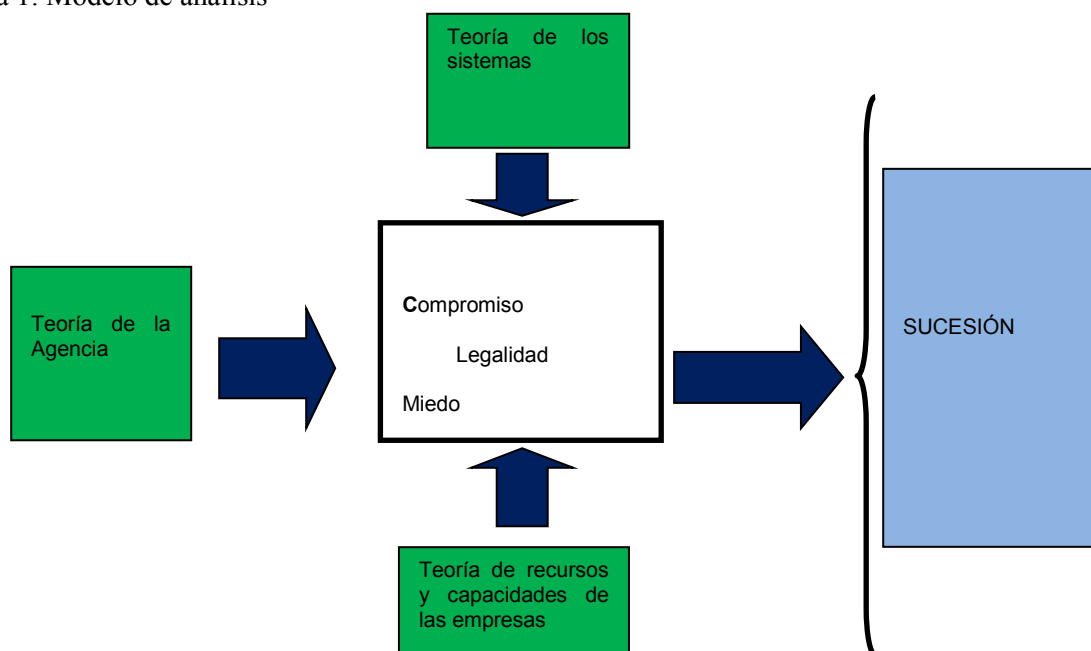

METODOLOGÍA

El método llevado a cabo en esta investigación fue la investigación de carácter cuantitativo correlacional, el cual ayuda a conocer o a medir el grado de relación que exista entre dos o más conceptos o variables. Su propósito es saber los comportamientos de las variables afectadas (Hernández Sampieri et al, 2010). Por ello interesa observar la manera en que las variables independientes influirán en la dependiente en la obtención de los resultados. La población, objeto de estudio, comprende a los propietarios de pequeñas empresas del área de servicios que se encuentran en la ciudad de Tecomán Colima, México, próximos a realizar la sucesión. La muestra utilizada fue de 38 propietarios de pequeñas empresas familiares de un total de 42 registradas en la Cámara Nacional de Comercio de Colima, México. Cabe aclarar que las 38 empresas están en proceso de sucesión, lo que viene a representar el 90 por ciento del total de las pequeñas empresas registradas que sí están en esa etapa. En el presente estudio, se ha obtenido la información a través de un cuestionario aplicado directamente a la muestra de pequeñas empresas familiares. Para la elaboración del cuestionario, se recurrió a investigaciones previas relacionadas con las variables independientes: compromiso, legalidad y miedo. Mediante el análisis crítico de las teorías y modelos propuestos se construyó el cuestionario conformado por 5 preguntas de la variable dependiente y 12 de las variables independientes relacionadas al tema de estudio.

Se procedió a la elaboración de una base de datos para su correcta validación a través del programa estadístico SPSS (Statistical Package for Social Science) versión 17.0. A partir de esta base de datos se obtuvieron los estadísticos descriptivos, la tabulación de las variables del estudio, la elaboración de las medidas de fiabilidad así como la elaboración del análisis de regresión. Posteriormente se continuó con la captura de la información para luego realizar el estudio detallado de la información. Este estudio se realizó durante el año 2011. La empresa familiar se considera de gran importancia en la economía de un país con un sistema de libre mercado, pues representa un alto porcentaje del total de empresas que operan

en este. En este campo se han llevado a cabo diversas investigaciones en varias áreas, sin embargo la sucesión sigue erigiéndose como uno de los temas trascendentales en el campo, por lo cual todas las etapas del tema de sucesión toman gran trascendencia (Rutherford et al; 2006). Es por ello que se propone en la presente investigación la aportación del siguiente modelo (Figura 1) donde se analiza cómo tres variables independientes son afectadas por las teorías de los sistemas, de la agencia y de los recursos y capacidades de las empresas, de tal manera que ayudarán a tener una mejor planeación de la sucesión administrativa en las empresas familiares.

Figura 1: Modelo de análisis

Fuente: Elaboración propia

RESULTADOS

Las generaciones que se han tenido en estas empresas familiares, el 47% están en la primera generación; un 40% ya tienen 2 generaciones de sobrevivencia y solo 13% las que están en la tercera generación. Según Kets de Vries (1993), comentaba, que el 70% de los negocios familiares dejan de existir al pasar a la segunda generación y el 90 % a la tercera generación. Se puede agregar que estas empresas en Tecomán Colima, México, son parte de la estadística de no sucesión administrativa exitosa. En cuanto al origen del capital de la empresa familiar, resulta que el 65.00% es de recursos propio, es decir son fundadores, mientras que el 35.00% es por herencia.

Análisis De Fiabilidad De Las Variables De Estudio.

A cada variable de esta investigación se le hicieron cuatro pruebas de fiabilidad así como el análisis factorial de tal manera de validar las preguntas cuestionadas. Las cuatro pruebas de fiabilidad fueron, Alfa de Cronbach, la prueba Kaiser-Meyer-Olkin (KMO), las comunales y la varianza. Fiabilidad y análisis factorial de las variables objeto de estudio. En la siguiente tabla se presentan los valores obtenidos, que resultaron todos aceptables, por cada una de las variables, tanto la independiente como la dependiente, por ejemplo el Alfa de Cronbach que arrojó valores considerados como muy buenos, la prueba KMO (Kaiser Meyer y Olkin), las comunales con valores mayores a .3 y la varianzas que resultaron con valores aceptables. Con estos valores es posible y aceptable la realización de un análisis de regresión.

Tabla 1: Resultados de las pruebas de fiabilidad de las variables.

Variables	Alfa de Cronbach	KMO	Comunalidades	Varianza
Dependiente Sucesión	0.83	0.50	Superiores al 0.45	60.62%
Independientes	0.81	0.79	Superan el valor de 0.30	58.17 %
Compromiso				
Legalidad.	0.74	0.72	Superiores a .35	58.79%
Miedo	0.65.	0.61	Mayores que 0.46	59.83%

Fuente: Elaboración propia.

Análisis de regresión. Al elaborar el análisis de regresión se obtuvo un R^2 con valor de 0.71% que es un valor interesante por tratarse de un estudio empírico. Los resultados obtenidos a partir de la regresión permiten identificar la capacidad predictiva de las teorías convertidas en variables, como se muestra en la tabla 2.

Tabla 2: Resultados del análisis de regresión.

Variables	Coeficientes no estandarizados		Coeficientes estandarizados	t	Significación
	B	Error típico	Beta	B	Error típico
Compromiso	.117	.195	.117	.598	.554
legalidad	.386	.176	.386	2.194	.035**
Miedo	.292	.194	.292	1.504	.142

Fuente: Elaboración propia. *** $P < 0,01$; ** $P < 0,05$; * $P < 0,1$

Para conocer la influencia que ejercieron las variables independientes, se ha encontrado la existencia de una relación significativa de la sucesión con la legalidad, con un valor de 0.035, esto significa que los empresarios les importa mucho que el negocio familiar esté en regla pagando los impuestos requeridos por el SAT (Sistema de Administración Tributaria). Sin embargo la variable compromiso no resultó tener una significación con la variable dependiente sucesión. Esto se puede interpretar que por parte de la familia, puede haber problemas de administración en un futuro ya que no existe interés y deseo por realizar una correcta sucesión y por ende una equivocada planeación de la sucesión de la empresa familiar. Respecto a la variable miedo, el valor de significación fue .142, lo cual indica que los encuestados no tienen miedo de la sucesión en las empresas familiares. Esto se puede explicar de tal forma que los empresarios cumplen con la normatividad legal existente para este proceso, por lo que no les resulta tener pánico o pensar en que debido momento pudiera ser un problema sustancial la sucesión.

CONCLUSIONES

En el presente trabajo se analizó la sucesión administrativa siendo afectada por el compromiso, la legalidad y el miedo a la muerte de los fundadores. Cabe mencionar que cada variable independiente nos arrojó valores que conllevan a las otras. Es por eso que los encuestados no tienen miedo de fallecer debido a que cumplían con todas las legalidades vigentes en la ciudad de Tecomán, Colima. De las variables independientes relacionadas en este estudio, como son compromiso, legalidad y miedo, se ha comprobado dos de las tres hipótesis planteadas. En cuanto a la primera hipótesis propuesta, en la que se menciona el compromiso, se ha obtenido una relación no significativa, este resultado es muy similar a los obtenidos por Ward y Sorenson, (1988); y Barach, Ganitzky, Carson y Doochin (1988), los cuales encontraron, que la mejor manera de entrenar a la siguiente generación para que dirija la empresa familiar, es comprometiéndose a trabajar y experimentar en carne propia.

Por lo que respecta a la hipótesis relacionada con la variable legalidad, se ha obtenido un valor positivo significativo que se relaciona con la sucesión de la empresa. De igual forma, con la relación a la tercera hipótesis, la variable independiente miedo, se ha comprobado, en virtud en que el valor obtenido no resulta tener una relación significativa con la variable dependiente sucesión. Respecto a los objetivos específicos planteados se observó lo siguiente. Se logró identificar a las pequeñas empresas familiares en

la ciudad de, Tecomán Colima, con ayuda de la CANACO local (CAMARA NACIONAL DE COMERCIO, 2011). Por lo que se refiere a quién sería el futuro sucesor, no existió una regla que siempre sería el primogénito, ya que en varias familias era el segundo o tercer hijo el cual se le veía con más aptitudes a obtener la sucesión de la empresa familia

CARACTERÍSTICAS Y CLASIFICACIÓN DEL COMERCIO INFORMAL EN CIUDAD JUÁREZ, CHIHUAHUA

Jesús Velázquez Valadez, Universidad Autónoma de Chihuahua

Antonio Salas Martínez, Universidad Autónoma de Chihuahua

RESUMEN

El presente estudio, hace una descripción de las características que presenta el comercio informal en Ciudad Juárez Chihuahua, México. En Ciudad Juárez, el alto índice de desempleos en el sector maquilador y el cierre de negocios debido a la creciente inseguridad, nutren al sector informal de forma exponencial. En la primera parte del estudio se presenta un panorama general del fenómeno de la informalidad; se hace el planteamiento del problema a investigar y los objetivos que persigue el estudio. Así mismo, se presentan las diversas ideas y posicionamiento de los expertos en el estudio del fenómeno de la informalidad; los alcances y el diseño de la investigación son presentados en la metodología utilizada. Los resultados que arroja la investigación, permite presentar un panorama general de las características que presentan los comerciantes de los mercados informales de la ciudad; así también, se dan a conocer la características de los establecimientos utilizados en la actividad del sector informal, y la clasificación utilizada por la dependencia a cargo de los informales. Se dan a conocer las estadísticas de cada una de las variables del estudio, así como un breve análisis de la relación entre variables; las conclusiones de los objetivos y las recomendaciones para posteriores estudios sobre el sector informal.

PALABRAS CLAVE: desempleo, informalidad, comercio, características, clasificación, estadísticas.

CHARACTERISTICS AND CLASSIFICATION OF INFORMAL TRADE IN CIUDAD JUAREZ, CHIHUAHUA.

ABSTRACT

This study makes a description of the characteristics presented by the informal trade in Ciudad Juarez Chihuahua, Mexico. In Ciudad Juarez, the high unemployment rate in the manufacturing sector and the business closure due to the growing insecurity, nourish the informal sector exponentially. In the first part of the paper presents an overview of the phenomenon of informality; it is the approach of the research problem and the objectives of the study. It also presents the various ideas and positioning of experts studying the phenomenon of informality; the scope and the research design are presented in the methodology. The results shown by research, can provide an overview of the characteristics shown by informal market traders of the city, so too, are given to know the characteristics of the establishments used for informal sector activity and the classification used by the unit in charge of the informal sector. We present the statistics of each of the variables of the study, and a brief analysis of the relationship between variables, the conclusions of the goal and recommendations for further study on the informal sector.

KEYWORDS: unemployment, informality, trade, characteristics, classification, statistics.

INTRODUCCIÓN

El análisis de la situación actual del mercado de trabajo informal, adquiere una importancia relevante, debido a la crisis económica y la carencia de empleos en el Estado de Chihuahua; como caldo de cultivo, impulsa el crecimiento de la actividad informal. Sin presuponer que la actividad económica informal tenga una relación directa con las actividades ilícitas, llamados giros negros o economía subterránea, actividades como la producción, distribución y venta de discos piratas y “fayuca”; En la economía informal podemos encontrar actividades con una composición y condiciones económicas múltiples, esto es, podemos encontrar actividades con fines económicos distintos.

Ciudad Juárez, como en la mayoría de las ciudades fronterizas, presenta una expansión del sector informal urbano, debido a la pérdida de más de 60 mil empleos en el sector maquilador; sumado a esto, la precariedad de los salarios, la inseguridad, la falta de políticas públicas y acciones de gobierno. Se presenta la oportunidad de conocer el comportamiento que han tenido las actividades informales a través de esta investigación, que realiza una descripción de las características que presentan los mercados y comerciantes informales de la ciudad. La ENEU, que tiene como objetivo obtener información estadística sobre las características de la ocupación de la población urbana, así como de otras variables demográficas y económicas; dejó de aplicarse en Ciudad Juárez en el mes de julio del 2003. De acuerdo a información ofrecida por la Dirección de Comercio Municipal, inician en el año 2007 con 1,098 vendedores informales; entre los años 2008 al 2010 se contabilizaban 2,731 de los cuales se regularizaron en el 2009, 1,321 y a la fecha se han regularizado 750, quedando aproximadamente 650 comerciantes sin regularizar. Sin embargo, indica la misma dependencia, que cada día se integran al subsector informal, un promedio de treinta nuevos ambulantes. El crecimiento del comercio informal se ha recargado hacia la zona sur oriente de la ciudad siguiendo el crecimiento natural de la misma, debido a que los programas de vivienda están proyectados únicamente para esta zona, donde se ubican también las grandes empresas y centros comerciales constituidos como empresas formales.

Datos del censo del INEGI 2005, indican que se construyeron más de 400 mil viviendas, y otras 85 mil en los años siguientes. Durante años, Juárez recibió la distinción como la comunidad donde se construyó mas vivienda en el país; azuzado por el boom de la también burbuja artificial de la maquiladora, está sujeto al vaivén de los mercados norteamericanos; el criterio de selección para la edificación de nuevas viviendas que sigue la mayoría de los municipios, es la reserva territorial. La cantidad de mercados informales, vendedores ambulantes, prestadores de servicios, presentan diversas características en la operatividad de sus actividades. De la misma forma, la clasificación adoptada por la Dirección de Comercio Municipal en Juárez, no está fundamentada en las propuestas por organismos internacionales. Los indicadores propuestos por los organismos especializados en el estudio del fenómeno, fueron tomados como base para el diseño de la investigación. La aplicación de un instrumento de medición diseñado con las variables que se consideraron necesarias para la recolección de la información, permitió obtener los datos suficientes para la aplicación de un programa estadístico que arrojó los resultados expuestos en el trabajo, a través de tablas de frecuencias y gráficos de cada variable.

REVISION LITERARIA

En la nonagésima reunión de la Conferencia Internacional del Trabajo (OIT) realizada en el año 2002. Se adoptó una resolución que proporciona un nuevo marco integral que refleja el consenso mundial mas reciente y amplio referido a la forma de abordar los desafíos que plantea la economía informal. A partir de ello, se propone el término economía informal que incluye el de sector informal para dar lugar al conjunto de actividades económicas que, se encuentran insuficientemente contempladas por sistemas formales. De acuerdo con los datos de la Encuesta Nacional de Ingreso y Gasto de los Hogares de México (ENIGH), en 1984 existían 2 millones 401 mil trabajadores (12.6 de la PEA). Con una tasa media anual de crecimiento, entre 1984 y 1996 de 9.3 por ciento. Este grupo alcanzo la cifra de 6 millones 991 mil 898

personas en 1996; es decir, el 22.9 por ciento de la PEA ocupada. Esto nos dice que, este sector (informal) creció 81.7 por ciento. (Aguilar, G. 2000).

La característica heterogénea y compleja de la problemática de la informalidad y las modificaciones que, como todos los fenómenos socio-económicos, ha sufrido con el transcurso del tiempo, han generado no pocos inconvenientes para su análisis. La imprecisión que ha caracterizado su conceptualización, se ha reflejado en la presencia de un debate de larga data, todavía inconcluso, respecto de la aplicación del concepto de informalidad a distintos procesos de la economía y del mercado laboral (economía informal, sector informal, trabajo informal y precariedad laboral. (Novick, 2007).

La cantidad de personas ocupadas en el subsector informal de los hogares (SSIH) aumentó en los últimos 10 años; pasó de 8 362 miles de personas en 1995 a 11 380 miles en el 2004; esto implica que en estos 10 años se integraron más de tres millones de personas al trabajo informal, que representa un aumento global de 36.1 por ciento. (Fernández, et. al.2008) La expansión de la informalidad durante los años noventa ha sido un fenómeno común en América Latina. El informe de la decimosexta Reunión Regional Americana de la OIT realizada en el año 2006, estima que la economía informal afecta al 75 por ciento de los trabajadores en América Latina, contribuye con un 40% del PIB de la región, representando el 70 por ciento del número total de empleos creados en la época (Apella, 2009).

Más allá de las diferencias entre las distintas corrientes de pensamiento, hay consenso en que el sector informal incluye actividades heterogéneas que van desde trabajos ambulantes de carácter precario hasta actividades por cuenta propia y trabajo asalariado. Sin embargo, una característica común de todas las actividades informales es la baja productividad, por el uso de tecnologías obsoletas y trabajo no calificado (Castells, Portes y Benton, 1989; Rosenbbluth, 1994; Tokman, 2001; Maloney, 2004) En México las actividades informales se concentran en el Sector Institucional de Hogares (INEGI, 2004), y por sector económico en cinco grandes grupos de actividad: Industria Manufacturera, Construcción, Comercio y Restaurantes, Transporte y Servicios Personales. Adrián J. Miranda,(2010) señala que una clasificación se podría dar de acuerdo a las utilidades que genera, esto es, una clasificación basada en las utilidades que se obtienen de las actividades comerciales, profesionales y de servicios, debido a que básicamente en ello radica la posibilidad de pagar impuestos. El comercio informal se puede clasificar a través de los siguientes enfoques: El enfoque dualista cuyo origen se encuentra en la Teoría de la Dependencia, que otorga a las economías de los países en desarrollo un carácter estructural de subordinación de sus mercados internos respecto al mercado internacional, controlado por los países desarrollados.

El enfoque estructuralista que se refiere a los modos de producción arguyendo que aunque sobreviven, han sido capaces de renovarse y establecer relaciones funcionales con las economías modernas y transnacionales. Por ejemplo, cada vez más familias trabajan a destajo para grandes empresas globales. Aunque estas actividades son informales, ellas no se encuentran estructuralmente segmentadas y separadas de la formalidad, sino que ambas se vinculan estrecha y funcionalmente. La escuela económica neoclásica analiza la informalidad con base a la Ley de Say, la cual indica que, en condiciones de equilibrio (macroeconómico), toda oferta crea su propia demanda. Rechaza la idea de escasez de vacantes o de barreras en el mercado formal para absorber a todos los individuos. La informalidad se debe más bien a que las vacantes disponibles en el sector formal no cubren las expectativas de los trabajadores.

En el enfoque institucional-legal se considera al sector informal como aquel que funciona al margen de la ley, es decir, es aquel que con fines lícitos utiliza medios ilícitos para conseguir esos mismos fines. Considera que en las sociedades en desarrollo tanto la formalidad como la informalidad traen consigo una excesiva carga normativa: los costos de acceso y permanencia en la formalidad son demasiado altos, tanto en tiempo como en dinero. Una de las características centrales de este sector y del trabajo precario, es su concentración en las zonas metropolitanas de las grandes urbes y de las ciudades emergentes. (Mulder, 1999; Cross, 1998; BNDS, 1996; Gordon, 1996; Ark, 1995; Dawson, 1995; y Gras, 1993).

Características que definen a las empresas informales:

- 1.- Las facilidades de acceso: determinadas por los bajos capitales y pocos requisitos de capacitación. Las ventas callejeras, servicio doméstico, reparaciones domesticas menores y otras actividades semejantes son realizadas por cualquier persona sin necesidad de entrenamiento especial.
- 2.- los trabajadores de ese sector suelen tener bajos niveles de educación y provienen mayormente de determinados sectores de la población (mujeres, niños, ancianos, inmigrantes urbanos recientes).*
- 3.- tienen ingresos significativamente menores que los de los trabajadores del sector formal y sus oportunidades de progresar son muy limitadas.
- 4.- cuentapropistas, familiares no remunerados y trabajadores domésticos (Portes, 1995).

¿Quiénes son los trabajadores que muestran una mayor probabilidad de trabajar en el sector informal? La mayor parte de los estudios identifican al mismo grupo de trabajadores: aquéllos con menos experiencia y educación. En consecuencia, en el sector informal figura una gran proporción de jóvenes. Además, existe una probabilidad mucho mayor de que las mujeres trabajen en el sector informal. Por último, es menos probable que los jefes de hogar trabajen en el sector. (Freije, 2000). En el extremo inferior se encuentran principalmente trabajadores independientes que comercian con productos básicos, como son los alimentos o prestan servicios de transporte elementales. En el nivel intermedio se encuentran aquellos que se dedican a un comercio más organizado y a la transformación simple y a pequeña escala de bienes básicos para los consumidores de la economía informal, y dan empleo a familiares.

En el extremo superior se encuentran los que se dedican a la fabricación a pequeña escala con bajo nivel tecnológico, o que prestan servicios tales como la reparación de maquinaria y vehículos, dan empleo a familiares y a otras personas, y que suelen constituir microempresas. (OIE, 2002) El Subsector Informal incluye a los trabajadores por cuenta propia que ocasionalmente emplean asalariados y generalmente no se inscriben en registros oficiales, fiscales o de seguridad social, y parte de los dueños de los negocios informales pueden ocupar uno o más asalariados de manera continua, cumpliendo parcialmente con reglamentaciones o requisitos gubernamentales. Así, dentro de la economía informal quedan incorporados, los vendedores ambulantes de mercancías y de alimentos, artesanos, transportistas, prestadores de servicios domésticos de todo tipo y de reparaciones diversas, así como sexo-servidores, entre otras. (INEGI, 2004). Las microempresas, por lo general entendidas como unidades de producción con un número de trabajadores inferior a diez.

Todos los establecimientos que no cumplen con alguna disposición legal relativa al ámbito laboral. Aquellas unidades que incumplen alguna regulación gubernamental como el registro fiscal. Dichas unidades funcionan con bajo nivel de organización, poca división del trabajo y capital, con mano de obra y tecnología poco calificada; los activos fijos pertenecen a los propietarios y pueden ser utilizados indistintamente por su empresa no constituida en sociedad o por el hogar, no existen garantías formales de contratación y pueden realizar transacciones y contraer pasivos sólo en nombre propio.

El trabajo en la economía informal se distingue por sus reducidos y mal definidos lugares de actividad, condiciones inseguras y poco saludables, bajos niveles de competencias, productividad e ingresos, extensas jornadas laborales y restricciones al acceso al crédito. Asimismo, los trabajadores de la economía informal no son reconocidos, no se encuentran inscriptos y sus actividades productivas no están reglamentadas ni protegidas por la legislación laboral y de la seguridad social (Apella, 2009). Las investigaciones basadas en la definición que aporta Tockman (1978), se han inclinado casi exclusivamente a calcular el tamaño del sector informal, ya sea en términos de la población económicamente activa que absorbe, el número de puestos que origina, o de ambos. Con este propósito, el

empleo informal se define operacionalmente como el que abarca una o más de las siguientes categorías. Servicio domestico, autoempleo, trabajo familiar no remunerado y trabajo en pequeñas empresas que tienen menos de 5 y hasta 50 empleados, los estudios de PREALC estiman que el sector informal en los diferentes países Latinoamericanos abarca del 30 al 60 por ciento del empleo urbano.

En México, mediante la ENAMIN se puede caracterizar al Subsector Informal. Por ejemplo, a través de ésta se sabe que del total de la población ocupada en negocios informales el 36.9 por ciento son mujeres y el 63.1 por ciento son hombres, y que los motivos para iniciarse en alguna actividad informal son: 35.9 por ciento lo hacen para complementar el ingreso familiar, el 33.1 por ciento señaló que ganan más que como asalariados, el 13.6 por ciento porque no encontró empleo como asalariado, el 5.5 por ciento por tradición familiar, y el 11.9 por ciento del total de negocios informales por razones diversas, tales como horario flexible y pérdida de empleo, entre otras. Los negocios del sector informal de acuerdo a su antigüedad están integrados de la siguiente manera: 11.4 por ciento del total tiene menos de un año de haberse iniciado, 41.2 por ciento tiene de 1 a 5 años, 22.3 por ciento se ubican entre 6 y 10 años, y el 25.1 por ciento de los negocios cuenta con más de 10 años, es decir, cerca del 50 por ciento de estos negocios tienen una antigüedad de 6 años o más. Adicionalmente, se desprende que del total de los negocios informales, sus dueños tienen como expectativas continuar con su actividad en un 89.6 por ciento, cambiar o abandonar la informalidad el 8.9 por ciento, y sólo el 1.5 por ciento no tiene planes.

Otra característica que se identifica a través de la encuesta, es que del total de negocios informales iniciados el 93.0 por ciento no solicitan créditos; 4.8 por ciento lo obtienen a través de amigos, familiares, vecinos o prestamistas particulares, y en menor medida en cajas populares; mientras que sólo el 2.2 por ciento restante gestiona financiamiento en instituciones bancarias o acude a otros intermediarios financieros. En México las actividades informales se concentran en el Sector Institucional de Hogares, y por sector económico en cinco grandes grupos de actividad: Industria Manufacturera, Construcción, Comercio y Restaurantes, Transporte y Servicios Personales.

Actualmente, el monto del Subsector Informal se ubica en 445,486 millones de pesos corrientes, que representan el 12.7 por ciento del PIB total del país, cantidad que equivale por ejemplo a casi tres veces el producto generado por la agricultura y ganadería consideradas de manera conjunta. Por su parte, las percepciones obtenidas por los dueños de los negocios informales, representan el 17.0 por ciento de las ganancias generadas por la economía en su conjunto. A su vez, este Subsector absorbe el 28.5 por ciento de la población ocupada total, excluido el sector agropecuario. Otro resultado relevante es que los negocios informales destinan sólo el 19.0 por ciento de sus ingresos a la compra de insumos, como electricidad, agua, teléfono, combustibles y diversas materias primas, entre otras; en tanto que por remuneraciones pagan únicamente el 9.2 por ciento. Estos resultados contrastan con los de la economía en su conjunto, ya que los gastos en insumos son de 44.2 por ciento y de 18.7 por ciento para el pago de remuneraciones. Cuando se analiza el Subsector Informal con relación a la producción nacional por sector de actividad económica, se observa que éste representa en promedio el 30.8 por ciento del Comercio y Restaurantes, 11.5 por ciento de los Servicios Personales, 6.1 por ciento de la Industria Manufacturera, y en menor medida en el Transporte y la Construcción con 4.6 por ciento y 3.3 por ciento, respectivamente.

METODOLOGÍA

El alcance de la investigación es descriptivo; describir las características del comercio informal en Ciudad Juárez a través de la recolección de datos de las variables que presentan los comerciantes informales, como son: socio demográfico, tipos de establecimientos, jornada laboral, ingresos, servicio médicos tipo de negocio, antigüedad, horas trabajadas. Con un enfoque cuantitativo, debido a que los datos son producto de mediciones, se representan mediante números (cantidades) y se deben analizar a través de métodos estadísticos. (Hernández et al. 2006). El desarrollo del presente trabajo, se lleva a cabo en Ciudad Juárez Chihuahua, México en las zonas donde se ubican los mercados informales de la ciudad;

asentados en terrenos irregulares donde se observaron en primera instancia, un alto crecimiento del subsector informal; mercados móviles y semifijos, donde se concentran además, algunos prestadores de servicio. Los mercados en observación, fueron aquellos que se consideraron semifijos o móviles, que sus integrantes ofrezcan: artículos nuevos o usados; ropa, calzado, muebles y artículos para el hogar, herramientas, alimentos preparados, productos procesados en el hogar, servicios personales, cuentapropistas y sus trabajadores asalariados que no cuentan con seguridad social. Los resultados esperados en el mismo, podrán tener algunas diferencias en cuanto a características y clasificación que pudieran no estar consideradas en otros trabajos, debido a las diferencias en los tipos de mercancías o productos que se ofrecen. Así mismo, el Instituto Municipal de Investigación y Planeación, no cuenta con información actualizada y la Dirección de Comercio Municipal, carece de información actualizada en cuanto al número total de mercados y comerciantes informales. El diseño de la investigación es: no experimental transversal, se aplicó un cuestionario para la recolección de los datos y características particulares que presenta el fenómeno en su contexto natural, para su posterior análisis sin la manipulación de las variables. (Hernández et al.2006).

RESULTADOS

De acuerdo a las respuestas de los entrevistados, encontramos que 264 comerciantes informales originarios de Ciudad Juárez tienen de 2 a 5 años laborando en la actividad; mas 108 comerciantes que tienen 6 o más años de antigüedad en su negocio (50.2 por ciento). Haciendo un análisis de estos resultados: un poco más del doble de los comerciantes iniciaron labores a partir del 2007, con respecto a los 108 que conforman el grupo de 6 o más años, esto indica que la crisis económica por la que atraviesa el país, sumado a los altos índices de inseguridad que sufre la ciudad disparó el crecimiento de comercios informales del 2007 a la fecha. Por otro lado, se difiere un poco sobre la idea de que una de las causas del crecimiento de la informalidad, se debe a un alto número de migrantes, en primer lugar, debido a que el número de personas que llegaron de otras ciudades del país a partir de los noventas, optaron por establecerse en la ciudad, donde el promedio de años de residencia en Ciudad Juárez es de 25 años; estos resultados sumados al tiempo en que se “perdieron los empleos” nos indican que los nuevos trabajadores informales: son residentes de la ciudad con más de 25 años de establecidos y perdieron sus empleos en empresas formales a partir del 2007.

Haciendo un análisis con las variables: lugar de procedencia y tipo de establecimiento, los resultados marcan que los comerciantes informales provenientes del Sur y Centro del país utilizan en mayor número el tipo de establecimiento semifijo (11.6 por ciento), y en muy contados casos el establecimiento de tipo fijo (1.7 por ciento). De la misma forma, los habitantes originarios de alguna de las ciudades o poblaciones del Estado, incluyendo a Ciudad Juárez, utilizan el tipo de establecimiento semifijo (41.7 por ciento) y fijo (9.4 por ciento). Además de existir un número mayor de vendedores a pie (11.2 por ciento) entre los habitantes de Juárez y del norte del país.

Los comerciantes informales perdieron su anterior empleo en el sector formal debido al despido; 238 trabajadores fueron despedidos del año 2008 al 2011(32.1 por ciento). Por otra parte, 173 trabajadores renunciaron a su empleo (23.3 por ciento) por diversas razones, y 111 se quedaron sin trabajo debido al cierre del negocio o empresa donde laboraba anteriormente (15 por ciento). Debido a la pérdida de empleos en el sector formal, los ciudadanos buscan en la informalidad una válvula de escape para la presión económica por la que atraviesan.

La relación que se observa entre la antigüedad en la actividad informal y el tipo de establecimiento utilizado, es que el número de trabajadores con mayor antigüedad (6 o más años laborando en el subsector informal) posee el mayor número de establecimientos fijos (5.1 por ciento) y un 23.8 por ciento de establecimientos semifijos; en el caso de los comerciantes con menor tiempo en la actividad informal (hasta 2 años), tienen un número muy cercano de establecimientos fijos (4.7 por ciento).

De igual forma, los comerciantes con menos tiempo en la informalidad poseen el porcentaje más alto de establecimientos de tipo semifijo con un 28.7 por ciento del total. En el caso de los comerciantes que tienen laborando (3 a 5 años) optan también por establecimientos semifijos con un 14.4 por ciento y solo un 3.4 por ciento de los comerciantes con esta antigüedad, poseen establecimientos fijos.

Aunque los comerciantes “en vehículo” (3.9 por ciento) son los menos, es importante remarcar que los de menor tiempo en el subsector aumento en los últimos dos años, de un 0.9 por ciento, pasaron a un 2.2 por ciento, siendo que en los 6 años anteriores el aumento se daba en una décima por año. En el caso de la relación entre el tipo de establecimiento y el horario de trabajo, es notorio el alto número de comerciantes con establecimiento semifijo que laboran en un horario de 8 a 10 horas diarias (30.2 por ciento), seguido por el mismo tipo de establecimiento pero con un horario de 5 a 7 horas diarias (29.4 por ciento). En el caso de los comerciantes con establecimiento fijo, el horario mayormente utilizado es el de 8 a 10 horas con un 8.5 por ciento; seguido por un horario de 5 a 7 horas (2.8 por ciento).

Para los comerciantes ambulantes(a pie), el horario más utilizado es de 5 a 7 horas diarias con un 7.8 por ciento; igualmente, los vendedores con vehículo utilizan el mismo horario con un 2.3 por ciento. Esto indica que el horario diario de trabajo de los trabajadores informales, independientemente del tipo de establecimiento, se encuentra dentro de los parámetros de un horario regular en el sector formal. Aunque un alto número de comerciantes se negó a contestar (269) número que nos da un 36.3 por ciento del total, la relación existente entre la edad de los comerciantes y el monto de sus ingresos queda de la siguiente forma: las personas con edades de 29 años o más, son quienes obtienen mayores ingresos: con un 7.4 por ciento los que obtienen 1500 pesos o más. Un 17.3 por ciento obtiene ingresos de 500 a mil pesos y de mil a mil quinientos pesos, un 17.3 por ciento.

Enseguida se encuentran los comerciantes con edades entre 23 a 28 años que obtienen ingresos de mil quinientos pesos o más con el 1.5 por ciento; una tasa del 1.8 por ciento los que ganan de mil a mil quinientos pesos y un 3.6 por ciento de comerciantes con ingresos de 500 a mil pesos. En el caso de los adolescentes, sus ingresos resultaron los más bajos del estudio; el nivel medio de ingresos, lo obtienen los comerciantes informales entre 23 y 28 años.

CONCLUSIONES

Después de realizar un análisis de la situación de los comerciantes informales y del desarrollo que han tenido este tipo de actividades, a través de documentos y entrevistas con los responsables del área de Comercio Informal que depende de la Dirección de Comercio Municipal de Ciudad Juárez; los resultados obtenidos por el instrumento de recolección de información aplicado a los comercios informales de Juárez, las conclusiones relativas al primer objetivo específico de la investigación fueron las siguientes: Debido a la crisis económica que inicia en el año 2007, y al aumento de comercios que sufren los embates de la inseguridad a través de extorsiones en los propios establecimientos, los comerciantes del ramo abarrotero sacaron a las calles sus productos con la finalidad de continuar en sus actividades comerciales, tratando de no ser ubicados por los extorsionadores en un establecimiento fijo.

Las consecuencias que resultaron de esta estrategia de los abarroteros, fue que se eliminó la recaudación de impuestos que anteriormente generaban estos establecimientos. Ante esta situación de la pérdida de la recaudación de impuestos, el Municipio de Juárez, decide apoyar a dichos comerciantes para que continúen laborando, pero ahora desde la informalidad; el único requisito que solicitan las autoridades Municipales es el pago del permiso que expide a través de la Dirección de Comercio Municipal. Actualmente, el Municipio de Juárez emite un permiso provisional para los comerciantes informales que tiene un costo de 154.00 pesos; manifiesta el funcionario que existen algunas personas, sobre todo las de la tercera edad, que no pueden pagar el costo del permiso; en estos casos, el Municipio otorga un permiso para que laboren 15 días sin cubrir el costo del mismo. La Dirección de Comercio Municipal en Ciudad

Juárez, caracteriza a los comerciantes informales, como personas que buscan el sustento diario ofreciendo un producto o servicios personales tratando de hacerlo de una forma legal; como lo señala Ramos (2006), quien caracteriza a la economía informal como: los individuos que buscan obtener un ingreso por vías legales y distintas al desempeño de una actividad económica y que caben en lo que se conoce como estrategias de supervivencia. Todos los establecimientos que no cumplen con permisos para laborar, los establecimientos que ofrecen alimentos elaborados en el hogar, o en el mismo lugar donde son ofrecidos al público, todo el establecimiento que no cuente con el título de propiedad que comprenda el área de venta, así mismo, todos los vendedores ambulantes a pie y de casa en casa.

Los comerciantes que ofrezcan sus productos o servicios en su propio vehículo, y que el mismo no sea el apropiado para tal efecto. Aunque algunas de las características son propias de las características propuestas por los organismos internacionales, la Dirección de Comercio no cuenta con una estructura o un diagrama fundamentado en las características utilizadas por organismos nacionales o internacionales. De acuerdo a la información recabada en la Dirección de Comercio Municipal, y de la revisión y análisis de los formatos utilizados por los inspectores de la dependencia, se concluye que la clasificación utilizada por dicha dependencia es la siguiente: En el caso de los establecimientos, existen los fijos y semifijos. Para los comerciantes ambulantes, existen tres tipos: Ambulante (A) son los ambulantes de a pie, incluye a los vendedores que visitan los mercados informales así como los de cruceros y vendedores casa por casa. Ambulantes (B) ambulantes que utilizan vehículo ligero como triciclo, carro de madera o metálico.

Ambulantes (C), son los comerciantes que utilizan vehículo de motor para ofrecer sus productos o servicios. La clasificación aportada por la Dirección de Comercio, es una clasificación exclusiva del Departamento de Comercio Informal para definir el tipo de vendedores y el tipo de permiso que debe pagar. Esta clasificación no utiliza ninguna corriente de pensamiento; sin embargo se debe reconocer que, aunque un tanto débil, existe un enfoque Institucional-legal y un marcado enfoque de Comercio informal de Subsistencia; esto, por el apoyo que se les da a los comerciantes informales notoriamente más desprotegidos. En la revisión y análisis de las características y ubicación de los mercados informales de Ciudad Juárez, se llegó a las siguientes conclusiones:

Según las estadísticas de la Dirección de Comercio Municipal, en cuanto a los mercados informales, se tienen detectados 122 mercados informales en la ciudad(sin contar los que están en formación); de estos mercados, los de mayor número de establecimientos y de mayor afluencia de vendedores ambulantes y clientes, se encuentran los mercados: el mercado Victoria de Zaragoza, el mercado Talamas Camandari, El Pozo (Carlos Amaya y Tetzales), mercado Guillermo Prieto y el mercado Miguel de la Madrid. Aunque casi todos los mercados más numerosos están ubicados al sur oriente de la ciudad, la mayoría del total, están dispersos entre el centro, oriente y el poniente de Juárez.

La Dirección de Comercio Municipal, inicia labores en el año 2011, con un padrón de 15,700 comerciantes informales, de los cuales un 255 se han dado de baja debido a los problemas de inseguridad. Sin embargo, del mes de diciembre (2010), se han registrado 67 nuevos comerciantes informales y más de 40 ambulantes. Los mercados informales están ubicados en colonias de estratos sociales bajos y con problemas de inseguridad; aunque algunos de los comerciantes poseen establecimientos fijos, con estructura metálica o madera, la gran mayoría solo poseen un espacio de terreno, el que acondicionan con una manta o plástico para cubrirse de las inclemencias del tiempo, no cuentan con ningún tipo de servicio, ni seguridad por parte de la policía municipal. Sin embargo, señala la Dirección de Comercio, que los informales que logran mejores ingresos son los que están ubicados dentro de los mercados, esto en comparación con los segunderos que operan fuera de los mercados o inclusive en el exterior de sus hogares, en los cuales, se dan casos, que en algunos días no obtienen ninguna ganancia.

No tienen un horario de trabajo extenuante y la mayoría atiende su establecimiento los fines de semana. En cuanto a la antigüedad que presentan, es notorio el crecimiento en el sector en los últimos tres

años, por la cantidad de personas que perdieron su empleo por causas como el despido o por el cierre de negocios. Los comerciantes de los mercados informales, se agrupan en asociaciones de comerciantes, con el fin de protegerse de los delincuentes; así mismo, algunos de ellos participan de actividades de partidos políticos. La media en la edad de los comerciantes está por arriba de los 25 años, son pocos los menores de edad dedicados a esta actividad, y los que se encuentran laborando, el negocio es de tipo familiar. Se encontró un número mayor de mujeres laborando en la informalidad, esto debido a la pérdida de empleos en el sector maquilador en los últimos tres años. Es importante reconocer que los comerciantes informales se encuentran con un nivel de escolaridad entre secundaria y preparatoria; aunque se encontraron pocos comerciantes con nivel universitario, no deja de ser importante señalar que el número de universitarios detectados en el sector informal se encuentra a la alza.

Según los resultados del estudio, cada comerciante informal tiene por lo menos dos dependientes y sus ingresos fluctúan de mil a mil quinientos pesos, para su manutención. Así mismo, la mayoría de los comerciantes no cuenta con seguro médico; los menos, son atendidos a través del Seguro Popular. El comercio informal en Ciudad Juárez Chihuahua se encuentra en los parámetros de una clasificación con un enfoque Institucional-legal, debido a que los comerciantes informales son personas que consideran, que la formalidad como la informalidad traen consigo una excesiva carga normativa y que los costos de permanencia en la formalidad son demasiado altos en tiempo y costos; así también, poseen características del comercio informal de subsistencia, porque son sujetos con bajos recursos, sin acceso al crédito, que encuentran en la economía informal, por el momento, su única alternativa de empleo.

Por otro lado, aunque el comercio informal presenta características similares a las propuestas por organismos internacionales, es importante remarcar que los comerciantes informales se encuentran en un nivel educativo de secundaria, y un considerable porcentaje de estos, tiene estudios de nivel preparatoria; debido a lo anterior, el autor del estudio disiente de Freije (2000) quien señala “los trabajadores que tienen mayores probabilidades de ingresar al sector informal son aquellos con menos experiencia y educación. El comercio informal, es un trabajo precario; son trabajadores independientes que comercian con productos básicos como los alimentos o prestan algún servicio personal en el hogar. Tienen a familiares trabajando en el establecimiento, sin un salario o compensación, además de carecer de servicio médico.

RESUMEN

Tras la apertura comercial vivida en México, muchas han sido las opiniones en torno a los efectos benéficos o negativos de este proceso en la economía nacional. La teoría nos indica que cuando un país incursiona en el proceso de libre comercio y ampliación de los mercados los niveles de bienestar se ven incrementados en la población. También fundamenta lo anterior en que la industria entra en un proceso de convergencia entre los países socios (esencialmente con los más cercanos como sería el caso de Canadá y Estados Unidos de Norteamérica), lo que conlleva a un incremento en la participación del libre comercio de las mismas. Es de esperar que los flujos comerciales interindustriales incrementen, así como aquellos que se generan dentro de los intercambios comerciales entre empresas del mismo ramo, también conocido como comercio intraindustrial, y este debe ser el caso para la relación comercial entre México y Canadá.

PALABRAS CLAVE: Comercio Intraindustrial, Relaciones Comerciales, Indicador y Comercio.

INTRA-INDUSTRY TRADE IN THE RELATIONSHIP MÉXICO-CANADA

ABSTRACT

After the trade opening lived in Mexico, there have been many opinions on the beneficial or negative effects of this process in the national economy. The theory tells us that when a country goes into the process of free trade and market expansion levels of welfare are increased in the population. Also based the above in that the industry enters a process of convergence between the partner countries (essentially with those closest to it would be the case in Canada and United States of America), this leads to an increase in the participation of the free trade of the same. It is hoped that the interindustry trade flows increase, as well as those that are generated within the trade between companies in the same industry, also known as intra-industry trade, and this must be the case for the commercial relationship between Mexico and Canada.

KEYWORDS: Intra-Industry Trade, Commercial Relationships, Indicator and Trade.

INTRODUCCIÓN

De conformidad con la Teoría del Comercio internacional, el llamado comercio interindustrial se ve incrementado con la incursión de los distintos sectores de una economía en los intercambios internacionales. También se argumenta que el comercio entre las empresas pertenecientes al mismo sector también tiende a incrementarse llevando al aumento del llamado comercio intraindustrial. El presente estudio busca demostrar que tras catorce años de la apertura vivida en México, el comercio intraindustrial ha tomado un sitio importante para explicar gran parte de los intercambios comerciales que se gestan entre las industrias del país, y como un indicador de la convergencia que viven estos sectores industriales

en la actualidad con nuestro segundo socio comercial Canadá. El análisis girara en torno al Índice de Comercio Intraindustrial que permitirá saber con exactitud en qué cuantía ha ido incrementando a lo largo del tiempo tras la apertura de los mercados nacionales en 1994, los intercambios comerciales dentro de las principales industrias del país con sus contraparte extranjera en Canadá que pertenecen a la misma industria. Es de esperar que la teoría se sustente en un incremento del comercio intraindustrial y con esto dejar de manifiesto que México participa activamente de los procesos de fragmentación de los procesos productivos de las empresas, que es la práctica que rige y caracteriza a la Nueva División Internacional del trabajo contemporánea. Un índice de comercio intraindustrial alto en la relación México-Canadá nos habla de una mayor concentración del comercio entre industrias semejantes y de un proceso de globalización que se encamina de conformidad con la teoría económica.

Por otra parte un índice de comercio intraindustrial bajo es clara señal de la poca interdependencia de las industrias con los socios comerciales del país, y de un proceso de divergencia del sector industrial. El estudio permitirá evaluar el grado de participación de las industrias nacionales en los procesos de integración económica en los que el país se encuentra inmerso hoy día con uno de sus principales socios comerciales desde los procesos de apertura como es Canadá.

REVISIÓN LITERARIA

Después de los colapsos económicos vividos en el país durante el lapso que abarcaron las crisis recurrentes sexenales (1976, 1982, 1988), y de la “brillante” respuesta del Gobierno Mexicano de estatizar la banca en 1982 como mecanismo para hacer frente a la gran macro devaluación y elevados volúmenes de capitales golondrinos generados en la crisis de la deuda. El Gobierno integra al país a la dinámica moderna de la economía apoyada en el libre mercado, buscando a su vez dar cumplimiento a los acuerdos pactados por las cartas de intención firmadas ante el FMI para hacer frente a la deuda, decidiendo dar marcha atrás a su estrategia de estatización, reprivatizando la banca y el sector financiero en su conjunto en 1988, así como una apertura sin precedente de los mercados nacionales (Ruiz 2004).

Este proceso liberalizador continuo y se asentó aún más con la firma y entrada en vigor del TLCAN, hubo quien sostuvo que como consecuencia de este tratado, se incrementaría la eficiencia de los distintos sectores (sobre todo del exportador) y por tanto, se vería una disminución en los costos de intermediación en México. Además que se tendría el plus de una gama nueva de productos y servicios en los distintos sectores en beneficio del sistema en su conjunto y por ende de los usuarios de los mismos (Carstens 1993). El movimiento de ideas, capital, tecnología y personas a través de las fronteras, conlleva a la integración de países, y que es signo de un entorno cada vez más globalizado. Se puede detectar también procesos de integración entre países de determinadas regiones, que se puede leer como signos de regionalización. Dentro de este proceso de regionalización se desarrollan bloques a nivel mundial, estos constituyen una “triada” conformada por 3 grandes bloques: El europeo (Unión Europea), El americano (EUA-Canadá) y El asiático, comandado por Japón (Calva 2000).

En un clima donde todo señala hacia la integración como un mecanismo de sobrevivencia en los mercados, surgen las llamadas alianzas estratégicas, estas son acuerdos cooperativos horizontales, dado que surgen entre competidores de la misma industria. Esto da pie a una nueva forma de realizar comercio, esta es, el comercio intrafirma o mejor conocido como comercio intraindustrial y que es el que se lleva a cabo entre empresas que pertenecen a la misma industria pero que se encuentran en diferentes naciones (Grubel y Lloyd 1975). Estas nuevas tendencias nos permiten comprender que el comercio tanto interindustrial (el que se realiza entre industrias de los diferentes sectores), como el comercio intraindustrial (el que se realiza entre empresas pertenecientes a la misma industria) se incrementarán entre más este inmerso el país en el proceso de apertura comercial (Krugman y Obstfeld 1999).

METODOLOGÍA

En esta investigación se pondrá especial atención al comercio intraindustrial, dado que a mayor apertura comercial se esperaría de conformidad con la teoría del comercio internacional un incremento en este tipo de comercio, y siendo México uno de los países en Latinoamérica más inmersos en los procesos de globalización e integración económica es de esperar que el comportamiento de dicho comercio fuera en crecimiento en los últimos años.

Este comercio suele medirse a través del llamado Índice de Comercio Intraindustrial (T):

$$T = 1 - \frac{|X - M|}{(X + M)} \quad (1)$$

Donde, respectivamente X y M representan las exportaciones e importaciones de una industria o grupos de bienes en particular respectivamente, las barras verticales en el numerador de la ecuación denotan el valor absoluto. El valor de T fluctúa entre 0 y 1 (0 al 100%), si T = 0 se puede decir que es cuando el país sólo exporta o importa el bien en particular (lo que denota que no existe comercio intraindustrial), si T = 1 se puede afirmar que este país tiene su comercio intraindustrial en su punto máximo (Grubel y Lloyd 1975). Este tipo de indicador presenta algunas limitaciones como que en algunas ocasiones se presentan mediciones un poco distintas de conformidad de la manera en que se agrupan o definen la industria o el grupo de productos. Por ejemplo, entre mayor sea la amplitud con que se defina una industria, la probabilidad de que dicho país exporte alguna variedad de dicho producto de forma diferenciada e importe otras será mayor. A pesar de esto este índice es una herramienta de gran utilidad para medir las diferencias en el comercio intraindustrial en las diferentes industrias y los cambios en las mismas en el tiempo (Krugman y Obstfeld 1999, Salvatore 1994).

Para este estudio se tomaron datos provenientes de la Base de Datos de las Naciones Unidas (COMTRADE) de los informes de México con sus principales socios, para este análisis se ha decidido trabajar con los datos del comercio con Canadá por ser el Tratado de Libre Comercio más antiguo que nos permita medir la evolución del comercio en el periodo 1994-2007. Se han agrupado las principales industrias en base al Sistema Armonizado, destacando para el análisis las siguientes Industrias: Industria alimentaria, minerales, industria química, plásticos, cueros y pieles, materias textiles, calzado y sombreros, metales y sus manufacturas, aparatos mecánicos y material de transporte.

RESULTADOS

Tras la firma del Tratado de Libre Comercio de América del Norte (TLCAN) y su entrada en vigor en 1994, mucho se ha valorado la pertinencia del mismo y los efectos que este ha tenido en el crecimiento del comercio en el país. Al determinar el índice de comercio intraindustrial para la relación México-Canadá se pueden encontrar datos interesantes. Por ejemplo en la Tabla 1 se puede observar la evolución que ha tenido el comercio intraindustrial en la industria alimentaria, las relaciones de intercambio dentro de la misma industria alimentaria ha ido en claro aumento pasando de tener un grado de integración de 35% en 1994 a un 84% para el año 2007.

En cuanto a la industria Minera (Tabla 2), el comercio intraindustrial al interior de la misma ha mantenido un ritmo de crecimiento descendente oscilando de un 98% en 1994 a un 39% para 2007, por lo que podemos decir que el comercio con características intraindustriales en este sector es bajo, debido principalmente que si bien los niveles de intercambio en lo que a productos mineros se refiere es considerable, las relaciones de ayuda entre las firmas del sector ha ido disminuyendo al volverse el mercado más competitivo.

Tabla 1: Índice de Comercio Intraindustrial dentro de la Industria Alimentaria para Mex-Can-EUA (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007

La tabla muestra los índices de comercio intraindustrial calculados para la industria minera en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte, ICII USA entre empresas mexicanas y Americanas y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

En la industria química (Tabla 3) denotamos un fenómeno interesante a todas luces, nos referimos al incremento del intercambio entre las empresas pertenecientes a este sector, a diferencia de la industria anterior, este sector ha logrado ir poco a poco consolidando sus lazos intraindustriales, pero esto se ha dado de forma gradual y por demás moderada llevando al índice de 32 % en 1994 a un 61% en 2007.

Tabla 3: Índice de Comercio Intraindustrial dentro de la Industria Química para Mex-Can (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
ICII AN	50%	65%	54%	52%	52%	54%	50%	47%	47%	44%	43%	45%	45%	41%

La tabla muestra los índices de comercio intraindustrial calculados para la industria Química en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

La industria del Plástico parece no sufrir ningún cambio en cuanto a los intercambios entre las empresas del mismo sector, el crecimiento es nulo llevando al índice de 22% a un 26% a lo largo del periodo de análisis, curiosamente se puede leer que producto de los acontecimientos del 9-11 para el año 2001, esta industria aún dentro de la zona de libre comercio de América del Norte si reciente en sus intercambios a nivel intracomercial como se aprecia en la Tabla 4.

Tabla 4: Índice de Comercio Intraindustrial dentro de la Industria del Plástico para Mex-Can-EUA (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
ICII AN	46%	49%	43%	42%	41%	43%	45%	44%	43%	44%	50%	51%	50%	51%

ICII CAN	21%	33%	30%	33%	25%	23%	19%	15%	16%	21%	30%	33%	26%	27%

La tabla muestra los índices de comercio intraindustrial calculados para la industria del Plástico en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte, ICII USA entre empresas mexicanas y Americanas y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

La industria de la piel después de registrar un decrecimiento considerable que llevo al indice de intercambio intraindustria de un 98% en 1998 a un 30% en 2000, ha registrado un considerable repunte en el último año oscilando el indice en los 97% lo que nos indica que es una industria muy integrada, pero que le impactan los altibajos de los mercados vinculados a dicho sector (Tabla 5).

Tabla 5: Índice de Comercio Intraindustrial dentro de la Industria de la Piel para Mex-Can (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
ICII AN	83%	94%	78%	75%	75%	75%	78%	69%	64%	64%	56%	66%	81%	97%
ICII CAN	77%	96%	66%	65%	95%	36%	29%	44%	53%	70%	93%	77%	50%	92%

La tabla muestra los indices de comercio intraindustrial calculados para la industria de la piel en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

La industria textil (Tabla 6) por su parte ha sufrido debido a la aplicación de políticas de mayor apertura a la competitividad de la misma, lo que llevo al indice de ocupar un 99% de integración en 1994 a una caída hasta de 60% en el año 1997, a pesar de esto desde 2000 se ha recuperado hasta oscilar en 90% del comercio intraindustrial, siendo una de las industrias mas integradas en este aspecto.

Tabla 6: Índice de Comercio Intraindustrial dentro de la Industria Textil para Mex-Can-EUA (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
ICII AN	87%	95%	95%	90%	91%	90%	89%	91%	88%	85%	83%	80%	83%	86%

ICII CAN	100%	77%	69%	62%	63%	83%	99%	90%	90%	98%	95%	94%	95%	91%

La tabla muestra los indices de comercio intraindustrial calculados para la industria Textil en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte, ICII USA entre empresas mexicanas y Americanas y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

En la industria del calzado (Tabla 7) el comportamiento del comercio intraindustrial ha ido en clara caída, lo que indica que las relaciones entre las empresas del mismo ramo es cada vez menor entre estos dos países miembros del TLCAN, este ha caído de cerca del 40% que representó en 1994 hasta un 5% en 1997, aunque de 1998 a 2007 ha alcanzado un nivel cercano al 60%.

Tabla 7: Índice de Comercio Intraindustrial dentro de la Industria del Calzado para Mex-Can (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
ICII AN	57%	44%	33%	35%	37%	36%	35%	43%	33%	28%	24%	19%	22%	25%
ICII CAN	43%	22%	11%	6%	6%	8%	19%	28%	61%	45%	48%	59%	57%	58%

La tabla muestra los indices de comercio intraindustrial calculados para la industria del calzado en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte, y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

En la industria de los metales este se ha mantenido a la baja en el periodo, lo que nos indica una integración muy pobre en el sector, pasando de 40 % en 1994, habiendo llegado a cerca del 80% en 1997

hasta un 20% en 2007, esto principalmente por la participación tan fuerte en este rubro del principal socio comercial de México (EUA).

Tabla 8: Índice de Comercio Intraindustrial dentro de la Industria de los Metales para Mex-Can-EUA (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007
ICII AN	72%	84%	78%	78%	76%	69%	70%	77%	81%	76%	82%	83%	82%	82%
ICII USA	73%	85%	78%	78%	76%	69%	71%	78%	83%	78%	85%	86%	85%	85%
ICII CAN	40%	72%	46%	77%	63%	35%	31%	34%	36%	34%	27%	23%	14%	19%

La tabla muestra los índices de comercio intraindustrial calculados para la industria de los metales en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte, ICII USA entre empresas mexicanas y Americanas y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

El mayor caso de éxito en cuanto a integración intraindustrial se refiere es de la industria eléctrica y de aparatos eléctrico, boilers, y herramientas de este tipo, ya que se ha mantenido de un 78% que representaban en 1994 hasta un 80% que representó en 2007, lo que claramente nos indica una integración entre las empresas de este sector.

En la industria de los materiales vinculados al transporte este reporta un cada vez mayor integración entre las empresas del sector, pasando de 40% que representaba en 1994 hasta un 90% en 2007.

Tabla 10: Índice de Comercio Intraindustrial dentro de la Industria de los Materiales de Transporte para Mex-Can-EUA (1994-2007)

	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007

La tabla muestra los índices de comercio intraindustrial calculados para la industria de los materiales de Transporte en el periodo comprendido de 1994 a 2007, siendo ICII AN el indicador para el comercio intraindustrial entre las empresas pertenecientes a la misma industria en América del Norte, ICII USA entre empresas mexicanas y Americanas y las ICII CAN entre las empresas mexicanas y las canadienses, los valores cercanos al 100% nos indica un comercio intraindustrial muy activo mientras que los cercanos a 0 son clara señal de un comercio intraindustrial incipiente. Elaboración Propia con datos de la COMTRADE UN 2011.

CONCLUSIONES

Como se ha mencionado, los procesos de integración generan una variedad de cambios en los sectores económicos de los países que se incertan en los procesos de apertura comercial, es de esperarse que dichos cambios permitan a las empresas participantes de estos mercados cada vez más competitivos, entablar relaciones estratégicas a nivel comercial con aquellas empresas que le otorguen ventajas a la hora de competir. De conformidad con la teoría del comercio internacional algunas de las principales industrias en la relación comercial entre México y Canadá han seguido con el proceso de integración a través de relaciones de comercio intraindustrial que a lo largo del periodo comprendido entre 1994 y 2007 se ha ido fortaleciendo; pero notamos a su vez, que en otros estas relaciones se han deteriorado, lo que nos lleva a meditar cuales pudiesen ser las principales causas de dicho fenómeno.

Ya sea que este tipo de comercio intraindustrial ha cedido en torno a incrementos en flujos comerciales provenientes del comercio interindustrial o bien sea derivado de políticas de fortalecimiento de cadenas de valor al interior de los mismo países. Tenemos por otra parte los impactos de algunas variables de

índole exógeno como son la guerra contra el terrorismo global y el endurecimiento de las barreras no arancelarias en vías de la seguridad de las naciones, que de una u otra forma impactan los flujos comerciales entre nuestras economías. Sin embargo como se pudo apreciar aquellas industrias como las de componentes eléctricos, energéticos y de herramientas y componentes de transportes son clara muestra que se pueden formar cadenas de valor cimentadas en las transacciones intraindustria.

Por otra parte, es importante no dejar de lado las consecuencias reflejadas ya en las estadísticas del impacto de la recesión económica que actualmente se vive, pero con todo esto no se puede negar el impacto que ha representado el libre comercio en América del Norte para las relaciones de carácter intraindustrial y las tendencias de integración y convergencia en esta parte del hemisferio.

ANÁLISIS DE LA GESTIÓN DE LOS RECURSOS HUMANOS QUE APLICAN LAS PEQUEÑAS Y MEDIANAS EMPRESAS DE SERVICIO

Héctor Priego Huertas, Universidad de Colima, México

Roberto Espíritu Olmos, Universidad de Colima, México

Lorena Hernández Ruíz, Universidad de Colima

Albania Padilla Martínez, Universidad de Colima

RESUMEN

La práctica de gestión de los recursos humanos hoy en día es uno de los factores más importantes en toda empresa, ya que de ello dependerá la productividad de la empresa si se ha llevado a cabo un buen proceso de reclutamiento, selección y sobre todo de capacitación, ante el uso de las nuevas tecnologías. El objetivo del presente trabajo es identificar si se lleva a cabo un buen proceso de reclutamiento, selección, inducción, capacitación y desarrollo de los mismos en las empresas de servicios. Se pretende analizar si dichas empresas lo aplican. Con esto se podrá identificar los puntos que diferencian el proceso que aplican las mismas y lo que marcan las teorías del proceso de recursos humanos. La metodología utilizada en el presente estudio fue por medio de aplicación de cuestionarios, recopilándose la información necesaria a partir de una fuente primaria recabada directamente de la muestra de pequeñas y medianas empresas de servicios de la ciudad de Tecomán, Colima, México. La técnica estadística para representar los resultados fue a través de la aplicación de un análisis factorial de componentes principales para determinar las variables independientes y la dependiente. Y para la comprobación de resultados se realizó un análisis de regresión par determinar la influencia de las variables independientes, reclutamiento, selección, inducción y capacitación con la variable dependiente gestión de recursos humanos. Los principales hallazgos del estudio encontrados es que las pequeñas y medianas empresas de servicios fueron la influencia significativa de dos variables independientes inducción y selección con la gestión de recursos humanos, no así la capacitación y reclutamiento que no tuvieron una relación significativa con la variable dependiente gestión de recursos humanos, lo que significa que estas dos prácticas no las llevan a cabo las pequeñas y medianas empresas de esta ciudad.

PALABRAS CLAVE: Reclutamiento, selección, capacitación e inducción.

ABSTRACT

The practice of the management of human resources nowadays is one of the most important factors in businesses, because productivity of the enterprise will depend on this; if it's been carried out a good recruitment, selection and specially training process, considering the use of technologies. The purpose of this work is to identify whether it's carried out a good development process of recruitment, selection, induction and training in the service businesses. It's aimed to analyze whether the mentioned processes are applied by the enterprises. Thus, it will be able to identify the aspects that differentiate between the process that is applied by the enterprises and what is pointed by theories of human resources process. The methodology of this work was through the application of questionnaires, compiling the necessary information from a primary source, obtained directly from a sample of small and medium enterprises of service in the city of Tecomán, in the state of Colima, Mexico. The statistical technique to represent the results was a factorial analysis of the main components to determinate the dependent and independent variables. Regarding the testing of the results, a regression analysis was done to determinate the influence of independent variables "recruitment", "selection", "induction" and "training" on the dependent variable "management of human resources".

KEY WORDS: Recruitment, selection, training and induction

INTRODUCCIÓN

Es de reconocer que para el buen funcionamiento de una empresa debe tener una estructura adecuada en su organización, desde el nivel más bajo hasta el nivel directivo. Se sabe también que hay tres elementos importantes que una entidad económica debe tener, los recursos materiales, financieros y humanos. Los recursos materiales son los bienes tangibles con los que cuenta la empresa con estos ofrece un mejor servicio a sus clientes y en el menor tiempo posible. Los recursos financieros son los recursos con los que cuenta la empresa ya sean propios o ajenos y que son parte fundamental para el buen funcionamiento y desarrollo de la empresa. Los recursos humanos son el motor de la empresa y sin ellos no existiría un buen manejo y funcionamiento de los demás recursos.

Para Dessler (2009), en la administración de recursos humanos se deben llevar cuatro etapas que marca el proceso administrativo como son: Planeación, organización, integración, dirección y control de los recursos humanos. En la planeación, las empresas establecerán metas a corto, mediano o largo plazo, así como normas que deberán llevar a cabo dentro de la misma. En la organización, cada uno de los subordinados tendrá una tarea en específica para que la realicen lo mejor posible, deber existir la departamentalización y cada uno tendrá una función, delegar las funciones que les corresponde a cada uno y sin olvidar la coordinación del trabajo de los subordinados. En la integración, se debe tomar en cuenta el proceso de reclutamiento de personal. En esta etapa el encargado de contratar a la persona debe reunir los requisitos del puesto, el establecimiento de normas, la remuneración (gratificación por su buen desempeño y realización de sus labores), la capacitación, que cuando menos debe ser una vez al año.

En la dirección, trata de verificar que cada uno de los subordinados realice bien sus funciones, mantener un buen ambiente laboral para que el trabajador se sienta seguro de lo que está haciendo y buscar un tipo de estímulo para que la persona no sienta tanta presión en el trabajo. En el control, se encarga principalmente de observar que todas las actividades se estén realizando, tal como deben ser y por medio del cual se evalúa el rendimiento, e compara el desempeño real con los estándares y se aplican las medidas correctivas necesarias. En este trabajo se abordan los pasos anteriores que realizan las pequeñas empresas de servicio, con el fin de corroborar si se lleva a cabo este proceso, describiendo la importancia de la aplicación de la gestión de los recursos humanos. Según Alles, (2009), “la gestión de los recursos humanos comienza por la puesta en práctica de los subsistemas”, esos subsistemas son: Análisis y descripción de puestos; Atracción, selección e incorporación; Evaluación del desempeño; Remuneraciones y beneficios; Desarrollo y planes de sucesión; Formación. Pregunta de investigación Después de haber revisado y analizado los problemas con los que cuentan las pymes y debido a los argumentos vertidos en los puntos anteriores se plantea la siguiente pregunta de investigación: ¿Las pymes de servicio de la ciudad de Tecomán, Colima México, llevan a cabo el proceso de personal de acuerdo a lo que marcan las teorías sobre gestión de recursos humanos?.

Objeto De Estudio

La gestión de recursos humanos es un proceso poco practicado en las empresas de esta ciudad, por lo tanto se analiza, cómo llevan a cabo estas prácticas de recursos humanos. Es por ello que el objeto de estudio es analizar si las empresas de servicios de dicha ciudad mexicana llevan adecuadamente el proceso de gestión de recursos humanos. Es por esto que el objeto de estudio son las pymes de servicios de una la ciudad mexicana antes mencionada, en los aspectos relacionados con la gestión de Recursos Humanos (reclutamiento, selección, capacitación, inducción y desarrollo) para evaluar las técnicas que llevan a cabo.

Objetivo General Y Particulares

El objetivo general del presente estudio es identificar si llevan a cabo, adecuadamente, el proceso de los recursos humanos en las empresas de servicios, como son reclutamiento, selección, inducción, capacitación y desarrollo de sus recursos humanos. Y como objetivos específicos se tienen los siguientes:

a). Elaborar el marco teórico sobre el estudio del proceso de los recursos humanos. b). Describir una a una las prácticas de gestión de los recursos humanos. c). Identificar los problemas que se tienen en las empresas al no aplicarlo según las teorías.

Marco Teórico

En la actualidad la administración de recursos humanos dejó de ser una actividad marginal secundaria, alejada de los objetivos de la empresa, su tendencia, que se acentuara en el futuro, es en gran parte gracias a las universidades de Europa y América las cuales han concedido a la ciencia administrativa en general y a la administración de personal en particular, hoy en día los altos mandos, como las jefaturas de personal, suelen estar a cargo de personas preparadas académicamente, en este ramo de la administración. Antes de que se lleve el proceso de reclutamiento y selección es necesario que se tome en cuenta que debe existir una **planeación**, no es más que solo saber cuáles puestos debe cubrir la empresa y como cubrirlos. Al tratar de definir cuáles son las vacantes se deben de tomar datos precisos y concretos, para saber que cualidad debe tener las personas, así como las actitudes y aptitudes que debe tener para poder tener un mejor desempeño y que a la empresa no le cueste mucho dinero estarlo capacitando. Por eso en la actualidad las empresas deben de “planear antes de actuar y no actuar y después planear.” La planeación de personal debe tener en cuenta que se deben considerar todos y cada uno de los puestos a futuro, ya sea desde el nivel de menor jerarquía (mantenimiento), hasta el de mayor nivel (director general). Hay empresas que denominan a la “planeación de la sucesión” como el proceso por el cual se van a ocupar los puestos de los ejecutivos. (Dessler 2009).

Posteriormente, viene la etapa del reclutamiento, que según Cuervo García (1994), es *“el proceso mediante el cual la organización trata de detectar empleos potenciales, que cumplan los requisitos adecuados para realizar un determinado trabajo, atrayéndolos en cantidad suficiente, de modo que sea posible de modo que sea posible una posterior selección de alguno de ellos, en función de la exigencias del trabajo y de las características de los candidatos; teniendo en cuenta que el primer paso para atraer candidatos reside en conocer la empresa y sus necesidades”*. Las empresas deben prever, de acuerdo con sus planes de expansión y mantener un equilibrio apropiado en su planilla, las posibles bajas, muertes, pensiones, incapacidades, despidos voluntarios o involuntarios o las posibles plazas que se tendrán en un futuro próximo. En el reclutamiento es importante considerar la edad, género, nacionalidad, la ideología, nivel de preparación, experiencia, también considerar el empleo a minusválidos.

La selección de personal es un proceso dinámico, en el cual se busca encontrar a la persona más adecuada (tanto por sus características personales, aptitudes, motivaciones, etc.) para cubrir un puesto de trabajo en alguna entidad determinada (Nebot, 1999). La importancia de este proceso, radica en contar con las mejores expectativas, y por ende con los mejores empleados desempeñando sus actividades dentro de la entidad, las cuales deben tener el personal adecuado en los lugares precisos, es así como por consiguiente, la evaluación de los posibles colaboradores de la organización debe realizarse de una manera secuencial y precisa, analizando la experiencia laboral, su trayectoria académica y los aspectos psicológicos. Nebot (1999) nos señala que: Es un proceso dinámico, en el sentido que es una sucesión de fases que son flexibles y se adaptan a los cambios que van surgiendo.

Su objetivo (o finalidad) es encontrar el candidato más adecuado de acuerdo con unas características de personalidad, aptitudes, formación, experiencia, motivación, intereses fijadas de antemano. Dichos

requisitos o características están determinados en función de las actividades, funciones y tareas y puesto que se trata de cubrir y de las características de la empresa a la que pertenece.

Los métodos secuenciales se recomiendan cuando los gastos de los exámenes son elevados como por ejemplo en las pruebas que exigen aplicación y evaluación individual. Una vez tomada la decisión definitiva de admisión, el candidato debe cumplir con un examen médico así como su verificación de registro personal y profesional (Chiavenato, 2007). La **inducción** de personal es un proceso que proporciona a los nuevos empleados información básica de los antecedentes de la compañía, y en dicho proceso se les dice a los empleados sobre las actitudes, normas, valores y patrones de conducta que son esperados por el patrón. Al introducir a los empleados nuevos en la entidad se les proporciona la información básica de los antecedentes que se requieren para desempeñar tu trabajo de manera correcta. La inducción forma parte del proceso de socialización del empleador para personas nuevas. Un objetivo es algo que se desea lograr, un fin deseado, ya sea particular, parcial o total.

Y en el caso de la inducción el objetivo es proporcionar la información que necesita el nuevo empleado para ayudarlo a adaptarse satisfactoriamente a su trabajo y a llegar a sentirse parte de la organización. Toda organización persigue por lo menos estas tres cosas, lo cual llevarán a tener una buena inducción de personal. 1. Definir las condiciones de trabajo. 2. Familiarizarse detalladamente al empleado con las exigencias de su tarea. 3. Esforzarse por engendrar entre los empleados confianza en la empresa y en sus propias capacidades para realizar el trabajo.

La capacitación es un tema que a las empresas les concierne y a todo aquel trabajador también, ya que al primero por ley está obligado a proporcionar capacitación a sus empleados, y el segundo tiene el derecho a recibirla y de aprovecharla al máximo para el desempeño de sus labores. Dentro de la constitución política de los estados unidos nos señala que “la federación y los estados deben proporcionar capacitación para el trabajo como medio de readaptación social. (Art. 18).

Es el artículo anterior marca que es necesaria la capacitación que la proporcione la federación y los estados. Pero no marca la obligatoriedad para la empresa, es por eso que a continuación proporcionamos la base legal de la capacitación como obligación para la empresa. El art. 123, apartado A, fracción XIII de la Constitución Política de los Estados Unidos Mexicanos establece lo siguiente: “Las empresas cualquiera que sea su actividad, estarán obligadas a proporcionar a sus trabajadores, capacitación o adiestramiento para el trabajo. La ley reglamentaria determinará los sistemas, métodos y procedimientos conforme a los cuales los patrones deberán cumplir dicha obligación”.

Ayala Villegas (2004), nos dice *es un proceso educacional de carácter estratégico aplicado de manera organizada y sistémica, mediante el cual los colaboradores adquieren o desarrollan conocimientos y habilidades específicas relativas al trabajo, y modifica sus actitudes frente a los quehaceres de la organización, el puesto o el ambiente laboral.*

METODOLOGÍA

El método llevado a cabo en esta investigación fue la investigación de carácter cuantitativo correlacional, el cual ayuda a conocer o a medir el grado de relación que exista entre dos o más conceptos o variables. Su propósito es saber los comportamientos de las variables afectadas (Hernández Sampieri et al, 2010). Por ello interesa observar la manera en que las variables independientes influirán en la dependiente en la obtención de los resultados. La población, objeto de estudio, comprende a los propietarios de pequeñas y medianas empresas del área de servicios que se encuentran en esta ciudad mexicana.

La variable dependiente denominada gestión estuvo integrada por cuatro preguntas que fueron validadas con pruebas que más adelante se especifican. Las independientes fueron: Reclutamiento Selección,

Capacitación e Inducción La población a ser investigada fueron las pequeñas y medianas empresas de servicios, comprende a todos aquellos propietarios de empresas que se encuentran en el área de servicios a investigar ubicadas en esta ciudad mexicana, que realicen procesos de gestión de recursos humanos y que tengan empresas que estén en la clasificación de pequeñas y medianas.

Asimismo, se ha elegido una muestra, la cual consiste en un subgrupo de la población, esto es, una pequeña parte de elementos que pertenecen a ese conjunto que es la población definido en sus características y comprende a los 97 propietarios de pequeñas empresas. Se aplicó un cuestionario a los directivos de las pymes de Tecomán, con el propósito de saber si llevan a cabo el proceso de reclutamiento del personal tal y como marcan las teorías. El total de las empresas era de 2,054, debido a que son un número considerable, nos vimos a la tarea de aplicar una fórmula en la cual el número que se llegó a encuestar fue de 97 y como explicamos anteriormente cuando en una población existe un número grande de empresas es necesario que se tome una muestra de ella. Se procedió a la elaboración de una base de datos para su correcta validación a través del programa estadístico SPSS (Statistical Package for Social Science) versión 17.0. A partir de esta base de datos se obtuvieron los estadísticos descriptivos, la tabulación de las variables del estudio, la elaboración de las medidas de fiabilidad así como la elaboración del análisis de regresión. Posteriormente se continuó con la captura de la información para luego realizar el estudio detallado de la información. Este estudio se realizó durante el año 2012.

RESULTADOS

A cada variable de esta investigación se le hicieron cuatro pruebas de fiabilidad, así como el análisis factorial para validar las preguntas cuestionadas y determinar las variables tanto la dependiente como las independientes. Las cuatro pruebas de fiabilidad fueron, Alfa de Cronbach, la prueba Kaiser-Meyer-Olkin (KMO), las comunales y la varianza.

Tabla 1: Resultados de las pruebas de fiabilidad de las variables.

Variables	Alfa de Cronbach	KMO	Comunalidades	Varianza
Dependiente	.764	.638	De .514 a .795	70.098
Gestión de Recursos Humanos				
Independientes	.799	.751	De .487 a .771	64.26
Reclutamiento				
Selección	.837	.745	De .584 a .842	67.53
Inducción	.952	.934	De .582 a .789	67.62
Capacitación	.953	.923	De .488 a .798	68.41

Fuente: Elaboración propia.

Análisis De Regresión

Al elaborar el análisis de regresión se obtuvo un R^2 con valor de 0.529 que es un valor interesante por tratarse de un estudio empírico. Los resultados obtenidos a partir de la regresión permiten identificar la capacidad predictiva de las teorías convertidas en variables. La variable 1 se relaciona con la capacitación, la variable 2 con la inducción, la variable 3 con la selección de personal y la variable 4 sobre el reclutamiento de personal, tal como se muestra en la tabla 2.

Tabla 2: Resultados del análisis de regresión.

Modelo	Coeficientes no estandarizados		Coeficientes tipificados	t	Sig.
	B	Error típ.	Beta		
1 (Constante)	.024	.053		.446	.656
Variable indep 1	.123	.110	.123	1.118	.265
Variable indep 2	.313	.118	.313	2.656	.009
Variable indep 3	.371	.089	.372	4.173	.000
Variable indep 4	-.036	.079	-.036	-.460	.646

a. Variable dependiente: Variable dependiente Gestion de RRHH

Fuente: Elaboración propia.

Para conocer la influencia que ejercieron las variables independientes, se ha encontrado la existencia de una relación significativa de la variable dependiente gestión de los recursos humanos con las variables independientes 2 que es la inducción y con la 3 que es la selección de personal. Sin embargo las variables 1 que se relaciona con la capacitación y la variable 4 que es el reclutamiento de personal no resultaron tener una relación significativa

CONCLUSIONES

Para llegar a las conclusiones de este trabajo de investigación realizado con el objetivo de obtener información que ayude, a todo aquel que los consulte a tener una idea clara sobre las técnicas de la gestión de los recursos humanos que aplican las pymes de servicios en esta ciudad. Con relación al objetivo general de la investigación el cual fue “Identificar si el proceso de los recursos humanos en las empresas de servicios lo que es reclutamiento, selección, inducción y capacitación de los RRHH. Así mismo que identificar las diferencias entre lo que aplican las empresas y lo que se debe aplicar de acuerdo a las teorías del proceso de RRHH” Se identificaron cada uno de los procesos de los recursos humanos en las pymes de servicios de Tecmán y el desarrollo de RRHH. En relación a las diferencias se identificó que las pequeñas y medianas empresas de servicios fueron la influencia significativa de dos variables independientes inducción y selección con la gestión de recursos humanos, no así la capacitación y reclutamiento que no tuvieron una relación significativa con la variable dependiente gestión de recursos humanos, lo que significa que estas dos prácticas no las llevan a cabo las pequeñas y medianas empresas de esta ciudad.

JUZGADOS ADMINISTRATIVOS MUNICIPALES EN EL ESTADO DE TAMAULIPAS

Luis Moral Padilla, Universidad Autónoma de Tamaulipas
Jesús Apolinar Martínez Puebla, Universidad Autónoma de Tamaulipas
Salomón Elizalde Ceballos, Universidad Autónoma de Tamaulipas

RESUMEN

A fin de que los ayuntamientos gocen de una verdadera autonomía frente a la federación y a los estados a los que pertenecen, es imprescindible que ellos mismos ejerzan sus facultades de manera directa con las únicas limitaciones previstas en la Constitución Política de los Estados Unidos Mexicanos; no obstante, la realidad muestra un panorama distinto, mismo que los ordenamientos legales estatales vigentes en la mayoría de las entidades federativas del país pasan por alto, desconociendo las atribuciones ya concedidas a los municipios por la carta magna y arrogándose las mismas en su provecho, impidiendo con ello la creación de órganos jurisdiccionales municipales, que por disposición de la Constitución deben instaurarse a la brevedad posible. El objetivo de este trabajo es desentrañar las razones por las cuales interpretó nuestro órgano legislativo tamaulipeco de forma equivocada al artículo 115, fracción II, inciso a) de la Constitución Política de los Estados Unidos Mexicanos, publicada en el Diario Oficial de la Federación en fecha 23 de Diciembre de 1999, lo que impidió la instauración de los tribunales contenciosos administrativos municipales, y como consecuencia de ello, el desarrollo y crecimiento de los entes públicos denominados municipios. Como conclusión se puede llegar a la firme convicción de que una vez realizada la reforma en los términos propuestos, sólo quedaría por instaurar los tribunales contenciosos administrativos municipales en el estado de Tamaulipas, y lograr con esto el verdadero fortalecimiento de los municipios de México, particularmente los de nuestro Estado, para ser coherentes con la intención del legislador federal, en su reforma al artículo 115 constitucional de 23 de Diciembre de 1999.

PALABRAS CLAVE: Facultad jurisdiccional, Municipio, juzgados administrativos.

MUNICIPAL ADMINISTRATIVE COURTS IN THE STATE OF TAMAULIPAS

ABSTRACT

To allow councils to enjoy genuine autonomy, the Federation and the States to which they belong, it is essential that they themselves exercise their powers in a direct way with the only restrictions laid down in the political Constitution of the Mexican United States; However, the reality shows a different, same picture that State legal systems in force in the majority of the federal entities of the country overlooked, unaware of the powers already granted to municipalities by the Constitution, and assuming the same for their benefit, thereby preventing the creation of municipal courts, that provision of the Constitution must be put in place at the earliest. The objective of this work is to unravel the reasons by which he played our Tamaulipas legislative body in the wrong way to article 115, section II, subsection a) of the political Constitution of the Mexican United States, published in the Official Journal of the Federation on date on December 23, 1999, which prevented the establishment of municipal administrative disputes courts, and as a result of this, the development and growth of public entities referred to as municipalities. As conclusion can be the firm conviction that once the reform under the proposed terms, would only by establishing the municipal administrative disputes courts in the State of Tamaulipas, and achieve this true strengthening of the municipalities of Mexico, particularly those of our State, to be consistent with the intention of the federal legislature, in its reform constitutional article 115 of December 23, 1999.

KEY WORDS: Municipality, administrative courts, Tamaulipas, federal Constitution.

INTRODUCCIÓN

El presente ensayo trata de aclarar el verdadero significado y alcance que debe darse al término procedimiento administrativo establecido en el inciso a) de la fracción II del artículo 115 de la Constitución Política de los Estados Unidos Mexicanos, ya que dicha voz ha provocado dos corrientes antagónicas, consistentes, la primera, en que dicho vocablo exclusivamente se refiere a los recursos administrativos; y la segunda, incluye tanto los recursos administrativos, como la justicia contenciosa municipal, con lo cual permite el establecimiento de los tribunales de lo contencioso administrativo municipales. Por lo anterior, la monografía que ahora se presenta trata de probar que la correcta interpretación que se debe dar, es la relativa a la segunda corriente antes apuntada por los motivos y las razones que se exponen a lo largo del presente trabajo.

Es por ello que a través de este estudio se presentan, las razones por las cuales se considera equivocada la forma en que interpretó nuestro órgano legislativo estatal la reforma al artículo 115, fracción II, inciso a) de la Constitución Política de los Estados Unidos Mexicanos, publicada en el *Diario Oficial de la Federación* en fecha 23 de diciembre de 1999, lo que impidió la instauración de los tribunales contenciosos administrativos municipales, y como consecuencia de ello, el desarrollo y crecimiento de los entes públicos denominados municipios. No obstante, para lograr los objetivos trazados, es necesario realizar una reseña histórico-jurídica de lo que ha sido el establecimiento y desarrollo del Tribunal Fiscal del Estado, para estar en aptitud de abordar el tema de la presente monografía, y terminaremos como es preceptivo en todo trabajo, y de forma sintética las principales propuestas sobre la manera adecuada de lograr la debida interpretación del término *procedimiento administrativo* establecido en el inciso a) de la fracción II del artículo 115 de nuestra ley de leyes.

Antecedentes: Para tener idea de los motivos que propiciaron la elaboración del presente ensayo, tendré que referirme, aunque someramente, al origen y desarrollo del Tribunal Fiscal del Estado de Tamaulipas, en relación con la reciente reforma al artículo 115 constitucional publicada en el *Diario Oficial de la Federación* el 23 de diciembre de 1999, específicamente al inciso a) de su fracción II, que permite de manera expresa el establecimiento de tribunales de lo contencioso administrativo municipales.

El Estado de Tamaulipas cuenta con el tribunal contencioso administrativo más antiguo del país, fundado en Ciudad Victoria en 1951, en donde tiene su actual residencia (CIDE, 2011). El tribunal Fiscal del Estado de Tamaulipas conforme a los artículos 198 y 199 del es Código Fiscal para el Estado de Tamaulipas (CFET) es un órgano autónomo, unitario que conoce en una sola instancia las materias fiscal y administrativa. El marco normativo de este órgano de justicia administrativa, se encuentra integrado por los siguientes ordenamientos: Constitución política del Estado de Tamaulipas. (CPET), Ley Orgánica de la Administración Pública del Estado de Tamaulipas. (LOAPET), Código Fiscal para el Estado de Tamaulipas. (CFET), Procedimiento Contencioso del Código Fiscal para el Estado de Tamaulipas.

De Acuerdo al artículo 198 del CFET, El Tribunal Fiscal del Estado de Tamaulipas conocerá del juicio de nulidad, dictará sus fallos en representación del Ejecutivo del Estado o de los Ayuntamientos, pero será independiente de cualquier otra autoridad administrativa. En otras palabras el Código Fiscal del Estado, regula la organización y funcionamiento del Juzgado Fiscal del Estado que era un tribunal administrativo con facultades para tramitar los juicios que se presenten en contra de las resoluciones que pronuncien las autoridades fiscales estatales y municipales en donde se consideraba al juez de lo fiscal como autónomo dentro de la esfera del Ejecutivo estatal con facultades anulatorias. (Ruiz, 1991)

No obstante, en el Código Fiscal para el Estado de Tamaulipas, se observan una serie de problemas que genera la aplicación del artículo 198 de la citado ordenamiento; del análisis minucioso del artículo mencionado, se advierte que los dispositivos legales que aquí se comentan, transgreden la carta fundamental de nuestro país, específicamente la actual fracción V del artículo 116 constitucional al dotar de competencia al Tribunal Fiscal del estado para conocer y resolver controversias y conflictos entre la administración pública municipal y los particulares.

Planteamiento del problema de estudio: La aplicación del artículo 198 del Código Fiscal del Estado de Tamaulipas trasgrede la carta fundamental de nuestro país, al instituir el Tribunal de Fiscal del Estado con competencia para conocer y resolver controversias y conflictos entre la administración pública municipal y los particulares, aún y cuando con la última reforma realizada por el Poder Legislativo Federal al artículo 115 de la Constitución Política de los Estados Unidos Mexicanos, se otorgó expresamente a los ayuntamientos la facultad jurisdiccional con el fin de que éstos instaurasen tribunales de lo contencioso administrativo municipales; sin embargo, el artículo 58, fracción LVI de la Constitución Política del Estado de Tamaulipas, y en obvia contravención al dispositivo constitucional federal en comento, le da la competencia al Tribunal Fiscal del Estado para conocer y resolver controversias y conflictos que se susciten entre la administración pública municipal y los particulares.

Objetivo del problema de estudio: El objetivo de este trabajo es encontrar el verdadero significado y la debida explicación de las razones por las cuales interpretó el Congreso del Estado de Tamaulipas equivocadamente las reformas al artículo 115, fracción II, inciso a) de la Constitución Política de los Estados Unidos Mexicanos, del 23 de diciembre de 1999, impidiendo la instauración de los tribunales contenciosos administrativos municipales en Tamaulipas.

Justificación del problema: Considerando al artículo 58, fracción LVI, de la Constitución Política del Estado de Tamaulipas, tiene su razón de ser a nuestro juicio en una indebida interpretación realizada por la legislación local tamaulipeca al artículo 115, fracción II, inciso a) de la Constitución Política de los Estados Unidos Mexicanos, publicada en el *Diario Oficial de la Federación* en fecha 23 de diciembre de 1999, lo que impidió la instauración de los tribunales contenciosos administrativos municipales, y como consecuencia de ello, el desarrollo y crecimiento de los entes públicos denominados municipios.

Delimitaciones: El presente documento se delimitará a estudiar el fenómeno de estudio sobre la facultad jurisdiccional de los municipios en el estado de Tamaulipas.

Limitaciones: La presente indagatoria se limitará a estudiar el fenómeno de estudio sobre la facultad jurisdiccional contenciosa administrativa de los municipios en el Estado de Tamaulipas.

REVISIÓN LITERARIA

Análisis Sobre La Facultad Jurisdiccional De Los Municipios Del Estado De Tamaulipas:

Antes de iniciar el análisis de los objetivos trazados para este ensayo, es necesario determinar si el término *procedimiento administrativo* establecido en el multicitado artículo constitucional, incluye también la justicia contenciosa administrativa, administrada a través de tribunales especializados, con competencia exclusivamente municipal, o bien solamente se refiere al recurso administrativo, entendido como aquel que se interpone ante la misma autoridad que emite el acto, es por ello que resulta necesario mencionar el concepto de "procedimiento administrativo", el cual es el conjunto de formas y actos que preceden y preparan un acto administrativo (Fraga, 2009) Nuestra postura inicial respecto del concepto "procedimiento administrativo" nos permite coincidir con el pensamiento del maestro Eduardo García de Enterría cuando manifiesta que: " la actividad de la administración tiene que canalizarse obligadamente a través de unos cauces determinados como requisito mínimo para que pueda ser calificada de

legítima"(García et al, 2011). Así las cosas, dicho vocablo tiene dos acepciones válidas, la primera, que se trata de las decisiones unilaterales que realiza el estado a través de la administración pública — ya sea federal, estatal o municipal—, mismas que se ejecutan aún en contra de la voluntad del obligado; y la segunda, que el procedimiento administrativo constituye la primera de las garantías jurídicas del gobernado frente a la administración pública activa (Nava, 1959). El sistema de recursos contra los actos y disposiciones emanados de la administración constituye, en principio, un segundo círculo de garantías, puesto que permite a los administrados reaccionar frente a los actos y disposiciones lesivos a sus intereses, y obtener eventualmente su anulación, modificación o reforma.

En último término, corresponde a los jueces y tribunales pronunciarse definitivamente sobre la legalidad de la actuación administrativa, bien revisando a dicha actuación y anulando en su caso aquellos actos administrativos que sean disconformes con la norma jurídica, a través de los correspondientes juicios de nulidad o juicios contenciosos administrativos a aquellas actuaciones de la administración que constituyan una alteración al orden jurídico establecido (Nava, 1991). En consecuencia, se puede decir que se engloban, dentro de la acepción en estudio, tanto el recurso administrativo como la actividad jurisdiccional en los tres niveles de gobierno. Luego entonces, debe existir un procedimiento administrativo jurisdiccional — o mejor dicho proceso administrativo— que permita constreñir los actos de la administración pública al principio de legalidad, es decir, que permita deducir las pretensiones fundadas en el derecho administrativo ante un órgano jurisdiccional, que aunque forme parte de la estructura del estado, sea independiente en sus decisiones (Yanome, 2002). En este último sentido, entendido el término "procedimiento administrativo" en relación con el decreto de reforma a la fracción LVI del artículo 58 de la Constitución local, denota la intención del Poder Legislativo Estatal impedir el establecimiento de tribunales de lo contencioso administrativo municipales en el Estado de Tamaulipas, a pesar de que la Constitución general de la república ya permite expresamente su creación, razón por la cual se considera que la Constitución Local del Estado de Tamaulipas transgrede flagrantemente la ley de leyes al no permitir su instauración.

De la lectura que se realizó de dicho decreto, se puede llegar a concluir que dicho vocablo fue interpretado de manera estricta por parte de la citada legislatura estatal, lo que trae como consecuencia que la reforma fuera limitativa, con lo cual se impidió el desarrollo de la justicia administrativa en los municipios del estado al no permitir la creación y establecimiento de los tribunales contenciosos administrativos municipales. Por otra parte, no hay que olvidar que también el inciso a) de la fracción II del artículo 115 constitucional, así como el similar 131 fracción I de la Constitución local, señalan *ad litteram*: "incluyendo los medios de impugnación y los órganos para dirimir las controversias entre dicha administración y los particulares", lo que trae consigo de la interpretación literal que se realice a esta parte de las disposiciones que se comentan, que se otorga de manera expresa la facultad para instituir tribunales de lo contencioso administrativo municipales, por lo que se desconoce la razón lógico jurídica por la cual la legislatura estatal sostiene el criterio del contenido del artículo 58, fracción LVI, de la Constitución Política para el Estado Libre y Soberano del Estado de Tamaulipas, y no así el dispositivo en estudio con el fin de dar congruencia, aunque equivocadamente, al ordenamiento supremo del Estado.

Lo anterior trae consigo múltiples problemas en el momento de interpretar armónicamente las diversas disposiciones de la Constitución local, pues, por una parte, aparentemente se prohíbe el establecimiento de tribunales contenciosos administrativos municipales, y por la otra, se otorga la facultad para su instauración, es decir, conforme al contenido de la fracción LVI del artículo 58 del citado ordenamiento, la competencia del Tribunal Fiscal del Estado de Tamaulipas es para conocer controversias de índole estatal y municipal, pero a la vez, atentos a lo dispuesto por la fracción I del artículo 131 del referido cuerpo de leyes, se otorga la facultad de establecer tribunales de lo contencioso administrativo municipales, lo que generaría en el supuesto de su establecimiento una concurrencia de competencias entre el órgano jurisdiccional administrativo estatal y el que se llegue a instaurar con fundamento en este último dispositivo. En consecuencia, si bien es cierto que no existiría un estado de indefensión al

particular, al existir dos órganos jurisdiccionales con competencia para conocer las controversias municipales, sí generaría un estado de incertidumbre para el gobernado pues no sabría a ciencia cierta si sería necesario acudir a las dos instancias o, si acude a cualquiera de ellas, la sentencia que se dicte qué efectos tendría, es decir, ¿cuál de ellas tendría fuerza vinculativa para hacer exigible a la administración municipal el cumplimiento de su contenido? La respuesta, jurídicamente, debe ser ambas, sin embargo, aquí cabría un supuesto práctico, ¿podrá el municipio hacer caso omiso a una sentencia dictada por el órgano jurisdiccional administrativo estatal, al tener el primero un órgano jurisdiccional propio de la misma naturaleza? La respuesta la dará el tiempo.

Propuesta de Solución a la Problemática en estudio: Tomando en cuenta que la fracción II del inciso a) del artículo 115 constitucional hace referencia a los medios de impugnación y los órganos para dirimir las controversias entre dicha administración y los particulares, queda entonces por resolver qué debemos entender por el vocablo *procedimiento administrativo*, por lo que éste debe de entenderse con amplitud y abarcar a cualquier medio de protección de los derechos de los particulares, es decir, mediante el recurso administrativo o bien mediante un juicio llevado a través de los tribunales de lo contencioso administrativo municipales (Pérez, 1995).

Cabe recordar y añadir que la fracción V del artículo 116 constitucional otorga la facultad constitucional de establecer tribunales de lo contencioso administrativo estatales con competencia exclusiva estatal, que si bien es cierto, antes de la reforma del 23 de diciembre de 1999, se hacía extensiva a los municipios al no existir otra disposición de orden constitucional federal que permitiera el conocimiento de las cuestiones municipales, y con el fin de no dejar en estado de indefensión al particular de los actos municipales, se le concedió competencia municipal al Tribunal Fiscal del Estado de Tamaulipas.

Sin embargo, con la reforma al artículo 115 constitucional, publicada en el *Diario Oficial de la Federación* el día 23 de diciembre de 1999, específicamente la fracción II, inciso a), vino a integrar, complementar y dilucidar de manera expresa el contenido y alcance de la fracción V del artículo 116 constitucional, al instaurar en el primer dispositivo que se comenta, la facultad jurisdiccional municipal, es decir, la potestad constitucional de instaurar tribunales de lo contencioso administrativo municipales, lo que impide ya en estos momentos de nuestra historia constitucional el tener como válida la fórmula de la competencia estatal y municipal de los órganos jurisdiccionales administrativos estatales, con base en la fracción V del artículo 116 constitucional, pues al seguir con esa idea se transgrede el orden jurídico constitucional; dicho en otras palabras, se atenta contra la autonomía municipal concedida mediante dicha reforma. Si tomamos en consideración que el dispositivo en análisis otorga la facultad a los ayuntamientos de crear, por un lado, los medios de defensa que los gobernados deberán de tener frente a los actos de la administración pública municipal que puedan generar controversias y conflictos de intereses entre los primeros y los segundos, y por otro, la creación de órganos jurisdiccionales con competencia para conocer y resolver dichas controversias y conflictos entre ellos, que en el caso particular resultan ser las controversias de índole administrativa y fiscal; entonces, igualmente debe ser un tribunal de lo contencioso administrativo municipal el encargado de conocer y resolver los mismos.

Por lo tanto, si la legislatura local de algún Estado, a través de su facultad de iniciar leyes y aprobarlas, no respetara el nuevo contenido del artículo 115 constitucional, estaría contrariando el espíritu de nuestra carta magna, y por consecuencia, de conformidad con el principio de supremacía constitucional, dicha ley o cualquier precepto u ordenamiento alguno, según la denominación dada en su momento, resultaría inconstitucional, puesto que con ello se atentaría a lo dispuesto por el citado numeral, y como consecuencia, al pacto federal (Yanome, 2002). Razón por la cual se propone como solución, con el fin de salvaguardar la supremacía de nuestra Constitución general de la república, respecto de la similar local del Estado, esclarecer la intención del legislador en este ensayo, y así evitar confusiones futuras respecto de lo que debemos entender por *procedimiento administrativo* contenido en el inciso a) de la fracción II del artículo 115 constitucional. En este orden de ideas, dicho término debe ser entendido conforme a

Andrés Serra (1992) como aquella que contiene tanto el sistema de recursos administrativos como los juicios contenciosos administrativos, con el fin de estar acorde con el sistema de garantías de los gobernados por lo que se propone, con el fin de evitar confusiones doctrinarias, así como cumplir con uno de los objetivos trazados en este trabajo, que se suprima del inciso a) de la fracción II del artículo 115 constitucional, el vocablo "procedimiento administrativo", y en su lugar se establezca la voz "órganos jurisdiccionales".

Consecuencias de la propuesta de solución al problema en estudio: Es importante no quedarnos en el plano enunciativo del problema y su solución, por lo que la materialización de la propuesta expuesta en el apartado que antecede, sólo se cristalizaría mediante dos supuestos: el primero, que los Estados respeten los derechos y prerrogativas concedidas a los municipios mediante la reforma al artículo 115 constitucional, publicada en el *Diario Oficial de la Federación* el 23 de diciembre de 1999, y segundo, independientemente de que se reforme el contenido del inciso a) de la fracción II del artículo 115 constitucional en los términos que se proponen en este escrito del apartado anterior, las legislaturas estatales comprendan el término "procedimiento administrativo", con el fin de que adecuen su Constitución local para permitir la instauración de los tribunales contenciosos administrativos en los términos que a continuación se exponen.

1. Por cuanto hace a su creación

De acuerdo a Yanome (2002), el fundamento constitucional para la instauración y creación de tribunales de lo contencioso administrativo municipales lo encontramos en la última reforma realizada por el Poder Legislativo federal al artículo 115 de la Constitución Política de los Estados Unidos Mexicanos, publicada en el *Diario Oficial de la Federación* el 23 de diciembre de 1999, la cual otorga la facultad para que los ayuntamientos de todo México instauren tribunales de lo contencioso administrativo municipales, atentos a lo dispuesto por la fracción II, inciso a) del artículo y ordenamiento que se comentan. Siendo necesario instituirlo, no por cada municipio, aún y cuando así lo determina la Constitución general, no obstante, se señalan a continuación sus ventajas:

- a. Obtendrían los municipios del Estado autonomía plena en materia jurisdiccional y se desincorporarían en esta función por completo.
- b. Se liberaría de una gran carga de trabajo a los tribunales federales, pues no existirían controversias constitucionales por invasión de esferas competenciales en este rubro.
- c. Se permitiría crecer a los Ayuntamientos del Estado, al poder ellos mismos dirimir su controversias y conflictos con sus gobernados, asimismo, se agilizaría el funcionamiento del Tribunal Fiscal del Estado al conocer éste solamente de controversias y conflictos de índole estatal.
- d. Se dotaría de un procedimiento confiable, claro y preciso en cuanto hace a la impartición de justicia administrativa municipal.
- e. La desventaja que hasta la fecha se ha encontrado para su establecimiento es la siguiente: debido a la precaria situación económica que tienen algunos municipios del Estado de Tamaulipas, y como todos ellos se rigen por un presupuesto de egresos, será necesario destinar una partida para su instauración en los municipios, razón por la que la propuesta elegida dependerá de ello.

2. Respecto a su funcionamiento

Se considera necesario que el Tribunal de lo Contencioso Administrativo Municipal cuente con al menos una Sala Superior y tres salas regionales, y para tal fin será indispensable dividir al Estado en tres regiones: la del Centro, la del Sur y la del Norte. En la primera se establecería la Sala Superior y una regional, y se erigiría en el Municipio de Ciudad Victoria; además, por territorio, tendría competencia en

los siguientes municipios: Abasolo, Bustamante, Casas, Güemez, Hidalgo, Jaumave, Jiménez, Llera, Mainero, Miquihuana, Padilla, Palmillas, San Carlos, San Nicolás, Soto la Marina y Villagrán.

En la del Sur se establecería una Sala Regional, y se erigiría en Tampico; también, por territorio, tendría competencia en Aldama, Altamira, Antiguo Morelos, Ciudad Madero, Gómez Farías, González, El Mante, Nuevo Morelos, Ocampo, Tula y Xicoténcatl.

En la del Norte se establecería una Sala Regional, y se erigiría en Reynosa; por territorio, tendría competencia en Burgos, Camargo, Cruillas, Guerrero, Gustavo Díaz Ordaz, Matamoros, Méndez, Mier, Miguel Alemán, Nuevo Laredo, Río Bravo, San Fernando y Valle Hermoso. Una vez dividido el Estado en regiones, será necesario determinar la competencia de la Sala Superior y la de las salas regionales de los tribunales de lo contencioso administrativo municipales, mismas que se delimitaría en una iniciativa de ley que se denominaría: Ley de Justicia Contencioso Administrativa para los Municipios del Estado de Tamaulipas, y que para fines de una mejor comprensión del tema se transcribe lo siguiente: Por una parte, se encuentra la Sala Superior que tendría las siguientes atribuciones:

I. Resolver los recursos de revisión que se interpongan en contra de las resoluciones de las Salas Regionales; II. Establecer los criterios de interpretación de las disposiciones legales; III. Conocer las excitativas que para la impartición de justicia promuevan las partes, cuando los Magistrados de las Salas Regionales no dicten la resolución que corresponda dentro de los plazos señalados por esta ley; IV. Calificar las excusas o impedimentos de los Magistrados del Tribunal y en su caso, designar a quienes deban substituirlos; V. Resolver los conflictos de competencia que se susciten entre las salas regionales; VI. Establecer las reglas para la distribución de los asuntos entre las Salas Regionales y entre los Magistrados de la propia Sala; VII. Conocer del cumplimiento de las sentencias del Tribunal y en su caso ejecutarlas; VIII. Designar de entre sus miembros al Presidente del Tribunal; IX. Fijar y cambiar la adscripción de los Magistrados de las Salas Regionales; X. Designar a quienes suplan las ausencias temporales de los Magistrados de las Salas Regionales;

XI. Nombrar al Secretario de Acuerdos, a los Secretarios, a los Actuarios, Jefe de la unidad de apoyo administrativo, de documentación y difusión y defensores de oficio; así como concederles licencias y acordar lo que proceda con respecto a su remoción; XII. Dictar las medidas necesarias para el despacho pronto y expedito de los asuntos de la competencia del Tribunal; XIII. Designar las Comisiones de Magistrados que sean necesarias para la administración interna y representación del Tribunal; XIV. Formular anualmente el proyecto de presupuesto de egresos del Tribunal; XV. Expedir o modificar el reglamento interior del Tribunal, así como las demás disposiciones necesarias para su buen funcionamiento; XVI. Designar entre sus miembros a los Magistrados visitadores de las Salas Regionales, los que darán cuenta del funcionamiento de éstas a la Sala Superior; XVII. Dictar las medidas administrativas para el buen funcionamiento y disciplina de las Salas y aplicarlas a los secretarios, actuarios y demás empleados, incluso los defensores, en los casos procedentes; XVIII. Publicar las sentencias del Tribunal que considere deban darse a conocer por ser de interés general; XIX. Aplicar los medios de apremio para hacer cumplir las resoluciones del Tribunal; y XX. Las demás que señala esta ley. Por la otra se encuentran las salas regionales; la cuales tendrían las siguientes atribuciones:

I. Son competentes para conocer de los juicios que se inicien en contra de los actos o resoluciones dictados, ordenados, ejecutados o tratados de ejecutar, por autoridades administrativas, fiscales u organismos descentralizados de la Administración Pública Municipal, o de participación Municipal, que a continuación se indican: a) Que determinen la existencia de una obligación fiscal, la fijen en cantidad líquida o den las bases para su liquidación; b) Que nieguen la devolución de un ingreso de los regulados por las leyes de hacienda de los municipios, indebidamente percibido; c) Los dictados en el procedimiento administrativo de ejecución fiscal, siempre y cuando se afirme: 1. Que el crédito fiscal que se exige se ha extinguido legalmente; 2. Que se es poseedor, a título de propietario, de los bienes embargados en el

procedimiento administrativo de ejecución seguido contra otras personas; o que se es acreedor preferente al fisco, para ser pagado con el producto de los mismos; y 3. Que el procedimiento fiscal de ejecución no se encuentra ajustado a la ley. En este caso no podrá hacerse valer el juicio de nulidad sino contra la resolución definitiva en la que se apruebe o desapruebe el remate, excepción hecha de las resoluciones cuya ejecución material sea de imposible reparación. En los juicios que se promuevan por alguna de las causas a que se refieren los dos últimos números de este inciso, no podrá discutirse la existencia del crédito fiscal. d) Que causen un agravio en materia fiscal, distinto a los precisados en los números anteriores, así como todos aquellos actos realizados por cualquier autoridad administrativa, municipal, fuera del procedimiento de ejecución fiscal; e) Que impongan sanciones no corporales por infracción a las leyes y reglamentos municipales; f) Que constituyan responsabilidad administrativa en contra de los funcionarios, empleados o trabajadores al servicio de los municipios del Estado; g) Los dictados en materia de pensiones con cargo al erario municipal de cualquiera de los municipios de la entidad, o de las instituciones municipales de seguridad social; h) Que se refieran a la interpretación, cumplimiento o incumplimiento de contratos administrativos, en los que sea parte los municipios de la entidad, los organismos descentralizados o las empresas de participación municipal; i)

Los relativos a la responsabilidad reclamada a los municipios del Estado, a los organismos descentralizados o empresas de participación municipal. Estos organismos podrán repetir de los funcionarios o empleados responsables administrativamente del hecho o acto que originó el daño; j) Los relativos a las indemnizaciones que deban cubrirse a particulares, motivadas por la expropiación de bienes por causa de utilidad pública y que den motivo a controversia; k) Los relativos a la responsabilidad de los funcionarios o empleados de los municipios del Estado, de los organismos descentralizados o empresas de participación municipal mayoritaria de quienes provenga el acto administrativo, en los términos de la Ley de Responsabilidades de los Servidores Públicos del Estado de Tamaulipas; l) Los que se promuevan contra cualquier acto u omisión de las autoridades administrativas de los Municipios pertenecientes al Estado, o de los organismos descentralizados o empresas de participación municipal, que afecten los intereses jurídicos de los particulares; m) Los que se promuevan en contra de las resoluciones dictadas por autoridades administrativas o fiscales municipales, al resolver los recursos establecidos por las leyes y reglamentos respectivos; n) Los que promuevan las autoridades municipales o los titulares de los organismos descentralizados o las empresas de participación municipal para que sean nulificadas las resoluciones administrativas o fiscales dictadas por ellas mismas, favorables al particular; o) Los que se promuevan en contra de las resoluciones negativas fictas, configuradas por el silencio de la autoridad para dar respuesta a la instancia de un particular en el plazo que la ley fije o a falta de término en treinta días hábiles; p) Los demás juicios que se promuevan en contra de los actos o resoluciones que las leyes consideren como competencia de este Tribunal; q) De los recursos de reclamación que se interpongan en contra de los autos de desechamiento de la demanda o contestación; el que niegue la intervención del tercero perjudicado; y el que deseche las pruebas ofrecidas antes de la celebración de la audiencia del juicio; r) De reclamaciones por el incumplimiento de las sentencias de la propia Sala Regional; y s) De los recursos de queja.

II. Las atribuciones administrativas de la Sala Regional serán:

a) Despachar la correspondencia de la Sala; b) Rendir oportunamente al Presidente del Tribunal un informe bimestral de las labores de la Sala y de las principales resoluciones dictadas; c) Imponer las correcciones disciplinarias que procedan; d) Proponer a la Sala Superior los nombramientos de Secretarios, Actuarios, Defensores de Justicia Administrativa y al Presidente del Tribunal; el personal administrativo de la Sala; y e) Las demás que señalen las disposiciones aplicables.

III. Las Salas Regionales conocerán, por razón del territorio, de los actos o resoluciones que dicten u ordenen las autoridades administrativas con sede en su jurisdicción; pero si la resolución es susceptible de

ejecución, será competente la Sala Regional en cuya jurisdicción se ejecute, se haya ejecutado, trate de ejecutarse o deba tener ejecución.

CONCLUSIONES

De todo lo antes expuesto, podemos llegar a la firme convicción de que una vez realizada la reforma en los términos propuestos, sólo quedaría por instaurar los Tribunales Contenciosos Administrativos Municipales en el Estado de Tamaulipas, y lograr con esto el verdadero fortalecimiento de los municipios de México, particularmente los de nuestro Estado, para ser coherentes con la intención del legislador federal, en su reforma al artículo 115 constitucional de 23 de diciembre de 1999.

2. Finalmente, el último de los objetivos de este opúsculo es dejar con inquietud a los lectores, así como despertar el interés por el análisis de este tema en algunos de los servidores públicos encargados de la reformas a las leyes tanto federales como estatales.

RESUMEN

El objetivo de este trabajo es estudiar la relevancia y tendencias de las “prestaciones de previsión social” con la nueva reforma laboral que actualmente se vive en México, así como la pertinencia del impacto en el trabajador y el empleador. La Ley Federal del Trabajo no señala alguna definición de Previsión Social, aun cuando se trata de un término laboral (con implicaciones fiscales); sin embargo, este tipo de prestaciones son otorgadas a los trabajadores por el simple hecho de serlo, es decir, no están condicionadas a la calidad o productividad en la prestación del servicio y normalmente se incluyen en un plan de previsión social al interior de las empresas. La reforma laboral va orientada a impulsar la productividad, flexibilización en las contrataciones y empleabilidad, entre otras reformas propuestas; las cuales, de no articularse con otro tipo de modificaciones en el ámbito tributario, legal y penal, impactan en la disminución de las prestaciones de previsión social para las generaciones futuras.

PALABRAS CLAVE: Previsión Social, Prestaciones, Salarios, Trabajador.

LABOR REFORM: TREND OF THE FORECAST FOR THE NEW SOCIAL GENERATIONS

ABSTRACT

The objective of this article is to study the relevance and trends of the “benefits of social insurance” with the actual new reform in Mexico, just as the relevance of the impact on the worker and employer. The Federal Labor Law does not show any definition of Social Insurance, even when it is a technical term (with tax implications; however this type of benefits are granted to workers by the simple fact of being what it is, they are not subject to the quality of or productivity in the provision of the service and are normally included in a plan of social welfare within the companies. The labor reform is oriented to encourage productivity, flexibility in hiring, and employability, among other proposed reforms; which if not be articulated with other type of modifications in the area of taxation, and criminal law, impact in the decrease of benefits for future generations.

INTRODUCCION

Las condiciones de México han cambiado mucho desde que entro en vigor la Ley Federal del Trabajo (1970), tanto en el aspecto social, económico, político, demográfico, aunado al impacto del entorno mundial y la globalización. Esta situación hace necesaria una reforma estructural, que contemple y propicie condiciones favorables para generar empleo y promueva la competitividad sin agravio de las condiciones de bienestar social del trabajador. Si bien es cierto que los mercados laborales actuales hacen

necesaria una reforma laboral integral, las modificaciones propuestas en la actual reforma laboral no están articuladas con otro tipo de acciones que equilibre la protección social y el nuevo entorno. Por otra parte, se resalta que la otorgación de estas prestaciones beneficia a los trabajadores para satisfacer contingencias o necesidades presentes o futuras y su impacto en la superación de la calidad de vida y superación física, económica o cultural no debiera adquirir mayor dominio en las normas fiscales; olvidando el origen de una regulación más profunda como es la laboral.

Es así que las tendencias de la reforma laboral actual abarcan entre otros aspectos no menos importantes, el de favorecer la empleabilidad y productividad de los trabajadores; no obstante, la esencia o relevancia principal de las prestaciones de Previsión Social están pasando a segundo término para las futuras generaciones y las estrategias fiscales utilizando las citadas prestaciones, continúan tomando fuerza en las leyes fiscales para efectos tributarios. Lo antepuesto derivado de que México es un país donde la gran parte de la población económicamente activa percibe salarios con los que apenas se puede subsistir, justificando con esto, las estrategias fiscales para la promoción del otorgamiento de estas prestaciones, principalmente, para disminuir el impuesto sobre la renta y cuotas de seguridad social para el empleador y trabajador respectivamente.

REVISION DE LITERATURA

La Constitución de 1917 introdujo la garantía social del derecho al trabajo, reglamentaria del artículo 123 constitucional, denominada "Ley Reglamentaria del Artículo 123 Constitucional". La Ley Federal del Trabajo de 1970 contiene los principios para dar cumplimiento a los derechos sociales de los trabajadores consagrados en nuestra Carta Magna desde 1917 y las bases que permiten regular la relación de trabajo conforme al principio de dignidad del trabajo y de garantizar los derechos sociales de los trabajadores. Desde sus inicios, ha sido un ordenamiento legal fundamental para el bienestar social, la operación y desarrollo económico nacional y regional del país, aspectos todos esenciales para elevar los niveles de bienestar, el desarrollo humano y económico de México.

Legalidad Del Salario

Para abordar el tema de Previsión Social señalaremos su relación intrínseca con los salarios, así como con los incentivos y prestaciones. En México, el régimen contributivo es complejo y los salarios son un elemento esencial de las condiciones de trabajo y empleo en las entidades. Al ser éstos un costo para los empleadores y principal fuente de ingresos de los trabajadores, los salarios pueden ser objeto de conflictos y se han convertido en un trascendental tema de las negociaciones colectivas en todo el mundo. Al mismo tiempo, los salarios pueden causar situaciones de discriminación y privación si no se les garantiza a los trabajadores un nivel mínimo que sea digno. Desde el punto de vista de la economía, los salarios son parte importante de los costos laborales y son una variable esencial para la competitividad de las empresas que requiere ser analizada, también en su relación con otros factores como el empleo, la productividad y la inversión. Por estos motivos los Estados, junto con representantes de empleadores y trabajadores, han reconsiderado sus políticas salariales y han realizado importantes reformas o han evaluado nuevas estrategias, para lo cual se ha pedido apoyo a la Organización Internacional del Trabajo (OIT 2012).

En el artículo 3o. de la Ley Federal del Trabajo se señala que el trabajo es un derecho y deber social, no es artículo de comercio, exige respeto para las libertades y dignidad de quien lo presta y debe efectuarse en condiciones que aseguren la vida, la salud y un nivel económico decoroso para el trabajador y su familia; entendiéndose entonces el salario como un instrumento de justicia social.

Conceptos Por Pagos De Servicios Subordinados

En el ámbito laboral y de seguridad social prevalece el uso del vocablo "salario"; el artículo 123 apartado "A" de la Constitución, la Ley Federal del Trabajo y la Ley del Infonavit lo emplean Nuestra Ley Federal

del Trabajo, en el artículo 82, define el salario como: “la retribución que debe pagar el patrón al trabajador por su trabajo”, a su vez, el artículo 84 señala que el salario se integra con los pagos hechos en efectivo por cuota diaria, gratificaciones, percepciones, habitación, primas, comisiones, prestaciones en especie y cualquiera otra cantidad o prestación que se entregue al trabajador por su trabajo. Diccionario de la Real Academia:

a) *Salario*: salario. (Del lat. *salarium*, de *sal*, sal).

1. m. Paga o remuneración regular.

2. m. En especial, cantidad de dinero con que se retribuye a los trabajadores por cuenta ajena.

b) *Sueldo*: (Del lat. *solidus*).

1. m. Remuneración regular asignada por el desempeño de un cargo o servicio profesional.

2. m. Moneda antigua, de distinto valor según los tiempos y países, igual a la vigésima parte de la libra respectiva. Real Academia Española. Todos los Derechos Reservados La Ley del Impuesto sobre la Renta maneja varios conceptos para referirse a la retribución por la prestación de servicios personales subordinados: salario, sueldo e ingresos asimilados a salarios.

c) *Asimilables a Salarios*: Este concepto aparece en la Ley del Impuesto Sobre la Renta (LISR) para efectos fiscales. En este sentido, el artículo 110 de la LISR plantea ingresos que pueden recibir las personas físicas sin ser salarios. Lo que se asimila es una serie de ingresos a los que esta ley le da un tratamiento análogo al salario, ya que el término asimilable a salario no lo contempla la Ley federal del Trabajo.

Prestaciones E Incentivos: Para comprender cabalmente la jerarquía de las prestaciones de previsión social, a continuación se presenta explicación de lo que se considera “incentivos” y “prestaciones”; lo que nos lleva a resumir que las prestaciones de previsión social se otorgan por el simple hecho de serlo, es decir, no están condicionadas a la calidad, cantidad o prestación del servicio o trabajo y normalmente se incluyen en un plan de previsión social al interior de la empresa.

Incentivos: El aspecto legal a observar por la empresa al otorgar un incentivo, es que una vez establecido un sistema de esta clase resulta obligatorio, en virtud de que de alguna forma se integra a las condiciones del trabajo convenidas por la compañía, sólo que a diferencia de las prestaciones que guardan el mismo principio, éstos se otorgan únicamente por méritos del trabajador. Ocurre con mucha frecuencia, sobre todo tratándose de incentivos sobre ventas, que las empresas pretendan modificar el incentivo otorgado y los trabajadores se nieguen a aceptar tal modificación. Al respecto se debe señalar que los incentivos podrían ser sustituidos con la anuencia de los trabajadores, pero no eliminados, pues se trataría de una renuncia de derechos, no permitida según lo establecido en el artículo 33 de la Ley Federal del Trabajo (LFT).

Entre los incentivos se pueden citar: Gratificaciones extraordinarias; Premios por: asistencia, puntualidad, productividad y compensación por antigüedad. Como puede apreciarse en esta última lista, el trabajador se ve obligado a cumplir con determinado requisito para tener derecho a la retribución.

Prestaciones: El otorgamiento de estos conceptos tiene como finalidad proporcionar a los trabajadores y a sus familias la satisfacción de sus necesidades esenciales y la posibilidad de superación de su nivel de vida, esto es, las concede el patrón a sus trabajadores por el simple hecho de tener esa calidad, por tanto, no las vincula con la prestación del servicio. Regularmente este tipo de prestaciones se plasman en un plan de previsión social o en las políticas por escrito del otorgamiento de prestaciones, en donde se precisan cuales son estos beneficios y quienes tienen derecho a los mismos, y una vez otorgados ya no se pueden eliminar, salvo que se justifique ante la Junta de Conciliación y Arbitraje la razón por la que se desea hacer y ésta analice y autorice tal modificación en las prestaciones de los trabajadores (artículos 17,

33 y 57 de la LFT). Como puede apreciarse, los incentivos o premios resultan sin duda atractivos para los trabajadores, por lo que las empresas deben constituirlos como un instrumento para el logro de sus objetivos.

Naturaleza de las prestaciones: A diferencia de lo que ocurre con los incentivos o premios, las prestaciones aunque no estimulan la productividad, sí generan un sentimiento de lealtad a la compañía.

Incentivos contra Prestaciones: Ciertamente los incentivos tienen una naturaleza diferente a la de las prestaciones, pues las últimas forman parte de la estructura salarial otorgada usualmente a todo el personal, en virtud de que son parte de la contratación misma en cuanto al elemento salarial se refiere. Por su parte, los estímulos si bien son ofrecidos a los trabajadores en general, no siempre son otorgados a éstos en su conjunto, ya que su obtención está vinculada al logro de un objetivo determinado por la empresa, en tanto que las prestaciones se otorgan simplemente por ser trabajador de una compañía, por ejemplo: Gastos médicos y/u hospitalarios; Despesas; Ayuda económica por fallecimiento; Subsidio por incapacidad; Ayuda para transporte; Becas educacionales, Guarderías infantiles; Cuotas IMSS pagadas por el patrón entre otras.

Es preciso comentar que algunas de estas prestaciones se otorgan ciertamente sólo a un sector de los trabajadores en el país, pero ello obedece a la naturaleza de la prestación, así como a los razonamientos de orden legal, principalmente en materia de seguridad social y fiscal.

Legalidad De La Prevision Social

Una vez analizada la naturaleza de los salarios, así como la diferencia entre los incentivos y las prestaciones; nos enfocamos al análisis de las Prestaciones de Previsión Social para analizar la tendencia que van tomando con la propuesta de reforma laboral actual. En su artículo segundo, la Ley Federal del Trabajo 2012, establece que: “Las normas de trabajo tienden a conseguir el equilibrio y la justicia social en las relaciones entre trabajadores y patrones”. Las prestaciones de previsión social contempladas en diferentes ordenamientos, desde la Constitución Política hasta las leyes federales, se rigen bajo los principios rectores de justicia social implícitos en los preceptos de referencia y todas ellas tienden a generar condiciones favorables a los trabajadores para el desempeño de sus actividades, no sólo en el aspecto económico, sino también en lo que concierne a su dignidad humana.

Por lo tanto, en el derecho mexicano, la previsión social emanó como un capítulo del derecho laboral y complementario del derecho individual del trabajo como se corrobora en el rubro del artículo 123 constitucional: “Del trabajo y la previsión social”. No obstante lo anterior, la Constitución Política Mexicana y Ley Federal del Trabajo no señalan textualmente alguna definición propia de Previsión Social, aun cuando se trata de un término laboral aunque con alcances fiscales.

Conceptos De Prevision Social

En el Diccionario de la Real Academia Española, 2012, se manifiesta que el término previsión social, puede definirse como la “acción de prever lo conveniente para atender a contingencias o necesidades previsibles, mientras que la palabra social es un adjetivo y significa perteneciente o relativo a la sociedad o a las contiendas entre unas y otras clases”. De igual forma el Diccionario Jurídico sobre Seguridad Social, 2012, señala que el concepto previsión social se refiere al “apoyo económico que se otorga a obreros y empleados, así como a sus familiares, en el caso de sobrevenir la falta de medios para subsistir por motivos naturales o involuntarios, derivados de accidentes, enfermedades, paros forzosos, invalidez, ancianidad o fallecimiento”. Entre otras definiciones importantes podemos mencionar la siguiente:

Bobadilla, R., 2005, hace referencia a una definición del autor Mario de la Cueva, donde define la previsión social como: Las políticas y las instituciones que se proponen contribuir a la preparación y ocupación del trabajador, para facilitarle una vida cómoda e higiénica y asegurarle contra las

consecuencias y los riesgos naturales, sociales y profesionales. Existen definiciones emitidas por los tribunales judiciales dentro de las cuales podemos citar la siguiente tesis:

*Tesis: 2a. XLV/2010 Semanario Judicial De La Federación Y Su Gaceta Novena Época 164248
8 De 40 SEGUNDA SALA XXXII, Julio De 2010 Pag. 324 Tesis Aislada (Constitucional,
Administrativa) [TA]; 9a. Época; 2a. Sala; S.J.F. Y Su Gaceta; XXXII, Julio De 2010; Pág. 324 RENTA.
EL ARTÍCULO 80. DE LA LEY DEL IMPUESTO RELATIVO, QUE CONTIENE EL CONCEPTO DE
PREVISIÓN SOCIAL DIRIGIDO TAMBIÉN A LAS SOCIEDADES COOPERATIVAS, RESPETA EL
PRINCIPIO DE EQUIDAD TRIBUTARIA (LEGISLACIÓN VIGENTE A PARTIR DEL 5 DE JUNIO DE
2009).*

El precepto legal citado no considera previsión social a las erogaciones efectuadas a favor de personas que no tengan dicho carácter; sin embargo, esta última precisión sólo se traduce en el reconocimiento del derecho de los socios o miembros de dichas sociedades a gozar del beneficio referido, y no implica que se equiparen las relaciones entre trabajadores y patrones con la existente entre las sociedades cooperativas y sus socios. Ahora bien, en atención a que el objetivo de considerar a las sociedades cooperativas como personas obligadas a otorgar tal beneficio surgió por la necesidad de evitar la erosión de la base del impuesto sobre la renta, ya que fue notorio el incremento de sociedades cooperativas dedicadas a la prestación de servicios profesionales y al suministro de recursos humanos creadas para reducir cargas

fiscales y de seguridad social, provocando la no retención del impuesto de que se trata, resulta indudable que el artículo 80. de la Ley del Impuesto sobre la Renta, vigente a partir del 5 de junio de 2009, respeta el principio de equidad tributaria contenido en el artículo 31, fracción IV, de la Constitución Política de los Estados Unidos Mexicanos, pues da un trato distinto a sujetos diferentes, y además porque sólo destaca lo que debe entenderse por previsión social, entendida como la prestación que debe beneficiar a los trabajadores, socios o sus familiares; luego, cualquier erogación efectuada a favor de persona distinta no puede considerarse como tal, pues no se cumpliría con el objetivo de satisfacer contingencias o necesidades presentes o futuras en beneficio de los trabajadores, socios o miembros de las sociedades, logrando con ello su superación física, económica o cultural, para mejorar su calidad de vida y la de su familia.

Jurisprudencia

Materia(s): Administrativa

Renta, Impuesto Sobre La. Gasto De Prevision Social. Concepto. Tomando En cuenta lo dispuesto por los artículos 20, fracción VII, y 26, fracción VII, de la Ley del Impuesto sobre la Renta en vigor para el ejercicio de 1975, en relación con el artículo 50, fracción II, inciso b) del mismo ordenamiento legal, por gasto de previsión social a cargo de una empresa, debe entenderse aquel que se traduce en una prestación en beneficio de los trabajadores, de sus familiares dependientes o beneficiarios, tendientes a su superación física, social, económica, cultural e integral; esto es, toda prestación en beneficio de los trabajadores y de sus familiares o beneficiarios que tengan por objeto elevar su nivel de vida económico, social, cultural e integral.

TERCER TRIBUNAL COLEGIADO EN MATERIA ADMINISTRATIVA DEL PRIMER CIRCUITO.
Amparo directo 843/77. Embotelladora de Reynosa, S.A. 29 de noviembre de 1977. Unanimidad de votos.
Ponente: Sergio Hugo Chapital Gutiérrez.
Nota: En el Informe de 1978, la tesis aparece bajo el rubro "RENTA, IMPUESTO SOBRE LA GASTO

DE PREVISION SOCIAL. CONCEPTO."

Genealogía:

Informe 1978, Tercera Parte, Tribunales Colegiados de Circuito, tesis 81, página 198.

Por otra parte, continúa vigente la definición de Previsión Social en el artículo 8 penúltimo párrafo de la Ley del Impuesto sobre la Renta 2012, el cual establece: Para los efectos de esta ley, se considera previsión social las erogaciones efectuadas que tengan por objeto satisfacer contingencias o necesidades presentes o futuras, así como el otorgar beneficios a favor de los trabajadores o de los socios o miembros de las sociedades cooperativas, tendientes a su superación física, social, económica o cultural, que les permitan el mejoramiento en su calidad de vida y en la de su familia. En ningún caso se considerará previsión social a las erogaciones efectuadas a favor de personas que no tengan el carácter de trabajadores o de socios o miembros de sociedades cooperativas.

Consideraciones Estipuladas En La Ley Del Seguro Social
