# A SCHEME FOR ASSESSING NON-OIL EXPORTS PERFORMANCE (NEP)-EVIDENCE FROM NON-OIL EXPORTING FIRMS IN NIGERIA

Sama'ila Idi Ningi, Abubakar Tafawa Balewa University, Bauchi- Nigeria

## ABSTRACT

*Using the 644 registered performing non-oil export firms in Nigeria obtained from Nigerian Export Promotion Council, a sample of 193 firms was arrived at using Israel formula. Due to some methodological difficulties only 120 Non-oil exporting firms (NEF) representing 62.17% of the sample size actually filled and returned a questionnaire used for the assessment. The Five point likert scale questionnaire was constructed ranging from strongly agree =1, agree =2, undecided =3, disagree =4, strongly disagree =5. It consists of five (5) sub-sections specifically seeking information on the Bank financing (BF) and the dependent variable non-oil exports performance (NEP). Validity, reliability and normality of the research instrument were assessed and found to be fit for analyses. Data on the underlying variables of interest were assembled and regression was employed to estimate the quantitative effect of the independent variables upon the variable that they influence. This was done after examining Principal assumptions of multiple regressions on the data. The method was found suitable for analyzing Bank finance of non-oil exports in Nigeria.*

**KEY WORDS:** - Scheme, Assessing Non-Oil Exports Performance (NEP), Firms in Nigeria

## INTRODUCTION

A cross- sectional survey research method was used to assess bank financing of non-oil exports. Questionnaires were constructed and distributed to non-oil exporting firms in Nigeria. Non-oil export performance (NEP) was identified as dependent variable; the independent variables are the cost of bank finance (CBF), foreign currency exchange rates (ERN), and exporting firms' perception of bank attitude to risk of financing non-oil exports (FPBARF) another variable was the access to credit facilities to non-oil exporting firms (ACN).

*Population of the Study:* The target population was the 644 registered performing non-oil export firms in Nigeria obtained from Nigerian Export Promotion Council.

*Sampling Procedure and Sample Size Determination:* Simple random sampling and Judgmental sampling techniques were used; Lagos, Kano and Port Harcourt, Kaduna, Jos and Abuja cities were used to reach 193 non-oil export firms.

## Data Collection Instruments

Data were sourced from questionnaire distributed and retrieved from 120 Non-oil exporting firms (NEF) representing 62.17% of the sample size, Nigerian Export-Import Bank (NEXIM) and the Central Bank of Nigeria (CBN) filled and returned the questionnaire. Many of the states in Nigerian have no non-oil exporting firms or have very few (NEPC, 2010). Response rate was affected by the inability to locate some of the firms. More so most of the firms are located in Lagos and Kano metropolitan areas where response rate may be low as posited by (Frederik, Filip, Eveline and Beata, 2010; Papadopoulos 2003; Frederik, Filip, Eveline, Beata, 2010 and Deepali, Rahul, Snehal, Kannaujia and Puneet, 2011).

### The Questionnaire Design

The questionnaire was divided into five (5) sub-sections specifically seeking information on the following items:-

*Costs of Bank Finance to Non-Oil Exports (CBFN):* High cost of borrowing and difficult access to credit, inability to access institutional credit to replace equipment and modernize factory; lack of adaptation of institutional financial services to the development needs of the country is one of the major causes discouraging production in general and for export, or discouraging potential exporters from entering into export business. This is in line with studies by (Odularu, 2008; Chukuigwe, 2008 Sanusi, 2010a, 2010b).

*Effects of exchange rates on non-oil exports (ERN):* This affected the ability of non-oil exporting industries to procure raw materials from abroad and equally constrains the availability of trade credits for non-oil exporting by banks (Oyejide, 1986 [Elumelu](#), 2002 and Theodore, 2004). In line with previous studies variables.

*Volume and Access to credit to non-oil Exports (VACN):* Access to banks financial services for non-oil exporters is one of the major problems stifling the growth of non-oil exporting firm in Nigeria, because of high interest rates and little disbursement in terms of the volume of credit (Ijaiya, 2003; Theodore, 2004 and Sanusi, 2010a, 2010b).

*Firms' Perception of Bank Attitude to Risk of Financing Non-Oil Exports (FPBARF):* The risk-averse behavior of banks in funding non-oil exports in Nigeria has constrained the non-oil exporting firms from obtaining loans and hence the contribution of this sub-sector to GDP (Crocket, 1997; Ogujiuba, Ohuche and Adenuga, 2004).

*Non-Oil Exports Performance (NEP):* In this research based on previous researches, such as the research by (Osuntogun, Edordu and Oramah, 1997; Theodore, 2004; Lages, 2000 and Czinkota, 1994) rate of growth in non-oil exports, non-oil Export product quality improvement, firm's ability to compete at the international market and rate of growth in earnings in non-oil exports were used. In addition non-oil exporting firm's characteristics has also been analysed visa-a-vis the derivers of non-oil exporting financing.

### Tests for Validity of Data Collection Instruments

Expert review was used to establish validity of the research instrument. Pearson correlation was used to measure the validity of the constructs used in the study. Table 1 displays the result statistics showing the relationship between the 4 independent variables and the dependent variable.

### Tests for Reliability of Data Collection Instruments

Cronbach's alpha was calculated for the data using SPSS software package which revealed alpha values ranging from .516 to .724 (Hinton et al, 2004).

Table 1: Pearson Correlation

		Non-oil Exports Performance	Cost of Bank Finance to Non-oil Exports	Effect of Exchange Rate on Non-oil Exports	Firms Perception of Bank's Attitude Risk of Financing Non-oil Exports	Access to Credit Facilities For Non-oil Exports
Pearson Correlation	Non-oil Exports Performance	1.000				
	Cost of Bank Finance to Non-oil Exports	-.309	1.000			
	Effect of Exchange Rate on Non-oil Exports	-.110	.409	1.000		
	Firms Perception of Bank's Attitude Risk of Financing Non-oil Exports	-.362	.469	.305	1.000	
	Access to Credit Facilities For Non-oil Exports	-.079	.309	.279	.267	1.000

Source: Field survey, 2011

## METHODS OF DATA ANALYSIS

Five point likert scale questionnaire was constructed ranging from strongly agree =1, agree =2, undecided =3, disagree =4, strongly disagree =5. The independent variables were measured against the dependent variable is non-oil Exports Performance (NEP).

### Data Normality

Box plots were used to assess the normality of the data. Refinements were made to the basic box plots by combining two constructs i.e volume and access to credit facilities (renamed access to credit facilities) eliminate extreme values or outliers, means, and significant differences. Having done that, the data exhibits no outlier and the shape of the box plot indicate some degree of normality. The graphical methods used included box plots it also included the histogram, as explained earlier all outliers detected were cleaned and for the histogram it exhibits a high degree of normality as it is bell-shaped as with all normal curves (Brian, 2007). The means of the distribution of the various constructs varies from 2.1885 to 2.3202. The dependent variable non-oil exports performance has a mean value of 3.9875. The skewness and kurtosis statistics for the variables cost of bank finance which are 0.875 and 0.271 respectively, effect of exchange rate on non-oil exports 0.501 and -0.345, firms perception of banks attitude to risk of financing non-oil exports has a skewness value of 1.011 and kurtosis of -.122. For access to credit facilities to non-oil exports skewness and kurtosis values are 0.518 and -.455. The dependent variable is also having skewness and kurtosis of -0.024 and .035 respectively. Based on the descriptive statistics displayed the data is normal to an acceptable degree kim, (2003).

Table 2: Descriptive Statistics

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance	Skewness	Kurtosis
Non-oil Exports	Statistic: 120	Statistic: 2.00	Statistic: 3.00	Statistic: 5.00	Statistic: 3.9875	Statistic: .47617	Statistic: .227	Statistic: -.024	Statistic: .035
Cost of Bank Finance to	Statistic: 120	Statistic: 1.20	Statistic: 1.80	Statistic: 3.00	Statistic: 2.2083	Statistic: .31048	Statistic: .096	Statistic: .875	Statistic: .271
Effect of Exchange Rate on	Statistic: 120	Statistic: 1.40	Statistic: 1.60	Statistic: 3.00	Statistic: 2.2100	Statistic: .32781	Statistic: .107	Statistic: .501	Statistic: -.345

Valid N (listwise)	120								

Source: field survey 2011

### Regression Analysis

The “statistical significance” of the estimated relationships, that is, the degree of confidence that the true relationship is close to the estimated relationship was found (Barrett, Marc and Janet, 2010). As mentioned earlier normality of the data was checked using various descriptive statistics and the data was found to exhibit an appreciable degree of normality as suggested by (Hinton, Brownlow, McMurray and Cozens, 2004).

*Assumptions of regression:* Issues of linearity, adequacy of sample and normality of the model were looked in to.

*Adequacy of the sample:* In respect of sample size Tabachnick and Fidell (2001), observed that “a rule of thumb for testing b coefficients is to have  $N \geq 104 + m$ , where  $m$  = number of independent variables”. Another popular rule of thumb is to have at least 20 times as many cases as independent variables (Coakes, 2005; Hair et al., 2006). With 4 independent variables and a sample size of 120, the sample of this research satisfied the sample size requirements of  $N \geq 104 + 4$  i.e.  $N > 108$  and  $N \geq 20 \times 4$  i.e.  $N > 80$  prescribed by Tabachnick and Fidell (2001) and (Coakes, 2005; Hair et al., 2006) respectively.

*Model linearity and Homoscedasticity:* the model followed a linear pattern signified by the p-p plot of the standardised residuals plot. The variance of residuals is homogenous across levels of the predicted values.

*Normality of the Model:* The model showed a random scatter of the points with a constant variance and with no value beyond  $\pm 3$  standard deviation reference line. This indicates absence of outliers in the residuals. The residuals appear to be approximately a normal distribution. The assumptions of regression are met since the residuals show the points close to the line. In assessing the assumption of multivariate outliers, standardize residual values and Mahalanobis distance are examine as suggested by Coakes (2005), Pallant (2001) and Tabachnick and Fidell (1996). The minimum .338 and maximum 14.795 mahalanobis distance values were found respectively in table 3. The mahalanobis distance maximum value of 14.795 is less than critical chi-square benchmark of 18.47 applicable for dataset with 4 independent variables.

*Multicollinearity:* Correlation matrix of the study does not show any evidence of multicollinearity as all the constructs has correlation coefficient ranging from -0.079 to -0.362. The collinearity statistics in table 4 indicate tolerance level and variance inflation factor (VIF). All these appear to be within limit and therefore indicate absence of collinearity in the distribution.

Table 3: Residuals Statistics<sup>a</sup>

	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	3.5174	4.2929	3.9875	.19092	120
Std. Predicted Value	-2.462	1.600	.000	1.000	120
Standard Error of Predicted Value	.047	.162	.087	.027	120
Adjusted Predicted Value	3.5194	4.3268	3.9861	.19255	120
Residual	-1.16137	1.09094	.00000	.43621	120
Std. Residual	-2.617	2.459	.000	.983	120
Stud. Residual	-2.640	2.513	.001	1.004	120
Deleted Residual	-1.18147	1.14010	.00136	.45525	120
Stud. Deleted Residual	-2.712	2.574	.002	1.014	120
Mahal. Distance	.338	14.795	3.967	3.098	120
Cook's Distance	.000	.089	.009	.015	120
Centered Leverage Value	.003	.124	.033	.026	120

Source: field survey 2011 a. Dependent Variable: Non-oil Exports Performance

## CONCLUSION

Having assessed the assumptions of multiple correlation and regression the succeeding parametric and inferential analysis was done. The method was found suitable for analyzing Bank finance of non-oil exports in Nigeria. However, the factors influencing non-oil exports performance includes other non bank financial and non financial factors which must also be included to measure the performance of the sector with more precision.

Table 4: Collinearity Statistics<sub>a</sub>

Model	Collinearity Statistics	
	Tolerance	VIF
1(Constant)		
Cost of Bank Finance to Non-oil Exports	.685	1.461
Effect of Exchange Rate on Non-oil Exports	.796	1.256
Firms Perception of Bank's Attitude Risk of Financing Non-oil Exports	.753	1.328
Volume and Access to Credit Facilities For Non-oil Exports	.863	1.158

a. Dependent Variable: Non-oil Exports Performance

# A CASE STUDY OF THE CASH FLOW STATEMENT: US GAAP CONVERSION TO IFRS

Peter Harris, New York Institute of Technology

Liz Washington Arnold, The Citadel

Katherine Kinkela, New York Institute of Technology

William Stahlin, Stevens Institute of Technology

## ABSTRACT

*International Reporting Standards (IFRS) has become the required framework for most of the world financial markets effective on January 1, 2011. The United States is in a transformation stage, and it has not yet been determined when the US will adopt IFRS. The introduction of IFRS accounting rules into the curriculum is valuable because it presents an alternative method of accounting which can be used to heighten students understanding of GAAP. At present, the CPA Uniform CPA exam is testing IFRS and its testing content is increasing with each current test. Additionally, the CFA exam tests IFRS exclusively and has eliminated US GAAP from its curriculum, basing its action on the fact that the CFA examination is a global based exam. This case requires students to prepare an IFRS cash Flow Statement from a presented US GAAP presented Statement of Cash Flow, from a given set of facts in the case. This case study can be used at the undergraduate or graduate level. It is most suitable for Intermediate Accounting 2, Accounting Theory, Financial Statement Analysis, and an Accounting Capstone classes. Students must have or develop a solid understanding of both US GAAP and IFRS rules is required to adequately address this cash flow case study.*

**JEL:** H83, G32, M41, M42

**KEYWORDS:** US GAAP, IFRS, LIFO, Statement of Cash Flows.

## COMPANY BACKGROUND

JAL Corp, a publically traded NASDAQ company (symbol JAL), is a manufacturer of prescription drugs. Its main headquarters is based in Miami, Florida and the company has been operating since 1981. The company sells its products on the worldwide retail market. The primary compound in JAL's leading products is found only in the rainforests of Central America. Its major customer is Wal-Mart. Its stock sells at 45 US dollars per share, and its 52 week price range is between 37.75 and 67.85 US Dollars, with a market cap of 10.2 billion dollars.

The financial statements presented below for the Year Ending December 31, 2011 have been prepared using US GAAP. JAL's controller, Mercedes, would like to see the effect of using IFRS on the statement of cash Flows.

**JAL CORP.****Cash Flow Statement (Direct method) under US GAAP****1/1/2011-12/31/2011**

<b>Cash Flow From Operations</b>		Cash Collections from Sales	\$ 266,000
Cash paid for Operating Expenses	( 29,000)	Cash paid to Suppliers	( 183,000)
Cash Flow Provided from Operating Activities	41,000	Cash paid for Interest Expense	( 4,000)
		Cash paid for Income Taxes	( 9,000)
<b>Cash Flow from Investing</b>		Purchase of Equipment	( 13,000)
Net Increase in Cash for the Year 2011	25,000	Beginning Cash Balance	28,000
		Ending Cash balance 12/31/2011	<u>\$ 53,000</u>

The company would like to adapt IFRS by as early as next year as it is considering a new stock issue in Costa Rica, which requires IFRS compliance. You have been assigned the task of converting this cash flow financial statement from US GAAP to IFRS.

**ADDITIONAL INFORMATION**

- 1- JAL Corp. uses the LIFO method to account for its inventory. The LIFO reserve was \$15,000 at the beginning of the year and \$19,000 as of year-end. The effective tax rate for JAL is 25 percent. The company pays all tax liabilities when accrued.
- 2- Management has established that there is an increase in the Fair market value of Property, Plant and Equipment as of 12/31/11 of \$6,000 above book value.
- 3- In 2011, the company spent \$4,000 on internally feasible development costs, which relates to their pipeline of pharmaceutical drugs.
- 4- JAL leased specialized machinery manufactured by the lessor, Bell Corp. The lease term is for 3 years with a lease payment made to lessor in the amount of \$5,000. Payment is due on December 31 of each year, with the first payment due on December 31, 2011. At the end of the lease term, ownership reverts back to lessor. There is no option to buy the equipment.
  - The lessee will pay all executor costs.
  - The estimated useful life of the lease is 49 months; 4 and 1/12 years.
  - The fair market value of the equipment is \$15,000.
  - The implicit rate of Bell Corp. is 6 percent, and this is known to the lessee, Axe.
  - The incremental borrowing rate of Axe is 7 percent.
  - This lease is treated as an operating lease under US GAAP, and the US GAAP prepared cash flow statement reflects this.
  - Under IFRS, this lease is treated as a capital/financing lease.
- 5- Assume that AXE has elected to treat interest expense as a cash flow from operations activity, thereby being consistent with the US GAAP prepared statement.

**REQUIRED**

- 1- For items 1-4, identify whether there will be a change in cash flow under IFRS, a reclassification of cash flows, or no effect on cash flow.

- 2- For items 1-4, identify where applicable, the reclassification of cash flow among operating, investing and financing activities.
- 3- Make the necessary changes on the worksheet presented.
- 4- Prepare an IFRS Compliance Cash Flow Statement for the period 1/1/11 to 12/31/11
- 5- What other differences exist between US GAAP and IFRS Cash Flow presentation.

NOTE: The focus here is only on the Cash Flow Statement.

## RECOMMENDED SOLUTIONS

### SOLUTIONS 1 and 2:

- 1- IFRS disallows the use of LIFO as an acceptable accounting method. LIFO is allowed under US GAAP, and if used for financial reporting purposes, has to be used for tax purposes: known as the conformity rule. In this case, IFRS will require the use of FIFO and the differential between the cost of goods sold and pre-tax total between LIFO and FIFO will equal the difference in the beginning and the end of year LIFO Reserve. This amount is \$19,000 less \$15,000, which equals an increase in pre-tax income under FIFO, by virtue of a higher ending inventory total and lower cost of goods sold amount of \$4,000. At a tax rate of 25 percent, this amounts to a greater cash tax payment under FIFO of \$1,000. This will cause a decrease in cash flow under IFRS by virtue of FIFO use. Cash will be reduced by \$1,000 to \$52,000.
- 2- The increase in the carrying amount of Property, Plant and Equipment which is allowable under IFRS and precluded under US GAAP, has no effect on cash flows. It increases comprehensive income on the balance Sheet by \$6,000.
- 3- The development costs are capitalized under IFRS, if such costs are traceable and if deemed feasible. Under US GAAP, such costs are expensed when incurred. As such, the \$4,000 is reclassified under IFRS as a cash payment for Investing Activities, from cash paid from operating activities under US GAAP.
- 4- A reclassification from operating lease, which treats the rent payment as an operating expense; a cash payment for operating activities, to a capital / financing lease, will result in the purchase of an asset and an incurrence of a liability in the same amount, calculated by discounting the minimum lease payments using the lower implicit rate of the lease or the lessee's incremental borrowing rate. The payment of the lease obligation will thus result as a cash payment for financing activities; which includes a payment of the minimum lease obligation and an interest payment. The amortization table is presented below:

Assuming a capital/financing lease, the amortization table is as follows:

Year	Payment	Interest-6%	Principal	Minimum Lease Obligation-Payable
1	\$5,000	802	4198	9,167
2	\$5,000	550	4450	4,717
3	\$5,000	283	4717	0
Total	\$15000	1,635	13365	N/A

### Effects on the Cash Flow Statement

A: In the year of inception US GAAP treats the \$5,000 rent expense as an operating lease payment; a cash outflow from continuing Operations as an Operating expense on the income statement.

Under IFRS, the financing/ capital lease is treated as a purchase of Property, Plant and Equipment and Capitalized on the balance Sheet as such in the amount of \$13,365, with a corresponding liability in this amount. The effect of the cash flow statement is the payment of the \$5,000 results in a cash payment of the minimum lease obligation—a cash outflow from Financing Activities in the amount of \$4,198, and an interest payment—a cash outflow from Financing activities or Operating Activities for \$802; keeping the same total amount payment of \$5,000.

B: Subsequent to Year of Inception—years 2 and 3 of lease payments:

US GAAP: The \$5,000 annual Lease payment is treated as a rent expense; a cash outflow from Continuing Operations as an Operating expense.

IFRS: The \$5,000 lease payment is treated as an interest expense payment and a reduction in the liability—Minimum lease obligation Under Financing/ Capital Lease, in the amounts enumerated above per year 1, 2 and 3 calculations. The interest expense is treated either as a cash Outflow from Continuing Operations or a financing activity payment, and the minimum lease obligation payment is treated as a cash outflow from financing activities.

### The Resulting Cash Flow Effect under IFRS

There will be a decrease in cash flow under IFRS by virtue of FIFO use. Cash will be reduced by 1,000 to \$52,000.

### **Solution 5: Other Differences between US GAAP and IFRS Cash Flow Statement Classifications:**

Interest Expense is treated either as a cash flow from operations or a cash flow from financing for IFRS purposes. For US GAAP, interest expense is a cash outflow from continuing operations. Additionally, Interest Revenue and Dividend Revenue under IFRS, is treated either as a cash flow from operations or a cash flow from investing activity, whereas under US GAAP, these items are treated as cash inflows from operating activities.

### **CONCLUSION**

IFRS is the future of worldwide financial reporting and should be included as a major part of any accounting and/or business curriculum in the US, as well as the rest of the world. This case illustrates a situation where a Cash Flow Statement is prepared using US GAAP as a basis and converting to IFRS for comparison purposes. In this case study IFRS rules are discussed, and key Cash Flow similarities and differences between US GAAP and IFRS are addressed. The differences between US GAAP and IFRS can lead to significant reporting of cash flows, as well as different cash totals, as illustrated in this case.

**SOLUTION 3: AXE CORP.****Cash Flow Statement (Direct method) US GAAP to IFRS Adjustments and Reconciliation  
1/1/2011-12/31/2011**

<u>Flow</u>	<u>US GAAP</u>	<u>ADJUSTMENTS</u>	<u>IFRS Cash</u>
<b><u>Cash Flow From Operations</u></b>			
Cash Collections from Sales	\$ 276,000		276,000
Cash paid to Suppliers	( 183,000)		( 183,000)
Cash paid for Operating Expenses	( 39,000)	(3)4,000 +(4) 5,000	( 30,000)
Cash paid for Interest Expense	( 4,000)	(4) ( 802)	( 4,802)
Cash paid for Income Taxes	<u>( 9,000)</u>	<u>(1) (1,000)</u>	<u>(10,000)</u>
Cash Flow Provided from Operating Activities	41,000	7,198	48,198
<b><u>Cash Flow From Investing</u></b>			
Purchase of Equipment and Development Costs	<u>( 13,000)</u>	<u>(3)( 4,000)</u>	<u>(17,000)</u>
Cash Flow from Investing Activities	(13,000)		(17,000)
<b><u>Cash Flow From Financing Activities</u></b>			
Cash Dividends paid	( 3,000)		( 3,000)
Payment of Minimum Lease Obligation Liability	( 3,000)	<u>(4) ( 4,198)</u>	<u>(4,198)</u>
Cash Flow From Financing Activities		(4,198)	( 7,198)
Net Increase in Cash for the Year 2011	25,000	<b>(1,000)</b>	24,000
Beginning Cash Balance	<u>28,000</u>		<u>28,000</u>
Cash balance 12/31/2011	<u>\$ 53,000</u>	<u><b>(1,000)</b></u>	<u>\$ 52,000</u>

*Note: (1) The decrease of \$1,000 cash is a result of higher taxes paid by virtue of additional income of \$4,000, by the use of FIFO-as LIFO is not acceptable under IFRS. (25 percent tax rate time's \$ 4,000 results in \$1,000 of additional tax). (3) The development cost has been reclassified from operating expense to an investing activity-as the \$4,000 represents the purchase of an intangible asset. (4) The \$5,000 has been reclassified as a result of operating to capital/financing lease treatment under IFRS*

**Solution 4: IFRS Prepared Cash Flow Statement****AXE CORP.****Cash Flow Statement (Direct method) : IFRS Prepared

# ENGAGING STUDENTS IN ONLINE MARKETING CLASSES

Susan Silverstone, National University  
Jesse Keeler, University of California Irvine Extension

## ABSTRACT

*The 2011 Sloan Survey of Online Learning revealed that “the number of students taking at least one online course has now surpassed 6 million. Nearly one-third of all students in higher education are taking at least one online course. The rate of growth in online enrollments is ten times that of the rate in all higher education.” The authors, a subject matter expert and an instructional technologist at National University, a not for profit California university, will share how they updated an existing four week undergraduate online marketing course, to include the seven key principles identified by Graham C. et al (2001),*

*Principle 1: Good Practice Encourages Student-Faculty Contact*

*Principle 2: Good Practice Encourages Cooperation among Students*

*Principle 3: Good Practice Encourages Active Learning*

*Principle 4: Good Practice Gives Prompt Feedback*

*Principle 5: Good Practice Emphasizes Time on Task*

*Principle 6: Good Practice Communicates High Expectations*

*Principle 7: Good Practice Respects Diverse Talents and Ways of Learning*

*They used multiple instructional strategies and new technology, which included synchronous chat sessions, developing embedded voiceover presentation lecture videos, creating avatars, and rethinking the course layout for clarity. They will also include students’ feedback and Instructors comments.*

**JEL:** Bea

**KEYWORDS:** instructional technology, online education, synchronous chat, accelerated format

## INTRODUCTION

The 2012 Survey of Online Learning conducted by the Babson Survey Research Group (2012) “reveals the number of students taking at least one online course has now surpassed 6.7 million. Higher education adoption of massive open online courses (MOOCs) remains low, with most institutions still on the sidelines. The rate of growth in online enrollments remains extremely robust, even as overall higher education enrollments have shown a decline,” said study co-author Jeff Seaman, Co-Director of the Babson Survey Research Group. Key report findings include:

- More than 6.7 million students were taking at least one online course during the fall 2011 term, an increase of 570,000 students compared to the previous year.

- Thirty-two percent of higher education students now take at least one course online.
- Seventy-seven percent of academic leaders rate the learning outcomes in online education as the same or superior to those in face-to-face classes.
- The proportion of chief academic leaders who say online learning is critical to their long-term strategy is at a new high of 69.1 percent.

National University (NU) ([www.nu.edu](http://www.nu.edu)) the second-largest, private, non-profit institution of higher learning in California and the 12<sup>th</sup> largest in the US is considered a leader in online education. The five schools and one college offer more than 100 Graduate and Undergraduate Programs. More than 60% of the courses are offered online, and most of the onsite courses have an online component. Its programs offerings are in an accelerated one month format. The characteristics of the average NU student resemble those identified by Cull, Read, and Kirk (2010). "Online learners are a varied group, but there are commonalities that can assist instructors in developing effective strategies in course design and pedagogical approach. In particular, these students desire a flexible schedule to achieve their educational goals through self-paced learning while juggling the other demands on their time.

- The requirements of self-paced learning – self-discipline, effective time management, writing skills, self-directed work, organization and prioritization of effort, and confidence in presenting ideas openly and recognizing gaps in understanding through self-assessment and reflection.
- Type of students we serve - online students range from fast-tracked, high achievers to students currently on academic probation who may take courses through continuing education. The average age of students is generally older and there is higher percentage of female students than in the offering institution as a whole.
- Study habits - many online students have multiple demands on their time, causing odd, sometimes irregular, hours online. Multiple and sometimes competing obligations are squeezed into their daily schedule (other courses, accelerated graduation schedule, work, travel and family), consequently online coursework may not always be their top priority, causing assignments to be pushed aside to last minute, especially in general education courses."(page

They continue, "The challenge of keeping our students engaged and motivated is common across grade levels, subject matter, and all types of institutions and courses. Online courses, however, present a special concern. Without face-to-face contact, faculty are not able to pick up nonverbal cues from students that can indicate they are disengaged, frustrated or unenthusiastic.

- Faculty also cannot share their emotions easily and may find it harder to express enthusiasm, encouragement or concern.
- The anonymous feeling of the online environment can make it easier for students to withdraw, participate minimally, or completely disappear from the course.

Students may enroll in online courses because they feel they will be easier and require less of their time. So before the course even begins, these students may be prone to disengagement."

## DISCUSSION

The authors of this paper upgraded an existing undergraduate Marketing Fundamentals course MKT 302a, utilizing **The Seven Principles of Effective Teaching** by Graham et al (2001) which are considered a landmark in the design of online courses. They also included responses to the items listed above. The "Seven Principles for Good Practice in Undergraduate Education," was originally published in

the *AAHE Bulletin* Chickering, and Gamson, (1987), are a popular framework for evaluating teaching in traditional, face-to-face courses. The principles are based on 50 years of higher education research Chickering, and Reisser, (1993). A faculty inventory Johnson Foundation, "Faculty," (1989) and an institutional inventory Johnson Foundation, "Institutional," (1989) based on these principles have helped faculty members and higher-education institutions examine and improve their teaching practices.

#### Principle 1: Good Practice encourages Student-Faculty Contact

*“Lesson for online instruction:* Instructors should provide clear guidelines for interaction with students.” Graham et al (2001) Ten days before the start of class a copy of the course outline is emailed to each student with a welcome letter from the instructor providing contact information. This is the same course outline that will be followed over the four-week session; all details and expectations are included. The same content is shared in the Home Section of the Course shell, in addition to:

- Course Learning outcomes
- National University policies
- Instructor contact details
- Full details of Weekly assignments/activities and time lines
- Participation and grading details
- Instructor expectations
- Examples of APA formatting
- A twitter feed (specific and restricted to this class) has been added, to offer an additional communication channel for the Instructor and students.

Once the class goes live Sunday at 1:00a.m. PST, the design layout of the course provides a critical role in the user experience. Students make judgments about the course based on their first impression of its appearance. Following are three basic principles specific to good instructional design practices, after which we explain what changes we made to the course to conform to these guidelines.

1. The course design must be easy to navigate and follow.
  - These principles were followed in the course design revision. In an effort to make the navigation and layout easy to follow, an assessment of the previous course content was made, content items were consolidated to reduce sections and clarify navigation. Labeling across all sections was made consistent, for each for the four weeks.
2. Any visible content must be up to date and all and any links active.
  - A thorough review of lectures and related content were evaluated. Images like clipart were considered for relevancy to the topic and contemporary design practices were introduced.
3. It must deliver all the required elements of the course over the duration of the class. The home section of the course includes the following links;

- Course requirements, , an explanation of University Plagiarism policies, and guidelines to APA formatting, an introduction to the course is also included with accompanying short videos created by the instructor using Camtasia relay and Xtranormal with avatars. The introduction of avatars and recorded lectures add the instructor's personality to the course.
  - NU syllabus and Department information
  - Links are included to;
  - The Document Sharing Link which include
    - The course outline,
    - Power point slides
    - Grading rubrics
  - Instructions and Link to the Class Live Pro ( VOIP)
  - Assignments drop boxes
  - Grade book
  - Bibliography
4. A twitter feed is added to the course to utilize social media that allows the instructor and students to share current and timely information. The twitter feed is monitored by the Instructor.

#### Principle 2: Good Practice Encourages Cooperation Among Students

***“Lesson for online instruction: Well-designed discussion assignments facilitate meaningful cooperation among students.”*** Graham et al (2001)

#### Weekly Discussion Boards

The discussion forum Corich (2009) states “is asynchronous technology, which does not require all participants to be online simultaneously. One of the strengths that the discussion forum provides to the online learning community is the ability to allow learners from a variety of time zones to interact at a time that suits the individual learner. Of all the communication tools provided to support e-learning, discussion forums do more to promote collaboration and sharing of information. When managed effectively, discussion forums can encourage learners to share information, build on the ideas of others, and construct understanding about the changing world of technology Garrison, D.R. (1993). The weekly Discussion Board topics are relevant to the weekly chapter reading assignments. They also include the following information:

- Students are required to participate in at least three threaded discussions, posting a minimum of one message every 2-3 days: Sunday-Tuesday, Wednesday-Thursday and Friday-Saturday for a total of 15 points. Two types of responses are expected :first a reply to the topic posted or to a response from a classmate Continuous reading and

contributions to the discussion are required rather than last minute comments at the end of the week.

- Topics are relevant to the required weekly readings and also include current topics which provide an additional source to engage the learners.
- The first topic is instructor and student introductions. The instructor responds and welcomes each student to the class, demonstrating that the instructor is fully engaged in this class.
- Evaluation is based on the quality of postings. One sentence responses are not accepted. These postings should be substantive and add to the learning.
- Students are graded and receive feedback for their postings to the Discussion Boards

### Chat sessions

The School of Business and Management (SOBM) requires that once a week the students attend a synchronous chat session. Depending on the number of students enrolled in the class two sessions may be offered to accommodate students in the different time zones and their work schedules. NU uses Class Live Pro (CLP) synchronous online conferencing application for Voice Over Internet (VOIP) chat sessions. Rutgers (2012) “Class Live pro (CLP) is a synchronous tool available in Pearson eCollege which captures the essence of “face to face” classroom experience. Available CLP features include shared interactive whiteboard, application sharing, live webcam video, breakout rooms, chat, graphing calculator, PowerPoint import, content import, record and playback feature, polling, synchronized web browsing, and the archiving of sessions.”

- Chat agendas are posted ahead of time for each week
- Additional topics with links are posted in the chat agenda, which will encourage collaboration and learning
- Students are required to have microphones so that they can actively participate in CLP using the audio.
- Each student introduces themselves to their colleagues at the first session, and greet one another at successive sessions
- In each class it is required each student choose one text Chapter Review Assignment and deliver a 7-10 minutes PowerPoint presentation to their classmates during a weekly synchronous chat session.
- The presentation must be delivered to the Instructor before the chat session.
- Students are encouraged to ask questions and share content with their classmates.
- Presenters are graded by the Instructor.
- The live sessions are recorded. If a student is unable to attend, then they are expected to download and listen to the recording, summarize add their own comments and submit to the identified drop box for credit by noon on Saturday.

### Principle 3: Good Practice Encourages Active Learning

“Lesson for online instruction: Students should present course projects.” Graham et al (2001)

In addition to the postings to the discussion board, attending weekly synchronous chat sessions, sharing of events, tweets and a chapter review; students are required to complete weekly homework assignments and a final project

#### Homework assignments

The homework assignments take the form of responses to questions posed by the Instructor that are covered in the weekly text assignments. The submission deadline is Sunday at 6-00pm and the following guidelines are provided:

- The following message is sent to the students, “In your responses to the Homework assignments, I am NOT looking for minimal responses. One paragraph responses will not earn an A grade. All Homework should be in essay form. This is an undergraduate class and I am looking for depth to demonstrate your understanding of the theory and concepts of the subject. This is the only method for me to determine that you have a good understanding of the subject. You should include material from the text, chats, discussion threads and other examples (if you feel they are necessary).”
- Since this is the only medium we have to communicate and in the marketing profession good writing skills are mandatory, my expectations are high.
- Expectations are included in the course outline.
- All homework should be in essay form with APA documentation of references.
- Additional directions on APA format and its importance are included.
- A grading rubric is provided.”
- The assignment is evaluated and graded by the instructor and returned to the students with the instructor’s comments through the drop box.
- If the students does a “poor job” the instructor will send to the student an example of an A paper. (This is a previous student’s A work. Permission has been given by this previous student and all personal details have been removed).
- Faculty comments will state, “please review the enclosed, an example of an A paper, to review my expectations.”
- The purpose will be for the student to learn my expectations, make the necessary changes and incorporate them in successive weeks.

Final

project

The students are to develop a Marketing Plan for themselves. Solomon et al (2011) “This project will start them to think about Marketing in a practical sense. They gain experience formulating a plan, learning

how each part is dependent on one another. They gain some introspection and direction for the future. In fact the student may want to build on this exercise throughout their lifetime in preparing for earning a job after graduation.” Contents will include:

Title page

Abstract , 2 page final resume to be submitted to prospective employer

Introduction to project

Literature review (citations included) – Use of higher level reference materials is required.

Conclusions and recommendations

References

Next develop the following elements of the Marketing planning process

- A mission statement
- A SWOT analysis
- Objectives
- A description of the target market
- A positioning strategy
- A brief outline of the Marketing mix strategies,
  - The product
  - Pricing
  - Distribution and
  - Promotion strategies that satisfy the objectives and address the target market.
- A grading rubric is provided
- Examples of A papers are also provided

#### Principle 4: Good Practice Gives Prompt Feedback

“Lesson for online instruction: Instructors need to provide two types of feedback: information feedback and acknowledgment feedback”. Graham et al (2001) Timely feedback enhances the student/Instructor relationship and contributes to a healthy classroom dynamic. The online student has an expectation of immediate feedback for any and all concerns. They may feel isolated; therefore the Instructor has to manage the online environment differently than a face to face classroom. As stated previously, Cull

(2010) states “In a face to face classroom, instructors have an opportunity to interact with the students, respond immediately and be aware of visual and nonverbal cues from students that can indicate they are disengaged, frustrated or unenthusiastic.” One online classroom management strategy the instructor can use to overcome this issue is prompt information feedback and acknowledgment feedback. The student benefits from prompt feedback which helps them to stay “on track.” The instructor benefits with another additional method to manage their workload. As a best practice, responses should be provided within 24 hours. With NU’s accelerated format, and when the author teaches an online course, she finds that she is involved in managing the course throughout the day up to a total of four hours daily. She provides prompt feedback to all assignments and to all correspondence. Grades are posted promptly and by Monday morning of weeks 2-4 all weekly assignments have been graded and posted.

She has created an Email account, separate from her University account which students can use as an “Emergency help line.” This account allows her to monitor student issues that require immediate attention. The students are aware that this is for emergency issues only and has rarely been abused since it was implemented several years ago. This separate help line serves to protect the instructor’s privacy. The email address is shared in the course outline and in the first chat session. It is generally preferred for correspondence since it can be tracked and archived for future reference. On occasion the Instructor will contact the student directly by phone.

#### Principle 5: Good Practice Emphasizes Time On Task.

*“Lesson for online instruction: Online courses need deadline.”* Graham et al (2001) Students may have the preconception that online course are less demanding than their onsite counterpart. In addition Cull (2010) states that “Students may enroll in online courses because they feel they will be easier and require less of their time. So before the course even begins, these students may be prone to disengagement.” By providing detailed instructions with respect to all requirements and deadlines this gives the online environment a time framework and structure. Since students are accessing the course 24/7 it is important that deadlines are clearly articulated and they can plan their study time accordingly

- Dates and timelines are included in the course outline ( sent to the students 10 days before class)
- In the Home section of the course is an item labeled “Weekly Assignments” with due dates and links to relevant course content .This is easy to follow and easy to access.
  - This includes all assignments for this class with hyperlinks to. e.g. Discussion Boards, Chat sessions, Homework, Quizzes and the Final project.
  - Due dates are also included in FAQ’s section
  - Reminder announcements are posted in the course with due dates
  - The weekly quizzes are open all week from Tuesday at 1-00am until Saturday at midnight (PST. Each consists of 30 multiple choice, true/ false questions that must be completed in 45 minutes, at that time they be removed from the quiz.
  - The open start date provides the student with autonomy for creating their own schedule.
  - Instructors who make the students adhere to the deadlines helps the Instructor to manage the course workload, provides the student a workplace skill, and keeps them on the path to successfully completing the course

#### Principle 6: Good Practice Communicates High Expectations

*“Lesson for online instruction: Challenging tasks, sample cases, and praise for quality work communicate*

high expectations.” Graham et al (2001) In a recent study by *The Chronicle* and American Public Media's *Marketplace Fischer*( 2013) “ employers dinged bachelor's-degree holders for lacking basic workplace proficiencies, like adaptability, communication skills, and the ability to solve complex problems” "Woefully unprepared" is how David E. Boyes characterized the newly minted B.A.'s who apply to his Northern Virginia technology consulting company. Mr Boyes continues “grumbled that colleges weren't adequately preparing students in written and oral communication, decision-making, and analytical and research skill.” In my class the students are expected to come prepared to the weekly synchronous chat sessions: having familiarized themselves with the weekly readings and assignments.

- The instructions to the students for homework assignments are discussed earlier, communicate high expectations.
- In addition students are encouraged to research topics and share their findings in the weekly discussion boards. The instructor gives special attention to the students who research the topics and praises them for their additional effort.
- Case studies are introduced in the third week of the course. Since these are generally past events, students are encouraged to research the examples and share current information with their peers.
- Faculty feedback is provided to all students when their weekly assignments and final projects are reviewed, graded and returned. The instructor generally starts with positive comments .If a student under-performs I will include an example paper from a former student who exceeded the assignment rubric's expectations for them to review. The exceptional papers are archived by the faculty member with permission from the respective students to be shared with future students. Example papers are not posted ahead of the homework deadline time since most of the students do not require example papers.
- The exceptional final projects are the only examples shared before the final due date.

#### Principle 7: Good Practice Respects Diverse Talents And Ways Of Learning

“Lesson for online instruction: Allowing students to choose project topics incorporates diverse views into online courses.” Graham et al (2001) Several examples have been provided in this paper to demonstrate how students have autonomy to choose project topics; students chose which Chapter review to present in a weekly chat session, in the weekly discussion boards students can choose to do additional research, and the final project provides students the freedom to select from a list of suggested topics. The weekly synchronous chat session provide all class members the opportunity share their insights and opinions. Giving students options for making decisions allows them to personalize their learning experience and increases their engagement.

#### **CONCLUSION**

“Students learn in different ways. Knowledge can be gained in these courses when information is given through multiple means this includes lectures, handouts, videos, analyzing case studies, sharing of personal experiences and discussion.” University of Washington (n.d) In this paper the authors have identified the different methods and media they used in the course development. Students have diverse learning opportunities through readings, video lectures, discussions and conversations with peers. The course also includes a student feedback form which provides the instructor information to drive the ongoing development of the course. Continuous improvement of the course design ensures that all students master course content.

# BANK FINANCING AND NON-OIL EXPORTS IN NIGERIA

Sama'ila Idi Ningi, Abubakar Tafawa Balewa University, Bauchi- Nigeria

## ABSTRACT

*In Nigeria the Non-oil export sector of the economy is contributing only 4% of total exports and the volume of non -oil exports growth is very low. One of the reasons for the declining growth is the low bank finance. The problems stated above triggered this research; consequently, questionnaires were developed and distributed to 120 non-oil exporting firms. Multiple regression indicates that Non-oil Exports Financing by Banks significantly accounts for slightly 16% of variance in Non-oil Exports Performance, similarly beta coefficient reveals that Firm' Perception of Banks Attitude to Risk of Financing non-oil exports has the highest beta value followed by Cost of Bank Finance, in the case of Exchange Rate fluctuation Effects and Volume and Access to Credit Facility they present insignificant relationships with the Non-Oil Exports performance. This research indicates relative importance of NEFB in predicting the direction, composition and pattern of trade in non-oil goods in Nigeria. The research reveals the need for exports subsidies in developing countries because of the large number of small sized firms in the export business who cannot cope with the high capital requirements of exports business in Nigeria. Government should provide support to the banks for the wheels of export cannot move. And banks should be ready to learn and specialize in two to four export products that they can handle and do well and explore the letters of credit option to provide secured funding for exports.*

**KEY WORDS:** Banks, Non-Oil Exports, Nigeria

## INTRODUCTION

There are some challenges for countries with natural resource abundance such as oil (such as Nigeria) in comparison with other countries. The main point is that in parallel with windfall of oil revenues these countries have to pay more attention to the development of the non-oil sector as well as its export performance (Sorsa, 1999). Because in the most of the cases oil driven economic development leads to some undesirable consequences such as Dutch Disease in the oil rich countries. Therefore Nigeria needs to pay more attention to the development of non-oil exports sector to create the sorely needed growth and development. But, the Non-oil export sector of the Nigeria economy is faced with a lot of problems. For example, the export of non-oil commodities contributes only 4% of total exports in Nigeria (Okoh, 2004; Ogunkola et al 2006) and the volume of non -oil exports growth is very low (approximately 4% per annum) from the middle of 1965-1985 as asserted by Maidugu et al (2003). One of the reasons for the declining growth is insufficient access to finance in general and bank finance in particular. Access to banks financial services for non-oil exporters is one of the major problems stifling the growth of the sector in Nigeria, because of high interest rates and little disbursement in terms of the volume of credit (Ijaiya, 2003; Theodore, 2004; Sanusi, 2010a, 2010b).

In Nigeria very insignificant portion of non-oil exports was financed by bank credit. Export from Nigeria is largely crude oil which is funded from outside the country (CBN 2006). According to Ijaiya, (2003) Commercial banks credit to non-oil exports sector has been very low. According to Odularu (2008), high cost of finance does not allow non-oil exporting industries to modernize outdated plants and machineries in Nigeria, which results in poor quality goods for non-oil exports. Banks are not willing to advance credit to the non-oil export sector as they consider the sector very risky for investment despite directives from NEPC to do so (Odularu, 2008). The banks' lack of effectiveness in handling small, medium or long-term

credit risk (lack of training of loan officers, lack of information on borrowers and absence of a reliable credit registry) result in the entrepreneurs being burdened with high requirements, such as up to three years of financial statements, enough collateral to cover both the loan principal and interest (including a cash deposit that may be up to 30% of the loans' net present value), and to provide every detail of the international trade transaction in question (Marc, 2007). The sector has been declining due to poor access to credit facilities at pre-shipment and post shipment stages as opposed to what is happening in other countries of the world (Azzam, 2000). There is also the problem of increased cost arising from exchange rates fluctuations which has been identified by (Elumelu, 2002).

Some of the roles of NEXIM are purchase and sale of foreign currency, maintenance of a foreign exchange revolving fund for lending to exporters who need to import foreign inputs to facilitate export production. Exporters have access to these facilities only through commercial banks operating in the country (Theodore, 2004; Ijaiya, 2003 and NEXIM, 1997). However the effect of NEXIM bank source of finance on export performance was not found to be significant and encouraging Aworemi, Oyedokun and Odeyemi (2011). According to Lawal (2009) Most Nigerian banks were only interested in granting loans to facilitate importation rather than exportation. The high interest rate charged by some of the banks in Nigerian makes producers and exporters not being able to compete favourably with their counterparts in other African countries like Ghana. As a result of the adverse effects of the above factors, the non-oil exports dwindled. It is in view of that the banking sector being the major source of financing in Nigeria needs to be examined to ascertain the contribution of the sector to non-oil trade.

## LITERATURE REVIEW

The Nigeria's export sector is characterized by the dominance of a single export commodity (crude oil) which constituted 96% of total exports. Macroeconomic policies have been adopted with a view to achieve growth in non-oil exports particularly manufacturing. For instance in the 1960s and 1970s, manufactured merchandise exports grew under high protective fiscal barriers and the establishment of The Nigerian Export Import Bank (NEXIM) among others. But the problem still persists. Theories suggest that the level of financial development influence the pattern of international trade flows (Beck 2002). Kletzer and Bardhan (1987) compliment the Heckscher-Ohlin (1933) trade model by incorporating a financial sector and show that financial sector development especially the banking sector development gives countries a comparative advantage in industries that rely more on external financing. Therefore finance is very important in boosting non-oil trade.

Financial sector development that mitigated liquidity risk was primary causes of the industrial revolution in England. They further argue that information acquisition costs create incentives for financial intermediaries to emerge (Diamond, 1984; and Boyd and Prescott, 1986). Without intermediaries, each investor must pay the fixed cost. In response to this information cost structure, however, groups of individuals may form (or join or use) financial intermediaries to economize on the costs of acquiring and processing information about investments. Outside creditors – banks, equity and bond holders – that do not manage firms on a day-to-day basis will create financial arrangements to compel inside owners and managers to run firms in accordance with the interests of outside creditors. Without pooling, households would have to buy and sell entire firms. By enhancing risk diversification, liquidity, and the size of feasible firms, therefore, mobilization improves resource allocation (Sirri and Tufano 1995). The finance system including banks functions in the area of lowering of transaction costs and technological innovation in terms of the advantages of money over barter.

There are some theoretical models that stress the importance of different institutional forms financial systems can take, but more important are the underlying functions they perform such as risk amelioration and mobilisation of savings. Some experts on exports like Barnard and Jensen (1999a, 2001) and clerides,

Lach and Tybout (1998) opined that exporting firms are consistently larger, more productive, more capital intensive which clearly indicate the high need for finance in the sector.

*Cost and Access to banks financial services:* Access to banks financial services for non-oil exporters is one of the major problems stifling the growth of the sector in Nigeria, because of high interest rates and little disbursement in terms of the volume of credit (Ijaiya, 2003; Theodore, 2004; Sanusi, 2010a, 2010b). According to Odularu (2008), high cost of finance does not allow non-oil exporting industries to modernize outdated plants and machineries in Nigeria, which results in poor quality goods for non-oil exports (Ningi, Kurfi and Dutse, 2007). The banks' lack of effectiveness in handling small, medium or long-term credit risk (lack of training of loan officers, lack of information on borrowers and absence of a reliable credit registry) result in the entrepreneurs being burdened with high requirements, such as up to three years of financial statements, enough collateral to cover both the loan principal and interest (including a cash deposit that may be up to 30% of the loans' net present value), and to provide every detail of the international trade transaction in question (Marc, 2007).

*The Risk-Averse Behavior of Banks in Funding Non-Oil Exports:* In Nigeria risk-averse behavior of banks has constrained the non-oil exporting firms from obtaining loans and hence the contribution of this sub-sector to GDP (Crocket, 1997; Ogujiuba, Ohuche and Adenuga, 2004). The bank financed exports to GDP remained as low as less than 5% between the periods 1970- 2006 in Nigeria (CBN, 2006). Nikini, (2005) reported that banks perceive high risks associated with lending to exporting firms in Nigeria.

*Exchange Rate Fluctuation Risk:* Banks are capable of minimizing Exchange rate fluctuation risk between major traded currencies through a hedging operation by taking a reverse position in the forward market or using options (to buy or to sell) foreign exchange in the futures market, thereafter be able to provide importers and exporters with competitive rates (Nkini, 2005; Theodore, 2004; Ijaiya, 2003 and NEXIM, 1997 and Aworemi et al 2011). NEXIM carries out the purchase and sale of foreign currency and maintenance of a foreign exchange revolving fund for lending to exporters who need to import foreign inputs to facilitate export production. Exporters have access to these facilities only through commercial banks operating in the country. However, the finding of (Aworemi et al 2011) revealed that the effect of NEXIM as the banks' source of finance on export was not found to be significant and encouraging.

## METHODOLOGY

Based on the theoretical scales developed, a five-point likert scales arranged in the form of 1 strongly disagree, 3 neutral and 5 strongly agree with 24 items measuring the constructs was used. Questionnaires were personally distributed to firms across the cities of domicile of the firms. Out of the 160 questionnaires distributed, 120 were retrieved and used for the analysis. Tools used for data analysis and hypotheses testing included: Mean and standard deviation multiple regression. The sample of 193 could not be attained because of the apathy of respondents in returning the questionnaires. Therefore response rate was 62%.

## RESULTS AND DISCUSSION

Data analysis starts with data screening, assessment of data accuracy and normality test. Theoretical and statistical analysis of content validity as well as reliability supports the validity of the constructs. Consequently, multiple regressions indicate that NEFB significantly accounts for slightly 16% of variance in NEP (see table 1A and 1B),

Table 1A: Reliability Statistics

S/No	Construct	Cronbach's alpha	Cronbach's alpha based on standardized items
1	Cost of bank finance to non-oil exports	.503	.502
2	Effect of exchange rate on non-oil exports	.527	.530
3	Volume and access to credit facilities to non-oil exports	.511	.513
4	Firms perception of bank's attitude risk of financing non-oil exports	.723	.724
5	Non-oil exports performance	.589	.589

Table 1b: Model Summary<sup>b</sup>

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.401 <sup>a</sup>	.161	.132	.44374

Source:-field survey, 2011

similarly beta coefficient reveals that firms perception of banks attitude to risk of financing non-oil exports (FPBARF) has the highest beta value followed by cost of bank finance (CBF), in the case of exchange rate fluctuation effect on non-oil exports (ERN) and volume and access to credit facilities of non-oil exporting firms (VACN) present insignificant results (see table 3).

Table 2: ANOVA

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	4.338	4	1.084	5.507	.000 <sup>a</sup>
	Residual	22.644	115	.197		
	Total	26.981	119			

Source:-field survey, 2011

Non-oil exports financing offered by banks (NEFB) is useful as a predictor of non-oil exports performance (NEP). Combined analysis of overall Non-oil exports financing offered by banks (NEFB) vis-a-vis non-oil exports performance (NEP) mean plot comparison, constructs correlation and results of multiple regression particularly constructs beta coefficient reveals that the Hecsher Ohlin trade model which was developed further by Kletzer and Bardhan, 1987; Rajan and Zingales 1998; Beck, 2002 is robust in explaining bank financing of non-oil exports.

Table 3: Coefficients of the independent variables

Variables	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	5.287	.400		13.234	.000
Cost of Bank Finance to Non-oil Exports	-.319	.158	-.208	-2.013	.046
Effect of Exchange Rate on Non-oil Exports	.074	.139	.051	.533	.595
Firms Perception of Bank's Attitude Risk of Financing Non-oil Exports	-.399	.134	-.293	-2.977	.004
Volume and Access to Credit Facilities For Non-oil Exports	.076	.142	.049	.537	.592

Source:-field survey, 2011

Evaluation of construct correlation,  $R^2$ , beta coefficients and relationship between non-oil exports financing by banks (NEFB) mean in relation to non-oil exports performance (NEP) mean revealed that the model accurately explain the perception of exporting firms in Nigeria. This research also indicates relative importance of non-oil exports financing by banks (NEFB) in predicting the direction, composition and pattern of trade in non-oil goods in oil rich countries that suffers from Dutch disease similar to Nigeria. The research reveals that non-oil exports financing by banks (NEFB) affects non-oil exports performance among exporting firms in Nigeria. The result of the research would go a long way in making the managers of exporting firms to find ways of financing their firms especially as there is high need of up-front fixed cost in export business. The perception of firms as it relates to the banks is negative this indicates the need for the firms to strategically improves their image by the type of export business they do and be in business sectors intensive in external finance and intangible assets that can make them grow disproportionately faster. The research indicates the need for countries governments to financially develop their economies for improve exports (Rajan and Zingales 1998; Braun, 2003). The research reveals the need for exports subsidies in developing countries because of the large number of small sized firms in the export business who cannot cope with the high capital requirement of exports business in Nigeria.

## CONCLUSION

Non-oil export financing by banks (NEFB) affects non-oil exports performance (NEP) among exporting firms in Nigeria. The perception of firms as it relates to the banks is negative this indicates the need for the firms to strategically improves their image by the type of export business they do and be in business sectors intensive in external finance and intangible assets that can make them grow disproportionately faster.

## RECOMMENDATIONS

- 1) The Nigerian export promotion council (NEPC) should have a service that assists export-oriented firms especially Small and Medium Enterprises (SMEs) to improve their credit worthiness.
- 2) Government should introduce subsidized credit to non-oil exporters with a view to encouraging existing and potential exporters from entering into export business.
- 3) Exporting firms should examine their financial structure and composition so as to find out the sensitivity of their firm exports to external finance need.

# A CASE STUDY ON HOW BUSINESS STUDENTS COLLABORATE IN CREATIVE DESIGN

Siu-Kay Pun, Nanyang Technological University, Singapore

## ABSTRACT

*This paper examines the pedagogical merits of a collaborative learning and working approach used in a course aimed at raising the design literacy in non-design students. The course also aims to nurture the student to think creatively and to come up with creative design solutions. This paper studies the inner workings of small groups of students, most of whom from Business and Communication disciplines. They collaborate to share and enrich each other's learning and creativity. The goal is to nurture these students to be better future users, clients, co-designers, promoters and consumers of design in their Business and Communication professions. To gauge the effectiveness of the course, the students were interviewed. Their experiences in group creativity, benefits gained, and challenges faced in collaborative learning were examined. Based on their positive experience, there is reason to believe the collaborative approach taken is in the right direction to nurture creative thinking to solve design problems in Business and Communication students.*

**KEYWORDS:** Collaborative learning, group creativity, group dynamics, design making

## INTRODUCTION

To remain competitive in the rapidly globalizing world, Singapore leaders firmly believe that its future knowledge workers need to have creative minds and multidisciplinary skills. These future workers will be the ones who will challenge the conventional approaches to business, communication and aesthetics to break new grounds and compete in the globalized economy. Much efforts and resources have thus been invested to release and develop creativity among these future knowledge workers.

## LITERATURE REVIEW ON CREATIVITY

So what are the creative minds or creativity wanted in these future knowledge workers? Can every individual be creative? Contrary to conventional belief that only a few can be creative, Richard Florida, an [American urban studies](#) theorist, once stated that "Every single human being is creative". He argued the world is shifting from an economy based on physical assets – land, capital, and labor – to one based on intellectual assets, or human creativity (Florida, 2006). Some researchers defined creativity to "include the generation of ideas, alternatives, and possibilities" (Smith, 1998); "the ability to solve problems or to make something or to pose questions regularly in a domain; those questions are initially novel but are eventually accepted in one or more cultures" (Gardner, 1993). Others argued that "Creativity is an acquired behaviour - learnable, teachable, tangible, and crucial to human development" (Balkin, 1990).

With the belief that all human beings have the potential to be creative and to be competitive, future knowledge workers will need essential creative thinking skills. The challenge is to find effective ways of nurturing and releasing this creativity for the workers' and the nation's well-being.

## NURTURE CREATIVITY IN NON-DESIGN STUDENTS THE COLLABORATIVE WAYS

This paper examines an elective course conducted at the Nanyang Technological University entitled “Creative Thinking in Design Solutions” which is open to non-design undergraduates to promote creative thinking. Approved by the University Academic Board, the objectives of the course are twofold: as general education to nurture creative thinking in the non-design students; and to raise the standard of design literacy in these students. The methodology stresses group creativity and collaborative learning. Most of these students are from Business and Communication disciplines with Engineering and Science students form the minority. These students bring with them different views based on their different backgrounds and experiences. Collaborative learning allows them to share their views in a group setting to come up with innovative and creative approaches to design solutions. Done in a studio setting, the teacher serves as the facilitator to guide students in constructing knowledge. The goals are to nurture creative thinking through ideas creation and visual expression in group work; and to apply and evaluate creative ideas for effective design. These lifelong skills will prepare the non-design students to be better future consumers, clients, co-designers, promoters and interest groups of design.

The maximum enrolment of each class is 21. Students meet once a week in three-hour studio sessions for thirteen weeks. In a typical session, introductory lectures on basic principles and approaches in design and in creative thinking are first introduced as most of these students do not have visual art and design background. After the introductory lectures, students randomly form themselves into small groups of three. They work collaboratively on the class exercises which are intended to help them apply the basics of design and become familiar to using the various ways to think creatively in problem solving.

Students also form themselves into ‘permanent’ groups of three for their final design projects on which they spend four to five weeks to complete. This final project requires students to create and design a brand identity for the launch of an event or a company that promotes earth friendly awareness. Teams which create conducive environments for themselves often start with thorough brainstorming with all members present to ‘discover’ a design problem (Csikszentmihalyi, 1990). At times, individual has to do some research before the team meets again to evaluate the alternative solutions for their design project. Often the team brainstorms until all members are mentally and physically exhausted. They then break up, reflect individually on what transpired, research for more information, and come up with new ideas. They meet again in a group to share and evaluate each idea, build and improve on the selected ideas. The team may repeat this a few times to decide the best possible solution. One member may take on the role of writing minutes for, and scheduling, their meetings. Another may take on the role of ‘leader’ ensuring everyone does his or her ‘homework’ and present them on time for discussion. In this age of new media, the team may likely also create a Facebook for the project to ease their communication and co-creation online. Whenever the team needs extra research information, either the ‘leader’ assigns a member to do it or someone in the group volunteers to act on it. When the team selects a final solution, they may either divide the job or perform together. This depends on how competent each individual’s skills. Researchers on group creativity have pointed out the benefit of “communities of practice” which “provide an intellectual space for engagement and ‘imagination’ to manifest within individuals and amongst groups” (Wenger, McDermott & Snyder, 2002). Even after individual completes the designs, other group members often come together to evaluate the designs and improve on them. When members can uphold an environment conducive for learning, the interests, excitement and passion of even one member can motivate others to keep the group going so collectively they can achieve their goal.

After completing their final group projects, students present their projects to the whole class and give a report. Their presentations and reports include: 1) Reasons the design problem and issue are chosen. 2) Their research, brainstorming for ideas and their creative thinking techniques to form design solutions. 3) How they use visual images as tools for imagination and communication. 4) How and why they choose

design elements and principles to suit the message and spirit of the product. 5) And how they explore and experiment in creating the designs. Each student also includes his or her experience and contribution as an individual, and as a member of the team; challenges faced and benefits.

## FINDINGS

Through all the reports presented and interviews with group members at the end of each semester, the author gained further insights into the workings of each group in their final design projects. The following findings highlight certain group creative experience and typical manner when members from different background work together in small groups of three.

### Sharing of ideas

It is clear from the students' feedback the approach taken in the conduct of the course created a relaxed atmosphere and encouraged cross-fertilization of ideas. 82% of the students in the class reported that they had fun and good sharing of ideas during brainstorming; evaluation of design ideas; and exploration and improvement of designs. 69% felt that they could not achieve the results without each member contributing to the group.

### Leveraging on each other's strengths

There is clear evidence the groups took advantage of their diverse backgrounds and talents in carrying out their projects. 73% recognized the benefits from each talent in achieving their goals. Those with design software skills would carry out the designs. Others performed other roles. 56% cited improvement of design skills with the support and motivation from others.

### Benefit from what they learn from the course

74% reported the benefits of collaborative learning in the course in increasing their skills and confidence in applying design theories into practice. It also helped them in thinking creatively to solve design problems and in exploring their creative side they were not aware of.

### Self-managing teams and meeting challenges

All the groups showed some form of self-organization and "collective direction" with members contributing according to their strengths and talents. 37% reported major challenges but could resolve these, learn from them and eventually understand the diversity of the group. Challenges cited are major conflict in opinion, working styles, motivation and commitment of each member, time and effort spent on the project, and communication problem.

## RESULTS AND DISCUSSIONS

There was in general good sharing of ideas especially when group members clicked well with one another. With the approach taken in this course, most group members enjoyed working together and had fun. Most of them could benefit having group members with different disciplines and backgrounds as they contributed ideas from different perspectives. There is clear evidence of group self-organization and self-management. Various talents and capabilities existed among group members. The groups took advantage of the diverse talents and benefited from each other's talent. The special talents which showed up among the students include proficiency in design software, in copywriting, in facilitating brainstorming and in transforming ideas into sketches. A few performed well as 'leaders', ensuring every member complete his or her assigned duties based on the planned schedule. Most recognized the contributions of diverse talent. They understood that they have achieved the creative result because all

members committed and contributed fully. Most of them also applied what they learned in creative thinking like thinking out of the box and how unrelated ideas can be linked to their design projects. Some cited the opportunity to explore their creative side and gain better perspective in viewing and evaluating visual images. For Business students, in particular, who are more familiar with business strategies, the creative design making in this course has created a new aesthetic awareness in them. While they explored and evaluated their creative solutions, they realized that visual designs can be powerful form of communication to create impact in marketing their business strategies.

## CONCLUSION AND IMPLICATION

The findings of this study confirm the observations of other researchers on group dynamics in collaborative group learning and group creativity. This study shows that most groups organized and managed themselves while leveraging on, and benefiting from, each member's strengths and talents as they collaborate in learning and working. This is especially so when they come from different disciplines and have different backgrounds. They learned from one another. They shared the different ways of viewing and solving a problem. Though a few faced challenges, they overcame them as they progressed. All commented that they could achieve the results because every group member contributed fully. This study also shows the pedagogical model is well suited to nurture creative thinking and collaborative learning skills. For non-design students especially those in Business and Communication disciplines, design making as pedagogy is apt. Training the aesthetic sense, skills in creative thinking and visual communication and the ability to collaborate with others from different disciplines are all necessary in the 21<sup>st</sup> century workforce. The elective course in this study can be applied as a model for general education to nurture creative thinking in Business students and to raise the standard of design literacy in these students. Follow-up studies on how these students apply their new skills in their future careers will be valuable. Further studies on nurturing creative thinking in Business students without collaborative learning and working will be useful to understand the contrast in results.

# METAPHORS OF ORGANIZATIONAL CREATIVITY: FROM SYMBOLIC INTERACTIONISM AND CONSTRUCTIVISM

Juan Carlos Alicea Rivera, Universidad de Puerto Rico

## ABSTRACT

*Metaphors have been used to explain several processes in organizations over the years. The metaphorical analysis allows us to transfer concepts from one domain of knowledge to another, improving our understanding of organizations. Creativity, as psychological process, has been analyzed through the lenses of particular abilities of certain people. But, is it possible to personify organizations and consider them as creative entities? How powerful had been the use of metaphors to explain creativity as organizational process in the past? The purpose of this conceptual work, based on discourse or textual analysis, is to explain how two recent developed metaphors could be used as basis to increase our understanding of the creative process exhibited in organizations: from conceptual ideas of the symbolic interactionism, the creativity as a "role"; from theory of constructivism, the creativity as a "zone of potential development".*

**KEYWORDS:** creativity, organizational culture, organizational climate

## INTRODUCTION

The use of metaphors characterizes our way of thinking, acting, and our search for meaning (Grant & Osrick, 1996). Metaphors are the result of a cognitive process by which a concept or word is applied to a new context in a figurative sense and in a different but plausible way. In management research, metaphors serve as mechanisms to study organizations from different perspectives. Morgan (2006) state that metaphors help companies to analyze organizations from a "mosaic of different lenses or images". Bolman and Deal (2008), stresses that companies are ambiguous, contradictory and uncertain, thus metaphors help administrators to minimize the confusion caused by managing such a complex phenomenon. Managing creativity in organizations, for example, is subject to analysis from multiple perspectives. Creativity integrates mental processes belonging to different planes of reality: psychological, cultural, political, structural and others. Therefore, making an exclusive analysis of the creative process in organizations from only one of its many visions is simplistic (Pabón, 2001).

Therefore, a metaphorical analysis could be a useful tool to analyze management of creativity in organizations. In fact, the purpose of this paper is to explore the importance of two recently used metaphors associated with theoretical construction of creativity in management's literature: from social psychology, the reference to creativity as a "role"; from cognitive psychology and constructivism, creativity as a "zone of potential development". First, I will consider the importance of metaphors in organization theory and how such concepts have been developed, including characteristics which are relevant to organizations' context. Second, based on textual analysis, a research technique under discourse or content analysis, I will examine seminal texts related to interactionist and constructivist psychological views, in order to discover possible metaphors which will serve to understand the creative process. Finally, I will establish why these positions represent, possibly, a relevant approach to the study creativity in organizations.

## LITERATURE REVIEW

Since philosophers Plato and Aristotle established the concepts of *mimesis* and representation as the basis of *poetry* and literary fiction, metaphor has been a primary force through which humans create meaning. Metaphors allow us to link experiences in different areas, which help us to understand various concepts in different ways. Grant and Oswick (1996) stated that metaphors produce a new view of reality. The value of metaphors resides in how they facilitate the acquisition of new knowledge and permit the explanation of various aspects of a phenomenon (Tsoukas, 1991).

What metaphors have been used over the years to explain the concept of creativity? Several years ago, creativity was considered an "attribute" of some exceptional human beings (Woodman and Schoendelft, 2010). Brown (2010) cited three prolific researchers on creativity and their positions: Spearman said that to be creative is to have "general ability" or "talent", not a measurable characteristic; Guilford stated that creative talent is individual phenomena, not subject to analysis from social context; but Torrance developed tests to "measure" creative thinking, as did the intelligence tests. To some researchers (Brown, 2010), creativity must be analyzed from a biological standpoint, as a "process of adjustment" between the organism and the environment. For Romo (1997) and psychoanalysis creativity is "sublimation of conflict". For her, our instincts will be moved in opposite direction to the goals pursued and there will be an "unconscious fight" to attain high cultural values and behavior socially acceptable.

This struggle will release the creative potential. For behavioral researchers, a product or performance is creative only to the extent that it is novel and useful response to a problem or situation. For Skinner (1986) creativity is "programmed instruction": if repeated human responses are internalized, our creativity will be reinforced. The cognitive school, moreover, established the computer metaphor as the basis for the solution of major problems, including those having to do with the demonstration of creative thinking (Gardner, 2010; Varela, 2000). But metaphors considered above put human beings at the center, whether it alludes to biological or environmental factors, measurable or not measurable skills, something programmed or stimulated. However, those metaphors do not address the serious implications of the social context and the interaction with "other" human beings, important issues related to the liberation of creative spirit in organizations, today. Thus, what about metaphors in organizations? Over the years we have used metaphorical analysis to approach organizational culture, design and development studies (Morgan, 2006; Bolman & Deal, 2008). For example, two different metaphors stand out today as opposing views regarding the way companies are organized and developed: the mechanistic vision and the organic vision. The first view is projected over the metaphor of organizations as "machines", implying that the structural aspects of business and management are of greater importance.

The second view focuses on the metaphor of the company as an "organism", which implies that the adaptation, stability, and survival, as well as aspects related to human resource management, should be the main orientation in organizations (Morgan, 2006). What implications over management in organizations have these views or metaphors? When managers view organizations as machines, they design them rationally, with fixed and predetermined objectives to comply with and specific descriptions of jobs to perform. The principal assumption here is that businesses operate within a stable and efficient environment. Human resources, under this view, should adjust to task requirements and organizations' processes (Bolman & Deal, 2008). In case of the organic view, metaphor is used to compare companies with "organisms", which implies that the processes of adaptation, stability and survival, as well as aspects related to human resource management, are the main motivations in organizations (Morgan, 2006). Therefore, under this approach, the tasks must be tailored to the needs and expectations of the people, while we should use a lateral communication. The use of metaphors has allowed researchers to focus on organizational problems from several angles. In fact, if managers could understand the power of metaphors and integrate them as a basis to the study of organizations, their understanding of such entities will increase (Grant & Oswick, 1996). However, we can not liberally use metaphors as sole explanations of the organizational problems or processes, nor think that we have an indefinite number of possible

approaches to the study of organizations through the use of metaphors (Mangham and Overington, 1987). For example, Tsoukas (1991) says that operational definitions of organizational concepts are not possible by means of metaphors. So why different metaphors have been used to conceptualize aspects associated with the organizations in recent years? (Morgan, 2006; Bolman & Deal, 2008).

Pabón (2001) explained that while the concept of creativity has been defined in many ways in management's literature, the typical notion of creativity in use by organizations is a technical one. In fact, the difference between innovation and creativity is not clear for managers in various organizations. However, he stated that to understand creativity in terms of its procedural and technical aspects only, this implies forgetting its ontological dimension. Creativity is an inherent human capacity and, therefore, implicitly present in all organizations as groups of human beings.

Creativity is a human ability that can be shown in two ways, personally and socially. But companies are emphasizing the individual creative spirit only, not the interaction among all members of the organization (Ray & Myers, 1989). In other words, there is a tendency to think of creativity in organizations as a mere management tool to improve the quality of goods and services over time. However, companies have gone to the other end, too. Companies have raised various questions about the problem of creativity and how the "creative spirit can manifest, learn or develop" (Ray & Myers, 1989). Do they mean the rare individual that manifests it? If this is true, does it make sense to speak of organizational creativity? Is it possible to have "better explanation and direction" over the management of creativity in organizations through metaphorical analysis? As I will demonstrate, it is only when the process of continuous interaction among all members of an organization, together with an adequate management of organizational context, that we can "build" an environment that promotes the creative spirit in business.

The ability of members of an organization to take on different roles and to activate their potential development areas will be significant, too. We will examine seminal texts on social and cognitive psychology, through textual analysis technique, to do this. Discourse and content analysis refers to processes of search of meaning of texts. Whenever we use one of their related techniques, textual analysis, the objective is, not to examine the text itself, but something implicit which reveals his "sense" (Andreu Abela, 2010). To conduct such a textual analysis, we should follow some steps. First, we should determine the object of analysis. In our research, the unit of analysis will be seminal books in social and cognitive psychology, fundamental texts related to psychological processes present on human interaction. Secondly, we should determine the encoding rules and categorization of discourses present on those texts. In our case, we will apply an analysis in order to discover if some metaphors related to group dynamics are revealed in those books. Finally, we will make some inferences upon such categorization, that is, to demonstrate if such discovered metaphors could serve as better explanation on organizational creativity.

Ray and Myers (1989) argue that creativity depends more on the individuals of the organization for which they work and working conditions. This means that no one can speak of organizational creativity without reference to creativity manifested by individuals who compose it. Thus, to maintain its competitive edge in a deceptive environment, organizations need to develop their capacity to deal with the complex, contextual and circumstantial. To accomplish this, management has to promote, among all members of the organization, the continued desire to increase the stock of skills and abilities with which the company can count on. The organizational design should be flexible enough so that you can influence the conduct of members of the organization, so that there is congruence between the purposes and objectives of the business and of each individual as part of it. To promote the creative spirit will be decisive in this regard. This research showed that if we ensure the full cooperation and interaction among all members of the organization and provide an opportunity for employees to develop their capabilities to the fullest, and freely, we will produce a truly creative environment. The greater the degree of involvement of all human resources in companies in the process of participating and taking over the interactionist discourse of creativity, the greater the effect on the manifestation of organizational creativity as a whole.

# AN ASSESSMENT OF EMOTIONAL INTELLIGENCE UNDERSTANDING IN THE FIELD OF FINANCIAL PLANNING

Andree C. Swanson, Ashford University  
Randy Braidfoot, Ashford University

## ABSTRACT

*The Code of Ethics and Professional Responsibility of the Certified Financial Planner Board of Standards sets forth three principles that clearly identify the requirement to possess or obtain a high level of emotional intelligence. Researchers sought to discern if there was a need among CERTIFIED FINANCIAL PLANNER™ practitioners for a better understanding of emotional intelligence so they could better fulfill the requirements of the Code requirements. The outcome of the research demonstrated that there is a need for emotional intelligence training.*

**JEL:** Z00

**KEYWORDS:** Emotional Intelligence, Certified Financial Planners, Survey

## INTRODUCTION

The CERTIFIED FINANCIAL PLANNER™ designation is recognized as the “Gold Standard” of the financial planning industry when it comes to being a competent planner. As such, rules exist that CFP® certificants are required to follow. Within the Code of Ethics and Professional Responsibility of the Certified Financial Planner Board of Standards, high principles are established to maintain the professionalism and integrity of the certification marks (CFPBS, 2013). Also within three of the seven principles of the Code are indications that suggest practitioners possess or obtain a high level of emotional intelligence to meet the Code requirements (CFPBS, 2013).

### Principle 2 – Objectivity

“Provide professional services objectively” (CFPBS, 2013).

*Objectivity requires intellectual honesty and impartiality. Regardless of the particular service rendered or the capacity in which a certificant functions, certificants should protect the integrity of their work, maintain objectivity and avoid subordination of their judgment. (CFPBS, 2013)*

“Avoiding subordination of their judgment” (CFPBS, 2013) may be interpreted as a cognitive (thought) factor although emotional intelligence may be a part of this equation. The question is, when avoiding subordination of one’s own judgment, is it strictly cognitive or do emotions play a role? In conjunction with that, maintaining objectivity could also be seen as a cognitive function, although emotional intelligence will be a primary factor in maintaining objectivity due to the awareness an individual needs of one’s emotions and that of others to maintain the objectivity.

### Principle 3 – Competence

“Maintain the knowledge and skill necessary to provide professional services competently” (CFPBS, 2013).

*Competence means attaining and maintaining an adequate level of knowledge and skill, and application of that knowledge and skill in providing services to clients. Competence also includes the wisdom to recognize the limitations of that knowledge and when consultation with other professionals is appropriate or referral to other professionals necessary. Certificants make a continuing commitment to learning and professional improvement. (CFPBS, 2013)*

Because financial issues can sometimes be very stressful and quite emotional, competence can be interpreted as being able to recognize and maintain one's emotional balance during a stressful period and, in addition, recognize and manage the emotional condition of the other individual(s) in the meeting to produce a successful and productive outcome.

#### Principle 4 – Fairness

“Be fair and reasonable in all professional relationships. Disclose conflicts of interest” (CFPBS, 2013).

*Fairness requires impartiality, intellectual honesty and disclosure of material conflicts of interest. It involves a subordination of one's own feelings, prejudices and desires so as to achieve a proper balance of conflicting interests. Fairness is treating others in the same fashion that you would want to be treated. (CFPBS, 2013)*

For an individual to subordinate one's own feelings, prejudices, and desires, that individual must first recognize their own feelings, prejudices and desires and understand how to manage those. That is the heart of emotional intelligence-recognizing and managing one's own feelings and being able to subordinate that to achieve the balance described. The purpose of this qualitative study is to identify the levels of understanding of emotional intelligence (EI) within the field of CERTIFIED FINANCIAL PLANNER™ practitioners. This study assesses if emotional intelligence is an unrecognized component of the CFP Board Rules of Conduct based on the practice habits of CFP® certificants and to assess whether emotional intelligence should be included in the curriculum for CERTIFIED FINANCIAL PLANNER™ practitioners.

## LITERATURE REVIEW

The purpose of this literature review is to identify what is available in current literature from 2003 to Feb 2013 in the field of emotional intelligence and financial planning. The research took place using EBSCOHost and Google Scholar (Table 1).

Table 1: Key Word and Title Search

Theoretical concepts and research topics	Peer-reviewed journal articles		Websites	Newspapers and magazines
Emotional intelligence	1864	1	2	19
Emotional intelligence + financial planning	6	1	0	0
Emotional Intelligence + money	10	0	0	0

Key word searches are: 1) emotional intelligence, 2) emotional intelligence and financial planning, and 3) emotional intelligence and money.

Several constructs evolved from the theory of emotional intelligence. Some emphasize ability (Mayer, Caruso, & Salovey, 1999). Some emphasize trait characteristics, such as Reuven Bar-On (Reuven Bar-On, 2007). “Theorists who favor a trait-ability approach tend to refer to emotional intelligence as something testable and rather fixed, something like IQ” (R. Hammett, personal communication, Dec. 12, 2012). Trait theorists refer to emotional intelligence as emotional quotient (EQ), similar to intelligence quotient (IQ). “Mayer, Salovey, and Caruso's Emotional Intelligence Test (MSCEIT) and BarOn's EQ-I

are two assessment instruments that exemplify such approaches” (R. Hammett, personal communication, Dec. 12, 2012).

*Our approach emphasizes a person-centered and experiential way of thinking about emotional intelligence; emotional intelligence as learned skills and competencies. If emotional intelligence skills and competencies can be learned and practiced, then emotional intelligence itself can (and is) developed over time. Thus, we always refer to emotional intelligence as EI rather than EQ. For us, the abbreviation one uses for emotional intelligence reflects their fundamental position about what the construct is. For us, our choice to emphasize learned skills and abilities, and EI rather than EQ, also reflects the education-transformative approach... (R. Hammett, personal communication, Dec. 12, 2012).*

Darwish (2006) discussed the importance of emotional intelligence and the correlation back to the Code of Ethics. Finley (2008) reviewed methods for increasing one's EI: emotional self-awareness, emotional management, self-motivation, highly empathetic, and relationships under management. Sullivan (2011) stated that, “Emotions can influence financial decisions in surprisingly predictable ways” (p. 4). The search for emotional intelligence and money did not garner any useful information for this study. Brief statements regarding money smoking marijuana (Brackett, Mayer, & Warner, 2004) to just investing money wisely (Salovey, 2001) were the only brief mentions of money and emotional intelligence. Further research with an online librarian confirmed there is no more literature on the topic of emotional intelligence and certified financial planners.

### Significance Of Study

The significance of this study relates directly back to the Code of Ethics and Professional Responsibility of the Certified Financial Planner Board of Standards, Inc. As stated in the Code of Ethics, a financial planning practitioner must maintain the knowledge and skills necessary to provide professionally competent services. Competence includes the wisdom to recognize the limitations of that knowledge and referring to another professional when necessary. As practitioners dealing with emotional issues, financial planners are not psychologists nor should they refer clients to mental health professionals. Emotional recognition of the client plays a crucial role in understanding the client's motivation and feelings about his or her finances. Many studies have been published on how individuals with high emotional intelligence can enhance and increase the potential for positive outcomes. The researchers propose that financial planners should work to increase their emotional intelligence, to be successful when working with clients. Emotional intelligence is a learned and practiced skill. The completion of the proposed study may positively benefit the field of financial planning and in a greater sense may significantly change the landscape of communications and relationships in both business and academia as a whole.

### **RESEARCH METHODOLOGY**

The study was conducted using an Internet survey tool, Survey Monkey. Trochim (2006) stated that “Survey research is one of the most important areas of measurement in applied social research” (para. 1). One of the benefits of using a survey is the ability to remain anonymous and reduce the chances of participants to influence other participants (Trochim, 2006). Two studies were conducted. First, a pilot study was completed. The researchers reviewed the survey results from the first seven participants. After reviewing the results, the researchers removed the initial question 16, which asked: If appropriate training could increase your productivity by 25% or more, would that be of interest to you. The full study immediately commenced. The study's population was limited to Certified Financial Planners™ located within the United States with at least 1 year of experience as a practitioner. Recruitment was done through social media sources such as LinkedIn and Facebook.

## SURVEY RESULTS

The pilot study ended on February 28<sup>th</sup>, 2013. Seven CFPs participated in the pilot study. The data was gathered and analyzed. In question 1, all 36 participants were Certified Financial Planners™ and in question 2, the majority of the respondents 24 of 36 (66.7%) had heard of emotional intelligence, although only 12 (33.0%) had a clear understanding of the meaning of emotional intelligence. In question 5, the participants were asked if they had experienced formal training in emotional intelligence as part of financial planning training. Six (16.7%) participants had received training and 30 (83.3%) had not received formal training. In question 6, the participants were asked if they had received emotional intelligence training as part of other training. Five (13.9%) participants had received EI training, and 31 (86.1%) participants had not received EI training. In question 16, 27 (75.0%) participants would like to participate in future research on the topic of EI and financial planners. Nine (25.0%) participants did not want to participate any further. In question 17, 29 (82.9%) participants would like to receive the results of the study, while 6 (17.1%) participants do not want the results, and one participant abstained from responding to the question.

Table 2: Questions 1, 2, 5, 6, 16 And 17

Question	Yes	No
Are you a certified financial planner?	36 (100%)	0
Have you heard of emotional intelligence?	24 (66.7%)	12 (33.0%)
Have you had any formal training in emotional intelligence as a part of your financial planning experience?	6 (16.7%)	30 (83.3%)
Response to 5.		
1. Mostly in small workshops where the subject was introduced. No formal training.		
Have you received emotional intelligence training as a part of another field of study?	5 (13.9%)	31 (86.1%)
Responses to 6.		
1. Just some internal discussions on the topic.		
2. Social intelligence, body language, financial psychology		
3. Just through my own personal process. Reading, research, AA, Emotional Intelligence book		
4. Taught a class using "The emotionally intelligent financial advisor" as one of the texts.		
5. In conjunction with financial life planning training		
Would you be interested in participating in future studies on this topic? (Two people skipped this question)	27 (75.0%)	9 (25.0%)
Would you like to receive the results from this study? (Three people skipped this question)	29 (82.9%)	6 (17.1%)

*This is a table showing the answers to questions 1, 2, 5, 6, 16, and 17.*

Responses to question 4, which asked for a brief explanation of what the participants believed emotional intelligence was and how to use it. A broad range of responses were posted, some with a very clear understanding and other responses were unable to explain EI. The results are posted at Appendix A. In question 8, 23 (63.9%) participants believed that emotional intelligence is a learned ability and 13 (36.1%) participants believed that emotional intelligence is a trait that you are born with.

Table 3: Question 8

Question	Born with	Learned ability
8. Do you believe that emotional intelligence is a talent you are born with or is it a learned behavior?	13 (36.1%)	23 (63.9%)

*This is a table showing the responses to question 8.*

In question 3, 14 (38.9%) of the 36 participants strongly agreed or agreed that they had a clear understanding of emotional intelligence. Nine (25.0%) participants strongly disagreed or disagreed that they understood emotional intelligence. Fifteen (41.7%) participants were neutral. One would consider if an individual were asked if they understood a topic and they responded as neutral, the response would

indicate they did not understand the topic, although this cannot be verified. Because of this, the question is left for interpretation as approximately 42% of the participants responded neutrally.

In question 7, 29 (80.6%) of the 36 participants strongly agree or agreed that EI would be useful in their work as a financial planner. Two (5.6%) participants do not agree that EI would be useful as a financial planner. Five (13.9%) had a neutral feeling towards the usefulness of EI in financial planning.

In question 9, 30 (83.4%) of the 36 participants strongly agree or agreed that EI would improve their performance. Two (5.6%) participants do not agree that EI would improve performance. Four (11.1%) had a neutral feeling towards improving their performance.

In question 10, an overwhelming 32 (88.9%) of the 36 participants strongly agree or agreed that when working with clients they use emotional intelligence. Participants were given this statement before asking the question: "Emotional intelligence is your ability to recognize and understand emotions in yourself and others, and your ability to use this awareness to manage your behavior and relationships" (Paterson, 2011, p. 80). Although there were three (8.3%) neutral responses, there were no responses that disagreed with the statement. Interesting that one (2.8%) participant disagreed or strongly disagreed that they did not have a clear understanding of emotional intelligence.

In question 11, 31 (86.1%) of the 36 participants strongly agree or agreed on whether EI should be part of the primary curriculum for financial planners. Participants were given this statement: "Bradberry and Greaves (2009) indicated that EI is 'so critical to success that it accounts for 58% of performance in all types of jobs' and 'is the single biggest predictor of performance in the workplace and the strongest driver of leadership and personal excellence' (p. 20)." One (2.8%) participant strongly does not agree that EI should be a part of financial planning curriculum. Four (11.1%) participants had a neutral feeling towards the inclusion of EI into financial planning curriculum. In question 12, 27 (75.0%) of the 36 participants strongly agree or agreed that EI should be included as a continuing education unit (CEU) for certified financial planners. Two (5.6%) participants do not agree that EI should be included as a CEU for certified financial planners. Seven (19.4%) had a neutral feeling towards the inclusion of EI as a CEU for certified financial planners. In question 13, 35 (97.1%) of the 36 participants strongly agree or agreed that when meeting with clients in the past, they have personally experienced a situation where a client became distraught or emotionally upset. No (0%) participants had experienced an emotionally upset client.

One (2.8%) had a neutral response to this question. In question 14, 26 (72.2%) of the 36 participants strongly agree or agreed that when dealing with an emotionally distraught client, they felt comfortable with the situation and confident in knowing what to do. Three (8.3%) participants do not agree that when dealing with an emotionally distraught client, they felt comfortable with the situation and confident in knowing what to do. Seven (19.4%) had a neutral feelings about this issue. In question 15, 28 (77.8%) of the 36 participants strongly agree or agree that training in dealing with an emotionally distraught client be beneficial. Two (5.6%) participants did not agree that training would be beneficial. Six (16.7%) had a neutral feeling about having training in dealing with emotional clients.

In question 18, participants were asked for other comments. "Managing emotions of clients in our working relationship is critically important" (Participant 3). One participant thanked the researchers for "raising awareness of this area" (Participant 7). One participant felt that although EI was beneficial, but felt that EI appears as a sales tactic. Participant 2 stated, "The survey is not particularly scientific. Some questions are designed to elicit a desired response. The line of questioning strongly implies an agenda beyond scientific discovery on the part of the researchers." In question 19, three (8.6%) participants had between one and three years of experience. Twelve (34.3%) participants had between four and nine years of experience. Seven (20.0%) participants had between 10 and 14 years of experience. Five (14.3%)

participants had between 15 and 19 years of experience. Eight (22.9%) participants had 20 or more years of experience as a CFP (Table 5). One participant skipped this question

Table 4: Questions 3, 7, 9 - 15

Questions	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
3. Do you have a clear understanding of what emotional intelligence is?	4 (11.1%)	5 (13.9%)	15 (41.7%)	10 (27.8%)	4 (11.1%)
7. Do you believe that using emotional intelligence in your work as a financial planner would be useful?	1 (2.8%)	1 (2.8%)	5 (13.9%)	19 (52.8%)	10 (27.8%)
9. Do you believe that using emotional intelligence in your work as a financial planner could improve your performance? (Two people skipped this question)	1 (2.8%)	1 (2.8%)	4 (11.1%)	20 (55.6%)	10 (27.8%)
10. "Emotional intelligence is your ability to recognize and understand emotions in yourself and others, and your ability to use this awareness to manage your behavior and relationships" (Paterson, 2011, p. 80). When working with clients do you use emotional intelligence? (Two people skipped this question)	0 (0%)	1 (2.8%)	3 (8.3%)	18 (50.0%)	14 (38.9%)
11. Bradberry and Greaves (2009) indicated that EI is "so critical to success that it accounts for 58% of performance in all types of jobs" and "is the single biggest predictor of performance in the workplace and the strongest driver of leadership and personal excellence" (p. 20). Based on this statement, should emotional intelligence be included in the primary curriculum for financial planners? (Two people skipped this question)	1 (2.8%)	0 (0%)	4 (11.1%)	19 (52.8%)	12 (33.3%)
12. Do you think that emotional intelligence should be included as a continuing education unit (CEU) for certified financial planners? (Two people skipped this question)	2 (5.6%)	0 (0%)	7 (19.4%)	15 (41.7%)	12 (33.3%)
13. When meeting with clients in the past, have you personally experienced a situation where a client became distraught or emotionally upset? (Two people skipped this question)	0 (0%)	0 (0%)	1 (2.8%)	21 (58.3%)	14 (38.9%)
14. When dealing with an emotionally distraught client, did you feel comfortable with the situation and confident in knowing what to do? (Two people skipped this question)	0 (0%)	3 (8.3%)	7 (19.4%)	23 (63.9%)	3 (8.3%)
Would training in dealing with an emotionally distraught client be beneficial to you? (Two people skipped this question)	1 (2.8%)	1 (2.8%)	6 (16.7%)	14 (38.9%)	14 (38.9%)

*This is a table showing the responses to questions 3, 7, 9, 10, 11, 12, 13, 14 and 15.*

Table 5: Question 19

Question	1 – 3 years	4 – 9 years	10 – 14 years	15 – 19 years	20 or more years
19. How many years have you been working in the financial planning field? (One person skipped this question)	3 (8.6%)	12 (34.3%)	7 (20.0%)	5 (14.3%)	8 (22.9%)

*This is a table showing the responses to question 19.*

In question 20, 23 (65.7%) of the 36 participants were male and 12 (34.3%) of the participants were female (Table 6). One participant skipped this question.

Table 6: Question 20

Question	Male	Female
What is your gender? (One person skipped this question)	23 (65.7%)	12 (34.3%)

*This is a table showing the responses to question 20.*

Twenty-nine participants of 36 resided in 18 different states with the most coming from the state of Texas (25%) (Table 7). Seven participants skipped this question.

Table 7: Geographic Representation

State / Number	State / Number	State / Number	State / Number	State / Number	State / Number	State / Number
AK / 1 (3%)	AZ / 1 (34%)	CO / 1 (34%)	GA / 1 (34%)	IA / 1 (3%)	IL / 1 (3%)	MA / 1 (3%)
MD / 2 (6%)	MN / 2 (6%)	MO / 1 (3%)	MT / 2 (6%)	NC / 2 (6%)	NY / 2 (6%)	OR / 1 (3%)
TX / 7 (24%)	UT / 1 (3%)	WA / 1 (3%)	WI / 1 (3%)			

*This is a table showing the geographic distribution of participants. Seven participants did not respond to this question.*

## SUMMARY OF RESEARCH

Thirty-six certified financial planners participated in this survey to assess the understanding that they have regarding emotional intelligence. The researchers attempted to see whether a need to create emotional intelligence training as a part of the Financial Planning education process is necessary and beneficial. Over 85% of participants have not received any training on emotional intelligence and over 63% of participants believe that EI is a learned skill. Over 83% of participants see that learning about EI would be beneficial in their business of financial planning. Only one participant did not think that there would be a benefit. Based on the results of this study, indications show that there should be further research on this topic and perhaps an introduction of additional training for financial planners on emotional intelligence.

## FUTURE RESEARCH

Based on the results of this study, further research can be done to investigate the appropriate level of emotional intelligence needed to become a better Certified Financial Planner™ practitioner. The researchers plan on conducting a qualitative Delphi study to assess, through the use of expert CFPs (identified in this study), the appropriate levels of training required in emotional intelligence. This study can be replicated, by refining the questions and seeking permission from the Certified Financial Board to use their membership as a resource. The current study can also be replicated in foreign countries, for example, Australia, Ireland, India, and Denmark. Further research may use the Skills for Career And Life Effectiveness® (SCALE®), a highly valid assessment tool as used for 30 years.

## CONCLUDING COMMENTS

A limitation of the study is the limited sample size. Although the researchers reached out through social media, perhaps replicating this study with the support of the Certified Financial Planner Board of Standards could expand the sample size. In this study, a further literature review was conducted. "Limited literature is available for the financial planner to specifically learn the skill of emotional intelligence" (Braidfoot & Swanson, 2013, p. 7). This primary survey was done to gather data on the understanding of emotional intelligence and to assess whether there is a need for further training in the field of EI for certified financial planners. Educational leaders and financial planning leadership can use this data as a starting point for further research and decision making. Overwhelmingly, 97% of the respondents claimed they have experienced a situation with an emotional distraught client. Additionally, 75% responded that they desire Emotional Intelligence as part of a continuing education program. Over an 85% positive response was received to the question on establishing Emotional Intelligence as part of the primary curriculum for financial planners. The results of this survey strongly indicate that further study and training for financial planners is not only warranted but may be considered essential in the framework of being a competent planner.

## APPENDIX A

### RESULTS TO QUESTION #4

1. I really can't, sorry
2. I believe emotional intelligence is the impact or influence that emotions can have on normal decision making ability.
3. The ability to identify emotions in yourself and others.
4. Investing using emotions instead of economics.
5. Emotions will affect most decisions. I believe it is using emotional responses to change behaviors.
6. Being able to identify the emotions of others as well as your own.
7. Instead of working with clients based on a purely objective basis, working with the subjective and psychological sides.
8. Understanding how to work with clients in stressful situations.
9. In summary, to recognize and manage emotions in a relationship (financial).
10. It is the ability to not only understand oneself and the emotions that drive decision making but those of others as well and then interpret those emotions.
11. EI is the ability to understand your emotions and take them as a cue on how to react in life situations. It involves having empathy for others and reacting in an emotionally mature way. It has been useful in workplace settings classrooms, anyplace where there is an interaction of people.
12. Emotional driven behaviors and actions and recognizing the driving force behind such actions.
13. The ability to control not only your own emotions but influence those of others by your reaction or behavior in certain circumstances
14. My understanding is that it is my ability to combine my rational knowledge with my more irrational knowledge in better understanding how I think and work and also how my customers think and behave
15. Being able to understand what makes a person tick. Understanding why a person makes certain decisions based on personality or past experiences. After the CFP identifies these traits, he can tailor his presentation to address the client's feeling and concerns.
16. The ability to be aware of how your emotions are influencing the decisions you make and to realize the emotions of others in their decision making
17. Not sure
18. The ability to use social intelligence to detect the emotional reactions of individuals (clients) and react to them in ways that will appeal at the individual's emotional level.
19. Emotional intelligence to me is personal awareness. Seeing our own motives and understanding what drives our decision making. When we understand this about ourselves it becomes easier to understand this about other people. When we meet with clients, we can hear the things they are not saying because we have a higher emotional awareness. This allows us to better serve our clients.
20. Connecting with or marketing directly to the personality traits of individuals, clients, prospects, etc.
21. Decision making process when deciding on actions that triggers emotions.
22. Understanding how and what you say and how it will affect people.
23. Similar to IQ, but it is our ability to understand the feelings of others and how to best related to them in various contexts. Empathy can be used as an example of emotional intelligence.
24. Being aware and adjusting for your emotions
25. An innate ability to assess the mood and sensitivities of another which affects one's own approach to interaction with the other person in a way that results in enhanced effectiveness of communication

26. The ability to understand and control your own emotions and to understand and positively adjust to the emotions of others

## BIOGRAPHY

Randy Braidfoot is a securities principal and CFP® practitioner. He holds a Master of Science in Personal Financial Planning and a Bachelor of Arts in Mass Communications. He is a “subject matter expert” for the Certified Financial Planner Board of Standards. He also volunteers as a Texas judiciary-approved mediator. In 2011, he was honored as Mediator of the Year. Braidfoot is an adjunct professor for Ashford University. He can be reached at P O Box 582, Panhandle, TX 79068, email: <mailto:braidfoot@msn.com>

Andree Swanson is an assistant professor with Ashford University (Denver, Colorado) and adjunct associate professor with the College for Financial Planning (Greenwood Village, Colorado). Dr. Swanson holds a Doctorate in educational leadership and a Master of Arts in organizational management. She also holds a Master of Human Relations. Dr. Swanson has worked for the US government (DoD, USAF, & USA), corporations, and higher education. She can be emailed at 10259 Jill Avenue, Highlands Ranch, CO 80130: [andreeswan@aol.com](mailto:andreeswan@aol.com)

# IMPROVING THE FINANCIAL ENVIRONMENT FOR CONSUMER IN CHINA KEY OBSTACLES AND STRATEGY

Zheng Xingchen, Financial Research Institute of DRC, China

## ABSTRACT

*This paper discusses obstacles and approaches to improve financial environment of consumer in China. The key obstacle existed in financial environment is listed, including deficiency of information disclosing, undeveloped credit system, narrow personal services, and consumer with insufficient financial knowledge. To improve the financial environment for consumer, approaches are introduced, such as improving the law system, promoting the development of financial services system, and establishing mechanism for consumer protection.*

**KEY WORDS:** financial environment of consumer, obstacle, approach

## INTRUDUCTION

In china, the conception of financial environment of consumer indicates the convenient fair inclusive financial system, which including effective law system, jurisdiction, financial firms and whole financial market utilities. During the past twenty years, the development of financial environment of consumer in china was lagged after the rapidly enlarged demanding from economy. Also, law and jurisdiction system were lagged after the innovation activity by financial firms. During the next ten to twenty years, financial environment improvement will be the key fact to facilitate the development of China economy.

### The Importance of Improving the Financial Environment of Consumer

#### An Effective and Whole Financial Environment of Consumer Will Be Helpful to Stimulate the Consumption

During the next ten to twenty years, China's economy will have its international market and social investment growing slowly, so the social consumption of consumer will be the key element to stimulate the economy. By now, the financial environment is still urged by consumer to improve it capability to match the demanding form consumer, such as providing well disclosed information, fair and standardized contract. If obstacles which restraining activities of consumer are removed stage by stage, the economy of China will drive forward with more forceful engine of consumption.

#### An Effective and Whole Financial Environment of Consumer Will Be Helpful to Build Fair and Harmonious Society

During the rapid development in past twenty years, China's have accumulate their fortune, and now they need to manage the fortune and make investment to cope with inflation which existed everywhere in the world. But for most consumers, they have limited knowledge about finance and weak capability of decision-making in finance field. Without an effective and whole financial environment, most of the consumer of Chinese will can't get rid of high risk and be easy to lose their money. In fact, when people losing their money in market, they will accumulate the failure to the unfair game, hate the winner, and urge the government to regulate the market, such as stock market. Of course, it is harmful for building a

harmonious society. So if we want to build a fair and harmonious society, effective and whole financial environment of consumer is key element.

#### A Faultiness Financial Environment of Consumer Can't Support Sustainable Development of Economy

A faultiness financial environment of consumer means the unfair and low capability to match the demand from economy, which is ineffective in response to need of most consumers. Firstly, it will conduct the fortune displacing too few people which means polarizing in society. The polarizing will restrain consumption and investment of most consumers, and hurt their confidence to future. Secondly, when financial services are concentrated in narrow field which with high rate of return, the inclusive finance can't be developed effectively. It means that most of the poor consumer can't be served by financial firm effectively, and will get less chance to get rid of poor. On other hand, the concentrating of financial services in field with high rate of return, will conduct self-aggrandizement of finance sector independently out of economy development, which means risk accumulating. If consumers are restrained to consumption or investment by obstacles, or poor people get less chance to get rid of poor, the economy will not drive forth with full energy. If risk is accumulating continually in financial sector, it may cause finance crisis, such as the crisis in 2008. So a faultiness financial environment of consumer can't support sustainable development of economy.

#### **KEY OBSTACLES EXISTED IN FINANCIAL ENVIRONMENT OF CONSUMER IN CHINA**

To improve the financial environment of consumer in China, we should indentify key obstacles existed in financial sector. Due to problems in financial sector, we can identify key obstacles as follows:

##### Deficiency of Information Disclosing

There are key gaps in quality of information disclosing between Chinese financial firm and which of developed countries. For example, disclosed information files of banks oversea oriented are times of which of native banks. With deficiency of information disclosing, the consumer can't make decision correctly, which means probably to lose money in trading. It will restrain the consumption and investment activities of consumer.

##### Credit System Is Still in Developing

Without the credit system, financial system can only rely on guaranty or warrantor. It will rapidly increase the cost of loan without guaranty or warrantor. So in fact, ineffective credit system is unfair to most consumers who have the capability and is willing to give back the loan in time. In some times, consumer even can't get loan from bank without guaranty or warrantor.

##### Personal Financial Services Is Narrow

Firstly, until now most of the populace financial services by traditional financial firms are mainly concentrated in deposit and payment. Concern with the fortune management services by banks for consumer, in fact most of its business are engaged with loan which make borrower and loaner to cooperate directly. It means the function of finance system can't match the transformational economy well. Secondly, inclusive financial service is still undeveloped. For example, only 30% to 40% farmer can get adequacy loan from bank system. Poor people are difficult to get loan from business bank.

### Most of Consumers Have Insufficient Financial Knowledge in Consumption

Due to the cases occurred in recent years, most of consumers always could not identify out potential risk in contract of consumption, especially the elder consumer. In some cases, depositors were misguided to take insurance contract as deposit receipt. In some complicated contracts, it is also difficult for experts to identify out the potential risk. In fact, it is unfair to consumer and probably to cause series suit.

### **STRATEGY TO IMPROVE THE FINANCIAL ENVIRONMENT FOR CONSUMER**

To improve the financial environment for consumer, law and policy system are needed to be improved to match the demanding from China's economy which is in transformation.

#### Improve the Law System

*Lawmaking:* Until now, bylaws of department in government act as key role in consumer protection more than law, and in financial environment as well. For example, we have still no law of consumer protection. On other hand, different department engaged with the supervision on financial market by different bylaws. On this situation, there some fields are not supervised, and some fields are supervised by different department simultaneously. So consumer protection laws are needed to cover fields without being supervised, and to coordinate action of supervision. Protecting the benefit of consumer effectively will be the core objective of improving financial environment. To gain it, information disclosing and anti fraud should be key elements in consumer protection laws. The terms of law and bylaw about the violation to benefit of consumer should be effective for quoting.

*Keep business activities in financial market to be lawful:* With the law system about financial environment improved, if business activities are kept lawful, then the benefit of consumer will be protected. The judiciary system is a key role in maintain the fairness of financial environment of consumer. To bring the judiciary system into play more effectively, further steps are needed to enhance the capability in financial field. At the same time, monitor of media is necessary to urge continually improving in financial environment. So law and bylaw system should facilitate the overseeing on financial environment by media.

#### Promote the Development of Financial Services System to Facilitate Consumption

Facilitate the development of financial services by encouraging financial firms to improve their capability.

*Encourage financial firm to improve capability to match the rapidly enlarged demand from consumer in market:* Firstly, the construction utilities of financial market such as clearing, settlement, payment, are needed to be well developed and supervised, to avoid risk accumulation. Secondly, the development of financial firms and their services which engaged with services to consumption and social investment should be encouraged. Thirdly, standardization of financial services should be conducted to facilitate consumption and investment.

*Promote development of financial firms which engaged with inclusive finance services:* To serve the population in rural area and poor population in community of city to get rid of poor, inclusive finance is very important in their financing. To develop the inclusive finance continually, fiscal support is needed according to experience in developed countries. When identifying the population who should be supported by inclusive financial services, the cooperation between local government and financial firm are needed.

*Establish protecting mechanism for consumer:* Compare to the developed countries, China's mechanism of consumer protection is still waiting to be integrated effectively. Approaches urgent are listed as follows:

*Develop a whole mechanism which including laws and bylaws to protect consumer:* Firstly, financial product for consumer with limit information disclosing should be standardized especially in fields with high risk. For example, introduce standardized contract by supervisor. Secondly, enhance coordinating among departments with duty of supervision under the law of consumer protection, such as appointing a department of government to act as shepherd. Thirdly, integrated bylaws of different supervisors in government into a law, and re-admeasure the duty of different supervisors to abolish the blind spot of supervision.

*Consumer education for indentifying fraud :* Concerning the trading by consumer without understanding the contract with trap exactly, consumer education for indentifying the fraud is very urgent, especially for the elder citizen. To help the consumer to develop the capability of indentifying the fraud in contract, local government should cooperate with the branch of supervision department in training staff and educating consumer to deal with fraud in financial market.

# A SUSTAINABILITY EXERCISE FOR A MANAGEMENT SCIENCE COURSE USING EXCEL SOLVER AND GOAL PROGRAMMING

Michael Godfrey, University of Wisconsin Oshkosh College of Business

Andrew Manikas, University of Louisville College of Business

## ABSTRACT

*This paper discusses a sustainability exercise for use in a management science course. Specifically, we discuss an exercise using goal programming and Excel Solver for making supplier selection decisions incorporating a triple bottom line approach (economic, environmental and social performance objectives). The multiple, conflicting objectives and the qualitative nature of the social performance objective require the use of multi-criteria decision-making. Our goal programming exercise requires only Excel and could be expanded to include additional triple bottom line criteria.*

**KEYWORDS:** Sustainability, Management Science, Curriculum, Triple Bottom Line, Goal Programming

## INTRODUCTION

Our Supply Chain Management (SCM) major started integrating sustainability into our major in the Fall 2006 and continues to integrate sustainability into all of our SCM courses. The first widespread definition of sustainability was presented in *Our Common Future* (World Commission on Economic Development, 1987, p. 8) in which sustainable development was defined as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs.” Other researchers (e.g., Elkington (1994, 1998)) expanded the definition of sustainability to include the triple bottom line criteria of economic, environmental, and social performance. The least understood and under-researched of the three bottom lines is social performance. Mass and Bouma (as cited in Castro & Chousa, 2006) divided the social performance criteria into two broad categories: internal measures (education, training, safety, health care, employee retention and job satisfaction) and external measures (sponsoring, volunteer work, investment in society, and stakeholder involvement). Norman and MacDonald (2004) argued that it is impossible to calculate a social performance bottom line in the same way that an income statement is created. Summing a company’s performance on various social performance measures into a single bottom line is problematic due to: (a) the question of what units to use to express social performance, and (b) the manner in which social performance often is expressed—using percentages, which cannot be added or subtracted into a single meaningful measure. However, even though managers cannot calculate a bottom line for social performance, we argue that managers still could make value judgments and comparisons concerning which social performance criteria are more important. Multi-criteria decision-making (MCDM) methods, and in particular, goal programming, work well for making these value judgments and comparisons.

Goal programming is an extension of linear programming in which the objective function measures the minimization of unwanted deviations from goals (targets). As discussed by Romero (2004), two of the most common types of objective functions for goal-programming models are lexicographic and weighted. The lexicographic type of achievement function, used later in our paper, leads to preemptive, or prioritized, goals. As described by Anderson, Sweeney, Williams, Camm, and Martin (2012), goal-programming problems with preemptive priorities are solved by finding the solutions for a sequence of linear programming models with different objective functions: Priority Level 1 goals are considered first, Priority Level 2 goals second, etc. At each step of the solution procedure, a revision in the solution is

allowed only if it causes no reduction in the achievement of higher priority goals previously minimized. Anderson et al. (2012) discussed two types of constraints in a goal-programming model: hard constraints, which are typical linear programming constraints that cannot be violated, and soft constraints, which correspond to goal equations and can be violated but with a penalty for doing so (the penalty is represented by deviation variables).

Our paper discusses the continued integration of sustainability concepts in our supply chain management curriculum. We already have added several sustainability exercises in our Manufacturing Planning & Control, Supply Chain Management, Supply Chain Strategy, and Advanced Quality Management courses. In the current paper, we outline the use of goal programming for supplier selection decisions based on triple bottom line criteria. First, we present literature with applications of goal programming for sustainability type of multi-criteria decisions. Second, we present the in-class exercise using goal programming and Excel Solver. Third, we conclude with a summary of the goal-programming exercise and possible extensions to this exercise.

## LITERATURE REVIEW

Goal programming, with its ability to handle multiple, conflicting criteria, has been used to model sustainability decisions in many contexts, e.g., agricultural planning, utility planning, and supply chain planning. Examples of sustainability decisions in each of these areas are discussed below.

### Goal Programming Applications In Agricultural Planning

Darradi et al. (2012) discussed the use of goal programming to optimize environmental performance (nitrogen, sediments, and water yields) of agricultural activities in a case study in France. Acosta-Alba et al. (2012) applied goal programming to optimize economic, environmental, and social performance criteria in a study of dairy farms in France. Cisneros et al. (2011) created a goal-programming model to analyze the tradeoffs between economic, environmental, and social performance criteria when studying land uses, crops, pastures, and conservation practices in a case study in Argentina.

### Goal Programming Applications In Utility Planning

San Cristobal (2012) developed a goal programming model to determine the mix and location of renewable energy plants in Spain and include economic, environmental, and social performance criteria in that model. Papandreou and Shang (2008) proposed a goal-programming model for designing utility systems while considering economic and environmental (emissions) goals. Liner and deMonsabert (2011) considered economic, environmental, and social performance criteria in their goal-programming model for selecting water management alternatives using publicly available data from a California utility. Cowan, Daim, and Anderson (2010) combined the analytic hierarchy process (AHP) with goal programming to select an optimal mix of hydroelectric power and storage technologies to achieve triple bottom line objectives. They used AHP to assign weights to the deviational variables within the objective function of their goal-programming model.

### Goal Programming Applications In Supply Chain Planning

Oglethorpe (2010) illustrated a goal programming approach using real case study to create a food supply chain that considers triple bottom line objectives: economic (return on sales); environmental (GHG emissions and water use), and social (health impacts from fat content of products and number of jobs). Buyukozkan and Berkol (2011) also studied designing a sustainable supply chain by combining goal programming with quality function deployment (QFD) and the analytic network process (ANP).

In-Class Exercise Using Goal Programming and Excel Solver for Supplier Selection

The exercise described below analyzes the selection of new suppliers to replace a current hazardous material used in the manufacture of a company's product. The buying company must purchase 2,000 units per year of a similar material that performs the same function as the current material. Each supplier has limits on its capacity—Supplier 1 can provide at most 1,500 units; Supplier 2 can provide at most 1,200 units; Supplier 3 can provide at most 2,500 units. An explanation of the supplier selection criteria follows.

1. Economic Criterion: Purchase cost savings per unit compared to current supplier.
2. Environmental Criterion: Hazardous waste per unit generated by the supplier's process (stated in pounds).
3. Social Performance Criterion: Hours of employment per unit generated in an economically disadvantaged area.

As shown in Table 1, these criteria focus on economic, environmental, and social performance objectives.

Table 1: Estimated Supplier Performance on the Criteria

Criterion	Supplier 1	Supplier 2	Supplier 3
1) Purchase Cost Savings per Unit	\$10	\$25	\$8
2) Hazardous Waste per Unit (lbs.)	1.5	1.2	2.2
3) Hours of Employment per Unit	0.8	0.9	1.0

*This table shows estimated supplier performance for all three suppliers on the three criteria considered.*

Step 1 of the exercise is to prioritize goals and to set targets for each goal:

Priority 1 Goal: The desired annual purchase costs savings must equal at least \$32,000.

Priority 2 Goal: The total amount of hazardous waste generated annually by the suppliers should be at most 1,800 pounds. Priority 3 Goal: The hours of employment generated in economically disadvantaged areas should be at least 2,200. Step 2 is to define the decision variables, deviation variables, goal constraints (in order of priority), and hard constraints:

Decision Variables:

$X_1$  = units purchased from Supplier 1

$X_2$  = units purchased from Supplier 2

$X_3$  = units purchased from Supplier 3

Goal 1 Constraint:  $10X_1 + 25X_2 + 8X_3 - d_1^+ + d_1^- = 32000$

Deviation Variables:

$d_1^+$  = the amount greater than the goal of \$32,000

$d_1^-$  = the amount less than the goal of \$32,000

We wish to minimize the amount less than \$32,000 (represented by  $d_1^-$ ).

Goal 2 Constraint:  $1.5X_1 + 1.2X_2 + 2.2X_3 - d_2^+ + d_2^- = 1800$

Deviation Variables:

$d_2^+$  = the amount greater than the goal of 1,800 pounds of hazardous waste.

$d_2^-$  = the amount less than the goal of 1,800 pounds of hazardous waste.

We wish to minimize the amount greater than 1,800 pounds (represented by  $d_2^+$ ).

Goal 3 Constraint:  $0.8X_1 + 0.9X_2 + 1.0X_3 - d_3^+ + d_3^- = 2200$

Deviation Variables:

$d_3^+$  = the amount greater than the goal of 2,200 hours

$d_3^-$  = the amount less than the goal of 2,200 hours

We wish to minimize the amount less than 2,200 hours (represented by  $d_3^-$ ).

Hard Constraints:

$X_1 \leq 1500$  (Supplier 1 Capacity)

$X_2 \leq 1200$  (Supplier 2 Capacity)

$X_3 \leq 2500$  (Supplier 3 Capacity)

$X_1 + X_2 + X_3 = 2000$  (Total Demand)

Step 3 is to define the objective function. Here, we use the lexicographic approach demonstrated by Anderson et al. (2012):

Min  $P_1(d_1^-) + P_2(d_2^+) + P_3(d_3^-)$

$P_1$ ,  $P_2$ , and  $P_3$  are only labels—they remind us of the priority of each goal. Step 4 is to write the complete goal-programming model:

Min  $P_1(d_1^-) + P_2(d_2^+) + P_3(d_3^-)$

Subject to:

$10X_1 + 25X_2 + 8X_3 - d_1^+ + d_1^- = 32000$	(Goal 1)
$1.5X_1 + 1.2X_2 + 2.2X_3 - d_2^+ + d_2^- = 1800$	(Goal 2)
$0.8X_1 + 0.9X_2 + 1.0X_3 - d_3^+ + d_3^- = 2200$	(Goal 3)
$X_1 \leq 1500$	(Supplier 1 Capacity)
$X_2 \leq 1200$	(Supplier 2 Capacity)
$X_3 \leq 2500$	(Supplier 3 Capacity)
$X_1, X_2, X_3, d_1^+, d_1^-, d_2^+, d_2^-, d_3^+, d_3^- \geq 0$	(non-negativity)

Step 5 is to solve the model using Excel. To do this, first we modify the objective function to include only the  $P_1$  priority goals (called the  $P_1$  Problem):

$P_1$  Problem:

Min	$d_1^-$	
Subject to:		
	$10X_1 + 25X_2 + 8X_3 - d_1^+ + d_1^- = 32000$	(Goal 1)
	$1.5X_1 + 1.2X_2 + 2.2X_3 - d_2^+ + d_2^- = 1800$	(Goal 2)
	$0.8X_1 + 0.9X_2 + 0X_3 - d_3^+ + d_3^- = 2200$	(Goal 3)
	$X_1 \leq 1500$	(Supplier 1 Capacity)
	$X_2 \leq 1200$	(Supplier 2 Capacity)
	$X_3 \leq 2500$	(Supplier 3 Capacity)
	$X_1, X_2, X_3, d_1^+, d_1^-, d_2^+, d_2^-, d_3^+, d_3^- \geq 0$	(non-negativity)

The Excel spreadsheet is shown in Figure 1. The Changing Variable Cells are shaded in Cells B4:J4. You would leave them blank initially, although now in Figure 1, they show the results of the first solution run of Solver. The Set Objective Cell is shaded in Cell B7. The coefficients and right-hand-side values for constraints are listed in Rows 10 to 16. We simplify the entering of constraints as shown in Rows 18 to 24.

Figure 1: P1 Problem

	A	B	C	D	E	F	G	H	I	J	K	L	M
1													
2	<b>P1 Problem</b>												
3	Variables:	X1	X2	X3	d1+	d1-	d2+	d2-	d3+	d3-			
4		1200	800	0	0	0	960	0	0	520			
5		<b>Min</b>											
6	Objective	<b>d1-</b>											
7	Function:	0	=F4										
8													
9	Subject to:	<b>Enter coefficients and right-hand-side values for constraints here.</b>											
10	Goal 1:	10	25	8	-1	1						=	32000
11	Goal 2:	1.5	1.2	2.2			-1	1				=	1800
12	Goal 3:	0.8	0.9	1					-1	1		=	2200
13	S1 Capacity:	1										<	1500
14	S2 Capacity:		1									<	1200
15	S3 Capacity:			1								<	2500
16	Demand	1	1	1								=	2000
17		<b>Simplification of constraints using SUMPRODUCT function.</b>											
18	Goal 1:	32000	=SUMPRODUCT(B\$4:J\$4,B10:J10)										= 32000
19	Goal 2:	1800	=SUMPRODUCT(B\$4:J\$4,B11:J11)										= 1800
20	Goal 3:	2200	=SUMPRODUCT(B\$4:J\$4,B12:J12)										= 2200
21	S1 Capacity:	1200	=SUMPRODUCT(B\$4:J\$4,B13:J13)										< 1500
22	S2 Capacity:	800	=SUMPRODUCT(B\$4:J\$4,B14:J14)										< 1200
23	S3 Capacity:	0	=SUMPRODUCT(B\$4:J\$4,B15:J15)										< 2500
24	Demand	2000	=SUMPRODUCT(B\$4:J\$4,B16:J16)										= 2000

To run Solver, we specify the following:

1. For Set Objective Cell, enter: B7
2. Select "Min"
3. For Changing Variables Cells, enter: B4:J4
4. Select "Add" to enter the following constraint: B18:B20=M18:M20
5. Select "Add" to enter the following constraint: B21:B23≤M21:M23
6. Select "Add" to enter the following constraint: B24=M24
7. After entering the last constraint, select "OK"
8. Ensure that the following is checked to ensure non-negativity: "Make Unconstrained Variables Non-Negative"
9. For Solving Method, select "Simplex LP"
10. Select "Solve"

After running Solver, we have the following values for the variables:

$$X_1 = 1200; X_2 = 800; X_3 = 0; d_1^+ = 0; d_1^- = 0; d_2^+ = 960; d_2^- = 0; d_3^+ = 0; d_3^- = 520.$$

We can tell that we achieved our Priority 1 Goal fully because  $d_1^- = 0$ .

Note that there are multiple solutions possible for this  $P_1$  problem. As long as your solution has  $d_1^- = 0$ , it is correct. When we solve the  $P_2$  and  $P_3$  problems the solutions will converge.

### $P_2$ Problem

Next, we modify the objective function to include only the  $P_2$  priority goals (called the  $P_2$  Problem). We also must add a constraint to ensure that the solution from the  $P_1$  Problem is not degraded. These changes are shown in Figure 2  $P_2$  Problem. We need to change the formula in Cell B7 as follows: =G4. This change allows us to minimize  $d_2^+$ . Next, we must add a constraint to ensure that the Priority 1 Goal is not degraded, i.e., ensure that  $d_1^- = 0$ . We make this change as shown in Row 25 and then enter another constraint in Solver: B25=M25.

Figure 2:  $P_2$  Problem

	A	B	C	D	E	F	G	H	I	J	K	L	M
1	Figure 2												
2	P2 Problem												
3	Variables:	X1	X2	X3	d1+	d1-	d2+	d2-	d3+	d3-			
4		800	1200	0	6000	0	840	0	0	480			
5		Min											
6	Objective	d2+											
7	Function:	840	=G4										
8													
9	Subject to:	Enter coefficients and right-hand-side values for constraints here.											
10	Goal 1:	10	25	8	-1	1						=	32000
11	Goal 2:	1.5	1.2	2.2			-1	1				=	1800
12	Goal 3:	0.8	0.9	1					-1	1		=	2200
13	S1 Capacity:	1										≤	1500
14	S2 Capacity:		1									≤	1200
15	S3 Capacity:			1								≤	2500
16	Demand	1	1	1								=	2000
17		Simplification of constraints using SUMPRODUCT function.											
18	Goal 1:	32000	=SUMPRODUCT(B\$4:J\$4,B10:J10)									=	32000
19	Goal 2:	1800	=SUMPRODUCT(B\$4:J\$4,B11:J11)									=	1800
20	Goal 3:	2200	=SUMPRODUCT(B\$4:J\$4,B12:J12)									=	2200
21	S1 Capacity:	800	=SUMPRODUCT(B\$4:J\$4,B13:J13)									≤	1500
22	S2 Capacity:	1200	=SUMPRODUCT(B\$4:J\$4,B14:J14)									≤	1200
23	S3 Capacity:	0	=SUMPRODUCT(B\$4:J\$4,B15:J15)									≤	2500
24	Demand	2000	=SUMPRODUCT(B\$4:J\$4,B16:J16)									=	2000
25	P1 Problem Solution	0	=F4									=	0

After running Solver, we have the following values for the variables:

$$X_1 = 800; X_2 = 1200; X_3 = 0; d_1^+ = 6000; d_1^- = 0; d_2^+ = 840; d_2^- = 0; d_3^+ = 0; d_3^- = 480.$$

We maintained the achievement of the Priority 1 goal ( $d_1^- = 0$ ). As for the Priority 2 goal, we can see that we were not able to meet this goal fully because  $d_2^+ = 840$ .

### $P_3$ Problem

Next, we modify the objective function to include only the  $P_3$  priority goals (called the  $P_3$  Problem). We also add a constraint to ensure that the solution from the  $P_2$  Problem is not degraded. These changes are shown in Figure 3  $P_3$  Problem. Then, we change the formula in Cell B7 as follows: =J4. This change allows us to minimize  $d_3^-$ . Next, we add a constraint to ensure that the Priority 2 Goal is not degraded, i.e., ensure that  $d_2^+ = 840$ . We make this change as shown in Row 26 and then enter another constraint in Solver: B26=M26.

Figure 3: P3 Problem

	A	B	C	D	E	F	G	H	I	J	K	L	M
1	Figure 3												
2	P3 Problem												
3	Variables:	X1	X2	X3	d1+	d1-	d2+	d2-	d3+	d3-			
4		800	1200	0	6000	0	840	0	0	480			
5		Min											
6	Objective	d3-											
7	Function:	0	=J4										
8													
9	Subject to:	Enter coefficients and right-hand-side values for constraints here.											
10	Goal 1:	10	25	8	-1	1						=	32000
11	Goal 2:	1.5	1.2	2.2			-1	1				=	1800
12	Goal 3:	0.8	0.9	1					-1	1		=	2200
13	S1 Capacity:	1										≤	1500
14	S2 Capacity:		1									≤	1200
15	S3 Capacity:			1								≤	2500
16	Demand	1	1	1								=	2000
17		Simplification of constraints using SUMPRODUCT function.											
18	Goal 1:	32000	=SUMPRODUCT(B\$4:J\$4,B10:J10)									=	32000
19	Goal 2:	1800	=SUMPRODUCT(B\$4:J\$4,B11:J11)									=	1800
20	Goal 3:	2200	=SUMPRODUCT(B\$4:J\$4,B12:J12)									=	2200
21	S1 Capacity:	800	=SUMPRODUCT(B\$4:J\$4,B13:J13)									≤	1500
22	S2 Capacity:	1200	=SUMPRODUCT(B\$4:J\$4,B14:J14)									≤	1200
23	S3 Capacity:	0	=SUMPRODUCT(B\$4:J\$4,B15:J15)									≤	2500
24	Demand	2000	=SUMPRODUCT(B\$4:J\$4,B16:J16)									=	2000
25	P1 Problem Solution	0	=F4									=	0
26	P2 Problem Solution	840	=G4									=	840

Notice that solving the  $P_3$  problem, we were unable to improve the solution from the  $P_2$  problem. This means any improvement of the  $P_3$  problem would degrade either the  $P_1$  or  $P_2$  solutions. Therefore, we have found our best solution above.

### Summary & Possible Extensions

The goal of this paper was to demonstrate an in-class exercise using goal programming and Excel Solver. We presented triple bottom line objectives along with performance metrics for each objective. We could modify the Excel Solver model in future exercises in the following ways (a) include more objectives (goal constraints) and (b) consider objectives at the same priority level. Another possible follow-up exercise involves asking students to ponder which triple bottom objectives are important to a supplier selection decision and how to prioritize those objectives. Kearins and Springett (2003) described this type of thinking as “reflexivity.” Reflexivity requires students thinking about both personal and societal values. For example, the instructor could pose the following questions: (a) What other triple bottom line objectives would you include in the supplier selection decision and how would you prioritize those objectives if you were a purchasing manager at a company? (b) Now, revisit the previous questions and pretend you are the owner of the company. This type of follow-up question may lead students to place greater emphasis on economic objectives.

# COMMUNICATION ISSUES IN A MULTILINGUAL BUSINESS ENVIRONMENT: INSIGHTS FROM MANAGERS

Ernesto Escobedo, Walden University  
Felecia Jett, Manager Tropicana, Inc.  
Teresa Lao, Walden University

## ABSTRACT

*This paper presents the conclusions and implications of the research study based on responses from a sample of 20 manufacturing leader-managers working in the states of California or Florida. This research also presents recommendations for further action followed by a summary of findings. Organizational policies and procedures are in place to ensure standards are implemented for an efficient and safe work environment for all employees. It is expected that employees understand such processes so they can meet the goals of the organizations. Organizations that embrace diversity are able to bring unique talents and ideas that will serve clients' needs. However, when language presents a barrier to communication, then management has to weigh whether it is placing itself in a position to do more harm than good for employees involved. Two questions were fundamental to the research: 1. How do leader-managers share and transfer organizational knowledge to a linguistically diverse manufacturing workforce to prevent workplace injuries in their organization? 2. What are perceived challenges in sharing and transferring organizational knowledge in a linguistically diverse manufacturing work force to prevent workplace injuries in their organization?*

## INTRODUCTION

Organizations with a workforce that speak different languages can present challenges to the organization. The main difficulty particularly for management is the ability to communicate effectively with its employees. Organizations may see that having a diverse workforce with linguistic abilities could serve as an advantage to a global economy; however, literature presented asserted that linguistic diversity added complexity within an organization. For example, employees with limited English skills in organizations “places a significant expanded challenge on management, especially regarding communication” (Solomon as cited in Pierce, 2003, p. 41). The purpose of this qualitative phenomenological study was to contribute to the linguistic diversity literature by exploring lived experiences of a small sample of leader-managers in manufacturing environments. Twenty leader-managers from seven manufacturing organizations contributed to the study. Organizations and the location of the manufacturing sites are not referenced due to confidentiality. Research identified the estimated total economic costs in 2004 of occupational deaths and injuries were \$142.2 billion, with 120 million days of total time lost; 4,952 employees died and 3.7 million employees were disabled while on the job (National Safety Council, 2006, p. 1). Loh and Richardson (2004) stated, “In manufacturing, foreign-born workers’ share of employment increased by 22 percent, from 13 percent in 1996 to 16 percent in 2001, but their share of workplace fatalities increased by 46 percent over the same period, from 9 to 14 percent” (p. 47).

The study included a review of the literature related to the phenomenon of sharing and transferring knowledge in a linguistically diverse environment, and the growth of linguistic diversity within the workplace. The increase of workplace injuries was presented as relational to the increase of employees

with no or limited English proficiencies. Organizational literature was used to integrate the safety system as part of the organization's system and leaders' responsibility.

## LITERATURE REVIEW

The purpose of this qualitative phenomenology research study was to explore how leader-managers share and transfer organizational knowledge in linguistically diverse manufacturing organizations to prevent workplace injuries. The increase of linguistic diversity in the workplace and the increase in the number of employees with limited English skills, or English as a Second Language (ESL), have been linked with a disproportionate rise in the number of workplace injuries (Brooks, 2003; Kalaroa, 2004). The study used the modified Van Kaam method by Moustakas (1994) to explore the lived experiences of 20 California or Florida leader-managers about how they share and transfer organizational knowledge in linguistically diverse manufacturing organizations to prevent workplace injuries.

The literature review revealed research focused on the relationship between language and safety did not exist (Trajkovski & Loosemore, 2006). In addition, the lack of recognition by leaders or their decisions not to confront the existence of various languages in the workplace has resulted in language barriers within organizations (Kalaroa, 2004). With the lack of initiative from leaders to resolve problems associated with or caused by language barriers and unsafe working environment has been created within some organizations (Dutton, 1998, Kalaroa).

The safety system excellence model presented in the literature review identified leadership as an essential input (Blair, 2003). The role of leadership within organizations drives values, behavioral reinforcement, communication, accountability, and management credibility (McCarroll, 2004; Blair, 2003). The Hersey Blanchard model was used to emphasize leader-managers need to be adaptable and flexible to meet the changing needs of the employees and the various situations.

Twenty leader-managers from seven manufacturing organizations contributed to the study. The result of this study showed that no formalized program exists within the participants' organizations and that leader-managers are left to their own demise to create a means to address linguistic diversity within the workplace. Leader-managers may benefit by developing and implementing formalized communication strategies to address better the challenges in linguistically diverse manufacturing environments. In addition, leader-managers may benefit by understanding that cultural differences, motives, and needs behind specific behaviors can possibly enhance communication and team building within an organization, and can possibly facilitate the management of linguistically diverse workplaces (Parvis, 2003).

## DATA AND METHODOLOGY

As part of her dissertation, Dr. Jett conducted extensive research and data collection. Dr. Escobedo reviewed this study as part of his faculty affiliation with the University of Phoenix. The methodology used employed NVivo© qualitative data analysis software to ascertain themes, issues, and relationships of data obtained during the data collection process. The study included horizontalization, a reduction of the horizons, and a review of the common themes which evolved as a result of the analysis of the data. Direct quotes of participants were used to illustrate the themes in order to establish perceptions of the organizational culture, and the day-to-day impact of linguistic diversity.

The synthesis of the meanings and essence of the lived experiences identified by the participants presented that current systems or lack of systems in place to facilitate the sharing and transferring of knowledge, and challenges of leader-managers when sharing and transferring knowledge in linguistically diverse manufacturing environments exist. The participants' experiences of linguistic diversity did

conform to the assertions and claims presented in the review of relevant literature. Leader-managers within organizations have been challenged with facing workplace injuries within linguistically diverse environments. Participants identified that current systems within their organizations do not formally address challenges presented when sharing and transferring knowledge in a linguistically diverse environment. Informal practices are developed by leader-managers within specific departments to execute operating plans developed annually and to meet established objectives in a changing environment. These practices can vary within the same organization, as well as within a department. The variance was noted by dissimilar responses in this study from participants within the same organization. The overarching theme presented a gap in linguistically diverse manufacturing environments. As presented in the literature review, the overall result has been little or no guidelines for organizations, possibly leaving leader-managers to their own demise.

## RESULTS

This qualitative phenomenological study explored and captured the lived experiences of a small sample of leader-managers working in various linguistically diverse manufacturing environments in California and Florida. The primary intent was to contribute to the safety literature in the manufacturing sector to prevent workplace injuries. The central phenomenon, sharing and transferring organizational knowledge, was defined as moving knowledge from one individual to another through communication or across organizational boundaries to provide sustainable competitive advantage throughout an organization (Ichijo & Nonaka, 2007, p. 289). The manufacturing industry has a large percentage of employees who are English as Second Language workers, as identified in the literature review. The study revealed that sharing and transferring organizational knowledge in a linguistically diverse environment continues to be challenging in today's manufacturing environments, and continues not to be addressed formally by manufacturing organizations as revealed by participants of this study. A majority of participants have informally developed systems to address language barriers within their sphere of influence. For example, some of these systems include spending additional time observing employees, or requesting other employees, peers or leader-managers who can translate.

A large majority of participants agreed to using various languages in manufacturing environments, and translating various manuals to different languages. For example, Participant 256 stated, "...if language is a barrier then the only way you can communicate is to use language that somebody understands." This viewpoint is a significant finding primarily because Pierce (2003) identified that of the four strategies organizations implement to address the challenge of safety in the linguistically diverse workplace, implementing a systematic approach of inclusion was not commonly used. Most organizations focused on one of the following: (1) Do not address issue, or use sign-type language; (2) Learn to speak a different language, and hire only workers who speak that language; or (3) Reduce the number of non-English speaking employees and replace only with English-speaking. Additionally, Davenport and Prusak (1998), and Pelinka (2007) identified that the complexity of sharing and transferring knowledge within organizations can be reduced when there is a focus on a common language.

Table 1 presents the participants responses about methods of sharing and transferring safety communication. Participant unanimously identified meetings and training as a means of safety communication, emerging as the primary theme. Forty-five per cent of responses drove the theme as using signage to facilitate communication. Approximately 10% of the responses identified the use of translators. For example, other peers or resources to facilitate sharing and transferring of information related to challenges within a linguistically diverse environment.

Table 1: Methods of Sharing and Transferring Safety Communication

Emerging Themes/Textual Descriptors	Frequency of response	% of respondents endorsing themes	Significant Minority	Secondary Theme	Primary Theme
Meetings and Training	21	100			✓
Signage	10	45		✓	
Translators	2	10	✓		
Incentives and Recognition	4	15	✓		

*This table shows the frequency of responses and the percentage of respondents endorsing emerging themes and textual descriptors. A primary theme was supported by 65 percent or more of the participants. A secondary theme consisted of responses between 35 percent and 64 percent affirmed by participants. A significant minority theme had less than 35 percent response rate by participants.*

## CONCLUDING COMMENTS

While all aspects of manufacturing, such as productivity, quality, rewards and recognition, are important, safety is emphasized as being most critical by leader-managers. In addition, the results of the study revealed that participants believe employees in manufacturing environments want their needs to be addressed and a safe place to work. However, participants identified that current systems within their organizations do not formally address challenges presented when sharing and transferring knowledge in a linguistically diverse environment. Based on findings in this study, leader-managers need to address formally how knowledge is shared and transferred within the work environment. Leader-managers need to develop and implement communication strategies to address the challenges and gaps in linguistically diverse manufacturing environments. Leader-managers, senior and middle managers, and safety professionals need to work with Human Resource Departments to align on a specific approach for their organizations to mitigate legal issues, and address safety concerns. Dunlap (2004) emphasized it is the organizational culture which drives what is expected in health and safety, and to make changes or develop a safety culture the organizational culture must be aligned.

In addition, leader-managers within organization need to be adaptable and flexible to meet the changing needs of the employees and the organization's environment. Leader-managers should establish safety expectations, provide engineering support, set exemplary behavior, educate employees, enable employees, encourage employees, and evaluate effectiveness (Blair, 2003). The lack of ownership by leaders could possibly lead to the lack of literature on this subject, and the gaps that exist in the manufacturing environment. Not addressing the phenomenon of linguistic diversity cannot only increase workplace injuries (Brooks, 2003; Kalaroa, 2004), but also can stagnate the organization and its resources if language barriers affect communication (Roberson & Stevens, 2006).

This article recommends actions that leadership can take to improve safety in a linguistically diverse manufacturing environment. While all aspects of manufacturing, such as productivity, quality, rewards and recognition, are important, safety is emphasized as being most critical by leader-managers. Leadership within an organization drives values, behavioral reinforcement, communication, accountability and management credibility (McCarroll, 2004; Blair, 2003). In addition, leadership is highlighted as an essential input in the safety system excellence model presented by Blair (2003). Participants of this study identified that employees in manufacturing environments expect their needs to be addressed by leader-managers. Kalaroa (2004) identified cultural differences as a possible prevention that would keep employees from questioning authority or the unsafe acts of their coworkers, or unsafe work practices of organizations or leaders within their organization. In addition, Trajkovski and Loosemore (2006) stated, "People who speak different languages will therefore be more likely to view the world differently" (p. 2). Leader-managers should recognize and understand cultural differences, motives, and needs behind specific behaviors. Parvis (2003) identified this level of understanding by leader-managers could possibly enhance communication and team building within an organization, and facilitate the management of linguistically diverse workplaces.

### Limitations

Limitations of this qualitative phenomenological research study were that data obtained was limited to 20 participants working within linguistically diverse manufacturing organizations within California or Florida. Participants were limited to persons in leadership positions, and not manufacturing employees' perception of safety or the organization's safety culture. Even though participants volunteered to be involved in the study, participants may have provided bias and superficial responses based on their personal opinions, motivation to participate, their personality, or leadership style.

In addition, although there are a number of communication models, a widely held notion is that communication meaning is comprised of 57% nonverbal, 37% tone, and 6% words (Mehrabian, 1981). Therefore, this suggests that communication is most extensive when an individual does not use words; that is, 94%. This brings home the overall message that over half the meaning that individuals send at 57% is nonverbal. Therefore, leader-managers need to have an awareness of the nonverbal communication. The communication model will also vary by culture (Mehrabian, 1981). For instance, in one particular culture, certain hand gestures are entirely inappropriate and even simple eye contact can be a sign of aggression and sure disaster. In business, this could ruin a friendship or break a business transaction. Another exemplary cultural difference is proximity. Just how close can one person stand to another before it becomes uncomfortable or suggest inappropriate invasion of one's personal space. In one culture, this could be arm's length while in another this could very well be inches apart. In serious cases, this could be inappropriate conduct of a sexual nature and considered sexual harassment.

# THE ROLE OF CULTURE AND POLICIES IN GAINING INTERNATIONAL COMPETITIVENESS

Mehdi Hojjat, Neumann University

## ABSTRACT

*In this paper, I first define international competitiveness. Then, I discuss two common conceptions that are required to achieve competitiveness: government policies and culture. I explain the theoretical model that I used in this research, known as “Innovation Matrix”. I’ve collected data for both competitiveness and culture. After describing the sets of data, I test these two hypotheses: (1) Long-term economic growth is a function of government policies; (2) Culture plays an insignificant role in gaining competitiveness and economic growth. In conclusion, I make recommendations as how a country can improve its competitiveness.*

**KEYWORDS:** Competitiveness, Pillars of Competitiveness, Economic Growth, Cultural Traits, Economic Policies

## INTRODUCTIONS

### Defining Competitiveness

*The Global Competitiveness Report 2011–2012* comes out amid multiple challenges to the global economy. After a number of difficult years, a recovery from the economic crisis is tentatively emerging, although it has been very unequally distributed: much of the developing world is still seeing relatively strong growth, despite some risk of overheating, while most advanced economies continue to experience sluggish recovery, persistent unemployment, and financial vulnerability, with no clear horizon for improvement. In addition, rising commodity prices are eroding the purchasing power of consumers and are likely to slow the pace of recovery. Such uncertainties are being exacerbated by growing concerns about the sustainability of public debt amidst the slow growth of some advanced economies. The damage that would be wrought by the first sovereign defaults among advanced economies since the 1940s is impossible to gauge, although the mere possibility of this eventuality has already hit investor confidence, put the very viability of the euro into question, and further undermined the US dollar’s value and its place as the world’s preferred reserve currency.

The complexity of today’s global economic environment has made it more important than ever to recognize and encourage the qualitative as well as the quantitative aspects of growth, integrating such concepts as inclusiveness and environmental sustainability to provide a fuller picture of what is needed and what works. In the current challenging economic environment, our work is a critical reminder of the importance of taking into account the consequences of our present actions on future prosperity based on sustained growth. Since 2005, the World Economic Forum has based its competitiveness analysis on the Global Competitiveness Index (GCI), a comprehensive tool that measures the microeconomic and macroeconomic foundations of national competitiveness.

### Defining Competitiveness

We define *competitiveness* as the set of institutions, policies, and factors that determine the level of productivity of a country. The level of productivity, in turn, sets the level of prosperity that can be earned by an economy. The productivity level also determines the rates of return obtained by investments in an

economy, which in turn are the fundamental drivers of its growth rates. In other words, a more competitive economy is one that is likely to grow faster over time. The concept of competitiveness thus involves static and dynamic components: although the productivity of a country determines its ability to sustain a high *level* of income, it is also one of the central determinants of its returns to investment, which is one of the key factors explaining an economy's *growth potential*.

*The 12 pillars of competitiveness:* There are many determinants driving productivity and competitiveness. Understanding the factors behind this process has occupied the minds of economists for hundreds of years, engendering theories ranging from Adam Smith's focus on specialization and the division of labor to neoclassical economists' emphasis on investment in physical capital and infrastructure, and more recently, to interest in other mechanisms such as education and training, technological progress, macroeconomic stability, good governance, firm sophistication, and market efficiency, among others. While all of these factors are likely to be important for competitiveness and growth, they are not mutually exclusive - two or more of them can be significant at the same time, and in fact that is what has been shown in the economic literature.

*Theoretical Model: The Innovation Matrix:* Innovation Matrix combines cultural traits and social institutions to yield a growth model which leads to improve international competitiveness of countries.

*Cultural Dimensions:* Countries having a more individualist culture and weaker uncertainty avoidance (risk takers) have enjoyed higher long-run growth than countries with a more collectivist culture and stronger uncertainty avoidance (risk avoiders). Individualist culture attaches social status rewards to personal achievements and thus, provides not only monetary incentives for innovation but also social status rewards, leading to higher rates of innovation and economic growth, hence more national competitiveness. Also, weak uncertainty avoidance cultural traits encourage entrepreneurial and business formation activities which will lead to more innovation which in turn increase productivity and national competitiveness. The idea that culture is a central ingredient of economic development goes back to at least Max Weber, who, in his classical work "The Protestant Ethic and the Spirit of Capitalism," argued that the Protestant ethic of Calvinism was a powerful force behind the development of capitalism in its early phases. Yuriy Gorodnichenko and Gerard Roland in their research proposed both a theoretical model and empirical evidence showing that countries with a more individualist culture have more innovation, higher productivity and higher long-run growth than countries with a more collectivist culture. The main tenets of their theory are as follows:

*"Individualism emphasizes personal freedom and achievement. Individualist culture, therefore, awards social status to personal accomplishments such as important discoveries, innovations, or great artistic achievements. However, individualism can make collective action more difficult, because individuals pursue their own interest without internalizing collective interests. Collectivism, in contrast, makes collective action easier in the sense that individuals internalize group interests to a greater degree. However, it also encourages conformity and discourages individuals from standing out. This framework implies that individualism should encourage innovation more, but collectivism should have an advantage in coordinating production processes and various forms of collective action."*

Nishimura Kunio - a famous Japanese entrepreneur- articulated the relationship between and innovation as follow:

*A person cannot be creative unless two conditions are met, First, you must be willing to be different from other people; that is, to be individualist in the best sense of the word. Second, you must have an excellent sensibility, meaning knowing a good thing when you see it.*

I have added *uncertainty avoidance* cultural traits to this relationship to include entrepreneurs into the process on innovation. Entrepreneurs derive utility not only from consumption but also from social prestige associated with producing a higher than average quality of intermediate products and reap the wealth and income which comes with a successful commercialization of their ideas. As a result, the higher innovation rate in an *individualist* and *weak uncertainty avoidance* culture eventually leads to higher levels of productivity and output in the long run than a collectivist and strong uncertainty avoidance culture. In other words, the advantages of these two cultural traits improve competitiveness and long-run growth.

*Institutions and Policy Dimension:* In the context of Innovation Matrix, I define institution and policy the help of Global Competitiveness Index (GCI). GCI is a weighted average of many different institutional components, each measuring a different aspect of country competitiveness. These components are grouped into 12 pillars of competitiveness:

*First pillar: Institutions:* The institutional environment is determined by the legal and administrative framework within which individuals, firms, and governments interact to generate wealth. The importance of a sound and fair institutional environment became even more apparent during the economic crisis and is especially important for solidifying the fragile recovery given the increasing role played by the state at the international level and for the economies of many countries. The role of institutions goes beyond the legal framework. Government attitudes toward markets and freedoms and the efficiency of its operations are also very important: excessive bureaucracy and red tape, overregulation, corruption, dishonesty in dealing with public contracts, lack of transparency and trustworthiness, and political dependence of the judicial system impose significant economic costs to businesses and slow the process of economic development. In addition, the proper management of public finances is also critical to ensuring trust in the national business environment. Indicators capturing the quality of government management of public finances are therefore included here to complement the measures of macroeconomic stability captured in pillar 3 below.

*Second pillar: Infrastructure:* Extensive and efficient infrastructure is critical for ensuring the effective functioning of the economy, as it is an important factor determining the location of economic activity and the kinds of activities or sectors that can develop in a particular instance. Well-developed infrastructure reduces the effect of distance between regions, integrating the national market and connecting it at low cost to markets in other countries and regions. In addition, the quality and extensiveness of infrastructure networks significantly impact economic growth and reduce income inequalities and poverty in a variety of ways. A well-developed transport and communications infrastructure network is a prerequisite for the access of less-developed communities to core economic activities and services.

Effective modes of transport, including quality roads, railroads, ports, and air transport, enable entrepreneurs to get their goods and services to market in a secure and timely manner and facilitate the movement of workers to the most suitable jobs. Economies also depend on electricity supplies that are free of interruptions and shortages so that businesses and factories can work unimpeded. Finally, a solid and extensive telecommunications network allows for a rapid and free flow of information, which increases overall economic efficiency by helping to ensure that businesses can communicate and decisions are made by economic actors taking into account all available relevant information.

### Third Pillar: Macroeconomic Environment

The stability of the macroeconomic environment is important for business and, therefore, is important for the overall competitiveness of a country. Although it is certainly true that macroeconomic stability alone cannot increase the productivity of a nation, it is also recognized that macroeconomic disarray harms the economy, as we have seen recently. The government cannot provide services efficiently if it has to make

high-interest payments on its past debts. Running fiscal deficits limits the government's future ability to react to business cycles. Firms cannot operate efficiently when inflation rates are out of hand. In sum, the economy cannot grow in a sustainable manner unless the macro environment is stable. Macroeconomic stability has captured the attention of the public most recently when some European countries needed the support of the IMF and other euro zone countries to prevent sovereign default, as their public debt reached unsustainable levels. The potential impact of high indebtedness on competitiveness is very important, a topic of particular relevance given the growing concerns about the potential sovereign defaults in Europe, Japan, and the United States, which, if not prevented, could endanger the still fragile recovery worldwide.

*Fourth Pillar: Health and Primary Education:* A healthy workforce is vital to a country's competitiveness and productivity. Workers who are ill cannot function to their potential and will be less productive. Poor health leads to significant costs to business, as sick workers are often absent or operate at lower levels of efficiency. Investment in the provision of health services is thus critical for clear economic, as well as moral considerations. In addition to health, this pillar takes into account the quantity and quality of the basic education received by the population, which is increasingly important in today's economy. Basic education increases the efficiency of each individual worker. Moreover, workers who have received little formal education can carry out only simple manual tasks and find it much more difficult to adapt to more advanced production processes and techniques. Lack of basic education can therefore become a constraint on business development, with firms finding it difficult to move up the value chain by producing more sophisticated or value-intensive products. For the longer term, it will be essential to avoid significant reductions in resource allocation to these critical areas, in spite of the fact that many government budgets will need to be cut to reduce the fiscal burden built up over the past years.

*Fifth pillar: Higher education and training:* Quality higher education and training is crucial for economies that want to move up the value chain beyond simple production processes and products. In particular, today's globalizing economy requires countries to nurture pools of well-educated workers who are able to adapt rapidly to their changing environment and the evolving needs of the production system. This pillar measures secondary and tertiary enrollment rates as well as the quality of education as evaluated by the business community. The extent of staff training is also taken into consideration because of the importance of vocational and continuous on-the-job training—which is neglected in many economies—for ensuring a constant upgrading of workers' skills.

*Sixth pillar: Goods market efficiency:* Countries with efficient goods markets are well positioned to produce the right mix of products and services given their particular supply-and-demand conditions, as well as to ensure that these goods can be most effectively traded in the economy. Healthy market competition, both domestic and foreign, is important in driving market efficiency and thus business productivity by ensuring that the most efficient firms, producing goods demanded by the market, are those that thrive. The best possible environment for the exchange of goods requires a minimum of impediments to business activity through government intervention. Market efficiency also depends on demand conditions such as customer orientation and buyer sophistication. For cultural or historical reasons, customers may be more demanding in some countries than in others. This can create an important competitive advantage, as it forces companies to be more innovative and customer-oriented and thus imposes the discipline necessary for efficiency to be achieved in the market.

*Seventh pillar: Labor market efficiency:* The efficiency and flexibility of the labor market are critical for ensuring that workers are allocated to their most efficient use in the economy and provided with incentives to give their best effort in their jobs. Labor markets must therefore have the flexibility to shift workers from one economic activity to another rapidly and at low cost, and to allow for wage fluctuations without much social disruption. The importance of the latter has been dramatically highlighted by the recent events in Arab countries, where high youth unemployment sparked social unrest in Tunisia that

spread across the region. Efficient labor markets must also ensure a clear relationship between worker incentives and their efforts to promote meritocracy at the workplace, and they must provide equity in the business environment between women and men. Taken together these factors have a positive effect on worker performance and the attractiveness of the country for talent, two aspects that are growing more important as talent shortages loom on the horizon.

*Eighth pillar: Financial market development:* The recent economic crisis has highlighted the central role of a sound and well-functioning financial sector for economic activities. An efficient financial sector allocates the resources saved by a nation's citizens, as well as those entering the economy from abroad, to their most productive uses. It channels resources to those entrepreneurial or investment projects with the highest expected rates of return rather than to the politically connected. A thorough and proper assessment of risk is therefore a key ingredient of a sound financial market.

*Ninth pillar: Technological readiness:* In today's globalized world, technology is increasingly essential for firms to compete and prosper. The technological readiness pillar measures the agility with which an economy adopts existing technologies to enhance the productivity of its industries, with specific emphasis on its capacity to fully leverage information and communication technologies (ICT) in daily activities and production processes for increased efficiency and competitiveness. Therefore ICT access and usage are key enablers of countries' overall technological readiness. Whether the technology used has or has not been developed within national borders is irrelevant for its ability to enhance productivity. The central point is that the firms operating in the country need to have access to advanced products and blueprints and the ability to use them. Among the main sources of foreign technology, FDI often plays a key role. It is important to note that, in this context, the level of technology available to firms in a country needs to be distinguished from the country's ability to innovate and expand the frontiers of knowledge. That is why we separate technological readiness from innovation, captured in the 12th pillar, described below.

*Tenth pillar: Market size:* The size of the market affects productivity since large markets allow firms to exploit economies of scale. Traditionally, the markets available to firms have been constrained by national borders. In the era of globalization, international markets have become a substitute for domestic markets, especially for small countries. There is vast empirical evidence showing that trade openness is positively associated with growth. Even if some recent research casts doubts on the robustness of this relationship, there is a general sense that trade has a positive effect on growth, especially for countries with small domestic markets. By including both domestic and foreign markets in our measure of market size, we give credit to export-driven economies and geographic areas (such as the European Union) that are divided into many countries but have a single common market.

*Eleventh pillar: Business sophistication:* There is no doubt that sophisticated business practices are conducive to higher efficiency in the production of goods and services. Business sophistication concerns two elements that are intricately linked: the quality of a country's overall business networks and the quality of individual firms' operations and strategies. These factors are particularly important for countries at an advanced stage of development, when, to a large extent, the more basic sources of productivity improvements have been exhausted. The quality of a country's business networks and supporting industries, as measured by the quantity and quality of local suppliers and the extent of their interaction, is important for a variety of reasons.

*Twelfth pillar: Innovation:* The final pillar of competitiveness is technological innovation. Although substantial gains can be obtained by improving institutions, building infrastructure, reducing macroeconomic instability, or improving human capital, all these factors eventually seem to run into diminishing returns. The same is true for the efficiency of the labor, financial, and goods markets. In the long run, standards of living can be enhanced only by technological innovation. Innovation is particularly

important for economies as they approach the frontiers of knowledge and the possibility of integrating and adapting exogenous technologies tends to disappear.

Although less-advanced countries can still improve their productivity by adopting existing technologies or making incremental improvements in other areas, for those that have reached the innovation stage of development this is no longer sufficient for increasing productivity.

*The interrelation of the 12 pillars:* While we report the results of the 12 pillars of competitiveness separately, it is important to keep in mind that they are not independent: they tend to reinforce each other, and a weakness in one area often has a negative impact on other areas. For example, a strong innovation capacity (pillar 12) will be very difficult to achieve without a healthy, well-educated and trained workforce (pillars 4 and 5) that is adept at absorbing new technologies (pillar 9), and without sufficient financing (pillar 8) for R&D or an efficient goods market that makes it possible to take new innovations to market (pillar 6). Although the pillars are aggregated into a single index, measures are reported for the 12 pillars separately because such details provide a sense of the specific areas in which a particular country needs to improve.

### the Innovation Matrix Theory

The Innovation Matrix postulates an interesting relationship between long-term growth rate of a country with both culture and institutions. In societies with negative institutions and policies (low scores in the above 12 pillars), a predatory government can seize the monetary returns from innovation, create monopolies, impose too much taxes and regulations, and repress ideas. These policies lead to less innovation and less economic growth. On the other hand, societies with positive institutions and policies, there are no blockage of ideas, more democratic, less taxes and regulations, less corruptions, and more competitive industries. These policies lead to more innovations and a higher rate of growth. We have already discussed the effects of cultural traits on innovation and economic growth. Therefore, I can present the following diagram as a summary of the Theory of Innovation Matrix.

Figure 1: Innovation Matrix

Positive Traits		1		2	
Culture		3		4	
	Negative Traits	Negative Institutions and Policies		Positive	

Where as; **Positive Cultural Traits** include weak uncertainty avoidance and individualism. **Negative Cultural Traits** include strong uncertainty avoidance and collectivism. **Positive Institutions and Policies** is represented by having high GCI score. **Negative Institutions and Policies** is represented by having low GCI score.

### Hypotheses

These are the four hypotheses that I'll be testing in the Model:

*Hypothesis 1:* Positive cultural traits have influence over innovation and hence long-run growth countries with those traits should be found in quadrant 1 and 2.

*Hypothesis 2:* Positive institutions and policies have influence over innovation and hence long-run growth, countries with those traits should be found in quadrant 2 and 3.

*Hypothesis 3:* Countries in Quadrant 3 have the highest growth rates.

*Hypothesis 4:* Countries in Quadrant 4 have the lowest growth rates.

### Description of Data

*Long-term Growth Rate:* I have identified three fastest growing countries in 15 regions of the world as shown in Table 1. All together, GDP growth rate of 45 countries are presented. Institutions and Policies - Global Competitiveness Index

Table 1: Global Competitiveness Index for the Fastest Growing Economies

Country	GDP Growth Rate	GCI Ranking	GCI	Institutions & Policies in Innovation Matrix (Based in GCI Index)	Culture in Innovation Matrix (Based on Hofstede Cultural Values)
Algeria	2.90%	87	3.96	Neutral	Negative
Argentina	8.80%	85	3.99	Neutral	Neutral
Austria	3.30%	19	5.14	Positive	Positive
Bhutan	8.10%		NA	Neutral	Neutral
Botswana	6.20%	80	4.05	Neutral	Negative
Cambodia	6.70%	97	3.85	Neutral	Neutral
Chile	6.50%	31	4.7	Positive	Neutral
China	9.50%	26	4.9	Positive	Positive
Congo	6.50%		NA	Neutral	Negative
Dominican Rep.	4.50%	110	3.73	Negative	Negative
Egypt	1.20%	94	3.88	Neutral	Negative
Equatorial Guinea	7.10%		NA	Neutral	Neutral
Eritrea	12.05%		NA	Neutral	Negative
Estonia	6.50%	33	4.62	Positive	Positive
Ethiopia	7.50%	106	3.76	Negative	Neutral
Gabon	5.60%		NA	Neutral	Neutral
Ghana	13.50%	114	3.65	Negative	Neutral
Haiti	6.10%	141	2.9	Negative	Neutral
Hong Kong	6.00%	11	5.36	Positive	Positive
Iceland	2.40%	30	4.75	Positive	Positive
India	7.80%	56	4.3	Neutral	Neutral
Iraq	9.60%		NA	Neutral	Neutral
Kosovo	5.3 %		NA	Neutral	Positive
Kyrgyzstan	7.00%		NA	Neutral	Negative
Laos	8.30%		NA	Neutral	Neutral
Liberia	6.90%		NA	Neutral	Negative
Lithuania	6.00%	44	4.41	Positive	Positive
Luxembourg	3.60%	23	5.03	Positive	Positive
Moldova	7.00%	93	3.89	Neutral	Neutral
Mongolia	11.5 %	96	3.86	Neutral	Neutral
Morocco	4.60%	73	4.16	Neutral	Positive
Mozambique	7.20%	133	3.31	Negative	Negative
Nigeria	6.90%	127	3.45	Negative	Neutral
Panama	7.40%	49	4.35	Positive	Neutral
Paraguay	6.40%	122	3.53	Negative	Negative
Poland	3.80%	41	4.46	Positive	Neutral
Qatar	18.70%	14	5.24	Positive	Negative
Rwanda	7.00%	70	4.19	Neutral	Neutral
Sri Lanka	8.30%	52	4.33	Neutral	Neutral
Sweden	4.40%	3	5.61	Positive	Positive
Timor-Leste	7.30%	131	3.35	Negative	Neutral
Turkey	8.50%	59	4.28	Neutral	Neutral
Turkmenistan	9.90%		NA	Neutral	Negative
Uzbekistan	7.10%		NA	Neutral	Negative
Zambia	6.70%	113	3.67	Negative	Negative

### Testing Hypotheses

Now that we have the data showing the fastest growing countries in 15 regions of the world, using the above table, we can answer the following questions:

1. What countries had the right culture for the high GDP growth rate?
2. What countries had the right policies and institutions for the high GDP growth rate?
3. What countries had both the right culture and policies for the high GDP growth rate?
4. What countries had neither the right culture nor the right policies for the high GDP growth rate?

*Hypothesis 1:* GDP growth rate is a function of government policies (presented by its GCI)

*Hypothesis 2:* Culture plays a significant role in country's competitiveness

I started with running a regression. Here is the regression result between these two variables

Y = GDP Growth Rate		X = GCI				
SUMMARY OUTPUT						
Regression Statistics						
Multiple R	0.01788643					
R Square	0.00031992					
Adjusted R Square	-0.02292845					
Standard Error	0.03022114					
Observations	45					
ANOVA						
	df	SS	MS	F	Significance F	
Regression	1	1.25683E-05	1.26E-05	0.0137611	0.907162274	
Residual	43	0.039272632	0.000913			
Total	44	0.0392852				
	Coefficients	Standard Error	t Stat	P-value	Lower 95%	
Intercept	0.07459405	0.033499411	2.226727	0.0312545	0.007036047	
X Variable 1	-0.00094506	0.008056194	-0.11731	0.9071623	-0.017191919	

The regression results show no significant relationship between GDP growth rate and GCI. Because of lack of times series data, this type of data analysis is not going to lead us with a meaningful conclusion. Therefore, I have developed a cross tabulation table which resembles the Innovation Matrix, as shown below:

Table 2 : Number of Counties in Each Quadrant of the Innovation Matrix (N=45)

		Institutions and Policies			Total
		Positive	Neutral	Negative	
Culture	Positive Traits	8	2	0	10 (22%)
	Neutral	3	13	4	20 (44%)
	Negative Traits	2	9	5	16 (34%)
Total		13 (28%)	24 (52%)	9 (20%)	46 (110%)

An overwhelming majority of the countries (80%) with high growth rate, have positive or neutral policies and institutions. Therefore, we can accept the first hypothesis that policies and institutions have direct effects on the long term prosperity of countries. On the cultural side, only 22 percent of the countries in this sample have both positive cultural traits and high economic growth. That leaves 78 percent of the countries with high growth rate with having either neutral or negative cultural traits.

Therefore, the second hypothesis is rejected. The culture does not have a long-term effect on economic prosperity.

## CONCLUSION AND RECOMMENDATION

It appears that Innovation Matrix model is not a good predictor of long-term economic growth in mineral-rich countries. For these countries, long-term economic growth depends more on Chinese demand for their commodities (Qatar, GDP growth rate of 18.7%) and Chinese investment in their countries (Ghana, GDP growth rate of 13.5%) than their culture and government policies. For other countries, sustainable economic growth depends more government policies and institutions or GCI than culture; e.g., Turkey, Sri Lanka, India, and Guinea. To make this firm conclusion, we only have to look at the economic performances of member countries in the European Union. While culturally they are similar, unemployment rates are not: Spain at 25% and Greece at 22% while the German rate is below 7%. This variation can be explained by the degree of their competitiveness not their culture. Competitiveness is driven by the kind of policies that foster innovation. Another example for proving this point is the case of South Korea with \$30,000 per capita income versus \$1,900 for North Korea. Can this variation be explained by having different culture or different government policies and institutions?

# AN EMPIRICAL STUDY OF THE DETERMINANTS OF SAFETY-NET HOSPITAL FAILURES

Devin Alan Daugherty, University of Phoenix

Ernesto Escobedo, Walden University

## ABSTRACT

*Several safety-net hospitals have closed in the United States, but the scholarly literature does not adequately explain why. This study examines the relationship between the operational status (open or closed) of safety-net hospitals and unemployment, median household income, gross profit margin, efficiency ratio, operating margin, excess margin, and salary and benefit expenses per full-time equivalent. Study data were collected and analyzed by means of a logistic regression analysis. A significant relationship between hospital operational status and unemployment, operating margin, and salary and benefit expenses per full-time equivalent was indicated in this study. A safety-net hospital closure model was developed that showed that unemployment, operating margin, and salary and benefit expenses per full-time equivalent had a direct impact on hospital closures. Safety-net hospitals that experience upward trends in the unemployment rate in the areas they serve and have a poor operating margin and high salary and benefit expenses that make them more likely to close. This study provides supporting data to hospital administrators so decisions can be made to avoid future safety-net hospital closures. Information from this research can also provide legislators information and data as to why safety-net hospitals close and used as a tool for health care reform.*

**JEL:** I14, I18, I28, I38

**KEYWORDS:** charity care, county hospitals, finance ratios, indigent, indigent health care, medically indigent, safety-net hospital, uncompensated care, underinsured, undocumented alien health care, unemployment, and uninsured

## INTRODUCTION

There has been an evolution in health care in the United States. Safety-net hospitals have become the primary provider of care to the uninsured population (Hadley & Cunningham, 2004). For a variety of reasons, many safety-net hospitals have shut down and many have experienced challenges in a variety of ways (Cousineau & Tranquada, 2007). Bazzoli, Lindrooth, Kang, and Hasnain-Wynia (2006) stated that safety-net hospitals had a history of providing charity and discounted care to the uninsured population. DeLia (2006) reported that uninsured patients of all ages depend on uncompensated care from safety-net hospitals. As an indicator of uninsured patients, Weissman (2005) reported that hospitals in the United States spent \$25 billion on uncompensated care (care to the uninsured) in 2005. The amount of the uncompensated care represents the commitment safety-net hospitals have for caring for the uninsured and population who lack access to health care. In the process of dealing with socioeconomic changes and a rise in the number of uninsured patients, hospital administrators have made decisions to meet the current demands of their institution. In making these decisions, they were faced with an increased uninsured population and changes in socioeconomic factors.

## LITERATURE REVIEW

The areas commonly discussed in the safety-net hospital concept are effectiveness, efficiency, financial stressors, and payer mix. Safety-net hospitals commonly make comparisons among effectiveness,

efficiency, financial stressors, and payer mix to other safety-net and non- safety-net hospitals and the national average. These comparisons show safety-net hospitals how they are doing in comparison to others using financial indicators. Along with financial indicators, safety-net hospitals must contend with changing socioeconomic factors.

Cousineau and Tranquada (2007) stated that county hospitals are constantly challenged with balancing public health and indigent care. As county hospitals were providing care to the indigent to meet the public health requirements, they were doing so with high costs. Along with normal costs of doing business, safety-net hospitals were also faced with financial stressors. The financial stressors were mainly linked to a high rate of uninsured patients (Coughlin, Bruen, & King, 2004). Several researchers have shown that the common financial stressors faced by safety-net hospitals included government regulations, Disproportionate Share Hospital (DSH) and Upper Payment Limit (UPL) Funding, uncompensated care, primary care programs, and charity care programs (Bazzoli, Kang, Hasnain-Wynia, & Lindrooth, 2005; Bazzoli et al., 2006; Bennett, Moore, & Probst, 2007; Coughlin et al., 2004; Coustasse, Lorden, Nemarugommula, & Singh, 2009; Cunningham, Hadley, Kenney, & Davidoff, 2007; DeLia, 2006; Hadley et al., 2008; Lindrooth, Bazzoli, Needleman, & Hasnain-Wynia, 2006; Weissman, 2005; Wolfskill, 2007). Safety-net hospitals must deal with accomplishing the public health demand while relying on enough reimbursement and revenue from others.

## DATA AND METHODOLOGY

The purpose of this quantitative study was to address the gap in the understanding of the effects that increased uninsured population and socioeconomic factors have on safety-net hospital closures. We identified common factors found in California safety-net hospitals from 2002-2009. Based on Trochim and Donnelly's (2007) design descriptions, this study was similar to a non-experimental design. The non-experimental research design that was used in this study is a causal-comparative design or ex post facto design, as described by McMillan (2004). This design allowed us to understand a complex issue, enhanced the prior research, and explained the complex links. By using this design, relationships between the independent and dependent variables were determined through a logistic regression analysis (logic model). Once a logistic regression model was built using the postulated explanatory variables ( $x_1$  = unemployment rate,  $x_2$  = median household income,  $x_3$  = gross profit margin,  $x_4$  = efficiency ratio,  $x_5$  = operating margin,  $x_6$  = excess margin, and  $x_7$  = salary and benefit expenses per FTE) and response variable ( $y$  = hospital operating status; closed = 0 and open = 1), it must be assessed to assure all variables are a good fit and determine which coefficients were significant. The final result yielded the following logit model or hospital closure model:

$$P(y = 1) = \frac{e^{\beta_0 + \beta_1 x_1 + \beta_5 x_5 + \beta_7 x_7}}{1 + e^{\beta_0 + \beta_1 x_1 + \beta_5 x_5 + \beta_7 x_7}} \quad (1)$$

*This quantitative study was designed to test the following hypotheses:*  $H_0$ : There is no significant relationship between the dependent variable (hospital operational status) and independent variables (unemployment, median household income, gross profit margin, efficiency ratio, operating margin, excess margin, and salary and benefit expenses per FTE). All the coefficients ( $\beta_i$ ) equal zero.  $H_1$ : There is a significant relationship between the dependent variable (hospital operational status) and at least one independent variable (unemployment, median household income, gross profit margin, efficiency ratio, operating margin, excess margin, and salary and benefit expenses per FTE). At least one coefficient ( $\beta_i$ ) does equal zero. In the process of developing a logistic regression model, Minitab 16 was used to analyze the data. The computed coefficients ( $\beta_0$  and  $\beta_i$ ) were calculated and the quality of the regression model was tested using four assessments. The computed coefficients were constant =  $\beta_0$ , unemployment =  $\beta_1$ , median household income =  $\beta_2$ , gross profit margin =  $\beta_3$ , efficiency ratio =  $\beta_4$ , operating margin =  $\beta_5$ , excess margin =  $\beta_6$ , and salary and benefit expenses per FTE =  $\beta_7$ . The four assessments used to evaluate

the regression model were overall model evaluation, tests of individual predictors (the coefficients of the explanatory variables), goodness-of-fit test, and validation of the predicted probabilities. Once a logistic regression model was built using the postulated explanatory variables ( $x_1$  = unemployment rate,  $x_2$  = median household income,  $x_3$  = gross profit margin,  $x_4$  = efficiency ratio,  $x_5$  = operating margin,  $x_6$  = excess margin, and  $x_7$  = salary and benefit expenses per FTE) and response variable ( $y$  = hospital operating status; closed = 0 and open = 1), it must be assessed to assure all variables are a good fit and determine which coefficients were significant. The final result yielded the following logit model or hospital closure model:

$$P(y = 1) = \frac{e^{\beta_0 + \beta_1 x_1 + \beta_5 x_5 + \beta_7 x_7}}{1 + e^{\beta_0 + \beta_1 x_1 + \beta_5 x_5 + \beta_7 x_7}} \quad (2)$$

The criterion used for selecting the sample was based on an available data set and its relevance to the problem statement. The unit of analysis was California safety-net hospitals that operated at least 1 year during the 2002-2009 calendar years (January to December). Safety-net hospitals used in this study met the following criteria:

1. The hospital was classified as a general acute care and comparable hospital by OSHPD.
2. The hospital had a minimum of 3 years of operation prior to 2010.
3. The hospital had at least 1 year of operation from 2002-2009.
4. The number of total visits (outpatient and inpatient combined) by indigent patients, other indigent patients, and other patients, as outlined by OSHPD, equaled 5% or more of total hospital visits.
5. The hospital had an emergency department classified as open by OSHPD during its operational period.

The 1999 to 2009 OSHPD Hospital Annual Financial Data (HAFD) sets were used in determining which hospitals met the criteria. Based on these criteria, the sample size was 274 safety-net hospitals. Unemployment (3-year rate change) data were taken from LAUS. The formula used to calculate the unemployment 3-year rate change was:

$$\text{Unemployment (3 – year change)} = (2009 \text{ Unemployment Rate} - 2007 \text{ Unemployment Rate})(3)$$

If the hospital operating status was reported as closed prior to the end of the 2009 calendar year, the third to the last year and final year of the operational years were used (Example: if the hospital closed in 2002, then the unemployment rates for 2000 and 2002, were used). Unemployment rate was reported as a percent. Median household income (3-year change) data originated from the United States Census Bureau, with support from other federal agencies. The formula used to calculate the median household income 3-year change was:

$$\text{Median Household Income (3 – year change)} = (2009 \text{ Median Household Income} - 2007 \text{ Median Household Income})(4)$$

If the hospital operating status was reported as closed prior to the end of the 2009 calendar year, the third to the last year and final year of the operational years were used. Median household income was reported as a positive or negative number rounded to the nearest dollar. Median household income was also adjusted for inflation or normalized using the Consumer Price Index (CPI) Inflation Calculator provided by United States Department of Labor (2011). The data for gross profit margin were found on the OSHPD website using the ALIRTS system. The formula for gross profit margin was:

$$\text{Gross Profit Margin} = \frac{(\text{Gross Patient Revenue} - \text{Total Operating Expense})}{\text{Gross Patient Revenue}} \quad (5)$$

For the purposes of this study, the gross profit margin was reported in terms of a 3-year average. The gross profit margin variable with a 3-year average was calculated by adding the gross profit margin from 2007-2009 and divided by 3 years. The formula used to calculate the gross profit margin 3-year average was:

$$\text{Gross Profit Margin (3 - year average)} = \frac{(\text{2007 Gross Profit Margin} + \text{2008 Gross Profit Margin} + \text{2009 Gross Profit Margin})}{3 \text{ years}} \quad (6)$$

If the hospital operating status was reported as closed prior to the end of the 2009 calendar year, the last three operational years were used. Gross profit margin was reported as a positive or negative number rounded to the nearest thousandth. The data for efficiency ratio were found on the OSHPD website using the ALIRTS system. The formula for efficiency ratio was:

$$\text{Efficiency Ratio} = \frac{(\text{Total Operating Expenses} - \text{Interest Expenses})}{\text{Gross Patient Revenue}} \quad (7)$$

For the purposes of this study, the efficiency ratio was reported in terms of a 3-year average. The efficiency ratio variable with a 3-year average was calculated by adding the efficiency ratio from 2007-2009 and divided by 3 years. The formula used to calculate the efficiency ratio 3-year average was:

$$\text{Efficiency Ratio (3 - year average)} = \frac{(\text{2007 Efficiency Ratio} + \text{2008 Efficiency Ratio} + \text{2009 Efficiency Ratio})}{3 \text{ years}} \quad (8)$$

If the hospital operating status was reported as closed prior to the end of the 2009 calendar year, the last three operational years were used. Efficiency ratio was reported as a positive or negative number rounded to the nearest thousandth. The data for operating margin were found on the OSHPD website using the ALIRTS system. The formula for operating margin was:

$$\text{Operating Margin} = \frac{(\text{Total Operating Revenue} - \text{Total Operating Expense})}{\text{Total Operating Revenue}} \quad (9)$$

Operating margin is commonly reviewed over a length of time. For the purpose of this study, operating margin was calculated as a 3-year average. The formula for operating margin 3-year average was:

$$\text{Operating Margin (3 - year average)} = \frac{(\text{2007 Operating Margin} + \text{2008 Operating Margin} + \text{2009 Operating Margin})}{3 \text{ years}} \quad (10)$$

If the hospital operating status was reported as closed prior to the end of the 2009 calendar year, the last three operational years were used. Operating margin was reported as a positive or negative number rounded to the nearest thousandth. The data for calculating the excess margin can be found on the OSHPD website in the ALIRTS system. The formula for calculating excess margin was:

$$\text{Excess Margin} = \frac{(\text{Totaling Operating Revenue} - \text{Total Operating Expense} + \text{Nonoperating Revenue})}{(\text{Total Operating Revenue} - \text{Nonoperating Revenue})} \quad (11)$$

The excess margin with a 3-year change was calculated by subtracting the 2007 excess margin from the 2009 excess margin. The formula used to calculate the excess margin 3-year change was:

$$\text{Excess Margin (3 - year change)} = (\text{2009 Excess Margin} - \text{2007 Excess Margin}) \quad (12)$$

If the hospital operating status was reported as closed prior to the end of the 2009 calendar year, the third to the last year and final year of the operational years were used. Excess margin was reported as a positive

or negative number rounded to the nearest thousandth. Salary and benefit expense per FTE requires two variables: total expense: salary and benefits and number of FTEs allocated by the hospital. The data for this variable were found on the OSHPD website using the ALIRTS system. The formula for salary and benefit expense per FTE was

$$\text{Salary and Benefit Expense per FTE} = \frac{\text{Total Expenses:Salary+Benefits}}{\text{Total Number of FTEs}} \quad (13)$$

For the purpose of this study, salary and benefit expense per FTE was calculated as a 3-year average. The formula for salary and benefit expense per FTE 3-year average was

$$\text{Salary and Benefit Expense per FTE (3 - year average)} = \frac{(\text{2007 Salary and Benefit Expense per FTE} + \text{2008 Salary and Benefit Expense per FTE} + \text{2009 Salary and Benefit Expense per FTE})}{3 \text{ years}} \quad (14)$$

If the hospital operating status was reported as closed prior to the end of the 2009 calendar year, the last three operational years were used. Salary and benefit expense per FTE was reported as a positive or negative amount rounded to the nearest dollar. Salary and benefit expense per FTE was also adjusted for inflation or normalized using the CPI Inflation Calculator provided by United States Department of Labor (2011).

## RESULTS

The results of the log-likelihood test are shown in Table 1. The log-likelihood test showed that there was a significant probability that at least one coefficient ( $\beta_i$ ), was not equal to zero (log likelihood, or  $G = \chi^2 = 110.546$ ,  $df = 7$ ,  $N = 274$ ,  $p = 0.000$ ). Therefore, the null hypothesis (that all coefficients are equal to zero) was rejected. However, although the overall log likelihood  $p$  value equals zero, the individual  $p$  values do not indicate that any of the explanatory variables were significant ( $p > 0.05$  for all variables). That indicates a need for some model refinement.

Table 1: Logistic Regression Table:  $Y$  Versus  $X_1, X_2, X_3, X_4, X_5, X_6$ , And  $X_7$

Predictor	Coefficient	SE Coefficient	Z	P	Odds ratio	95% CI, Lower	95% CI, Upper
Constant	130.69**	1,828.6**	0.07**	0.943**	—	—	—
$x_1$	1,583.8**	22,416**	0.07**	0.944**	+	0.00**	+
$x_2$	-0.0212**	0.3271**	-0.06**	0.948**	0.98**	0.52**	1.86**
$x_3$	6,834.1**	108,832**	0.06**	0.950**	+	0.00**	+
$x_4$	6,968.2**	110,651**	0.06**	0.950**	+	0.00**	+
$x_5$	189.52**	2,883.5**	0.07**	0.948**	<0.0001**	0.00**	+
$x_6$	91.286**	3,102.8**	0.03**	0.977**	<0.0001**	0.00**	+
$x_7$	0.0000**	0.0293**	0.01**	0.995**	1.00**	0.94**	1.06**

This table shows the results of the logistic regression for  $y$  versus  $x_1, x_2, x_3, x_4, x_5, x_6$ , and  $x_7$ . The  $p$  values indicate that not all variables were significant. This indicates that model refinement is needed to establish a final model. SE = standard error; CI = confidence interval; + = Convergence has not been reached for the parameter estimates criterion; Log likelihood = -0.000; test that all slopes are 0:  $G = 110.546$ ,  $DF = 7$ ,  $P$  value = 0.000. \*\*\*, \*\*, and \* indicate significance at the 1, 5, and 10 percent levels respectively.

In an effort to build a valid logit model, the explanatory variables were analyzed in several different combinations using a stepwise regression approach until the remaining variables had a  $p$  value of less than 0.05. Using Minitab 16, every possible combination of explanatory variables were evaluated until three remained with  $p$  values less than 0.05. All other combinations yielded at least one  $p$  value greater than 0.05. Table 2 lists the results of the analysis conducted (logistic regression analysis of  $y$  versus  $x_1, x_5$ , and  $x_7$ ). In this logistic regression analysis, there was a significant probability that unemployment ( $x_1$ ), operating margin ( $x_5$ ), and salary and benefit expenses per FTE ( $x_7$ ) affect hospital operational status ( $\chi^2 = 92.700$ ,  $df = 3$ ,  $N = 274$ ,  $p = 0.000$ ). Interactions were considered and assigned as explanatory variables ( $x_8$  through  $x_{28}$ ). All combinations of the interactions variable yielded  $p$  values greater than 0.05. The

interactions analysis included the testing of all variables (response and explanatory) individually and in different combinations. Based on the interactions analysis, no interaction explanatory variables or other response variables will be included in the logit model. Additionally, the  $p$  value of each explanatory variable ( $x_1$ ,  $x_5$ , and  $x_7$ ) left in the model was less than 0.05.

Table 2: Logistic Regression Table:  $Y$  Versus  $X_1$ ,  $X_5$ , And  $X_7$

Predictor	Coefficient	SE Coefficient	Z	P	Odds ratio	95% Lower	CI, Upper	95% Lower	CI, Upper
Constant	9.5466**	3.649**	2.62**	0.009**	—	—	—	—	—
$x_1$	109.08**	36.989**	2.95**	0.003**	<0.0001**	<0.0001**	<0.0001**	<0.0001**	<0.0001**
$x_5$	14.381**	7.107**	2.02**	0.043**	1,759,984**	1.580**	1.570**	1.580**	1.570**
$x_7$	0.0002**	0.0001**	2.14**	0.032**	1.000**	1.000**	1.000**	1.000**	1.000**

This table reflects the results of a logistics regression analysis completed on  $y$  versus  $x_1$ ,  $x_5$ , and  $x_7$ . Based on the results of the  $p$  values, all variables were significant. SE = standard error; CI = confidence interval; Log-Likelihood = -8.875; Test that all slopes are zero:  $G = 92.797$ ,  $DF = 3$ ,  $P\text{-Value} = 0.000$ . \*\*\*, \*\*, and \* indicate significance at the 1, 5, and 10 percent levels respectively.

An interactions analysis was completed among the three remaining explanatory variables ( $x_1$ ,  $x_5$ , and  $x_7$ ) and resulted in no valid interactions between any of the explanatory variables. Table 3 provides the results of the interaction analysis. For the interaction analysis three interactive independent variables were created and tested ( $x_8$ ,  $x_9$ , and  $x_{10}$ ).  $x_8$  represented a possible interaction between  $x_1$  and  $x_5$ ,  $x_9$  between  $x_1$  and  $x_7$ ,  $x_{10}$  between  $x_5$  and  $x_7$ . The values for  $x_8$ ,  $x_9$ , and  $x_{10}$  were calculated by multiplying the modified values of the two possible interacting independent variables. Based on the results of the logistic regression analysis in Table 3, variables  $x_8$ ,  $x_9$ , and  $x_{10}$  will not be included in the logit model.

Table 3: Logistic Regression Table:  $Y$  Versus  $X_1$ ,  $X_5$ ,  $X_7$ ,  $X_8$ ,  $X_9$ , And  $X_{10}$

Predictor	Coefficient	SE Coefficient	Z	P	Odds ratio	95% Lower	CI, Upper	95% Lower	CI, Upper
Constant	29.667**	3,044.4**	-0.01**	0.992**	—	—	—	—	—
$x_1$	402.66**	105.931**	0.00**	0.997**	<0.001**	0.00**	+	0.00**	+
$x_5$	-17.798**	17,642**	0.00**	0.999**	0.00**	0.00**	+	0.00**	+
$x_7$	-0.0000**	0.1810**	0.00**	1.000**	1.00**	0.70**	1.42**	0.70**	1.42**
$x_8$	-3,207.9**	1,115,610**	0.00**	0.998**	0.00**	0.00**	+	0.00**	+
$x_9$	-0.0198**	8.569**	0.00**	0.998**	0.98**	0.00**	<0.0001**	0.00**	<0.0001**
$x_{10}$	0.0012**	0.8390**	0.00**	0.999**	1.00**	0.19**	5.18**	0.19**	5.18**

This table reflects the results of a logistics regression analysis completed on  $y$  versus  $x_1$ ,  $x_5$ ,  $x_7$ ,  $x_8$ ,  $x_9$ , and  $x_{10}$ . Based on the results of the  $p$  values,  $x_8$ ,  $x_9$ , and  $x_{10}$  will be rejected from the final model. SE = standard error; CI = confidence interval; + = Convergence has not been reached for the parameter estimates criterion; Log-Likelihood = -8.875; Test that all slopes are zero:  $G = 92.797$ ,  $DF = 3$ ,  $P\text{-Value} = 0.000$ . \*\*\*, \*\*, and \* indicate significance at the 1, 5, and 10 percent levels respectively.

The next step in a regression analysis is the assessment of the overall goodness-of-fit test. The goodness-of-fit uses the deviance or residual deviance. A good fit will reference a smaller deviance. Table 4 reflects the goodness-of-fit analysis. Pearson ( $p = 1.00$ ), Deviance ( $p = 1.00$ ) and Hosmer-Lemeshow ( $p = 1.00$ ) measures confirmed that this logit model was an effective predictor of hospital operational status of goodness-of-fit. The overall result of the goodness-of-fit tests also supports the rejection of the null hypothesis.

Table 4: Goodness-Of-Fit Tests For  $Y$  Versus  $X_1$ ,  $X_5$ , And  $X_7$

Method	Chi-Square	DF	P
Pearson	60.972**	270**	1.00**
Deviance	17.749**	270**	1.00**
Hosmer-Lemeshow	0.0868**	8**	1.00**

This table shows the results of the three goodness-of-fit tests completed for  $y$  versus  $x_1$ ,  $x_5$ , and  $x_7$ . The Pearson, Deviance, and Hosmer-Lemeshow tests indicate that  $x_1$ ,  $x_5$ , and  $x_7$  were effective predictors of hospital operational status. \*\*\*, \*\*, and \* indicate significance at the 1, 5, and 10 percent levels respectively.

The last assessment in the logistic regression model is validation of predicted probabilities. The probability model is expressed as:

$$P(y = 1) = \frac{e^{\beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_i x_i}}{1 + e^{\beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_i x_i}} \quad (15)$$

By using the coefficients ( $\beta_0$ ,  $\beta_1$ ,  $\beta_5$ , and  $\beta_7$ ) and explanatory variables ( $x_1$ ,  $x_5$ , and  $x_7$ ) in Table 3, a new logit model (hospital closure model) is developed and expressed as:

$$P(y = 1) = \frac{e^{\beta_0 + \beta_1 x_1 + \beta_5 x_5 + \beta_7 x_7}}{1 + e^{\beta_0 + \beta_1 x_1 + \beta_5 x_5 + \beta_7 x_7}} \quad (16)$$

Where the coefficients are calculated as

$$\begin{aligned} \beta_0 &= 9.54663 \\ \beta_1 &= 109.081 \\ \beta_5 &= 14.3808 \\ \beta_7 &= 0.0001613. \end{aligned}$$

To validate this model, we plugged in the values of the independent variables from the actual data to calculate  $y$  for each hospital in the sample. After plugging the data into the predictive model for the safety-net hospitals reported as open ( $y = 1$ ), 259 out of 260 produced probabilities close to 1, indicating they were very likely to be open. The only exception was Mercy Medical Center Merced – Community Campus whose data yielded a probability of being open of 0.018 (indicating a high likelihood of being closed) but OSHPD (2010) reported the hospital as open in 2009. For safety-net hospitals that closed ( $y = 0$ ), 13 of 14 hospitals had probability values indicating a high likelihood of being closed. As an exception, San Jose Medical Center had a probability value of 0.576; however, OSHPD (2010) showed the hospital to be closed in 2004. As an example of this validation of the model, Alameda County Medical Center had the following mean centered values for the independent variables

$$\text{Unemployment } (x_1) = 0.001$$

$$\text{Operating Margin } (x_5) = 0.112$$

$$\text{Salary and Benefit Expenses per FTE } (x_7) = 27,659.$$

When these values are placed into the hospital closure model we get the following result:

$$P = \frac{(e^{(9.54663 + (109.081 * 0.001) + (14.3808 * 0.112) + (0.0001613 * 27,659)))}}{(1 + (e^{(9.54663 + (109.081 * 0.001) + (14.3808 * 0.112) + (0.0001613 * 27,659))}))} = 0.999.$$

Based on the results of the hospital closure model, the probability of the hospital being open is 99.9%. The operational status of Alameda County Medical Center at the end of the study was in fact, open (1). Another example that could be used is Orange County Community Hospital – Buena Park. The mean centered independent variables for Orange County Community Hospital – Buena Park were

$$\text{Unemployment } (x_1) = -0.049$$

$$\text{Operating Margin } (x_5) = -0.512$$

$$\text{Salary and Benefit Expenses per FTE } (x_7) = -37,701.$$

When these value were plugged into the hospital closure, the result was

$$P = \frac{(e^{(9.54663+(109.081*-0.049)+(14.3808*-0.512)+(0.0001613*-37,701))})}{(1+((e^{(9.54663+(109.081*-0.049)+(14.3808*-0.512)+(0.0001613*-37,701))}))} = 0.000.$$

Using the hospital closure model we were able to determine that Orange County Community Hospital – Buena Park is closed (0). During the data collection process, it was noted that Orange County Community Hospital – Buena Park closed in 2003.

## CONCLUDING COMMENTS

The results of this study were used to yield a hospital closure model that can be used to predict hospital closure or identify hospitals nearing closure. In this model, unemployment, operating margin, and salary and benefit costs were directly related to hospital closure. When safety-net hospitals experienced a low unemployment rate change, negative operating margin (negative value or loss of profit), and decreased salary and benefit costs; the probability of hospital closure was significant. This information contributed to existing research already completed on safety-net hospitals. The results of this study are useful for public and hospital administrators when evaluating socioeconomic changes and hospital financial data. In order for change to occur, collaboration is necessary to address the causes of safety-net hospital closures and prevent health care disparities.

# LEAN BUSINESS STRATEGIES FOR INTEGRATION IN THE ORGANIZATIONS

Jorge Hernández Palomino, Instituto Tecnológico de Ciudad Juárez  
José de Jesús Espinoza Medina, Instituto Tecnológico de Ciudad Juárez  
Manuel Aguilar Arellano, Instituto Tecnológico de Ciudad Juárez

## ABSTRACT

*This descriptive research study, identify the lean practices and elements in the actual literature. Despite widespread interest and a little empirical evidence to support its position in improving organization performance, there is a little understanding related key organizational factor of the lean business strategies. This research identified five elements to represent the lean business practices. An instrument was developed to empirically analyze the dimensions underlying the constructs of this study. In order to verify the results, cluster analysis was used to group organizations representing different patterns of implementation of lean manufacturing practices. The gathered results confirm that the lean organizations significantly differed from non lean organizations in their emphasis on cost and volume flexibility as the manufacturing strategy. Because the data collected here was cross-sectional, it cannot directly address the question of whether implementing lean manufacturing practices lead to high performance. Future research can analyze from different perspectives and different approaches. The limitations of the study are presented.*

**KEYWORDS:** Manufacturing, organization, firm strategy

**JEL:** L6, L2, L1

## INTRODUCTION

In the globalized world of the XXI century, competitiveness has become an obligation for companies of all sizes. In the quest to survive and thrive in today's dynamic and turbulent environment, organizations need to reconfigure their primary responsibilities (Hernandez, Rodriguez and Espinoza, 2010). To create and maintain competitive advantage of manufacturing, today firms need skills to adapt production processes to the needs of their customers and have a structure that supports a culture of continuous improvement through the identification and reduction of scrap in enterprises. Although it is generally accepted that SMEs are important to the national economy, not many governments have made feasible measures to enhance their contribution or increase their competitiveness. Most of these do not even have reliable statistics on SMEs (Saavedra and Hernandez, 2007). Nationwide companies of world-class manufacturing are focused on finding ways to improve their production processes and produce products or services with high levels of quality, productivity, reliability and lower cost.

Mexico has a large number of SME manufacturers seeking to gain competitive advantage by integrating both its production and administrative processes. In this study, we try to optimize the resources to apply new techniques and principles. It is intended that the traditional processes become simpler processes, leading to a cultural change within the organization. One alternative to replace traditional manufacturing practices in SMEs, it is lean manufacturing and enterprise integration. This represents an opportunity to remain competitive in the market, in which the general rule seems to be fulfilling the goal of "reducing costs." Lean manufacturing has been used by many organizations to compete globally, which is considered revolutionary in the process of continuous improvement in manufacturing concepts (Womack

and Jones 1996). There is also broad agreement that lean manufacturing techniques can help SMEs to meet the new paradigms in manufacturing (Maurer, 2005).

Additionally, there is a growing consensus about the attributes of lean manufacturing. This tool has been considered for its significant improvements in the performance of a large number of organizations. Despite the interest and agreement of its importance, current research has made very little progress in examining a wide range of characteristics associated with lean manufacturing systems. Based on the state of the art, current research contributes in two ways to fill this gap.

First, this study identifies lean practices and elements of the current literature. Second, it explores the different patterns of implementation of lean manufacturing and enterprise integration. Despite widespread interest and some empirical evidence to support the improvement in performance, there is very little theory to substantially cover the concept of lean manufacturing in the SME and explain its multidimensional nature. Examining the differences between companies that intensively implement these practices and their counterparts who do not implement them, this study provides insight into the development of a theory to explain the lean manufacturing systems and present managers of the companies that are considering implementing lean manufacturing guidelines.

Since the elements of lean manufacturing can be implemented individually or in combination, several possible patterns of implementation are feasible. The objective is to determine if companies that use lean manufacturing face a faster change their external environment than companies that do not use it. The paper is structured as follows, the review and analysis of the literature of the subject matter and the configuration of lean manufacturing are presented. Next, the paper continues with a discussion of the methodology used in the research. Then the paper presents the data and results of study. Finally, concluding remarks and the limitations are presented.

## LITERATURE REVIEW

*Traditional manufacturing:* The traditional manufacturing had its development in the cities, the framework for excellence. The craft guilds exercised a tight control of this urban industry, through a complicated regulation preventing the development of free enterprise. Even as the traditional industry could initially support the demands of the expansion of demand for manufactured goods, in truth the unions represented a capitalist concept, representing a barrier to the emergence of technically more advanced forms of productive organization. The industrialized world of today, every day more globalized, is experiencing a slow but gradual shift from traditional methods of production (Taylorism and Fordism) by new forms of work organization. Among these stands the Japanese model, also known as lean manufacturing, a concept coined by Womack (1996).

*Emergence of lean manufacturing:* The increase in the global competitive challenges of the last two decades has led a number of companies to adopt new manufacturing practices (Meredith and McTavish, 2004). Particularly lean manufacturing (Womack and Jones 1996). Lean manufacturing is a multi-dimensional practice that includes a wide variety of management techniques, including just-in-time quality control systems, employee involvement, supplier management, customer involvement, etc.. in an integrated system. Lean manufacturing emerged from the Toyota system. This system represents a new way to do business worldwide (Ohno, 1988). The pioneers in the development of tools that make the Toyota production system were: Toyoda, Ohno and Shingo (Kaufman, 2001). This system was begun in 1945, when the president of the Toyota corporation decided to look beyond the levels that the manufacturing plant in the United States had. One of the factors was the economic situation in Japan after the Second World War. This forced Japanese companies to seek a new strategy to optimize production processes, then developed the system which fits the Toyota lean manufacturing.

The main idea of lean manufacturing is that these practices can work synergistically to create a high quality sound system, which allows the creation of finished products at par with the demands of customers with little or no waste. The existing evidence supports the association of lean manufacturing and improved performance. While most studies have focused on the simple content of a specific area and their implications for performance (such as Hackman and Wageman, 1995; Samsom and Terziovski, 2003, MacDuffie, 2005), few studies have focused on analyzing the two elements of this study and much less in SMEs. Manufacturing programs such as lean manufacturing, which evolve slowly over a long period of time, are difficult to imitate and transfer. Lean manufacturing is valuable, rare and difficult to imitate (Barney, 1991). Lean manufacturing is valuable because it is associated with the highest performance of companies that have implemented it. It is rare because not all manufacturing companies, especially SMEs in Mexico, have this very demanding program.

The implementation of lean manufacturing practices and processes required distinctive, as well as high-level business processes (Teece, Pisano and Shuen, 1997). High levels include administrative coordination and communication processes with suppliers and customers. This suggests that lean manufacturing shows a high level of interdependence and their replication may be difficult because it would require systemic change through the organization and between organizational links. Thus, identifying the appropriate process to implement appropriate strategies becomes crucial point.

The strategy can be defined as "the number of coordinated actions aimed at achieving a particular goal" (MacCrimmon, 1993). Strategies exist at every level of the organization and hierarchical in nature (Hayes and Wheelwright, 1984). They are made at the corporate level as corporate strategies and business unit level as business strategies. A definition of manufacturing strategy is seen as the effective use of the strengths of manufacturing as a competitive tool to achieve business goal and corporate goals (Swamidass and Newell, 1987). The primary function of the manufacturing strategy is to put together the set of manufacturing capabilities that enable it to continue its business strategy chosen. Thus, the focus on research in manufacturing strategy has been to describe the key capabilities and choices between competing priorities (Ward and Duray, 2000). According to these authors, the literature on manufacturing strategy notes basically four competitive priorities: cost reduction, quality, delivery and flexibility.

According to Schroeder (2001), organizations can change by altering its structure, technology or changing its people. The change in the structure involves rearranging their internal processes. Change means altering the computer technology, processes of engineering, research techniques or methods of production. In manufacturing firms the processes are interdependent (Figure 1), which interact under the influence of joint forces. A change in its elements would affect the other (Stoner and Freeman, 1994). Therefore, the question arises on how to integrate these processes.

Figure 1: Interdependent Organizational Elements

*Source: Authors, based in Shah, 2002. This figure shows the processes of manufacturing firms, which explains how a change in its element would affect others.*

**Enterprise Integration:** The use of computers and systems has enabled companies to face new challenges and opportunities through information processing at very high speeds. Unfortunately, speed information flow was not sufficient to interconnect the various internal processes of an organization. Therefore, integration of business models aims to achieve an efficient and effective alignment of the elements of an enterprise through a simple modeling language (Chun, 2003). The process improvement is an opposing relationship between cost-benefit, lightly inclined to cost. Incomplete development and alignment with existing processes can lead to increased costs; expert systems and diversification of business lines can generate a costly complexity. Changes in business requirements of unfinished projects can reduce benefits. Enterprise integration is a solution to these challenges: drives assets and processes into a single adaptive infrastructure and more rational than is available as needed.

When integrated smoothly with existing tools in new ways within their preferred business these can maintain and increase the value of investments in technology and training. It is essential to select the important elements to look and hide the irrelevant items. The main objective of the integration of companies is to provide the necessary information and time, looking for companies to be able to integrate the factors of communication, cooperation and coordination between processes. Clearly the integration process is of great importance for it, a lot of research has focused on strategy.

# ACADEMIC PROGRAM REVIEW: LINKAGE BETWEEN ANNUAL AND OTHER PERIODIC PROCESSES

Sarah Ingle, Dublin City University

Malcolm Brady, Dublin City University

Mairéad Nic Giolla Mhichíl, Dublin City University

Ray Walshe, Dublin City University

Sheelagh Wickham, Dublin City University

## ABSTRACT

*In recent times in Europe and beyond, there has been a heightened emphasis on the need to periodically review academic programs to ensure that they continue to be relevant, meaningful and sustainable in a modern, 21<sup>st</sup> century society. The focus of this exploratory paper is an interim case study on one aspect of the development of a Periodic Program Review process in an Irish context within Dublin City University, one of the seven universities in Ireland. This focus is the linkage between annual and other periodic review processes in relation to academic programs. Following a literature review, the paper begins with an overview of DCU and in particular its procedures and related activities in regard to quality assurance. The recently introduced Periodic Program Review process is first described, along with an evaluation of the relevant issues and discussions that ensued. The views and insights of key DCU staff are then outlined to highlight key issues and constraints with particular reference to a number of programs in the Faculty of Humanities and Social Sciences in Dublin City University. The paper concludes with an indication for future research.*

**KEYWORDS:** Academic Program Review; Periodic Program Review; Quality Assurance.

## INTRODUCTION

The purpose of this paper is to outline the recently introduced Periodic Program Review (PPR) policy in Dublin City University (DCU), Ireland, and identify developmental and other issues in order to improve the process. The definition of 'periodic' in this context is a five year time period, which builds on and links with, an Annual Program Review (APR) process, undertaken with on-going external examiner input at local, School or Faculty level. PPR is also linked into the seven year, statutory internal review process of Schools and Faculties. Following an outline literature review, the paper begins with an overview of DCU and in particular its review processes and related activities in regard to quality assurance. The PPR policy introduced in 2012 is then outlined. In the results section, the views and insights of key DCU staff are provided to highlight key issues and constraints, with particular reference to three programs in DCU's Faculty of Humanities and Social Sciences.

## LITERATURE REVIEW

Quality assurance at third level has been a matter of scholarly and practitioner investigation for some time, and many authors have written in this field over the last number of years, from a number of perspectives (Solomon, 1993; Barnett, 1997; Galloway 1998; Pounder 1999; Tam, 2001; Kekäle; 2002; Narang, 2012). In reviewing the literature for this paper, four relevant themes were identified each of which have a role to play in a theoretical context:

1. There has been very little change in the Quality Assurance (QA) aspect of the higher education environment over the last twenty years
2. Higher education has tended to adopt industrial/manufacturing QA models which are not always entirely appropriate, or easily matched onto existing processes and procedures
3. Academic freedom/autonomy has tended to resist QA interventions as academics and other university staff become more familiar with the review type environment
4. Difficulties have arisen in the identification of what quality at third level 'looks like', and how it should operate within an academic context.

During the process of undertaking a literature review in the wider area of quality assurance within the perspective of a Higher Education Institution (HEI), the authors were struck by one particular over-riding issue. Given that there has been so much change in social, technological, economic and political landscapes over the last three two decades, and given that: 'all post 1992 universities now have extensive and comprehensive quality assurance mechanisms and extensive bureaucracies which seek to monitor every aspect of academic life from initial validation of programs to the periodic review and monitoring of all programs in their academic portfolios.' (Cartwright, 2007, p.289), it is surprising that the same rate of change has seemingly not occurred within HEIs. This issue was clearly brought home to us by a statement in a British government policy & strategy document, from the late 1980s which is still relevant today.

'Competition between HEIs will ... intensify as they increasingly target markets and industries, and most institutions will wish to differentiate themselves on the grounds of their excellent in selected area. (DTI/CIHE, 1989, p.29). Many HEIs have begun the process of adopting quality assurance models more related to those from industry than education or training (Doherty, 2008), and the proliferation of mission, vision, and strategy approaches by such organizations is well documented. Although undertaking regular program reviews requires ongoing work and effort including the collation of statistical and other data including staff and student feedback to be included in appropriate templates or pro-formas, in general those involved appreciate the necessity for such undertakings. This is exemplified by the following comment: 'I have met very few colleagues who reject the concept of evaluation as generally a good thing, but there seems to be a barrier to extending that perception to their performance within an institution, or between institutions for that matter.' (Doherty, 2008, p.262).

## METHODOLOGY

A number of methods were used to undertake the research for this exploratory, working paper. First, as already outlined, the relevant literature was explored in order to try and determine an appropriate theoretical fit. The literature provided a number of potential themes identified earlier. Following the literature review, secondary information informs the explanation of the PPR policy and associated procedures. In the discussion section, the issues arising are informed by a survey of all 110 Program Chairs (Course Leaders) in DCU.

There were 59 respondents to the survey and the relevant PPR topics included questions on the:

- Clarity of the relationship between APR and PPR
- Awareness of the DCU guidelines and policy on PPR
- Knowledge of how APR will link with PPR
- Knowledge of how PPR links in with the internal quality review process

A semi-structured interview was also undertaken with two program chairs undertaking the PPR process for the first time in DCU during the academic year 2012/2013. In the small School involved within the Faculty of Humanities and Social Sciences, two undergraduate programs with some common modules comprised one PPR process, and one post-graduate program comprised another. At present the PPR reports in the required template format are with the external reviewers, and the School is waiting for their responses.

### The Context: Dublin City University

#### Overview

Dublin City University is a young academic institution, set up as a National Institute of Higher Education (NIHE) in 1980, on the outskirts of the City of Dublin. It was initially established to address the country's need for an emerging skilled workforce trained in the areas of science, engineering, business, computer technology, communications and languages. DCU was awarded university status in 1989, and that time it broke with the traditional mold and introduced a number of ideas which had enormous impact on the Irish education system. It currently models itself as Ireland's 'University of Enterprise' and aspires to the inclusion of all aspects of social, commercial and community enterprise in its under-graduate and graduate programs. It is also different to traditional universities in that it seeks to prioritise key strategic objectives and associated actions that address key challenges for Irish society, and has a proactive aim of seeking to enhance the efficiency with which it 'translates' its research activities into societal impact and commercial reality by developing strategic alliances with complementary partners.

#### Quality Assurance In DCU

Quality assurance and enhancement activities undertaken across the university make a strong, and vital, contribution to DCU, and are clearly related to its institutional aims and objectives. DCU has always had a tendency to judge and perceive quality differently to other third level institutions, partly as it is a relatively young university, just 23 years old. Under the Universities Act (1997), all Universities in Ireland have a statutory obligation to conduct internal quality reviews on the teaching, research and other appropriate activities of all academic and administrative areas on a periodic basis. With oversight from the DCU Quality Promotion Office (QPO), and the Director of Quality Promotion, these reviews are currently facilitated and arranged on a seven year, cyclical schedule. The objective of the internal review process is one of quality improvement and enhancement, and DCU has fully embraced internal review, undertaking 44 such reviews of Schools, Faculties, Research Centres and Support / Service Offices since 2001.

#### Development of Periodic Program Review Policy

As part of her role, the Director of Quality Promotion has a clear remit to advise the decision making body of DCU, University Executive, and the Senior Management Group of relevant changes and developments in quality assurance and enhancement, and recommend new procedures and processes appropriate to the changing environment. She is also a member of Education Committee (EC) in DCU, a body which is responsible for the shaping of university strategy in relation to academic affairs, and is chaired by the chief academic officer, the Registrar. All of the Executive Deans are members of this Committee along with the Dean of Teaching and Learning and the Dean of Graduate Studies. This committee is a key group within the University, and is highly regarded in terms of its remit, membership and depth and breadth of its work. Over the period 2010-2012 the Director of Quality Promotion participated in two major quality assurance initiatives undertaken by Education Committee. One of these initiatives in which she had a key, leadership involvement, together with the Associate Deans for Teaching and Learning, was the development of a DCU policy and associated procedures for Annual and

Periodic Program Review (APR/PPR). Although annual and periodic review had been carried out previously for many programs on an informal basis, again, as a result of institutional and other reviews, a working group was set up to develop a clear policy, purpose, principles and procedures document, with associated timelines and templates.

#### Outline of Periodic Program Review Policy

The purpose of DCU's PPR policy is to fulfil DCU's commitment to consistent, transparent quality assurance, by means of a rigorous and effective quality monitoring process. It provides evidence that DCU's internal quality assurance and enhancement procedures are reliable and effective. The PPR policy requires that the process is conducted in a consistent, systematic and comparable manner across the university by means of a clear, published PPR procedure that includes:

- Following an agreed five year cycle within each Faculty
- The involvement of an external reviewer
- The use of templates / proformas for the PPR report and the external reviewer's PPR report
- The provision of statistical data by the business intelligence system to inform the process
- Articulation within the DCU internal quality review process by ensuring, to the extent possible, that the PPR reports of all programs within a School or Faculty are completed in the preceding five years before a School or Faculty's internal quality review.

#### **RESULTS AND DISCUSSION**

A number of interesting results arose from the survey of 110 program chairs with a 54% response rate. Only 24% of respondents agreed, or strongly agreed, that the relationship between the APR and the PPR was clear, and over 10% strongly disagreed. A relatively similar result was obtained in relation to whether the guidelines and details of the PPR policy were understood. Here only 29% of respondents agreed, or strongly agreed that this was their experience, while again, over 10% strongly disagreed. Turning to the knowledge that respondents had on how APR will link with PPR, most respondents indicated that they were unsure or unclear about this, although those that were aware of the link indicated a high level of understanding with comments such as:

- *'APR should serve as the 'net' to help inform the 5 year PPR which presumably will adopt a more strategic stance.'*
- *'The information from each APR will be collated to inform the 5 year PPR'*
- *'APR should inform 5 year PPR. APRs over 5 years should be able to identify trends and issues that have not been resolved'*
- *'The APR will form part of the PPR documents submitted to the external review panel. The same statistics as used in the APR will be reported in the PPR presumably to make it possible to track progress.'*

There was a slightly higher appreciation of the link between APR/PPR and the statutory internal quality review process of Schools and Faculties with external reviewers that is organised and facilitated by the QPO. Comments included:

- *'I understand they feed into and inform quality reviews'*
- *'Standardization of data collected cross-programs and Schools/Faculties will facilitate analysis and improve clarity in capturing and measuring outputs in the quality promotion space.'*

- *'The data in the PPR (and consequently the APR) form the basis of the program information and assessment which replace the School quality review, and the Schools are then reviewed within a Faculty review.'*
- *'The APR will feed into the PPR which will form part of the Self Assessment Report [SAR, the main document required for the internal review process].'*

In regard to the views of the Program Chairs currently involved in undertaking PPR, overall they could see the necessity for periodic review as it requires stepping back from the program on a regular basis with a critical eye, and reaffirming the original accreditation criteria and justification for the programs especially in regard to their sustainability. They explained, however, that it was not an easy process to obtain some of the statistical information from the business intelligence system, and they recommended that this should be a key area to focus on in the future to ensure that PPR is undertaken rigorously across the university. One interesting issue that arose was that of the PPR process in relation to programs jointly offered/delivered by two or more Schools/Faculties. In this particular School undertaking PPR, another School in the same Faculty provided some modules to the program, but in recent times, changes to assessment and other formats have resulted in a mismatch in some areas between the two Schools.

What the external reviewers are therefore examining is the programme based on the modules delivered within the context of the first School. A further issue that the program chairs identified, is the need for PPR external reviewers, if they are also already external examiners for a module or related programme in the usual University process, to be provided with a clear guidelines and terms of references for their role over the course of their external examiner appointment. One potential difficulty with this aspiration is the fact that the Schools / Faculties do not have the sole mandate to liaise with external examiners, as that role is also undertaken by the Registry, the academic administration office in DCU, in consultation with the program chair and others.

## CONCLUSION

Harvey and Green (1993, p.28) suggest: 'at best we should define as clearly as possible the criteria that each stakeholder uses when judging quality and for these competing views to be taken into account when assessments of quality are undertaken'. With the development of its PPR policy, DCU has clearly articulated the required criteria for periodic review, and has begun the process of implementation that will take place on a phased basis over the next five years, linking back with outcomes from annual program reviews and linking forward to the requirements for the seven year internal review process. The feedback from the external reviewers will make for interesting reading as it begins to be submitted, and it will also be necessary to ensure that Schools and Faculties consistently follow up on the information provided to ensure that the reviewers have confidence in the process, as well as for the benefit of the relevant programs and the students involved. It is also planned that further research on the development and implementation and implementation of the annual and five-yearly program review processes will be undertaken in order to track the overall process and subsequent progress within a scholarly context.

# THE MICRO LOANING INDUSTRY IN COLOMBIA: A MARKETING RESEARCH STUDY TO INTERPRET THE CONSUMER BEHAVIOR

Santiago García Carvajal, Universidad la Gran Colombia

## ABSTRACT

*The paper explores the importance of bringing a scientific approach to the Financial Marketing discipline based upon retail surveys and problem definition. Principal component analysis, hypothesis generation, and multidimensional scaling are used to determine market segments, interpret customer attitude, perception and behavior and finally profiling future clients.*

## INTRODUCTION

Microcredit industry in Colombia is defined as the set of credit operations with productive destination that is granted to the micro companies whose individual loaned amount does not exceed a 120 Monthly Legal Current Minimum Wage (MLCMW) margin. Micro companies are featured by having approximately (10) hard-working permanent employees and not exceeding total assets of 501(MLCMW). In Latin America the nature of the microfinance industry has not changed very much in the past 6 years. Approximately, 50% of the clients are attended by Non-Government Organization (NGO), another 25% by watched Commercial Financing Entities (CFE) and the remaining 25% by commercial banks.

The Financial Colombian sector has done important efforts to extend the level of coverage on its population through micro financing activities. In spite of these efforts, entities do not reach out to the number of clients they want to attend since their operation is limited by a credit laying valuation that impedes sustainability on minimal credit totals. Nevertheless the above obstacles, Both (CFE) and banks are still committed to the developing and designing of products and financial services that will lead to achieve major penetration of the microcredit industry by carrying out loans to sectors that could develop feasible projects and pay their obligations. The Government has played a very important role on developing the microcredit sector in Colombia, since it has understood the importance of offering financing opportunities to the Colombian micro entrepreneurs, therefore supporting the economic development of the country. Microcredit has been one of the outmost flagged programs of the current Government, hence the so called “Banking of the Opportunities” has served as an instrument to encourage its development, in conjunction with different actors of the financial traditional market such as banks and (CFE)s. By looking in prospective, high social commitment NGOs have supported the microcredit industry around the world, but the rules of the game compel these types of programs to be profitable. It turns out unviable for an NGO to support its social work when it only receives donations from the public.

The exercising of microcredit policies is costly, since its methodology demands a lot of fieldwork to capture clients, many of which are in the informality. On the other hand constant visits for a suitable follow up on the loans to assure good bank-client relationships are necessary to make up for the shortcoming of the information. The number of attendees can be important, but due to the low totals placed on credits, the margin is very moderate and, therefore, slightly profitably for the entities. In addition to that, considering that in Colombia a maximum ceiling of interest has remained frozen for the past two years, the microcredit operation becomes less profitable and, consequently, less attractive for new actors in the financial industry to engage. The main cost of this type of business is concentrated primarily, on the assessment of good future clients. Also high costs on billing systems development that

often include traveling to remote areas in the country to locate clients in overdue balance. This causes a great deal of investment for the bank on hiring and training field work representatives, implying a heavy burden on the on the state of final results at a microcredit program.

The laying of every microcredit loan must be accompanied by flexible guarantees that in some occasions can be very effective. Nevertheless, many of the financial entities must assume permanent losses after having realized low amount operation records. Microbusinesses are small production units that easily change their activity, place or have experienced reduction in payment capacity, working capital and in many cases family related issues that all together reduce chances of recovering from setbacks. These aspects of the business constitute the biggest risk in the operation and administration of the microcredit.

The principal challenge is turning microcredit into a sustainable operation. Therefore, eliminating restrictions to the valuation of interest rates (as it happens in many countries) should be a matter of research. So that micro financing reaches greater market penetration and hopefully, as long as regulation allows it, microcredit can displace individual money-changers that often times put entrepreneurs in cut throat situations. Another important challenge for financial entities is not only to concentrate on the microcredit, but to enhance business portfolio i.e. additional services to satisfy additional client needs.

(Insurances programmed saving accounts, money transfers etc.) It is necessary to determine market segments, designing products that look for a balance between what the clients need and what the financial entities need in order to administer credit risk. Differentiation is indispensable at an industry that calls very specific needs and has to be singled out from the banking industry to prevent the market from over indebtedness. The purpose of this paper is to introduce a Marketing tool that improves Micro loaning operations. The introduction makes an overview of the environment to bring the reader in prospective, the literature review attempts to establish differences in the definition of Microcredit to latter transfer those concepts into the interpretation of data collected from fieldwork. The Methodology explains the modeling of the data to determine market segments and future client prospection. The empirical results section establishes the size of market segments and hypothesis testing to explain consumer perception, attitude and behavior. Finally the conclusion section makes a contrast between the problem definition and research outcomes to end with future research ideas.

## LITERATURE REVIEW

Our intention, it is to analyze the profiles of the micro financial entities in Colombia from two principal approaches of the microfinance industry; 1. The approach of mitigation to the poverty based upon the banking Grameen model 2. The minimalist approach used by entities as the USAID or International Action. After reviewing the concepts and characteristics of the microfinance in Colombia at normative, financial and institutional level, and with regard to the approaches mentioned previously, we will characterize the entities in Colombia whose mission and principal activity are overtly the micro financial services. Therefore we, propose a categorization of the entities based on their proximity to one of the approaches. The microfinance is a set of financial tools that has different treatments nowadays, for this reason it is necessary to tackle it from a few basic definitions 1. The original vision named (poverty relief), widely represented by the microcredit summit and Yunus with his bank Grameen; 2. The (minimalist), vision represented by actors as the CGAP (Consultative Group to Assist the Poor), USAID (Agency of the United States for the International Development), ACTION International and the University of the State of Ohio among others.

Gómez and Peron, (2009) define the term microfinance as the “provision of financial services to persons of low incomes, particularly to the poor. Such services include small loans for commercial or personal use, deposits, money transferring, means of payment and insurance, among others”. According to Maple (2006) the term microfinance alludes to the rendering of financial services to persons or groups whose access to the traditional banking system is limited or nonexistent by virtue of their socioeconomic

condition. The previous financial services can be saving mechanisms, investment, or loans (microcredit), between others. On the other hand micro financing is the set of activities oriented to the rendering of financial and non-financial, complementary services designed to attend the population of scarce resources who have been excluded from the traditional financial system (young people or elders of low resources, unemployed or employed with precarious works, low skilled workers and micro businessmen), (Observatory of microfinance, 2012).

Microcredit is the essence of the Microfinance sector and it alludes to the rendering of saving services, payment, pension, loaning for housing, insurances, emergencies, and other loans, etc. Microcredit is tailored for persons of low incomes and for productive initiatives as the micro and small-scale enterprises. The Microcredit is one of the most important mechanisms that contribute to the small productive units, by gaining access to the financial services. All these small productive units need different financial sources ranging from the conventional ones to those that do not fulfill the requirements that traditional banks demand, that is to say the microcredit brings loans over to persons who previously did not have access to one. (Rosenberg, R. 2010). Marketing science seldom places an interest on individual idiosyncratic perceptions; it rather seeks to reach consensus upon perceived environment among various consumers.

Environment can influence affective-cognitive responses and behavior (Peter & Olson, 2008) for example; an individual can react to a new store layout and decide what type of behavior will lead to reach purchase objectives. Marketing analysts are interested to know how the consumer perceived the environment, sometimes called functional environment or perceived environment. Since every consumer has his or her own belief system, the perceived environment will be different for every consumer (Peter & Olson, 2008. page 256). Perceived customer's value is the apparent difference between the sums of advantages minus costs form a product offering compared to others (Kotler & Keller 2006, pag 141). From the entrepreneur's viewpoint, a marketing strategy is a conjoint of artificial stimuli applied to a consumer's environment designed to produce an effect on the affective-cognitive system and its behavior. Marketing strategies influence not only consumers but entrepreneurs as well.

The three elements to be explored to develop effective marketing strategies are: (1) Consumer's affective-cognitive system, the affective system means the effect of the environment on feelings and emotions, such as either acceptance or rejection towards products. The cognitive system refers to thoughts such as beliefs towards particular products. (2) Consumer's behavior refers to the ability to observe and measure consumer's physical actions. For example, Behaviors can be retail, internet shopping or credit card usage. (3) Consumer's environment refers to externalities that ultimately influence what they think, feel and do. This includes social stimuli in a culture, subculture, reference groups and families that influence consumer. Peter et al. (2008, 25) says; "Elements are connected one another by a two way arrow, called reciprocal system, meaning that an alteration on anyone of the elements can be the cause or effect of the alteration in one or more of the others" (p.25).

Constantin and Lush (1994) define operand resources as resources on which an operation or act is performed to produce an effect, and they compare operand resources with operant resources, which are employed to act on operand resources (and other operant resources). A goods-centered dominant logic considered operand resources primary. A firm (or nation) had factors of production (largely operand resources) and a technology (an operant resource), which had value to the extent that the firm could convert its operand resources into outputs at a low cost. Service-centered dominant logic perceives operant resources as primary, (Vargo & Lush, 2004) because they are the producers of effects. This shift in the primacy of resources has implications for how exchange processes, markets, and customers are perceived and approached. (See figure 1)

Figure 1: the Wheel of Consumer Analysis (WCA)

*Marketing strategy involves designing, execution and control of a plan to influence exchanges leading to achieve organizational objectives. Entrepreneurs are used to designing marketing strategies to increase the probability that consumers have thoughts and favorable feelings toward products, services and specific brands; testing them and repeat purchase. (Garcia, 2010)*

## DATA AND METHODOLOGY

The main purpose of collecting data was to confirm theoretical approaches about the industry. By September 2012, we conducted 304 research surveys in Bogota among low profile entrepreneurs such as pet shops, pastry shops, car shops, eateries, grocery shops, etc.

Figure 2: Example of Microcredit holder in Colombia

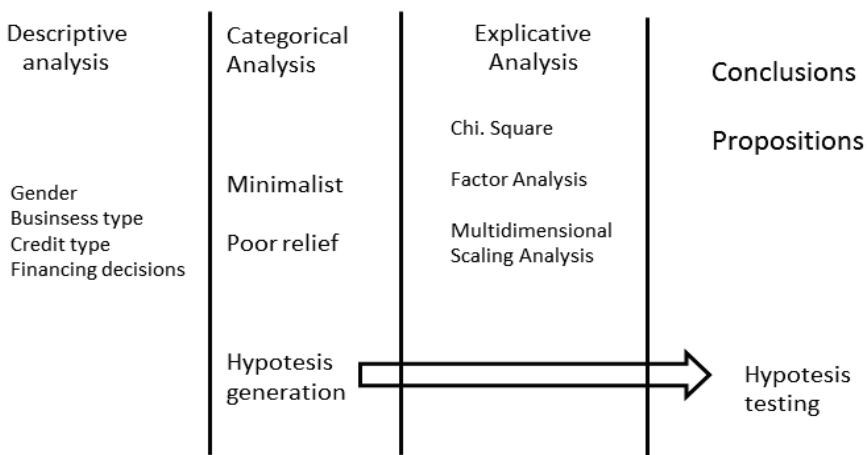

*The Micro credit entrepreneur include mostly human capital as opposed to intellectual or working capital, in the picture we can see a pastry shop, where the owner does most of the work.*

The research questionnaire was designed to produce descriptive analysis to sense the nature of the subject, including dichotomy questions, to gauge statistical significance among categories. The following part of the questionnaire included semantic scale questions, in order to measure (WCA) elements. i.e., Environment was measured as perceived entrepreneur's environment, hence questions about, adaptability to changing situations helped to determine how the entrepreneur interpreted his/her market to survive and compete. In order to explore the Affective-cognitive system, Attitude measurement and evaluations inferred a course of action based on environment assessment. Last, behavior was measured by asking the frequency or the number of times that certain course of action was engaged, this last measurement was oriented to explore overt behavior rather than intentional behavior.

The use of descriptive and explicative research combined, helped the testing of different working hypotheses along the way, so that the ending permitted an existing set of conclusions based upon opportunities to position new micro financing services and the contrasting of different case studies helped to propose customer profiling for different segments all together.

Figure: 3 Research Methodology in graphical prospective

*The above research design creates a mirror to mirror approach, to view the qualitative and quantitative analysis in a mutual understanding oriented to test literature based hypothesis with empirical based measurements of those hypothesis*

Figure 3 explains the main feature of this research design is the “perseverance and cohesiveness”, a different way to say reliability and accuracy. The research questionnaire intended to explore different types of micro loaning services, based on asking the entrepreneur about the type of credit they hold. Later data analysis categorized micro loaning by either Minimalist or Poor relief and run several statistical significance tests according to the grouping of all semantic, non-parametric based questions according to the grouping of those categories.

## EMPIRICAL RESULTS

Our first concern was to determine sample adequacy for every category, being Microcredit, Banking credit or no credit. The Barlet's sphericity test makes the comparison between every business category with that of the population to test weather or not there is a strong correlation between the sample matrix and the population by assessing its level of identity (Malhotra, 2008) The Kaiser Mayer Olkin (KMO) test for the four different categories show that Bank micro loaning has a sample adequacy value of 0.660, Minimalist 0.467, Bank loan 0.519 and no credit 7.00, All four categories reject the null hypothesis ( $p < 0.05$ ) of independence between the population and the sampled data. However (KMO) test, shows a value

below 0.5 on the Minimalist category which makes it unreliable to leave it as a separate category, therefore it was regrouped under the bank micro loaning one.

Cross tabulation provided statistical significance between credit categories and gender using the chi-square test being Phi (0.207) V Cramer (0.147) and  $p < 0.05$ , and so describing a clear tendency of women to engage in Micro loaning activities. By answering yes to the question ¿Would you increase your total microcredit approved amount to invest more in your business? They show a tendency to maintain longstanding relations with the bank. In order to bring the state of the art into prospective, questions belonging to every (WCA) element were summed to establish multiple comparisons by categories (Financing means vs WCA). Mean comparison ( $*0.05$ ) were established to observe differences in behavior between those with no credit and those using micro credit. Also differences in the affective and cognitive system between those with bank loan and no credit were observed. Factor analysis was performed based upon every business category to reduce the amount of data by grouping variables into factors that from the Marketing prospective can be viewed as market segments.

Figure 4: Factor Analysis Under Category Analysis

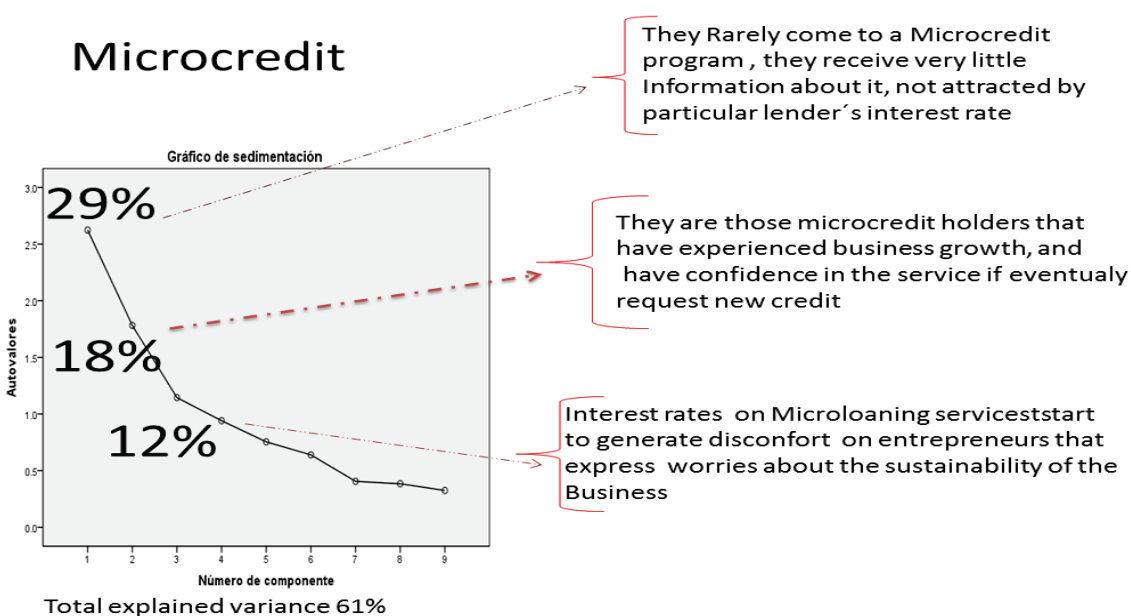

Figure 4, presents a data reduction analysis for the micro loaning category where 3 market segments appear to have importance. The largest segment (29%) provides a dominant logic for the micro loaning industry; entrepreneurs are talked into the service, they didn't know about it, they didn't want it, they engaged in the service due to sales work, but later on they find some benefit in the service, (18%) once they experience some working capital for the business, eventually maintain business relationships with the financial entity. Last, (12%) of the market find a heavy burden to bear in their business because of the interest rates charged on the service and eventually withdraw his or her account from the bank.

Figure 5: Multidimensional scaling for the Microcredit industry

Multidimensional scaling (MDS) is a set of statistical techniques often used in information visualization for exploring similarities or dissimilarities in data. MDS is a special case ordination. An MDS algorithm starts with matrix of item-item similarities, and then assigns a location to each item  $N$ -dimensional space, where  $N$  is specified a priori. For sufficiently small  $N$ , the resulting locations may be displayed in a graph 3-D visualization technique such as bubbles.

The use of multidimensional scaling in this project was based upon motivation. It was imperative to identify the latent variables underneath the variables that all combined provided the most intentional behavior to engage in a microcredit activity. A semantic scale table was presented to the interviewee on the following variables: Low interest rates, greater totals approved, Long term credit, fixed payments, Subsidies, savings fund with dividends, Insurances, fund transfers. Based on proximities on the data we defined the following latent variables to interpret the perceptual mapping on figure 5. Trust: It is a conduct based structure of energy generation and delivery in the entrepreneur's environment. Working Capital: It is the entrepreneur's capacity to carry out his or her activities with normality in the short term. This can be calculated from the assets that remain in relation to the short term debits. Permanence: It is the determination of the microbusiness man to react to changes in the environment to preserve and improve an offer in the market.

## CONCLUSIONS

Conclusions can be drawn from a set of alternative hypothesis generation, once null hypothesis have been rejected: Ha1: Minimalist category, in sample data is not present in the population. That means the entrepreneur does not perceive a great difference between an ordinary bank loan and Microcredit loaning. Ha2: Microcredit industry is more appealing to the female market. Single mothers in search of opportunities and low savings to begin hands on business ideas are a very likeable segment for the micro loaning in Colombia. Ha3: The non-banking loaning industry has a very bad reputation, and the entrepreneur wants to stay away from that; to the point it becomes a motivator to engage in Microcredit activities. 45% of the sampled data shows no banking activity, which provides room for further market penetration. As far as (WCA) Ha4: Lowering interest rates could be an effective artificial stimuli to begin a credit processing activity tailored to recapitalize existing projects Ha5: Those entrepreneurs marginal to the banking industry may feel attracted to open bank accounts based on the dislike of private money loaners and motivated by low interest rates in the banking industry. Ha6: Entrepreneurs show no personal initiative to research microfinancing options but when prompted shows acceptance to engage in Microloaning activities. Factor analysis portrays a natural adoption curve of the microfinance industry.

The early majority was evangelized about the product, then those who experienced the benefit of microcredit want to keep the service and eventually increase their total amount loaned but the late majority experience the burden of debit accounts based on interest rates and eventually talks his or her way out of the program. The multidimensional scaling combined with factor analysis is very useful to interpret underlying variables to foresee future behaviors. Also by interpreting the dimensions on figure 5 we not only see the current perceptual mapping with the blue bubbles but we can also graph the negative or the opposite to the actual perception with the white bubbles. So opportunities for positioning new concepts or services can be observed, for the micro entrepreneurs we can see a great opportunity to develop a service that can be kept on a long standing basis to provide just enough working capital that helps maintain the business and develop long term relationships with the financial industry.

# ECONOMIC GOALS RANKING APPROACH IN COMPARATIVE ANALYSIS OF ECONOMIC SYSTEMS

Alexander Katkov, Johnson & Wales University

## ABSTRACT

*Three main economic systems that have coexisted during last 100 years: pure market, pure command, and mixed economies, have the same mission: to satisfy unlimited human needs and wants using the set of limited economic resources. Each of them is pursuing the same major economic goals: economic efficiency, economic growth, economic stability, economic equality and economic self-sufficiency. But these systems are very different. One reason why they are different, as I think, is the difference in the priorities and ranking order of these five major economic goals. This ranking order is different for every system. As the result, each system has established the different economic structure and has determined the different role for the government, and has used the different strategy for the functioning and the economic development. In this paper I will compare the correlation of the perceived priorities in the economic goals ranking orders of selected countries of the world: USA, China, Russia and Costa Rica, with ranking orders of so called “pure” market, “pure” command, and “ideal” mixed economies using the Kendall rank correlation coefficient as the instrument of the measurement of correlation between “ideal” orders and perceived real orders of economic goals.*

**JEL:** P5, P51, C40

**KEYWORDS:** Economic Systems, Comparative Analysis, Ranking Approach

## INTRODUCTION

Each economic system has the same mission: to satisfy peoples' unlimited needs and wants using limited economic resources. But there are important differences between all of them in systems' structures determined by the difference in the property rights, and in methods of organization of processes of manufacturing and distribution of products and services among people. As I discussed in my earlier publication (Katkov, 2012) the identity of economic systems' missions defines the identity of the list of major economic goals. But priorities of those goals realization would be different for every economic system. As result, each system will design and use the different strategy for the functioning and the development. So, if we would be able to find the tool that will allow us to compare the ranking orders of those economic goals for every economic system we would be able to establish the “ideal” ranking orders to each one of them. Using those “ideal” orders as “standards” we would be able to find the correlation of the recent goals ranking order for any country with those standards and to make some conclusions about this country developmental strategy.

## METHODOLOGY

Every country has its own order in the prioritization of economic goals. We can measure the differences between the “ideal” order and the particular order as it build on the basis of the observation of the economic policies of this country. To measure those differences we can use the idea of ranking correlation. The ranking correlation approach has been developed by the British mathematician Maurice Kendall. We can take the determined order of economic goals for the given country and compare it with the “ideal” order. The received coefficient of correlation can be closer to the “ideal” ranking order of the pure market or pure command economy. The hypothesis used in this case was very simple: than closer

Kendall tau ranks correlation coefficient value to the market economy's economic goals ranking order than more market and freedom of choice options left for the private sector. But if the correlation coefficient value is closer to the command economy's economic goals ranking order than this economy has a very substantial government's involvement into economic matters. (Katkov, 2012) According to Herve Abdi (2007) when we are comparing two ordered sets we should look at the number of different pairs between two sets which allow us to get something which is called the "symmetric difference distance" between two sets.

$$\tau = 1 - \frac{2 \times [d_{\Delta}(\mathcal{P}_1, \mathcal{P}_2)]}{N(N-1)}$$

Where the symmetric difference distance between two sets of ordered pairs  $\mathcal{P}_1$  and  $\mathcal{P}_2$  is presented as  $d_{\Delta}(\mathcal{P}_1, \mathcal{P}_2)$ .  $N$  is number of ranked objects (goals), in our case  $N = 4$ . Kendall coefficient can have values between -1 and +1:  $-1 \leq \tau \leq +1$  where -1 is the largest possible distance and +1 is the smallest one. The Kendall coefficient  $\tau$  can be interpreted as the difference between the probability to have goals in the same order and the probability that they are in the different order:

$$\tau = P(\text{same}) - P(\text{different}).$$

We used the Kendall tau rank correlation coefficient between two ordered sets for selected leading economies: USA, China, Germany, Japan and Russia. The result of that analysis was published in 2012 (Katkov, 2012). Recently we came to the conclusion that selected list of major economic goals needed to be expanded. The obvious choice of the first additional goal is the goal that also is common for every economic system: the goal of the economic self-sustainability.

The goal of economic self-sustainability became the one of the leading economic goals for any country now when the problem of resources scarcity has been grown almost exponentially as the result of the population growth during the XX century from 1.65 billion people in 1900 to 7.1 billion now. The ability of each country to use own resources in the most efficient way and develop new technologies that will allow to increase the usage of renewable resources should be considered among the most important priorities of every country. The self-sustainability is the key of the future growth and also it is the factor of political stability and peace because the dependence of imported resources makes countries economically vulnerable and forces them to use the large share of their resource endowment on the development of the military sector and the military expeditions growing to wars.

The above mentioned order of goals ranking for all three main economic systems with the addition of the economic goal of self-sustainability will change. We understand that other economists can have different opinion both about the goals lists and about their "ideal" ranking and accept that. The purpose of this publication is to get some feedback from colleagues to see the future perspectives of presented approach. The new modified economic goals ranking orders for three economic systems are following: Pure market economy's goals ranking order is: *efficiency, growth, stability, equality, self-sustainability*. We placed the goal of sustainability to the last position because in XIX century most developed economy have expanded their resource bases either by acquiring neighboring territories (USA, Russia), or by taking the political and economic control over less developed countries converting them into colonies (Britain, France). The resource basis through this expansion will grow and the goal of the self-sustainability would be accomplished as the consequent effect of the economic expansion into new territories.

Pure command economy' goal ranking order would be different: *equality, stability, growth, self-sustainability, efficiency*. As we see, the goal of the self-sustainability has the low priority for this system

also. Soviet Union had probably the largest natural resources base in the world and had the third largest population after China and India. Because of the low standard of living the level of consumption could be satisfied by mostly local resources. Mixed economy's "ideal" ranking order of economic goals is the most debatable. One of the possible reasons would be in the permanent changes in the global economic environment that would affect the process of the prioritization of economic goals.

For example, during the phase of economic expansion the goal of economic stability should take the leading position because of the inflation that traditionally will be the consequence of the economic growth. At the same time during the recession phase the goal of economic growth should become the leading one. The suggested "ideal" order for the abstract mixed economy could be the following:

*efficiency, self-sustainability, equality, stability, growth*: The next step would be the development of economic goals ranking orders for selected countries. Our choice of countries for this paper is following: USA, China, Russia, and Costa Rica. To get the economic goals ranking orders for each country we should collect experts' opinions. After those opinions would be analyzed and summarized we can build these orders on the basis of the generalizations of those opinions. Because in our case we are discussing not the perfection of the ranking orders but the application of the ranking method we can build rankings orders based upon our own understanding of economic situation in each selected country.

USA: *stability, growth, efficiency, self-sustainability, equality*

China: *growth, stability, efficiency, equality, self-sustainability*

Russia: *stability, efficiency, self-sustainability, equality, growth*

Costa Rica: *self-sustainability, stability, efficiency, equality, growth*

Now we can find Kendall tau rank correlation coefficients for each country using the consequently as standards economic goals ranking orders for the pure market, the pure command, and the mixed economies. Let assign the following ranks to five main economic goals based upon our understanding their importance to the modern mixed economy: Efficiency – 1, Self-Sustainability – 2, Equality – 3, Stability – 4, Growth – 5. In this case the economic goals order for the mixed economy would be: [Efficiency, Self-Sustainability, Equality, Stability, Growth] with the ranking:  $\mathcal{R}_1 = [1, 2, 3, 4, 5]$ .

Respectfully the economic goals order the pure market economy would be: [Efficiency, Growth, Stability, Equality, Self-Sustainability] with the following ranking:  $\mathcal{R}_2 = [1, 5, 4, 3, 2]$ .

The economic goals order the pure command economy will look like: [Equality, Stability, Growth, Self-Sustainability, Efficiency] with the following ranking:  $\mathcal{R}_3 = [3, 4, 5, 2, 1]$ . When we are comparing two ordered sets we should look at the number of different pairs between two sets. It will allow us to get something which is called the "symmetric difference distance" between two sets.

$$\tau = 1 - \frac{2 \times [d_{\Delta}(\mathcal{P}_1, \mathcal{P}_2)]}{N(N-1)}$$

Where the symmetric difference distance between two sets of ordered pairs  $\mathcal{P}_1$  and  $\mathcal{P}_2$  is presented as  $d_{\Delta}(\mathcal{P}_1, \mathcal{P}_2)$ .  $N$  is number of ranked objects (goals), in our case  $N = 4$ . Kendall coefficient can have values between -1 and +1:  $-1 \leq \tau \leq +1$  where -1 is the largest possible distance and +1 is the smallest one. Knowing this coefficient we can conclude how close the particular country recent economic policy to the declared list of economic goals outlined by the new leader or the new government after he/she/it were elected and declared the own economic policy priorities. Those priorities can be ranked and this "ideal" declared rank order could be compared with the factual results of the prioritization of economic goals' realization after one, two and etc. years of the leader or the government administration. We also can use

this approach to illustrate the differences in economic goals priorities when discussing the different economic systems in the general Macroeconomics course or in special course on comparative economic systems. Each country traditionally formulates major economic goals and establishes the rank of their priorities. This rank can be compared with ranks that could be established for the particular standard that we are calling “the pure market”, “the pure command” and “the ideal mixed” economies. The results of this comparison are shown below.

## RESULTS AND DISCUSSION

Table 1 Represents results of the computation of Kendall tau rank correlation coefficients for four countries: USA, China, Russia and Costa Rica.

Table 1: Kendall Coefficients of Rank Correlation of Economic Goals for Selected Countries

System/Country	USA	China	Russia	Costa Rica
Mixed Economy	-0.2	-0.6	0.4	0.4
Pure Market	0.2	0.6	0.4	0
Pure Command	-0.4	0	-0.2	-0.2

The interpretation of those coefficients is the separate task which is outside of this paper goal. But we can offer in this paper some very general conclusions that we can be made after the comparative analysis of coefficients for four selected countries. The table below that includes all coefficients shows that Russia and especially China are closer to the pure market economy than the USA and Costa Rica. It can be explained by the drastic structural changes in the Russian and Chinese economies during the last 25-30 years when both countries tried to build market economies as soon as possible. At the same time Chinese economy is a little closer to the former command approach than Russia because of the greater control of the national economy in the capital goods sector by the Chinese government. At the same time the Chinese economy shows the lowest correlation with “ideal” mixed economy because of the very high level of the dependence of the Chinese economic growth from the exported raw materials.

As the result of that the goal of self-sustainability which supposed to have one of the highest ranks for the modern “ideal” mixed economy from our point of view has the lowest priority for China now, so the Kendall tau coefficient of rank correlation shows the largest distance with the ideal order that could be interpreted as the largest difference with “idea” mixed economy. The great dependence of the U.S. economy from the imported energy resources also pushed the goal of the self-sufficiency for that country to the end of the goals priorities ranking and as the result the coefficient of rank correlation of economic goals with the “ideal” mixed economy is also negative.

## CONCLUSISON

The introduced in this paper approach of the comparative analysis of different economic systems and selected countries based upon the rank correlation of their economic goals can open from our point of view the discussion about the ability to compare directions of the economic development of any specific country with the declared directions of that development. We understand that the method itself could be improved, that orders of economic goals ranks should be built upon the opinions of experts' pools. We are looking for the constructive criticism that can stimulate the future improvement of that method and its possible expansion.

# EVOLUTION OF THE CONCEPT AND DEFINITION OF CORPORATE SOCIAL RESPONSIBILITY

Firuza S Madrakhimova, UONA

## ABSTRACT

*There is an impressive history associated with the evolution of the concept and definition of corporate social responsibility (CSR). In this article, the author traces the evolution of CSR beginning construction in 1950, which marks the modern era of CSR. Definitions expanded in the 1960s and spread in the 1970s. In 1980, there were fewer new definitions, more empirical research, and alternative themes began to mature. These alternative themes included corporate social performance (CSP), stakeholder theory, and the theory of business ethics. In the 1990s, CSR continues to serve as the basic design, but inferior or turns into alternative thematic framework.*

**KEYWORDS:** conceptual development, corporate social responsibility, history, organizational behavior, Society

## INTRODUCTIONS

*Article type:* Literature review. The concept of corporate social responsibility (CSR) has a long history associated with how this affects the behavior of organizations. In order to understand the impact of CSR on the organization of behavior, therefore, it is necessary to understand its development. Subsequently, the aim of this paper is to trace the evolution of concepts of CSR. Design / methodology / approach - paper review the literature and take a chronological structure organized by time basis. The results showed that CSR research constantly changed in the last 60 years. Findings - In 1950, the main focus was on the responsibility of business to society, and to do good for society. In the 1960s, key events, people and ideas have played an important role in characterizing the social changes ushered in during this decade. In the 1970s, business leaders on traditional management functions in matters of corporate social responsibility, while in 1980, the business and social interests of the company came closer and become more responsive to their members. In the 1990s, the idea of CSR has become almost universally accepted, CSR also has been associated with the strategy literature, and finally, in the 2000s, CSR has finally become an important strategic issue.

*Research limitations / implications:* The focus of this work on the study, which caused much of the original discourse on this issue, as it is difficult to cover all of the existing literature. In addition, the analysis of the conceptual evolution of CSR began with Bowen, although earlier references can be found. Originality / value - This paper provides information about conceptual evolution of CSR, as it moves to discuss the progress of CSR in the course of time, which attracted the attention of many researchers, and finally, it makes recommendations for further research.

## LITERATURE REVIEW

Starting from the 1950s in the world of scientific and business literature, especially the U.S., the problems of business and society is dedicated to many informative research materials, which offers concepts that can be associated with corporate social responsibility. Among them were the most popular ones that are tied to the definitions: the actual "corporate social responsibility", "Corporate Social Performance," "corporate social integrity." Consistently evolving, these concepts just replaced each other as accumulated the previous achievements. In the 1980s this series continued the concept of "business ethics", "corporate philanthropy", "corporate social policy", "and management of stakeholders." At the beginning of the XXI

century theories of "sustainable development", "corporate citizenship", "corporate sustainability", "corporate reputation" and "socially responsible investment", "Corporate Social Reporting", and others came along. [1] Obviously, the approach to such complex design by random selection of a concept fraught with not only theoretical fragmentation, but also making the most problems in the subject of political speculation imposed on business, separated from the process of its own development. Therefore approach of A. Kerolla - one of the world's leading experts in the field of business and society seems quite reasonable, because he combined a link to all above mentioned set of concepts to the development of the theory of corporate social responsibility as "core "main alternative concepts or transforming them.

[2] It appears that this approach allows to translate the issue of the common arguments about the role of business in social development to the analysis of a particular business enterprise, strictly speaking, is not necessarily related to the corporate sector. The first attempts to study of the issues of corporate social responsibility have taken place at the beginning of XX century. Hence, the beginning of a systematic scientific analysis was initiated in the first scientific paper by Bowen's "Social Responsibility of a businessman," published in 1953. [3] In this monograph were defined framework conditions and directions for further discussion on this topic. K. Davis first substantiated that the issue of social responsibility should be considered in the management context. He emphasized that this responsibility is related to the "business decisions and actions that are undertaken for reasons at least partly outside the scope of direct economic or technical interest companies", and "some socially responsible business decisions can be in the long-term, complex process of analysis are explained as a good time for the company long-term economic effect ". [4] In a paper published in 1975, C.

Davis and R. Blomström defined orientation of CSR as "the responsibility of decision-makers, to take actions that will not only meet their own interests, but also to the protection and enhancement of public wealth "[5]. Problem of the content was updated CSR J. McGuire, who pointed out that "the corporation has not only economic and legal obligations, but is also a certain social responsibility that goes beyond them" [6]. C. Networks, in turn, elaborated the content of CSR, stating that it "assumes elimination of corporate behavior to the level corresponding to the prevailing social norms, values and expectations" [7]. Based on the approaches J. McGuire and C. Network and trying to reconcile economic and social responsibility, A. Keroll proposed interpretation of CSR, means "the relevant economic, legal, ethical and discretionary expectations of the Society of the organization during this period". [8] That approach A. Kerolla, later embodied in the model of detailed, most prevalent, was largely determine the scope of current research in the field of CSR. CSR, in terms of A. Carroll, are public expectations for a particular organization in four different areas: economic, legal, ethical, philanthropic.

CSR model initially seemed to them like a pyramid, the base of which is economic responsibility. Economic responsibility for Carroll is a basic duty of the organization to carry out its functions in the market for the provision of services / products to society and profit. Legal responsibility is the need for the organization to exist in law and the legal field. Ethical responsibility implies the need to correlate the actions of firms with moral norms specific to a particular cultural environment. Philanthropic responsibility, per Carol is the highest point of the pyramid and the need to participate in social programs. [9]. Of course, the interpretation of CSR as a "pyramid" by itself does not eliminate all the issues related to social responsibility, but also allows them to organize. Subsequently, with the support of Pyramid, Carroll M. Schwartz transformed into three model of CSR. Where as the major types of responsibility were identified economic, legal and ethical. Ideally, any organization must combine all three areas, and the real level of CSR is a particular firm depends on variations of these combinations [10].

A more complete analysis of the formation and development of similar concepts, as well as attempts to systematize them are in the works of Carroll, J. M. van Marreviyka Windsor, R. Steuer, etc. In particular, A. Carroll, aware of the complexity and inconsistency of the genesis of the concept of social responsibility, set out to trace only the basic terminology changes over decades. So, 50 years of the last

century, they have been identified as the beginning of the modern era of social responsibility, the 60th - a period of deepening meaningful definitions of CSR, the 70th - the spread of a variety of definitions of CSR; 80 years have been a period characterized by decreasing the number of definitions, the growth of research and development of alternative existing. In this context interesting was the concept of corporate social responsibility, proposed by K. Davis. Analyzing works of many corporations, K. Davis and other researchers have found that social responsibility contributes to the development and increase the value of companies and, conversely, avoiding social responsibility reduces economic opportunities enterprises.

This will confirm that in the long run, those who do not use the available power in a direction that society considers responsible, has steadily lost this power. Early 90-ies of the last century has demonstrated the preservation of the concept of corporate social responsibility as "core" to the gradual transformation into alternative thematic framework. The above interpretation, reflecting the general logic of the concept of CSR, of course, do not exhaust the variety of approaches to the content of corporate social responsibility, considered in the management of world literature. All existing approaches X Johnson presented a continuum levels. [11] At one extreme are authors who say that the purpose of business is to increase profits or increase value for its shareholders, and the task of improving the public welfare as a whole should be addressed primarily by the government, non-profit and religious institutions.

The position of the school is most clearly represented in the classic article of Nobel laureate Milton Friedman, "Social responsibility of business is to increase its profits". [12] Milton Friedman, in particular, stresses that the company should focus on maximizing profits for shareholders, and managers who practice "social responsibility", in fact "stolen money from the owners" and invade the area, which lies outside their professional competence, at the other extreme - the authors who believe that the business has numerous social, civic and moral obligation towards the growth of the general welfare in a broad social contract. Thus representatives of each of the areas of use are equally normative argumentation (business, based on its nature, must, or, conversely, should not bear the "broad" social responsibility), instrumental reasoning ("narrow" or, alternatively, a "wide" social responsibility for the benefit of business) or a mixture of the argument. D. Windsor, generally agreeing with the theoretical definition of the "core", citing "economic concept of responsibility", "global corporate citizenship" and "stakeholder management" as the alternative. [13] M. van Marreviyk, Kotler, L. Nancy drew attention to the need for harmonization of corporate social responsibility "corporate sustainability". [14] R. Steuer, M. Langer, A. Conrad and A. Martinuzzi proposed a model that links the theoretical "core" of the concepts of "sustainable development", "corporate sustainability", "management of relationships with stakeholders". [15] According to the logic of the actors, the study of the genesis of the basic concept is possible in a broader context that includes alternative approaches, and thus allows us to consider it as a kind of "umbrella" concept (see Table 1).

It is important to note that the main promoter of the ideas of corporate social responsibility is the United Nations. Quite natural in this context is of course the draft agreement to comply with the World leading international corporations social responsibility. The project was hailed by UN Secretary General Kofi Annan at the World Economic Forum in Davos, December 31, 1999 It includes the following principles of corporate social responsibility.

Human rights. Commercial organizations should support and respect internationally recognized human rights, and not to be associated with human rights violations. Standards of work. Businesses must recognize the right of workers to form associations and bargain collectively, and to adhere to the following principles: the abolition of all forms of forced labor, the actual elimination of child labor, the abolition of all forms of discrimination in employment and vocational training. Ecology. The business community should be: to carry out preventive measures to avoid environmental problems, to carry out steps to a more responsible attitude to the environment, to promote the development and diffusion of technologies that reduce the negative impact on the environment.

Table 1: the Genesis of the Concept of Corporate Social Responsibility

The name of the concept	Authors	Basics
Corporate social responsibility	Bowen, 1953 Davis, 1960 Networks, 1975 Carroll, 1979	Ordered content of CSR, systematic level of normative
Corporate social responsiveness	Ackerman, 1973 Preston, Post, 1975 Frederick, 1978 Carroll, 1979	Corporate social susceptibility The capabilities of corporations to take social action
Corporate social performance	1975 Carroll, 1979 Vatika, Korhogo, 1985 Wood, 1991	A model of corporate social performance
Corporate social performance Management (concept) stakeholders	Freeman, 1984 Clarkson, 1985 Donaldson, Preston, 1995 Post, Preston and Sachs, 2002	Give a new definition of the corporation disclosed its relationship with stakeholders
Corporate Citizenship	Longsdon Wood, 2002	A model formed of corporations in relation to its stakeholders
Corporate Sustainability	Van Marreviyk, 2003 Steuer, 2005	The relation between social responsibility and corporate social problems of stability with agency problems

Anti-corruption. The business community should work against corruption in all existing forms, including bribery and extortion. Legal responsibilities. Legal responsibility should be aimed at improving the enforcement of the legal framework of the territory in which the company markets. Planetary (global) responsibility. Planetary responsibility implies voluntary compliance with international standards of social responsibility. Environmental Responsibility. Environmental responsibility is aimed at the formation of such social responsibility standards that combine harmonious relationship demands of consumers and society with the rational use of natural resources and competitive ways of business, effective management of the environment and public health from the production of environmentally friendly products, etc. Cultural and ethical responsibility. Cultural and ethical responsibilities of business requires not only compliance with the relevant territory the cultural and ethical traditions, but also the non-action that runs counter to existing norms of morality (the economic interests of corrupt lobbying practices, the use of double standards to employees or other stakeholders regardless of activity or the country, etc.). Philanthropic responsibility. Philanthropic responsibility should be directed to the support and development of the society and of the individual marginal groups through voluntary participation in social programs, including through social investment.

Even a cursory examination of foreign materials on CSR tends to suggest that now is an evolution and change of paradigm structure and development of business from shareholders - for a broad coalition of stakeholders. CSR is treated as a kind of self-regulation of business, integrated in the business model focus on the interests of stakeholders begins to adjust behaviors business. In this new paradigm can be seen a few blocks, we have just outlined. Bookmark ideology CSR architecture business model is manifested in the formation of a new understanding of "value" in the notions of "ethical production" and "ethical consumption", to participate in the business of CSR programs in the social networks of CSR, in constant collaboration with NGOs and other stakeholders, such as the licensing of the new parameters of the products and the business standards of CSR international NGOs, finally, there are strategic areas such as responsible investing. New parameters of corporate governance include new approaches to personnel management and human capital, stakeholder engagement, the emergence of concepts such as accountable governance, strategic cooperation in the management, along with the long-known organizational development appears organizational accountability, a new type of employees - managers of ethics (by the way already united internationally to his NGO - Association of Managers of the Ethics and Compliance), and finally, there are new areas: certification, verification of standards of CSR, and so on.

New options include marketing differentiation branding with new criteria and new interpretations of cost competitiveness in the field of climate impact (annually published a comparative analysis on the effect of

competition on the climate), the competitiveness of companies in the field compared to create "green" jobs, reduce hydrocarbon consumption and emissions CO in the atmosphere, "ethical consumerism" generates product certification and even certification companies that manufacture products for compliance with the principles and values of CSR. In corporate governance, the requirements for transparency and disclosure are new areas captured in new concepts and terms: social and environmental reporting, CSR reporting, an account of sustainability and so on.

# TOOL FOR ASSESSING CORPORATE SOCIAL RESPONSIBILITY

Firuz S Madrakhimova, UONA

## ABSTRACT

*Social reporting is seen as a tool to assess the social responsibility of Russian business. Analyzed the current state of non-financial reporting. Grouped key indicators necessary for the social report, provide an overview of the total contribution of socially responsible companies in the development of the country, to assess the value and effectiveness of social ties with external stakeholders, and identify key criteria to assess the overall level of CSR in the country.*

**KEYWORDS:** corporate Social Responsibility, Corporate Social Responsibility Report, Non-Financial Reporting, Social Responsibility, Stakeholders, Sustainable Development

## INTRODUCTION

The concept of sustainable development is reflected in the national strategies of many countries, including Russia. Sustainable development - is a form of society in which the needs of the present generation are met without compromising the potential to have the same benefits in the future. Sustainable development requires a systematic approach to the interaction of economic, social and ecological processes in the country, leading to the gradual socialization of the economy. [1] Therefore, the vector of modern business development should be oriented towards social partnership, ie the company's motion to achieve their purposes, and not contradicting the global trend towards sustainability and, if possible, as assisting with public interest objectives. Consequently, the Corporate Social Responsibility (CSR) can be seen as a form of organizational behavior, which reflects the contribution of business to sustainable development.

The process of socialization of the economy is the reason that many Russian companies, particularly large, not only became actively involved in social activities, but have already started to fix it in the form of corporate social reporting. [2] The increase in the number of Russian companies providing social reporting, further stimulated by strengthening their ties with foreign counterparts who have social accountability is an everyday practice. Thus, Russia is expanding the use of a civilized social activity assessment tool companies. The broad understanding of corporate social (non-financial) report - a public document, by which the company shall inform all stakeholders (shareholders, employees, governments, partners and the public) about how the company implements its objectives laid down in the Strategic Plan, for economic sustainability, social and economic well-being in society and environmental sustainability. Thus, the social report allows companies not only to provide full information on their priority social programs, but also to bring it to the attention of a wide range of interested parties in the company, so it is a communication tool for social responsibility.

Today there's no single approach to defining social accountability and its principles do not, but there are a number of authoritative techniques examination of which can make a very balanced view on the issue. Thus, the World Business Council (WBCSD) on Sustainable Development calls social reporting voluntary presentation of information on the social, economic and environmental performance over a certain period of the company, standardized according to one of the systems of indicators and provided publicly available to all interested parties. The concept of "Corporate Social Reporting" - mostly Russian term. In international practice, the other is used - corporate sustainability reporting (literally - "corporate reporting in the field of sustainable development"). The concept and format of reporting, its ideology and prospects are closely linked to the concept implemented corporate social responsibility (CSR).

CSR origins date back to the trade union movement, which originated in the XIX century in the U.S. and Europe and had the strong political connotations. In the XX century the CSR agenda has been the stability of production, which threatened to strike movement, and stability of business needing serene picture of its future relationship with the community. For some time the idea of social responsibility opposed ideology of classical liberalism. However, the development of the information age dramatically increased the value of intangible assets. As a result of Milton Friedman's famous thesis that "the only responsibility of business - it is making a profit," conceptually transformed.

Today, according to the classical definition of the European Commission, corporate social responsibility is a concept that reflects the company's voluntary decision to participate in the improvement of society and the environment. This movement towards the business community, of course, is valuable in that it is expression of good will. However, some countries have made corporate social responsibility and accountability in the public and highly effective instrument of public policy. The relevant legislation already exists in Denmark, Sweden, Norway, Holland, France, Great Britain, the Government of Canada is working in this direction.

In many countries, the government's position to stimulate and support the process of reporting to a large extent determines its cycle and content. State law may encourage reporting, rigidly defining its terms, or leave the whole process of social reporting at the Company's discretion and be limited to recommendations. At the reporting cycle is also influenced by information capabilities of each organization. In Russia, most corporations tries their hand, releasing the first report on the results of several years of activity - from two (the most common option) to five. Further period of decline, and the company starts to yearly to social reporting. This trend is characteristic of international practice. The annual reporting cycle is the most optimal in terms of flexibility policy of engagement with stakeholders. Social reporting allows you to: provide a comprehensive public economic, environmental and social performance of companies, producing in these three areas, to conduct a dialogue with all stakeholders, identify their estimates and expectations, to prevent possible charges, get a competitive advantage, build trust of employees, shareholder, partners, customers, local communities, government agencies, the media, create a basis for the development strategy of the company. [3]

Today's business world has increased requirements for transparency of business, the notion of responsibility and accountability to the public. Many companies have realized that more successfully conduct business, functioning only in the isolated areas, they simply can't. For the development of openness to stakeholders and key partners was established area of social accountability. The first non-financial reports, according to foreign experts, have been made by European companies in the 70's. Over the past 30 years the number of non-financial reports in different industries and countries has increased significantly. According to a recent study audit firm KPMG, in 2005, of the 250 largest corporations in the world, more than half (52%) were presented to society and its social reports. In Russia, the beginning of the active phase of the non-financial reporting refers to 2000-2001. The indicators are much more modest: in 2002, only 2 companies presented its social reporting, in 2003 - 5, 2005 - 22, and at the end of 2008 - 66 companies, among which "Gazprom", Lukoil, Shell, TNK -BP, RAO "UES of Russia", "Sibneft", "Rusal", "Norilsk Nickel", etc. to production companies gradually began to join and financial institutions: a pioneer in the preparation of corporate social reporting format GRI G3 in the Russian market has become FC "URALSIB". [4]. This indicates a gradual understanding of the business that the social report is an important element of the corporate non-financial risk management and increase efficiency and competitiveness.

First principles for social reports were developed in the West. Investment funds the U.S. and UK in the 80's, when forming their portfolios began to consider the level of social responsibility of issuers of securities. There are stocks to invest in socially oriented organizations. Most often mentioned in Russian practice four international standards: Account Ability AA 1000; GRI (Global Reporting Initiative); ISO 14000 (International Standards Organization); SA 8000, designed by Social Accountability International.

These metrics and associated today with the concept of "international standards of corporate social responsibility." Meanwhile, there is a large number of alternatives: less known in Russia, but is actively developing a comprehensive approach to dealing with performance indicators (such as the balanced scorecard business evaluation of Balanced Scorecard Institute), initiatives based on the sectorial approach (the principles of sustainable business practices for companies agro IFOAM), the national initiative to create a balanced system of non-financial reporting.

The world-famous design institute Account Ability - standard AA 1000 - appeared as a national initiative of Great Britain. Similar popularity similar project of the Canadian Institute (CICA) and released its guidance on the analysis and discussion of management (Management Discussion and Analysis guidance, or MD & A). All of the above system of standards, in principle, move to a mutual agreement with the subsequent unification. Be interpenetration of knowledge and practice in this area. It is this development of the relations of the two developers are already showing leadership now standard - AA 1000 and Guidelines GRI (the next generation of economic indicators GRI developed with the participation of senior analyst Account Ability). This trend is typical of industry initiatives. Folding system is such that the most open standards tend to generalize a highly specialized, integrating them into its performance. For example, GRI produces industry-specific applications, which are the quintessence of the leaders reporting initiatives in each industry. This gives the opportunity to get acquainted with the experience of companies that have used in their reporting standards, limited by industry or geography.

Last year, the Russian Union of Industrialists and Entrepreneurs (RSPP), a National Register of corporate non-financial reports, most of which are prepared in accordance with the guidance of GRI. But it is important not only to make a report, but to bring it to all stakeholders. Often the effect expected by the business with the information available, not met expectations. Is directly associated with the perception of the information provided by various stakeholder groups. Most often such a situation arises either as a result of what information channels used by, for some groups of stakeholders are irrelevant, or because of the low level of confidence in any channel of information. In addition to shareholder and government users of social reporting are:

*The investment community, which includes not only the investors and investment funds, and credit rating agencies, stock exchanges, investment banks, and a wide range of investment analysts and experts; Employees, labor organizations;*

### Consumers

*Self-regulatory organization included in the "area" of the company: the association of employers, unions and business associations and employers, professional associations (such as the Union of Insurers), consumer associations, etc.;*

*Other stakeholders (actors, who themselves have an impact on the company, and those who are subject to significant influence on her part), such as environmental organizations, local governments, suppliers and contractors, etc.;*

International organizations, establishing various ethical and other business practices or addressing the convergence of such standards in different countries. The main channels of information about the contribution of business to society are the press releases to the media, corporate web sites, presentations and public speaking executives, corporate publishing company, specialized websites. All of the above information sources can be used as tools to assess the CSR, but the most important are the social reports, available on the corporate web site and published in the form of brochures and booklets.

Thus, the information stored in the corporate social report, and it is accessible to all interested parties

(stakeholders), is not only one of the criteria for a comprehensive assessment of CSR, but also an indicator of its maturity. Please be aware that the content of social reporting companies varies depending on the priorities of each company in the social, economic and environmental spheres. However, the following areas are common to all company programs [5]:

staff development - estimated amount of funds allocated for training and development of staff, the provision of social benefits and bonuses, etc., protection of health and safety at work - is the amount of funds allocated by the labor protection and safety, medical service employees in the company, to support mothers and children and to maintain hygiene and ergonomic working conditions, etc.; socially responsible restructuring - is determined by the amount of funds allocated by the re-training of employees, promoting employment of redundant employees for severance pay, etc., environmental management and resource - indicators are the amount of funds allocated by the organization of environmentally friendly production, the construction of sewage treatment plants, reduction of environmental impacts and the like; development of the local community - the end point of allocated funds directed to programs and actions to support vulnerable people, children and young people, to support the housing and communal services and objects of cultural and historical significance to the sponsorship of local cultural, educational and sporting facilities and events, and to participate in charity events. Sound business practice - indicators are the amount of funds allocated by the training of business partners and other interested parties in the organization, conduct programs to promote small businesses to publish information about the organization to all interested parties in the organization.

In Russia, widespread in use have international standards of compilation, evaluation and verification of reporting, such as Account Ability 1000, Guide to Sustainable Development Reporting (GRI) and the International Standard for Assurance 3000 (ISAE 3000). The analysis of the information provided in Social Report, to evaluate the level of development of CSR in the country on the following criteria: the essential understanding of CSR (the Russian business understands social responsibility) in general and the particular implementation of the Russian concept of corporate social responsibility, transparency and reliability of the information provided; nature of the relationship and the form of interaction with all stakeholders, the total contribution of business to solve social problems of the society, the direction and orientation of social programs and projects of the company, and stimulating the expansion of CSR. Main results from the introduction of the preparation of non-financial corporations in the following statements:

*Improved ratings, particularly its corporate governance, which in turn helps to attract debt capital for the company;*

*To assist in building an international reputation and a successful IPO on Western stock exchanges, as well as involvement as shareholders of institutional investors (such as pension funds, mutual funds, etc.);*

*The ability to attract cheaper and "long" loans (for example, obtaining loans from banks, following "Equator Principles", is impossible without assessing the level of environmental responsibility);*

*Increasing investor interest in not only the company, but also directly to the management, which uses non-financial reporting has demonstrated the quality of their corporate governance, corporate sustainability, high non-financial risk management and the ability to communicate effectively with stakeholders;*

*Increase the degree of confidence in the company's relationships with stakeholders, which helps to prevent potential threats and conflicts with stakeholders. "*

One major focus of the organization on the development of social accountability is its evaluation and

verification of an external independent auditor. And audience provides the company with a guarantee of a third party that the information published in the report are true and reflect an objective picture of reality. The auditor also confirms that the results obtained in the course of preparing the report, will be introduced and used in the further practice social responsibility. Undoubtedly, any effort of rating companies on corporate reporting unaudited bring PR-response, but the potential of corporate social reporting much more. The strategic goal of the Russian leaders are not the corporate reporting dividends from PR-actions, and the transition to a balanced weighted indexing stability of companies and their social and economic potential. Audit ratings - only a step on the way to the ratings exchange.

They, having strong enough factual basis and reputational weight, able to implant the idea that the statements in the company should be informative and open. Organizations should be interested in reporting, to see it as a tool of investment policy and pledge of their own sustainable development and prosperity. It should be noted that in the world the key factor in the decision to implement the social reporting process is its impact on profits. Companies have long been convinced that if corporate social responsibility is given due attention, loyalty to the company and the company's products is markedly increased. Back in 1999, the U.S. Think Tank Conference Board led evidence that the companies that implement the concept of social responsibility, the return on investment of 9.8 percent higher than that of ignoring its competitors, with assets of more revenue by 3.55 percent, and profit - by 63.5 percent.

Indexing of intangible assets is already an integral part of transactions, the leading rating agencies impose its own set of services in the rankings of social responsibility. According to the Social Investment Fund, the U.S. decision to invest every eight dollar affects it is the level of social responsibility of the company. Russia has already embarked on the path of social responsibility, according to which it will go on and on. In this case the driving force is exactly statements as values, vision and goals of responsibility as an integral part of Russia in the traditions of philanthropy, is now lost. Thus, in the near future will be the formation and establishment of the most important components of CSR. Russian business has already shared the foreign colleagues of the need for a balanced and coherent social policy and training of social reporting as an effective tool for engaging with stakeholders and increase capitalization.

This means that Russian companies will explore and develop this tool. The bigger business than multilateral and diversified its impact on society, the more important the independent evaluation of the information provided in the statements. Necessary to think about the experience of foreign colleagues and to create centers of its effective application, it will support the overall positive trend in the first place to revive the values of CSR. Social reporting large company should be in accordance with the world standards and requires a mandatory independent audit, because her performance had a significant impact on the capitalization of the brand and are an indicator of the Company's appeal.

At the moment the system of training of social reporting while not common in Russia, not only owing to the small business interest in problems of reporting, but also because of the lack of experience of the unit and specialists. Professionals need to grow in this area, including through the development of targeted educational programs on CSR. Will greatly assist the process of formation and development of social responsibility in Russia endorsement and support by the state. This may require company locomotives, work out a methodology for CSR in the Russian practice.

## CONCLUSION

Most likely, in the next five years in Russia will not be legally binding provision enshrined companies corporate social reporting. The most important task for Russian business in the next five to ten years will be a qualitative study of international standards and turn them into an effective instrument of dialogue with the world. More remote possibility could be to introduce a national strategy for the implementation of corporate social responsibility and the development of a centralized national reporting standard in

Russia. But there is another important aspect of the implementation of social responsibility and the presentation of the results - this is the real possibility of working for the benefit of society and to contribute to the formation of values and the development of a civil state.

## ABSTRACT

Corporate philanthropy is the act of corporations donating a portion of their profits or resources to various non-profit organizations. The function of corporate giving can be handled directly by the corporation or through a company foundation. The most common resource that corporations donate is cash; however, corporations also donate the use of their corporate facilities; property (such as used computers, buildings or land); gifts of products, services and equipment; advertising support; executive loans; and many corporations have employee volunteer groups that donate their time. Corporations give to a wide variety of nonprofit organizations, which include education, the arts, human services, health, the environment, public benefit and many others.

**KEYWORDS:** Corporate Philanthropy, charity, donations.

## LITERATURE REVIEW

The concept of corporate giving dates to the turn of the century and the rise of the modern corporation. In its early decades, corporate philanthropy was uneven in practice, limited in scope, and subject to legal and populist dispute. Since World War II, however, the debate has shifted from whether or not to give to how much to give, and most major corporations now engage in regularized giving programs. (Useem, 1987, p.340) It was accepted for the wealthy to spend their money on philanthropy in the late 19th and early 20th centuries; however, it was harder for corporate philanthropy to legitimize itself (Himmelstein, 1997, p.15). Most felt that corporations had an obligation to maximize profits for their shareholders and that was their only duty; some economists still feel this way. Roosevelt's 1936 tax act was the first time that corporations were permitted to deduct charitable contributions up to 5% of pretax profit from their federal income taxes. Prior to 1936, donations typically had to be a legitimate business expense; there had to be a direct benefit to the business or the employees. After 1936, more leeway was given to corporate giving; however, giving was still tied to direct benefit, and there was still a great deal of ambiguity as to what qualified. Another reform that intended to encourage corporate giving came in 1981 when the amount of charitable contributions that corporations could deduct increased from 5% to 10%.

One of the most obvious and most difficult questions concerning corporate giving is why they give. For many "corporate giving raised the distinct issue of whether or not the managers of corporations may donate money not belonging to them personally but to shareholders" (Himmelstein, 1997, p.16). Another theory as to why corporations give is that it is their civic duty to do so. Per James Joseph "Some businesspeople argue that businesses are corporate citizens, with rights and duties of citizenship. Some even argue that the corporate charter makes corporations trustees of the public good" (Shannon, 1991, p.9). This puts forth the idea that corporations should be doing more than simply making a profit: that they should be good corporate citizens.

## Findings

The main idea of the corporate charity of this period was that it was "from the heart", and does not focus on getting any specific preferences. Many experts were of the opinion that if the charitable activities of the company make a profit or other benefit, such activities should not be considered a charitable activity, and should be viewed solely as a commercial business. But in the 80's there are the first attempts to

combine social views on corporate philanthropy, in particular, its relation to the overall objectives of the company. Currently, companies are beginning treated charity as "enlightened self-interest."

### Research Limitations / Implications

One of the first manifestations of social responsibility, rooted in the deep past, can be regarded as charity, which being a form of compensation for the shortcomings of redistribution of public goods. Business community understands of social responsibility as a society to compensate for the uneven distribution of income. Many entrepreneurs agree that even if a high income is the result of efforts of individuals, they do not care to be "share" with the public. Originally charity was partial, since decisions on the provision of charity care was taken in the main owners of the businesses. Currently, however, a corporate charity is growing, implementing and managing on behalf of the companies. One of the first known cases of official legitimization of corporate philanthropy in the United States took place in 1954.

Prior to that time, such activities are carried out by separate individuals, not companies, which due to several reasons, such as - the legal limit. During the 60's and 70's of the twentieth century, corporate philanthropy has been recognized as a separate component of companies. During this period, it was thought that the best for business organizations is to provide charitable contributions, directing them to improve the overall social development. This involved donations to universities, local hospitals, cultural institutions and the support of other community service affairs. It was at this time began to actively create the first corporate funds companies. The key point, which is the basis of this concept is the belief that the charity will not digging a "quick" profits, and long-term benefits: consider and direct and indirect consequences of any actions for a long period, is also expected impact solutions to important partners and their expected reaction. The second postulate: a healthy company can not survive in a sick society, and companies that use part of their resources to solve social problems, ensure its survival in the future. There are several stages in the development of understanding of the purpose and form of charity.

One-time donation "on demand" (also called haphazard or sporadic charity), or targeted support. This is a donation of a socially disadvantaged or sponsorship in the social significance of the event. Time assistance is spontaneous and brings the "noisy" result. Keep in mind that the effect is not long-lived, as is spontaneous and sporadic. Depends on the nature of the event or of the beneficiaries and of the functions of the agency. This is the beginning of almost all companies, but with the professionalism in matters of charity shifted to other, more systemic forms. However, direct support to those in need and assistance to victims of emergencies remain in the arsenal of many charities and are used in cases where other means are not applicable. Philanthropy share (also called Socio significant shares). Activities or projects initiated by the company or person is among the founders of the event. In contrast to the one-time donation charity event involves an idea, for which it is carried out, for example, to help participants WWII Victory Day, greening the city, etc. There may be significantly expanded range of recipients of assistance and the range of participants. K it can join and other interested parties that can complement it with their capabilities.

As for the other partners, in almost many program partners include government agencies, or they are held in their support Software charity. The charity program is different from charity, or one-time donations, above all, the presence of management tools: typically, in any program must be defined goals and objectives, expected to score the result (partly in order to correlate these results with the goals, in part - to assess cost-effectiveness). The software is designed to structure charitable donations and sponsorship contributions, give charity organization mission, a clear understanding of the management and employees of the company. The transition from single actions to programs extends the planning horizon of charitable activities, as well as to deal with more serious problems that require time and money. Charity program can be in various forms, including the issuance of grants, activities or events, organization of training and exchanges, research, new techniques, etc. If there are a number of programs the company may decide to set up their own charitable foundation, will be shared professional commercial and professional charity.

4. Infrastructure charity. With the development of various social organizations, charity found its "infrastructure": there were various foundations and non-profit organizations (HKO), specializing in specific topics and have their own programs that can finance a business, or offering your services as a charity administrator (typically and grant) program of companies. Thus, companies were able to give their charitable programs for outsourcing, and if the partner is correct, to achieve a more professional and meaningful results. Today 70% of Russian companies participate in charitable activities (in the United States in this field only 2% of companies involved and in Europe - 4%), 87% of corporations declare their intention to develop a charitable direction [1].

In Russian practice charities often defined as any fact allocation or transfer of goods, non-commercial activities of the organization. This includes helping the seniors and businesses, and financial assistance, please outsiders, and free services to their employees. In this role, charity functions as compensation for vulnerable people, and not a tool to influence the future of the state of society. In developed countries, as a rule, there is a good corporate planning charity, set priorities, evaluation criteria. The Corporation in accordance with the priorities of the data, transfer money to profit organizations or specialized charities. This is where charity is not only an act of satisfying one's feelings, wishes, in the form of ownership of the "good cause" and "selfish" investment.

Thus, charitable activity falls within the definition of social investment, which (according to Western economic concepts) is defined as investment for profit or gain power and prestige. In other words, charity is one way of increasing the reputational capital. Charity is different from other types of activity that it is a mutually beneficial partnership. In fact, it is a joint project or program that meets the mutual interests. Public interest entities are clear - they receive funds for realization of his ideas, and list the help of a powerful company, its name and reputation. Companies are involved in similar projects for the following reasons. First, it provides additional opportunities in advertising their activities, products or services.

From this point of view, charity is part of an integrated marketing communications, one of the marketing strategies. The second reason for the company's participation in social programs is just the creation of a favorable image in the eyes of the general public. The experience of foreign companies shows that the functioning of the organization with a clearly defined social charity to allow the company to obtain the following results: improving the company's image in the local and national levels, coverage in the media, improving relationships with investors, the association with high quality and prestigious company, attracting new customers, attracting new employees, more sales, strengthening our position in the market, improving the in-house relationships, and so on. [2]

Among the benefits of charity can be identified as:

- Charity is a tool focused on compassion and care, which by itself implies generosity of such activities;
- Charity bears no apparent commercial painting (or rather hides it well);
- Charity companies are usually non-profit and socially important areas;
- Charity particularly flexible in the approach to the individual goals and needs of different target audiences.

The practice of using the tool shows that by selecting the scope and object of charity, makes a significant step in the formation of a positive image. However, to further develop the success must also take a lot of effort, including overcome the prejudice of society, distorted understanding the real meaning of charity, fulfillment of moral obligations to the community - not only the positive effects of such activities of companies. Big Russian companies support many projects that are not directly related to the principal of their activities. Many of them do not have a clearly articulated policy of support for non-core projects. As a result, charity involves with all other blends, including external and social costs. For comparison, in

developed countries, the adoption rate of the company's spending on charity does not exceed 1-2% of the profits. In this case, these costs do fall on corporate philanthropy - in the framework of the adopted in the company policy and priorities. Russian companies also bear the excessive burden of social costs, inherited or received "a gift" from the local and federal authorities.

A 2006 study conducted by the Association of Managers, found that among the main incentives of business participation in social initiatives, most large employers surveyed, highlights: the administrative burden of the authorities (73%) or good will of top management (55%). Among the most common types of cost are marked: capital investment in repairs boarding schools, children's homes, clubs, roads, and the construction of churches of various denominations, support sports teams and sporting events, the purchase of sports equipment, support for festivals, competitions, clubs, exhibitions, theaters, direct assistance to the individuals, gifts to veterans and orphans. [3]

Just five to seven years ago corporate charity was not on the agenda of any Russian company or representative office of foreign firms operating in Russia. It is clear why: the last decade of the last century in corporate history was occupied mostly tough section of the market, privatization, asset accumulation, incorporation, mergers and acquisitions. Talk about the charity at this time once again did not have (and reasons associated with haphazard distribution of funds were dubious) - the company was just not up to it. Practice shows that the issue of charity companies or corporate philanthropy "embedded" in corporate governance at a later stage of development and consolidation. Be perfectly accurate, they are addressed in the last turn - is once up and running all the other business processes, there is a clear development strategy there is a reasonable expectation of profit, confidence in the future. But with all this we must pay tribute anonymous donors of the corporate world, "artisanal" charity (one-time, in no way ordered stock) existed for all that difficult for the Russian economy and society of time, starting from the moment of the first private enterprises, not even designed to as legal entities.

Surprising is the fact that the culture of philanthropy in Russia existed before the formation of the USSR. Patronage involved many merchants and traders, putting their money into the arts, culture and education. With the advent of the Soviet charity was forgotten and reborn only in the nineties of the last century, when it started to be felt blowing west, where among successful people was fixed trend transfer funds to a worthy cause to increase its credibility. But this was not the only reason, because in the U.S., the most favorable conditions for charity: The companies do not pay tax on the amount of donations, and earlier does allow lower income tax. And, apparently, under the influence of the American experience in Russia in the mid-nineties, began to develop a way of saving money in the guise of civic impulse. In 1995, Russia adopted the Federal Law № 135 "On Charity and Charitable Organizations", which referred to the ability of organizations, businesses, and citizens to provide financial assistance to those in need and to receive benefits for these actions.

The law was far imperfect, and this by many educated people in matters of taxation. [4]. In the early 2000s, the government began to deal with this state of affairs as a result of the abolition of many benefits for donors. If, before a period of directing up to 5 percent of their income to charity, deduct as a whole, this legislation establishes that the donation firms and organizations can only occur at the expense of net profit. The Ministry of Finance has decided that the companies providing charitable activities through the provision of free services or delivery of goods are exempt from VAT, but payments to the state treasury is not reduced. In order to avoid the transfer of funds through bogus charities against government charity was introduced double taxation. According to the Tax Code of the Russian Federation donation recipients have to pay income tax, but people can avoid it if they get the grant in the field of education, science, culture and art of one of the seventy-two organizations included in the list, which was mentioned earlier.

World experience shows that full protection from financial fraud and abuse, including in the field of charity, does not exist. But now, in Russia it is necessary to overcome the negative tone that has emerged

as an echo precisely the period. And despite public alertness, Russian companies, common sense and pragmatic, yet currently developing its charitable programs.

Over the last five to seven years, corporate philanthropy discourse has undergone significant qualitative changes. First of all, the concept of "charity" was clearly separate from the "sponsorship" that we should not take for granted the statute. Then, from 2001-2003, the Russian practice were "imported" the concept of "corporate social responsibility (KCO)», «Corporate Citizenship", "Code of Ethics" ("code of good practice") that define a common framework for business and charities as part of the overall business strategy. To business in a new important questions arose: should the company public anything other than taxes paid, in what is voluntary participation in charity, how to charity programs for maximum effect, what amounts should be calculated, what the role of the state in promoting the development of charity, to which it should spend corporate funds - and many other questions to fill charity new content.

The modern practice of CSR in Russia as a whole retains its charitable focus, but it becomes more strategic in terms of own business interests of companies. So, first of all, to consider the interests of companies in the policy retention, expansion into new markets and enhance reputation, the underlying trend is reflected in the use of the skills and expertise of the staff, along with the traditional forms of charity. Company programs are increasingly used as a tool to establish relations with the authorities, suppliers and consumers. A growing trend links between the characteristics of individual industries and social investment (for example, aimed at reducing greenhouse gas emissions).

Today large companies in Russia, social and welfare programs are a significant part of their corporate strategy, as no company can be isolated from the society and work only for the benefit of its shareholders. Active in the community, to create the conditions for its prosperity, the company thus creates the conditions for its own long-term success. Charity work is one of the major social policies for many companies. The charitable activities of Russian companies is the need to overcome many obstacles, firstly, the low reputation and a bad image of charitable organizations, and secondly, the indifferent attitude of the state and inflexible to charitable organizations, and thirdly, the high taxes that must be paid not only donor, but the recipient. [5] The main difference relating to corporate philanthropy, between Russia and the West is in the area of taxation. In Russia, the company donates to various social projects, there are no benefits, ie All programs are paid out of net profits. However, the lack of tax benefits, apparently, is not the main problem. The big problem is the lack of infrastructure charity, professional partners among non-profit organizations in the region. Another problem of Russian charity is a very low level of activity of individuals. [6] The reason for this in a rather low awareness of the citizens of the state and the media about the charitable activities of the company, a negative image of the charity as a whole, the loss of traditions, spiritual emptiness and indifference of the considerable mass of the population. All of this should be attributed to the relatively low efficiency of services of public relations.

In modern Russia, charitable organizations do not trust since many of them, especially in the early to mid-1990s. Became actively created and actually be used for tax evasion, and money to the Foundation, often spent inappropriately. Today the situation has changed for the better, but public opinion has not changed. But while the company - philanthropists are trying to reverse the attitude of the society the state does not promote it. Pressure, it is often local and federal authorities in the company in order to get them to donate to certain things and the organization has been around for a long time. Social responsibility of business - an attribute developed corporate structure that is interested in the strict implementation of the requirements and standards of tax, labor, environmental law, to maintain a flexible and balanced relations between staff and owners, investing in human capital and the reproduction of having clear development strategy. Therefore really ensure social responsibility that can only business that external pressure to invest in social programs, in fact, are not charities, and seems to individual researchers - theoreticians and practitioners - in business. Thus, charity characterizes qualitatively higher stage in the development of businesses. In the U.S., most of the funds from corporations to social projects come from non-profit

organizations. These funds come mainly from companies directly (about 75% of cases) or through a legally independent company funds created by, for example, large companies for the selection of recipients and allocation of resources.

Nonprofit sector, "digest" coming charity has enormous size. The contribution of the nonprofit sector in the U.S. economy in 1997 was the third largest after the retail and wholesale trade to almost \$ 350 billion, far outpacing the banking sector and high technology. From 1993 to 1998, the non-profit sector grew by 2% faster than the entire U.S. economy, and given the fact that since the mid 90's public support of many social benefits was reduced by 18%, the role of this sector will continue to grow. Charitable activity of Russian business today is more of a "return" character - in most cases the initiative in the request for assistance comes from individuals and organizations in need. Enterprising charities business practices occur less often. Now obvious serious infrastructure deficiencies in charitable activities associated with not regulated communications business and NGOs, their mutual incomprehension.

And, often misunderstanding between businesses and NGOs is manifested not in the course of charity, but at the stage of establishing relationships or altogether composed correspondence (51% of businesses today do not have the experience of interaction with NGOs). This once again proves the relevance of this problem of the institutional environment in charitable activities as the establishment of a developed system of communication and information exchange between business and NGOs. Today many companies do not see the ways in which it would be possible effectively with NGOs and NPOs see "odd man out" unnecessary link in the chain of interactions between benefactor and beneficiary. In addition, the commercial sector, there are concerns of control and misuse of funds that go to a charitable assistance through NGO channels. In turn, many NGOs have a low charitable activity and unresponsive business, distrust of commercial companies to NGOs.

Established to date in Russia practice of charity business structures are though very active, but sporadic, haphazard, "point" character, lack of planning and are not aimed at a comprehensive solution of the problems. Therefore, estimates business representatives, NGOs and beneficiaries themselves effective charity although positive, but very reserved. The problems addressed by the charity today are solved, the general view in the main only partially. Among the reasons for the effectiveness of the charity business, there is objective and insurmountable circumstances. These include, above all, the lack of a significant part of the business structures of funds to carry out charitable activities, the lack of tradition, experience, and professionalism in providing the necessary support for the charity.

At the same time, there are a number of barriers related to institutional and infrastructural features in the organization of charity. These include, first, the imperfection relevant legal framework, lack of legal provisions in the laws of the federal and regional levels. The existing taxation "eats" a significant portion of the funds going to the charity, which was emphasized in the survey not only the representatives of business organizations and NGOs, but especially the beneficiaries. Considerably complicate the implementation of charity as excessive bureaucracy, the complexity of the procedures and their financial clearance. According to various studies, the Corporation sent mainly in three sectors: Social programs, arts and culture, science and education. Most often the objects of charitable support from commercial companies are organizations and agencies working with poorly protected sections of the population. This is, first of all: children's homes and shelters; nursing homes, public organization of veterans and the disabled, youth and children's groups, medical institutions, which have a lack of funding from the local budget and other sources of resources. Decision to provide charitable assistance to commercial companies is accepted in most cases on the basis of citizens and organizations in need of support themselves from businesses charity initiative came at a substantially lower.

Treatment by the NCB is the basis for the provision of charity care companies only in 5% of cases. The most popular and convenient for businesses form of charity is the direct financial assistance.

Those companies that are engaged in trade and procurement activities (markets, recreation, shopping, etc.), using natural forms of support for those in need, such as food. Such forms of charity, as the provision of professional services, vehicles, facilities, information support used commercial organizations is rare, because, first, these services are not in demand, and secondly, it is more convenient to businesses to support directly the money. Representatives of the Russian business community, identify "problem field" region, where their charitable activities would be relevant and effective, especially with focus on vulnerable groups. And such layers are not only groups traditionally identified as vulnerable (disabled, orphans), but also young families, students, etc.

Company with extensive experience in the implementation of charitable activities generally match the direction of the support of the company's strategy and take into account the most problematic area for themselves. Thus, the tobacco companies are supporting sporting events, car companies - environmental programs, companies in the field of high technologies - advanced research and development. As a rule, a charitable activity is concentrated in the area where the business is located. This is entirely consistent with the concept of the public about the right strategy of social activity: 59% of U.S. consumers believe that businesses should decide

social problems in the region, and 26% believe that, nationally, only 9% - in the international. An important trend in recent years has been the formalization of the mechanisms for selecting recipients. From more recent common situation where the decision on the choice made by the head of the object support on the basis of personal preferences, companies are moving to transparent selection criteria for support. Through the creation of independent corporate actors involved in charity work and is working on a clear regulation, sensation disappears bias, released-time leaders. In the emerging corporate philanthropy in Russia the company is certainly not act spontaneously. On the one hand, they take into account the interests of society, on the other - trying to benefit itself. If a business is considering charity as part of their strategy in the concept of KCO, it will identify and support the most effective projects.

The continued success of companies in the field of corporate philanthropy, strengthen public confidence in charitable projects by the business, of which its chief can: creating an enabling environment, including investment for entrepreneurs, the growth of transparency and information openness, support for culture of charity on the part of the media; It should be noted that most of the companies involved in charitable projects mainstream units, and most often it is for them a kind of social work. This fact leads to the cold attitude of managers to the process of implementation of such projects - and, as a rule, their rather low efficiency. Even when it comes to quite a logical part in the realization of local, charitable projects, departments and public relations, here there are problems. These units are usually trying to solve, the project is also the best of their functional tasks, forgetting the main thing - to continuously interact with the media. As a result of the charity is not in mass media because they do not see this as a significant cause of information. And to ensure that the media saw this importance, public relations department to identify and publicly declare: a clearly stated goal of charity; successful and completed projects, which would be the hallmark of the philanthropist, clear and transparent reporting to specific actions and figures.

## CONCLUSION

Over the long history of corporate philanthropy and the phenomenon itself, and attitudes on the part of stakeholders and society, and the forms in which it is carried out, many times have changed. Let's start with the fact that the charity is generally not directly related to the main economic activity of the company. This explains the contradictory attitude to charity on the part of the business community. Focused exclusively on the profit of the company believe that business should not spend money on non-core (and also difficult to analyze in terms of the final result) activity. Others take the position "to live in society and be free from society can not." Corporate responsibility attempted to provide answers to the

basic questions: What is this, and how it fits into the business goals. However, given that no one has by figures show a beneficial effect on the charity business in this part of the argument is not very convincing. Some progress in the economic justification of corporate philanthropy exists due to the appearance of social investment ideas. Russian companies prefer to help especially the elderly, orphans, the disabled, single mothers, large families, and support programs against drug abuse and AIDS, environmental projects, the organization of care for seriously ill, programs for the rehabilitation and education of young people. [7] Some companies provide to help, not money, have their services. [8]

# PERFORMANCE AUDIT IN BUDGETARY ENTITIES

Tatiana Antipova, Institute of Certified Specialists

## ABSTRACT

*Public sector all over the world is now facing the challenge of demonstrating better performance in managing budgetary resources. Performance audit seeks to answer how effective budget funding to spend on public sector organisations. In this paper, we consider performance audit as part of the government audit. In Russia the analogue of the government audit is the state financial control. All control procedures of state financial control in Russia are performed by inspectors, not auditors. Based on data from current official documents, other secondary information available as well as a survey of inspectors, we describe and analyze several tensions revealed in the course of performance audit in a public sector organization. The paper acquaints the reader with practice auditing in the public sector. Research materials for this paper came from various public sector organizations which audited of the Accounts Chamber and Federal Service of Financial and Budgetary Oversight (Rosfinnadzor). In the paper the scheme of performance audit in a public sector organisations are presented. Problem situations, order of reflection and the control of operations in practice of performance audit are considered. The method of performance audit, coordinated to system of key performance indicators of public sector is offered.*

**KEYWORDS:** Budgetary entities, performance audit, key performance indicators, public sector.

## INTRODUCTION

Public sector all over the world is now facing the challenge of demonstrating better performance in managing budgetary resources. Taxpayers of all countries need to know where the money is spent, they pay out of pocket to the budget. If the budget presentation or audit report doesn't respond to the citizens' interests, they are not going to pay attention, but their lack of interest doesn't justify poor content. Admiraal M. (2009) points: «Public sector users are especially interested in nonfinancial information, which reflects the results and effects of government policy. Therefore, the reliability and relevance of this information are highly important». We need to go from the telephone directory or accounting model of budgeting to a political model of accountability that builds public trust. In addition, only budgets that are accountable and transparent have a chance of reducing political corruption, which flourishes in the shadows. This study is important because it increases the awareness of foreign researchers and investors about the unique problems and dynamic issues facing performance audit in a transition economy such as Russia. In particular, it sheds light on the process through which people's democracy evolves and the interaction between the development of democratic politics and government auditing.

The research have based on studying of Annual Reports of Accounts Chamber and Rosfinnadzor for period 2005 - 2011. Also a large number of official documents relevant to this study have been collected and analysed. More than 100 conclusions of Russian state financial control were analysed such a result own author's 6-years experience as a Rosfinnadzor's inspector (1999-2005) and as a trainer of professional public sector accountants and inspectors. The informal discussions with participants of seminars on improvement inspectors' professional skills have been used as the data for the analysis as well. The discussions took place in 13 groups (373 inspectors) from all over Russia, where the author had lead training seminars for the certificates relating to the improvement of professional skills 2005 - 2011. The semi-structured interviews with open-ended questions provided free-flowing discussions with participants of the seminars were very useful because they represent attempts to capture the views of participants of the seminars in their "natural settings".

### Performance Audit In Public Sector "As Is"

In Russia the analogue of the government audit is the state financial control in spite of the fact that the terminology of that control process is not approved by law and in different laws is referred to differently. But in the Budget Code, the basic law regulating the budget process in Russia, the term 'state financial control' is used, although there is not a definition for this concept. This term is does not defines neither who in the government or banks has the power to control budgeting issues, what the order of control is. There are no common standards by state level. All control procedures of state financial control in Russia are performed by inspectors, not auditors. State financial control is leading two main bodies at state level: the Accounts Chamber of the Russian Federation (hereinafter – Accounts Chamber) and Federal Service of Financial and Budgetary Oversight (hereinafter – Rosfinnadzor). Accounts Chamber is the authority of the legislature, and Rosfinnadzor - executive branch of government. The structure of these bodies is different. Accounts Chamber has no branches or subsidiaries in the Russian Federation. This organization is located in Moscow in the own large buildings while Rosfinnadzor does not have its own building. The Rosfinnadzor's main office in Moscow and regional offices have rented space from other organizations. Rosfinnadzor has 78 regional offices in the Russian Federation. Actually, they both checked the federal budget, which they themselves feed. This is a kind of a "self-contained machine."

Accordingly, performance audit is lead only by Accounts Chamber inspectors. In Rosfinnadzor's activity performance audit is not required. Although, Rosfinnadzor has leading some elements of performance audit. For instance, they have incriminated financial mistake (failures) such inefficient using of budgetary funds. It is going on according to Russian Budget Code, where is written: *'The principle of effectiveness and efficiency of the budget means that the budget management of the budget process within the established budgetary authority they should proceed from the need to achieve the desired results with the least amount of money, or get the best results using a certain amount of budget funds'* (Budget Code of Russian Federation, art. 34.) The total sum of inefficient using of budgetary funds for fiscal year is formed by addition of all similarly failures that recorded in inspector's conclusion. Figures of this are really expressive. The structure of failures easiest to analyze from Rosfinnadzor annual reports because Accounts Chamber does not show it. The ratio between total failures mentioned in Table 1 and inefficient using of budgetary funds (money and material resources, [www.rosfinnadzor.ru](http://www.rosfinnadzor.ru)) in period 2005-2011 is presented in the follow table (see Table 2)

Table 1: Percentage of Inefficient Use Budget Money and Material Resources, Revealed Rosfinnadzor For The Fiscal Year, Mln USD

Fiscal Year	The sum of detected failures Rosfinnadzor for fiscal year	Sum of Inefficient use budget money and material resources	Col.3/ Col.2, %
2005	5866	358	6,10
2006	7312	309	4,23
2007	8897	223	2,51
2008	16877	643	3,81
2009	42666	no data	
2010	25399	587	2,31
2011	16220	1451	8,95
2005	5866	358	6,10

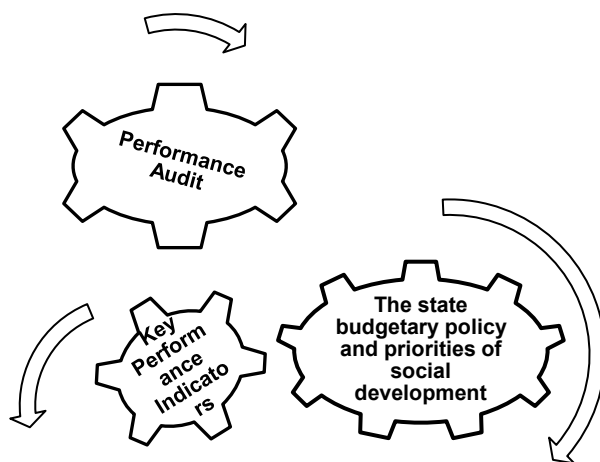

Thus, according to figures of table 2, the ratios of inefficient using of budgetary funds to the total sum of detected failures are from 2 to 9 %. In other words, we can see that element of performance audit (defining of inefficient using of budgetary fund) is just a part of state financial control in Russia.

## METHODOLOGY

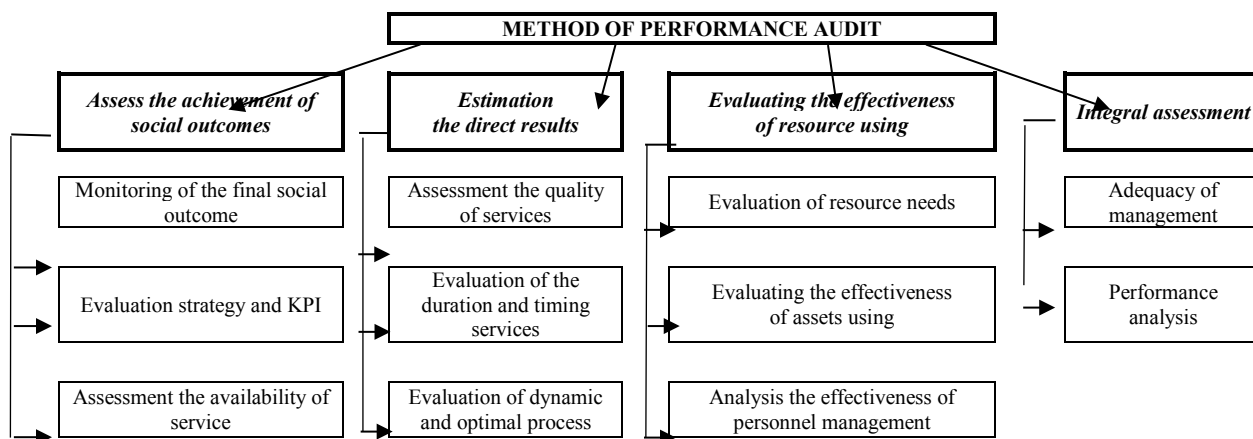

The most important part of the process of performance audit is the determination of its methodology. There is currently no methodology of performance audit at Russian federal level. At the control of public sector organizations' efficiency it is necessary to consider, firstly, conformity of the received result of the laid down social and economic aims, and also degree of this conformity; secondly, as object in view achievement is connected with level of the organisation of process of activity; and thirdly, as object in view achievement is connected with certain volumes of use of resources which are desirable for optimizing. The system of public sector organizations' KPI should be entered in model of an estimation of efficiency. The author's model of an estimation of efficiency allows to co-ordinate the purposes and priorities of the state budgetary policy, an evaluation of public sector organizations' activity and a performance audit methodology (see Figure 1).

Figure 1: Chart Flow

We propose a scheme of performance audit methodology (Antipova T. (2008a), p. 246), as shown in Figure 2. The main procedures of performance audit methodology should be linked to key strategic directions and corresponded to chart flow shown in Figure. 1.

Figure 2: Chart Show of Performance Audit Methods

In case the limitation of paper's volume, we do not represent the description of methodology.

## DISCUSSION AND CONCLUSIONS

Russian performance audit in the public sector has experienced reforms when new redaction of Budget Code was introduced. These reforms were inspired by “non-local” for Russia ideas found in different international auditing standards and promoted by international organizations through different cooperative projects with the Russian federal government. The reforms were supposed to bring changes to Russian public sector making it more transparent, efficient and accountable though unveiling power of performance audit in illuminating use of public sectors resources. In this process, the practicing inspectors were supposed to play along. However, after many years of reforms, Russia is still earlier in the stage of modernization of performance auditing practice.

Based on the state-of-the-art of performance audit in Russia, we can draw the following conclusions. In Russia there is a need to create a system of the terminology and methodology of the performance audit as part of state financial control. This system should be reflected in a complex of laws and the standards regulating control activity. Thus standards' provision must be fit current practical needs. In addition, this standard must be changed to improve readability, clarity of wording to ensure transparency of the actual movement of the budget and accountability of the federal government. The methodology of state financial control should be continuously improved. Technologies are constantly evolving, developing new programs. Taking into consideration the current situation the methodologies of state financial control should be updated and adapted in accordance with changing conditions of the control environment. Production of reliable financial statements should be viewed as a byproduct of effective business processes and financial management systems. The main goal is to improve the financial management system so that the financial information from these systems can be used to control the institutions more effectively and efficiently, day-to-day. Operating a well-designed an integrated financial management system will significantly reduce the cost and amount of financial reporting.

Each public sector organisation must be have own strategy and system of KPIs. All indicators must be correlated to the perspective in cause are also representative from a strategic viewpoint. Once the strategy and KPIs are seized, the public sector organization must then identify its crucial competences, essential to the development and the improvement of the processes relative to its strategic success. And then performance audit must to make an evaluation the amount of achievement these KPIs. Increasing meaning of performance audit linked to key strategic directions and key performance indicators. As it seems, reformers have not paid much attention to the role of professional inspectors because the role of “auditing curiosity” was marginal in the reform process. This means that auditing reforms cannot be fully materialized and translated into Russian public sector controlling practices until they are wholly known, sufficiently understood, and recognized by the organizational members.

# EVALUATION OF A FLIPPED CLASSROOM IN AN UNDERGRADUATE BUSINESS COURSE

Sandi Findlay-Thompson, Mount Saint Vincent University

Peter Mombourquette, Mount Saint Vincent University

## ABSTRACT

*This study examined the results of a flipped classroom trial conducted for Business 1112, an introductory business course at Mount Saint Vincent University in the Fall semester of 2012. Dr. Findlay-Thompson taught three sections of Business 1112 and used the flipped classroom style for one of the three sections and the traditional lecture-style teaching methodology for the other two. Post-term interviews were conducted with the students in the flipped classroom to gather information on their views of the learning environment in a flipped classroom. As well, a comparison of the quantitative results of the grades between the three sections was used to compare the academic outcomes between the two teaching methodologies. Student views on the flipped classroom were mixed and the academic outcomes were identical between the three classrooms. These findings are discussed in terms of how the flipped classroom teaching methodology needs to be implemented properly and whether or not it is an effective way to engage students in the learning process.*

**JEL:** A22, I21

**KEYWORDS:** Flipped Classroom, Effectiveness

## INTRODUCTION

Educators are continually challenged to find new strategies for engaging students in the classroom so as to increase the effectiveness of the learning process. A flipped classroom inverts the normal learning process. It “moves the lectures outside the classrooms and uses learning activities to move practice with concepts inside the classroom” (Strayer, 2012, p. 171). The use of technology is a key component in allowing lectures to be pre-recorded and made available to students outside of the classroom setting. The philosophy behind the flipped classroom teaching methodology is that it allows instructors to teach both content and process. Eric Mazur (2013), a professor of physics at Harvard University suggested that “Learning is a two-step process. First, you must have some transfer of information; second you must make sense of that information by connecting it to your own experiences and organizing the information in your brain” (Campus Technology, p. 34).

The flipped classroom is designed to create a classroom experience that inspires lifelong learning and meets the objectives of Mazur’s reference to a two-step process. Despite the recent accolades being extolled to the flipped classroom, there are also cautions about the need for both teachers and students to be properly trained in how to use and teach a flipped class. The remainder of this paper will review the relevant literature and how it integrates with the findings in this study. We will examine the data from actual results of a flipped classroom based on an experiment where the same professor taught an identical undergraduate business course to three sections using the flipped classroom methodology in one and traditional lecture-style teaching in the other two. The results will then be presented and the paper will close with some concluding comments.

## LITERATURE REVIEW

In 2008, Jonathan Bergmann and Aaron Sams, two chemistry teachers at Woodland Park High School in Colorado's Pike Peak, were finding it difficult to find the time to reteach lessons for absent students. They used their own money and bought software that allowed them to record lessons and they posted them online. The results were unexpected – they found that even students who had not missed class were watching the recordings because it helped them review and reinforce classroom lessons. This led to Bergmann and Sams rethinking how they used class time and the subsequent concept of a flipped classroom (Tucker, 2012). A flipped classroom is most commonly described as a reversed teaching model where the teacher uses various forms of technology such as videos to record the normal classroom lectures and students are required to view these recorded lectures outside the regularly scheduled classroom time. This allows for the homework portion, or other interactive activities, to be completed within the classroom setting. The intent is to create a more collaborative learning environment where students are focused on working through problems with both the guidance of their teachers and the support of their peers. According to Tucker (2012) teachers that use the flipped classroom model universally agree that viewing the recorded videos outside class time are not enough to make the model successful. Rather, it is how teachers integrate these instructional videos into an overall approach that makes the difference. Mark Frydenberg (2012) is a senior lecturer in computer information systems and involved with a company that produces software for the flipped classroom, CIS Sandbox.

He cautions that although the flipped classroom premise is very simple and it is an effective way to engage students in learning it is not a “one size fits all” model. On the teaching side, he suggests that many instructors find it difficult to put their egos aside as they make the shift from being the “sage on the stage” to becoming the “guide on the side” and that many “students need an incentive to watch videos at home just like they need to be motivated to read their textbooks and do their homework” (Frydenberg (2012). He also suggests that not all students have access to the same technology such as smart phones or laptops, especially at home, and points out that there could be a digital divide against the flipped classroom methodology. In schools where the flipped classroom has been used, the results appear to be positive. Carolyn Durley is a biology teacher at Okanagan Mission Secondary School in Kelowna, British Columbia, and adopted the flipped classroom in the 2011-2012 school year. She had noticed changes over the previous four years as to how students learned and recognized that she was losing her connection with them, something she had always relied upon in more than 20 years of teaching. She noted that students could get their biology from looking it up on YouTube or their phones and they “weren't buying into me spouting off – you know, the fountain of knowledge – anymore” (Pearson, 2012). She was not overly technology-savvy but realized she had to change and the flipped classroom gave her the ability to connect in what she considers an extremely powerful way.

She noted that the first time she used the flipped classroom there were struggles with her understanding of how to teach a flipped class and that the students were not ready to leap into a whole class of self-directed time. In her second semester, she structured the class differently, focusing in on the lessons learned from her first semester using the flipped classroom methodology. She has not yet measured academic progress by way of empirical data but feedback from students has been positive and she believes that her relationships with the students have strengthened. Durley stated that while empirical evidence is one way of measuring the effectiveness of the flipped classroom it can take many years of comparison to fully determine it from a quantitative approach. She concluded that there are many other benefits that although not measurable are positive signs that this particular pedagogical approach to teaching is effective.

Harvard university professor Eric Mazur was an early adopter of the flipped classroom model and states that “if you were to step into one of my classrooms, you'd think I was teaching a kindergarten class, not a physics class” (Demski, 2013). He insists that the pandemonium is a wonderful thing because students are actively engaging in the material rather than blindly sitting in a classroom and either ignoring or

writing down the words said by the professor. According to Chris Millet, assistant director of Education Technology Services at Penn State University the simplicity of technology allows the flipped classroom to be easily created. He states further “there are drop-dead simple technologies that keep the flow of idea generation and exchange moving inside the classroom to support active learning” (Demski, 2013, p. 33).

The academic literature is extremely limited on actual quantitative studies on the effectiveness of the flipped classroom. Three studies were found and are reported next. The first article was by Alvarez (2012) who reported on the students at Clintondale High School in Clinton Township, Michigan. In 2009, more than 50% of freshmen students failed English and school leaders had 736 discipline cases for 165 students. The school determined that a flipped classroom would offer students more time to prepare for class especially as many lived as far as 12 miles from the school and busing was not always reliable. A year after implementing the flipped classroom educators in the school saw the percentage of students failing fell from 52% to 19%; in math, a drop from 44% to 13%; in science, it declined from 41% to 19%; and in social studies, fewer than 10% of students failed, compared with nearly a third the previous year. The conclusions at Clintondale High School were that “the flip approach holds the golden key for students because educators can control and eliminate learning obstacles, and it allows teachers to give their best presentations and share resources” (Alvarez, 2012).

The second academic study was conducted by Jeremy Strayer (2012) on his own work with a flipped classroom. The research took place in two different introductory statistics classrooms taught by Strayer at an unidentified U.S. university. The typical student in his class was a middle-class white American from the Midwest. He structured one classroom to be a flipped and the other to be a traditional lecture-homework format. He did not compare the grade results between the two classes. Rather he used the College and University Classroom Environment Inventory (CUCEI) to assess the perceptions of the learning environment (both what they preferred and what they actually experienced). There were seven scale items, personalization, innovation, student cohesion, task orientation, cooperation, individualization, and equity. Students as a whole felt that their actual learning environment was not measuring up to their preferred environment. When comparing responses between students in the flipped class and students in the traditional class, students in the flipped class preferred an environment with greater Innovation and Cooperation but there was no evidence of a difference in preferences for the other scales.

The limitation of this study was that Strayer had control over final grades and he administered the test prior to the end of the semester. The third academic study was conducted by Ferreri and O'Connor (2013) on the redesign of a large self-care course previously delivered in a traditional lecture format to a small-group case-based course. The UNC Eshelman School of Pharmacy wanted to redesign a course to the flipped classroom style because application, analysis, and evaluation rather than knowledge of nonprescription products was the outcome required for the course. Instead of a content-delivery method which forced students to memorize information, they spent time gathering patient information and applying the information to patient self-care scenarios. To accommodate this shift in teaching style, classes were redesigned to a small-group discussion rather than a large lecture hall style course.

The results reported by Ferreri and O'Connor were that students in the smaller-class format reported a preference for working in teams and achieved significantly better academic grades with the new course format. There is always pedagogical debate by educators between content knowledge and skills acquisition. Although Jonathan Bergmann and Aaron Sams are often credited with formalizing the model and are successfully rolling out the flipped class model into the mainstream, the ideas behind flipping are not entirely new. The National Center for Academic Transformation (NCAT) has experimented with similar ideas over the past decade across a multitude of disciplines. Carol Twigg, NCATs president and CEO stated that redesigning courses offers an opportunity to reengage students and to improve their motivation but she dismisses pedagogical extremes by stating “If you don’t have basic math skills, you can’t do an interesting physics project” (Tucker, 2012).

There are other noted issues with the flipped classroom that limit some of the accolades it has received. Firstly, it has been argued that this type of teaching methodology could create a greater chasm between high-income and low-income students so it is only effective with a specific student population base. Secondly, not everyone has access to the internet especially in rural areas. Thirdly, schools generally have to have access to software that might be too costly and not a reality in educational budgets (Techsmith; Knewton). Fourthly, teachers have to be trained on how to use the software and how to properly structure a flipped classroom which is time consuming and requires a commitment on the part of the teacher. Finally, students must overcome their reliance on traditional classroom teaching and be willing to accept the responsibility for self-learning that comes with a flipped class.

## METHODOLOGY

Three sections of Business 1112, Introduction to Business Administration, were taught by Dr. Sandi Findlay-Thompson, an Assistant Professor at Mount Saint Vincent University and one of the co-authors of this paper, in the Fall 2012 semester. Section (01) was taught using the flipped classroom methodology and classes were held on Mondays and Wednesdays from 11:05 am – 12:20 pm. There were 30 students registered in this section and 28 were in the age category of 18-24 years. Section (02) was taught using a regular lecture-style methodology and classes were held on Mondays and Wednesdays from 3:05 – 4:20 pm. There were 42 students registered in this section and 37 were in the age category of 18-24 years. Section (05) was taught using a regular lecture-style methodology and classes were held on Tuesdays from 6:05 – 8:35 pm. There were 36 students registered in this section and 28 were in the age category of 18-24. Students were given the same course outline in each section including assignments, quizzes, and exams with identical weightings for each activity.

After the semester was completed and final grades had been published, students were interviewed relating to their experience in the flipped classroom. Case study interviews were deemed appropriate as Flyvbjerg (2006) and Zikmund (2003) agreed that case studies, specifically interviews with participants, are useful in gaining a better understanding of a phenomenon. Interviews also allow for the greatest depth and detail of information compared to other methods (Cooper & Schindler (1998). Further, Yin (1994) stated that case study interviews can provide insight into research problems, while Marshall and Rossman (1985) noted that interviewing was a better method of obtaining quality data. In this study, open-ended questions were used to inquire about the students' experience with a flipped classroom. Open-ended questions were used because they encourage respondents to answer freely (Zikmund, 2003), respond in their own words (Crano & Brewer, 2002), result in unanticipated answers (Zikmund, 2003), and often provide richer data compared to closed questions (Minichiello, Aroni, Timewell & Alexander, 1995).

While the general consensus among researchers was that there was no specific number of cases that should be used (Cooper & Schinder, 2001; Zikmund, 2003), some researchers have suggested upper and lower limits (Eisenhardt, 1989). Seven out of a potential 30 students were selected to be interviewed as the number fell between the range suggested by Eisenhardt (1989) and the results from this study will be considered and interpreted along with the students' final grades. The seven participants for the study were selected using a judgment sample. Cooper and Schindler (2001) and Tull and Hawkins (1997) both stated that judgment samples are appropriate for exploratory research. Furthermore, the researchers wanted to ensure participants had different academic backgrounds and the diversity in the classroom was represented in the sample. Flyvbjerg (2006) noted that this practice of judgment samples ensures a richer base of information for the researcher than random sampling.

The interviews ranged in length from 35-70 minutes and open-ended questions were recorded verbatim. The information from the interviews was then recorded using Excel spreadsheets to see patterns which

emerged in the research. Organizing data into sections with a matrix-like structure is acknowledged as a practical method for facilitating pattern matching of qualitative data (Yin 1994).

## RESULTS AND DISCUSSIONS

As noted above, the seven participants for the study were selected using a judgment sample. Table two shows the breakdown of type of student, number interviewed for each type of student, and the code used to represent the type of student.

Table 2: Students Interviewed

Type of Student	Number Interviewed	Coded
Traditional (direct from high school)	4	A,B,C,D
Mature	1	E
International (2 different countries)	2	F,G

*This table shows the number of students interviewed and the type of each student. They have been coded as Students A through G for discussion purposes in this study.*

Students were asked a number of questions including whether or not they would enroll in another flipped class if given the opportunity, allowing the researchers to gain insight into their opinion of a flipped classroom compared to a traditional classroom. Student's overall opinion on the flipped classroom was mixed. Students A, C, F and G spoke positively to somewhat positively about the experience and the opportunity to complete work normally assigned for homework in class. Student A stated: *"I enjoyed the flipped classroom. I liked going to class knowing I would get things accomplished which impacted my grades. I also enjoyed the convenience of accessing recorded lectures when I wanted to watch them."* Students F and G both felt the flipped classroom allowed them to access assistance from their professor enabling them to do better on assignments. The sentiment is perhaps best expressed by Student F who stated *"...it is easier to talk to your professor in the class. In other classes, we (students) sit and listen.*

*I do not like interrupting or asking questions. In our class, we could ask questions all the time. I did better because of this."* Students B and D, while offering some positive comments on aspects of the flipped classroom, such as the interaction with their peers and their professor, preferred a more traditional learning environment. Student B stated, *"I liked being able to interact with others in the room. I didn't like watching the videos at home and felt the lectures should be in the classroom."* Student D echoed this concern saying, *"... it (flipped classroom) seemed like more work. We had to watch the videos and do the work in class. I know in other classes we are supposed to read chapters and prepare for class. But this is my choice. In a flipped classroom I had to watch the video and had to complete the assignments."* Student E, the one mature student, was strongly opposed to the notion of a flipped classroom with a strong preference for traditional learning. *"I didn't enjoy the class. I want to come to class and learn the material from the professor. This way if I don't understand something I can stop and ask her. In this class, I had to watch lectures and if I was confused I had to email questions or remember to ask in class."*

The majority of students did express interest in enrolling in another flipped class with Students A, F and G all stating they would do so if given the opportunity. All of these students said the flipped classroom allowed them to complete assignments in the classroom which helped them meet deadlines, access immediate help from their professor and in their opinion helped improve their grades. Student A noted *"...the classroom set up was good for me. I could complete my assignments in class and if I needed help I could easily ask one of my friends or the prof."* Students F and G expressed similar sentiment that being able to ask their peers for assistance improved the experience and resulted in better grades.

Students B, C and D would consider enrolling in another flipped class. These students spoke positively about the classroom environment, interaction with their peers and professor but were somewhat

concerned that the flipped classroom resulted in more work with no impact on their grades. Student B said *“I don’t think it impacted my grades one way or the other. It was interesting to try and I would probably try another. If I felt it really improved my grades, sure I would be more open to it (flipped classroom), but after this I am not sure if it matters to my marks.”* Students C and D openly spoke about the extra work involved and their sentiment is likely best captured by Student D who stated *“... the class was more work. I liked the prof and my friends but I had to do more and my grades weren’t very different. I would take another course like this but I don’t have a strong preference.”* Student E would not enroll in a flipped classroom again preferring a traditional classroom experience.

It is interesting that the mature student was the individual opposed to the flipped classroom. Given the significant increase and popularity of distance learning and the numbers of mature students who are taking educational programs in this manner, we would have expected the reverse to be true. It is not possible to draw conjecture as to why this mature student did not have a positive experience or if he or she was simply an anomaly. Additional information would be required to draw any conclusions and it would necessitate a separate study comparing a controlled group of mature learners against a controlled group of younger learners to ascertain if there is resistance to the flipped classroom from this group set as a whole. The majority of comments from the student interviews concurred with the literature review findings. The results were a mixture of positive and negative responses to the flipped classroom style. It is not surprising that students found the workloads heavier because homework outside of the classroom is generally an option, whereas watching the videos outside of the classroom is mandatory because testing of material requires the students at some point to watch the lectures if they want to learn the material. For students in the flipped classroom in this study, they had a quiz at the start of the class immediately following the due date that the lecture had to be viewed.

Table 2: Grade Results Between Flipped Classroom and Non-Flipped Classrooms

Section	Exam 1 - 15	Exam 2 - 15	Exam 3- 15	Quizzes- 5	Video -10	Debate - 10	Networking -15	Case Study 15	Final Grade
Flipped Section (01)	10.62	10.62	10.51	3.94	9.10	7.05	12.36	10.87	75.09
Non- flipped Section (02)	10.40	10.53	10.61	3.25	8.97	8.08	10.97	10.94	73.80
Non- Flipped Section (05)	10.66	11.12	11.27	3.23	8.76	8.26	12.52	10.56	76.42

*This table shows the grade results for Business 1112, breaking down the sections between flipped classroom which was sections (01) and the non-flipped classrooms which were sections (02) and (05) for an actual course held in the Fall of 2012.*

Of interest, some of the students that were interviewed mentioned they believed they had earned better grades because of the flipped classroom. A comparison of the average grades between the flipped classroom (which was the course that the interviewed students came from) and two additional sections of the same course that were taught in a traditional lecture-style methodology are found in Table 2. In comparing the three sections of Business 1112 the average student scored in a “B” range (between 73-76) in all three sections. There were no grade differences when comparing the flipped classroom with the two other traditional-lecture style classes.

This does not invalidate the students’ belief that they did better in the flipped classroom but there is no evidence to support their claims other than their own perceptions of the learning experience. There was an expectation that grades would be higher in the flipped classroom for two reasons. The first was that quizzes were held the day following the due date for each video lecture. And as noted in Table 2 although the quiz scores were slightly higher for the flipped classroom section than for the other two

sections where they did not watch the videos, the overall major exam grades were comparatively similar to the other two non-flipped sections. It could lead to the conclusion that short-term memory was at play in the flipped-classroom quiz results. The second reason was that the in-class activities were designed to promote deeper learning of the course materials with the students doing more hands-on research and taking over more responsibility for the learning process. As noted by the interview responses, the majority of the students felt they had more opportunity in-class to ask questions of the professor or their fellow students and to work on projects but the grade results were not higher than those in the non-flipped classroom. A reason for this could be the inexperience of the professor teaching this flipped classroom. It was her first attempt at this style of teaching and it would be interesting to do a follow-up project with her when she has finished more flipped-classrooms and becomes more competent in the teaching methodology.

## CONCLUSIONS

This study was informative and confirmed that the flipped classroom to date has yielded both positive and negative outcomes. It appears that in order for the flipped classroom to be an effective teaching methodology, a number of processes must be in place. Firstly, student understanding of the purpose of the flipped classroom must be properly communicated and students given the opportunity to express concerns about their responsibilities to this new style of learning. Secondly, student buy-in must be gained so they will be committed to the learning process. Thirdly, the instructor must be willing to let go of traditional teaching practices and be fully trained in how to effectively implement a flipped classroom as it is not as simple as recording a video and letting students do homework in the class. If the conditions are properly set, the flipped classroom should have the potential to be an extremely effective learning style.

Prabha Ramseook-Munhurrin, Lecturer, University Of Technology, Mauritius

Sameer Mungur, University Of Technology, Mauritius

### ABSTRACT

*Island destinations have long been seen as the prime destinations for vacations. This paper evaluates the motives for tourists to choose Mauritius as their holiday destination. Key tourist attractions within Mauritius were chosen, namely popular beaches such as Flic en Flac, Pereybere, Grand Bay, Blue Bay and Belle Mare, to collect data using a self-administered questionnaire. The main findings reveal that tourists travel to Mauritius for its warm weather and beaches, however, they also visited the destination to discover a different culture. An important travel motive was also that the destination had to be of value for money.*

**KEYWORDS:** Travel, tourism, motivation, Mauritius

### INTRODUCTION

It is natural for individuals to travel from one place to another for the quest of power, amusement, knowledge, networking and making money (Kertwal, 2008). Nowadays, one of the most important reasons for travelling is for pleasure and hedonist tourists often a remote island with sun, sand and clear blue sea, and the smell of exotic fruits apart from a good bed to sleep in. Exotic is a powerful word that conveys equally powerful images (Prideux et al., 2004). The same authors define exotic as images that differentiate a place that is far removed from a person's normal physical and social reality and is normally able to experience this through the act of undertaking a journey. Exotic destinations, such as islands, are popular mainly because of its concept of the 3S namely the Sun, Sea and Sand. Islands have always been eye-catching tourism destinations because of its unique characteristics and as pointed by Walker and Bellingham (2011), islands' features include distance, geographic finiteness, cultural and environmental insularity, and its remoteness as compared to other developed countries.

Yoon & Uysal (2005) emphasize that, successful marketing of tourist destinations are backed by an extensive analysis of tourist motivation. Motivation has been defined *as the need that drives an individual to act in a certain way to achieve a desired satisfaction* (Beerli & Martin, 2004). Motivation is an important factor for travel. It is important to understand travel motivations to understand to understand how to enhance a destination's attractiveness and gain competitive advantage. Many studies have attempted to identify motivational factors (Crompton, 1979; Jang & Wu, 2006; Yuan & McDonald's 1990; Uysal & Jurowski 1993; Oh et al., 1995. A study carried out by Scrogin et al. (2010), showed that analysis of tourist motivation is very important for destinations to understand leisure tourist destination choice. As Yousefi & Marzuki (2012) suggested, the motivation of the individual person to travel, to look outside for what he cannot find inside have been largely created by society and shaped by everyday life. If a destination wants to attract tourism, it is very important for the stakeholders to understand the driving motivational forces that urge a traveller to choose or not to choose a destination for their holidays and what are their reactions about the visited placed and this can help them for product development according to their needs and wants and do promotional activities (Jang & Wu, 2006;

Sangpikul, 2008). Therefore this study attempts to identify the motives of tourist to travel to Mauritius.

## LITERATURE REVIEW

*Motivation:* Motivation is related to the psychological factors that drive the needs, wants, and goals of individuals, it is considered to be a dynamic process within human kind that guides behaviour (Correia, 2000; Chan & Baum, 2007). Motivation directs *why we want, what we want?; and why we do, what we do?* (Reeve, 2005; Backman et al. 1995). To better understand this motivational behaviour, its context (environment, individual and culture) needs to be taken into account. Furthermore, people are normally triggered to do, purchase or want something as a search to achieve some kind of stability also known as homeostasis (Crompton, 1979; Goosens 2000) and only becomes aware of it when this homeostasis is disrupted hence setting the scene for motivation in order to fill that gap (Gnoth, 1997). When it comes to tourist travel it is the same motivation that dictates behavioral intention of tourist to visit a particular destination (McCabe, 2000), the activities they endeavor into and their level of satisfaction (Prebensen, 2006; Yoon & Uysal, 2005). Personal motives known as push motives and the characteristics of the tourism destination known as pull motives determine perceptions and guides choice of tourist to travel to a destination (Mohammad & Som, 2010). These motives interact in a dynamic and evolving context (Correia, 2000), and the tourist motivation is seen as a multidimensional concept that explains tourist decision (McCabe, 2000).

*Push Factor:* The push factors are considered to be the socio-physiological motivations that urge people to travel to a certain destination. Most of the push factors are the intangible and intrinsic motivations of the individual travellers such as the desire for escape, rest and relaxation, health and fitness, adventure, prestige and social interaction (Mohamad & Som, 2010). Socio- physiological motives (as one of drivers) are the intrinsic motivations that push one to travel (Kotler, 1982). This theory also joins Maslow's (1943) pyramid of needs where an individual has five elements of behaviours, which comprise namely the basic needs, safety needs, social needs, esteem and self actualization (Mayo & Jarvis, 1981). In his nine motives for travel, Crompton (1979), proposed seven as socio physiological or push motives and two classified as cultural or pull motives. The push factors were *Escape* from a perceived mundane environment (McLean & Hurd 2011), *Exploration* and evaluation of self, *Relaxation* (Mohamad & Som 2010; Kumar, 2010; Jones 2011), *Prestige* (Baker, 2011; Woodside & Martin, 2008; Gilbert & Morris, 1995; Swarbrooke et al., 2012), *Enhancement* of kinship relationships (Swarbrooke et al., 2012; Berns, 2009), and *Facilitation* of social interaction (McLean & Hurd 2011). Awaritefe (2004) further classified the push motives as Foreign and has found that the elements that also push people to travel are, Cultural/Educational needs, Need for environment change, Self actualization and Belonging/love. These elements have also been examined in the studies made by Jang & Wu (2006). In addition to the above propositions, Awaritefe (2004), also showed that people are motivated in their choice of a destination, show self-improvement in an appreciative cultural or educational context and Leisure/ recreational pursuits. Thus, push factors are factors that can make one want to travel in order to satisfy one's needs.

*Pull Factor:* The pull factor is thought to be useful in explaining the actual destination choice. Pull factors are the destination attributes that serve as an attraction for the tourist and this plays an important role in destination choice (Crompton 1979; Awaritefe, 2004). Pull factors are those that emerge as a result of the attractiveness of the destination. They include tangible resources such as beaches, coral reefs, rivers, sea and landscape, biodiversity, intangible and tangible heritage. Beaches are considered as one of the major attraction of the industry (Philips & House, 2009). Prayag & Ryan (2011) conclude that beaches are one of the most important motivator for tourists to visit islands. Leisure and recreational facilities is another pull factor for travellers to visit an exotic destination they may be attracted by the sea based and land base activities (Cave, 2009). Historic resources and as well as travelers' perceptions and expectations such as novelty, benefit expectations, marketed image of the destination are all considered as pull factors. The

pull factors also refer to man-made attractions, which include infrastructure and superstructure, natural attractions, historical sites, beaches and climate (Sirakaya et al., 1996). Furthermore, Awaritefe (2004) classified pull motives as the domestic with emphasis on favorable location, facilities/amenities and access to centre, cost satisfaction, quality services and good accommodation. Attraction is a very important motivator for tourists to visit a region as without attractions there is no tourism (Lew et al., 2008). Furthermore, Graham & Lenon (2002) propose that leisure and recreational activities comprise of cultural attractions, including museums, heritage sites and parks. Infrastructure is an important element when people are planning to engage to travel to a particular destination (Ritchie & Crouch, 2000). Tourist accommodation caters both for the needs and wants of domestic and as well as international tourism (Backer, 2010). It is an important element in the tourism industry as it contributes to the tourism system and also raises the image of the destinations in the worldwide market (Suntikul et al., 2010).

*Tourist Topology:* The term ‘tourist topology’ is used to describe the forms of tourist consumer behaviour and motivation (Plog, 1987). Motivation in itself does not suffice for a destination to understand why people travel to a particular destination (George et al., 2010). The topologies explain the tourist motivations, interests and style of travel and are based on asking tourists about their general ‘lifestyles’ or value systems by conducting interviews (Sharma, 2007). Plog (1987) pointed out that this type of research helps to examine tourist motivations as well as attitudes to particular destinations and modes of travel (Sharma, 1995). Two types of topologies were initially proposed by Gray (1970) and further developed by Plog (1987): Sunlusts and Wanderlusts. Sunlust is related to resort based tourists where factors such as sea and sun are the motivating factors. On the other hand, wanderlust is more about the desire to exchange the known for the unknown, to leave things that are familiar and go and see different places such as learn about other cultures and people.

## METHODOLOGY

This study adopts a quantitative approach which involved the development of a questionnaire for the collection of data. The research targeted a population of tourists coming to Mauritius for vacations and a sample size of 250 respondents was chosen. Convenience sampling technique was used to identify tourists in prime tourist areas such as Flic en Flac, Pereybere, Grand Bay, Blue Bay and Belle Mare regions. The questionnaire comprised of questions set to identify why tourists to take a decision to come to Mauritius, referred to as Push Factors (Pearce & Lee, 2005; Jang & Wu, 2006) and the pull factors that attracted them to the destination. Tourists were asked to rate their responses on a Likert- Scale (1 strongly disagree – 5 strongly agree). The next part of the questionnaire focused on the sunlust factors and the wanderlust factors as motivating factors in choosing Mauritius as a holiday destination. The next part focuses on the results and discussion.

## RESULTS AND DISCUSSION

For this study, the push factors were categorized into nine dimensions; the pull factors into eight dimensions. Furthermore the study looks at assessing the types of tourist that travel to Mauritius, whether they are more of the Sunlust or Wanderlust category. Looking into the factors identified as push attributes, the findings revealed that experiencing new and different cultures are important for tourists with a mean score of 4.46, followed by exploring the unknown with a score of 4.43 (Table 1). These two attributes firmly support the work of McLean & Hurd (2011), Mohammad and Som (2010) and Awaritefe (2004). The lowest mean was obtained for the statement *I want to show others that I can travel to remote and luxurious destination* with a mean of 2.23 reflecting that exotic island characteristics are not the main factors motivating tourists to travel. It also shows that tourist are much motivated by the prestige side of the destination (Baker, 2011; Woodside & Martin, 2008; Gilbert & Morris, 1995; Swarbrooke et al., 2012) but that they were for other reasons such as they get away from their daily routine.

Table 1: Push Motivators

Statement	Mean	Standard deviation
1- When I travel experiencing new and different cultures are important to me	4.46	0.789
2- When travelling the relationship between my companion / family/ friends and me is important	4.12	1.100
3- When I travel I like to do things in my own way	4.38	0.861
4- Travelling is a way for me to explore the unknown	4.43	0.668
5- I travel to develop my personal interest	4.30	0.814
6- I gain self-confidence when I travel	4.17	0.918
7- When I travel I want to please my companion	3.89	1.248
8- I want to show others that I can travel to remote and luxurious destination	2.23	1.078
9- I travel because I wanted to get away from my daily routine	4.10	1.130

The pull factors that were identified for this particular study were based on the following attributes; the facilities offered at the destination in terms of accommodation; the relative cost of travelling to the destination; quality of goods and services; the attractions and leisure and recreational activities.

Table 2: Pull Motivators

Statements	Mean	Standard deviation
1- I prefer to travel to countries where they have the same tourism infrastructure as in my country	1.0	0.921
2- I prefer to travel in countries where there are international hotels	2.35	1.352
3- I prefer countries where hotels offer comfort and good service	1.83	1.219
4- I prefer to travel to countries where I can visit numerous local attractions (museums, historical sites, and beaches)	4.74	0.647
5- When I travel the price of air ticket is very important for me	4.42	1.111
6- When I travel the price of accommodation is very important	4.38	1.138
7- I prefer travelling to countries where there are activities that are not available in my home country	4.04	0.939
8- I travel to countries where I can get value for money	4.89	0.445

The major pull factors, for Mauritius was that it was categorized as a destination that offered value for money with a mean score of 4.89. This is congruent with the study of Awartifie (2004), who found that people are also motivated for value for money. The second major pull factor to Mauritius is the attractions that Mauritius has to offer which scored a mean of 4.74. As per Law et al. (2008), attractions at a destination remain one of the most common denominators for a tourist to make his choice of destination to travel to. Here in Mauritius local attractions are merged with recreational activities. It was also clear that tourists were not much interested to visit destinations which were similar to their home countries as the following statement only received a mean value of 1: I prefer to travel to countries where they have the same tourism infrastructure as in my country.

The study also assessed repeat intentions of customers and 77.1% of the respondents confirmed that they would return to Mauritius as the island met their expectations. Taking these results into consideration, it can be said that the likelihood to have repeat customers tends to be very high. Moreover, due to their positive experience, 78.4% of the tourist surveyed would highly recommend the destination to other people, hence bringing positive word of mouth for the destination.

As mentioned by George et al. (2010), analyzing motivation in itself is insufficient for marketers to understand why people travel to a particular destination. This is why this study also used Plog's (1987) Sunlust and Wanderlust attributes to characterize the tourists that visit Mauritius. Table 3 provides the mean scores obtained for Sunlust and Wanderlust factors. The highest mean of 4.74 was obtained for the statement *I prefer to relax and sunbath in warm places with lots of Sun, Sea and Sand* showing that tourists visiting Mauritius are mostly Sunlust visiting an exotic beach resort destination. However,

Wanderlusts characteristics were also observed through the mean scores of 4.48 for the statement of *I prefer to make friends with local people when travelling in a foreign destination* and 4.44 for *I am mostly interested in meeting local people, trying local food and speaking the local language*.

Table 3: Sunlust And Wanderlust Motivators

Statement	Mean	Standard deviation
I prefer to relax and sunbath in warm places with lots of Sun, Sea and Sand	4.74	0.661
I am mostly interested in meeting local people, trying local food and speaking the local language	4.44	0.955
I prefer to remain active, engaged in my favorite sports	4.23	1.082
I prefer to make friends with local people when travelling in a foreign destination	4.48	0.931
I prefer to have as much personal contact with the local people as possible when travelling to a foreign country	4.40	0.976
I prefer to travel to countries where the culture is similar to mine	1.81	1.115
I prefer to travel to countries where people are of different ethnic group as me	4.21	1.072

## CONCLUSION

The study clearly confirms that the factors that motivate tourists to visit the destination Mauritius are its exotic island characteristics such as Sun, Sea and Sand. However, the study does not confirm that tourists should be grouped in either Sunlust of Wanderlust categories. On the other hand, tourists visiting Mauritius show a combination of both attributes where travel motives encompass the warm weather and beaches as well as appreciating a new culture. Therefore tourists visit Mauritius because it is an exotic island destination with a tropical island but also of its unique socio-cultural fabric which contributes to destination attractiveness. However, the destination needs to ensure that the destination offers value for money. It is important for the government to take precautions to preserve the beaches and marine life since these are key travel motivators. Carrying capacity should be managed as well as preservation of beaches and lagoons. Moreover, authenticity should be maintained and promoted through local cuisine, handicraft and other activities which give value to local products and culture. As the tourism industry is highly competitive, it is a must for destination managers to understand the travel motivations of tourists before developing and marketing products and services.

# PARALLEL MARKETS FOR ENVIRONMENTAL EXTERNALITIES

Giani Grădinaru, Bucharest Academy of Economic Studies, Romania

## ABSTRACT

*Biodiversity loss is a symptom of a system that is not sensitive to changes that occur in its environment. Recognizing infinite value of ecosystems and biodiversity is a plus, but it is not enough. After several decades of environmental policy and specific arrangements for biodiversity conservation, increased funding, more research and tools becoming more efficient, the rate of biodiversity loss has not diminished. PES (payments for ecosystem services) is a global priority today, born from the conjunction of the two environmental front's interests - climate change and biodiversity. The paper deals with PES economy, detailing the economic rationale underlying PES. Thus, ecosystems provide not only goods for which there is a market, but also services with ecological contributions that occur at different scales. Ecosystem services are public goods, as externalities for which no markets, beneficiaries do not pay. In this case, market failure is usually the case and the society is provided with increasingly less services. The last part of the paper address national and/or local PES schemes, being applied in various forms in many countries, using national and regional systems.*

**JEL:** Q57, M21

**KEYWORDS:** payments for ecosystem services, biodiversity loss, economic approach

## INTRODUCTION

This relatively new concept of PES was clarified in 2007, in Heredia (Costa Rica), by the homonymous statement. Farley and Costanza (2010) analyzed the declaration, valued the results of a scientific workshop, organized by the Gunt Institute for Ecological Economics, and developed a set of ten principles for the use of PES systems: measurement, creating packages, agreeing scales, property rights, distribution, continuity of financing, adaptive management, education and policies, participation, political coherence. PES schemes should be a priority for irreplaceable ecosystem services, especially those that offer fails to meet the basic needs. Level of payments should be determined based on the cost of providing and not based on monetary estimate of benefits. However, the inclination to pay plays a role, but should be interpreted as a measure of viability and not of their value.

## LITERATURE REVIEW

The economic rationale underlying PES is relatively simple. Thus, ecosystems provide not only goods for which there is a market, but also services with ecological contributions that occur at different scales. Because ecosystem services are public goods, i.e. externalities for which no markets, beneficiaries do not pay, market failure is usually the case and the society is provided with increasingly less services. (Pagiola and al., 2002). Economic characteristics of ecosystem services determine the feasibility of using PES. The combination of rivalry and exclusion determines the type of goods represented by the ecosystem services and, based on this, if the introduction of PES will induce the supply at the desired level of society. Rivalry is a property that cannot be changed by policies and regulations. Ecosystem services often falls in the category of non-rival goods, so that the most effective method for delivering is their unique payment by a monopsonist. Exclusion is created by policies and regulations. An ecosystem service is non-excludable when it is impossible to create property rights or implementation costs are too high. For example, it is impossible to exclude anyone from the benefits of regulating climate.

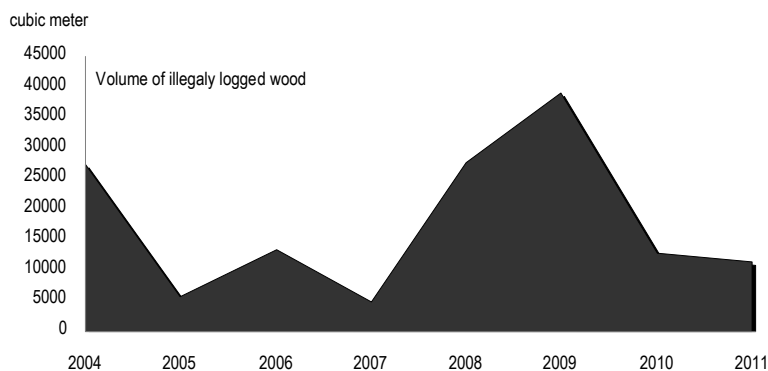

Farmers and foresters obtain less private benefits from land uses that correspond to ecological and social requirements (forest conservation, friendly agrotechnics from the biodiversity perspective). However, these uses are not competitive with the environmentally sensitive uses, which bring much higher private benefits (Engel and al., 2008). Market failure resulting from this is considered the main cause of irrational use of resources and environmental degradation (Pearce and Turner, 1990; Richards, 2000). PES seeks to create a compromise between conservation and use of natural resources by transferring management from the state to private actors who respond to monetary incentives (McAfee and Shapiro, 2008).

PES is trying to implement Coase theorem, which states that problems caused by the external effects can be overcome under certain conditions through private negotiations between affected parties. This develops the argument that PES avoids "punishing" non-organic farmers' behavior, replacing it with payment for "good behavior" by the beneficiaries. If the benefits are felt by society, then it must pay for them. Since not all social actors participate equally to these benefits of ecosystem services, those categories that have higher benefits should be identified, and then, mechanisms that ensure service levels correlate with the payments should be developed. Payments will generate the necessary funds for protection.

## DATA AND METHODOLOGY

By using PES, social costs of nature deterioration will be reduced due to avoidance of negative processes that could be produced. At the same time, social actors managing ecosystems that provide services can be rewarded and motivated to conserve ecosystems rather than exploit them. In Romania, Suceava County, the main motivation of illegal cutting is the resulted income by selling round wood or timber. Forest owners, who have recently acquired this status, faced with major new costs related to the management and protection of forests. They were not cleared by the new revenue, so cutting forest turned into a new source of income. The power of this motivation is illustrated by the evolution of illegally harvested wood volume (Figure 1).

Figure 1: Evolution of Illegally Harvested Wood Volume In Suceava County, 2004 Trough 2011

In Romania, there are many similar cases. Property rights were associated with a benefit of the new owners to be exploited. Their lack of respect is the effect of their lack of long-term benefits' knowledge, political uncertainty, associated with the possibility of losing the new properties and lack of alternative sources of income. In addition, wood traders use to offer generous proposals that pushed owners beyond legal obligations. Assuming that these offers were made by the representatives of PES schemes, owners would obtain these revenues and would have continued to be forests' owners and not of deforested areas.

In applying PES, the "polluter-pays" principle used to correct negative externalities is replaced by the "beneficiary-pays" principle, interpreted as "supplier-receives", since it is about positive externalities. Direct payments may ensure economic premise for optimizing efficiency in the case of insufficient resources for conservation (Ferraro and Simpson, 2002), based on the fact that land users know the cost of providing ecosystem services and seeks to reduce them, or focus on situations with better benefits. Thus, PES has the side effect of increasing local incomes, poverty reduction being considered one of the most important side effects (Grieg-Gran and al., 2005).

### Discussion

PES is applied in various forms in many countries, using national and regional systems. Latin America has been extremely receptive to the approach of the program, highlighting countries like Colombia, Nicaragua, Costa Rica, Ecuador, El Salvador and Mexico. Most programs focus on forests, but there are many initiatives that address agricultural ecosystems. In Mexico, *Scolec Te* project pays farmers for carbon sequestration services. Water supply is the service approached by most of PES programs, due to the urgent need to address water supply and ease with which water service users can be identified. In *Costa Rica* such a system was implemented since 1997. Services covered are: carbon sequestration, watershed protection, biodiversity and landscape conservation. The system covers 640 000 hectares of forest and forest plantations owned by 8000 owners.

The scheme includes direct payments of 64 USD/ha/year or 816 USD/ha/10 years. Funds to make these payments are grants by the World Bank, the Global Environment Facility (GEF) and the German Aid Agency, in addition to the collected revenues of carbon tax and individual agreements with water users. Assessments to date consider that system illustrates the functional potential of this mechanism. However, there are opinions that the system is not sufficiently effective in slowing deforestation.

*Nicaragua*: applies Silvopastoral program which aims not only internalize forest externalities, but also those of agriculture. To enter the program, farmers must undertake a series of actions such as planting trees, feeding on the leaves of trees, using hedges etc. Payments received by them vary from 180 USD/ha for grassland improvement to 400 USD/ha for high density planting trees on land previously used for grazing. To ensure a better matching of payments with provided ecosystem services, an Environmental Services Index (ESI) was developed. Annual payments are granted for four years under contracts which sets the ESI points to be gained by farmers. This element differentiates from other PES program where payments were represented by subsidizing additional costs necessary to protect ecosystems practices.

*Japan*: has implemented a PES in Kochi Prefecture in 2003. It was designed as a "*forest environmental tax*" or "*fee for water and forest management*". Each prefecture charged 5.10 USD per capita and 100 - 800 USD per enterprise to finance the restoration and improvement of ecosystem services (excluding the production of timber). An important feature is that forest owners are rewarded only if their effort is shown, respectively after they maintain the forest for at least ten years.

*New York* : depends on filtering services of natural ecosystems to maintain water quality of the reserves used by the city. Agro-techniques applied by farmers within the catchment area compromised water quality, so that the municipality had to find solutions to ensure the provision of safe drinking water. Decision alternatives consisted of building a treatment plant or applying good agricultural practices within the catchment area. Comparing the costs of the two options, the municipality decided in the favor of the second choice which is actually a PES program. Collection mechanism was established by charging consumers extra. In this case, the New York Water Authority worked as a monopsony, representing the city's water users.

*In Romania:* the World Wide Fund for Nature (WWF) launched the project "Promoting Payments for environmental services and sustainable financing schemes for the Danube Basin" in 2010. It aims to demonstrate PES functionality and has a total value of about 2.3 million USD, being financed by UNEP through GEF and supported by EU. The assigned price of a service has a range between a maximum, which demand is willing to pay, and a minimum represented by the supplier's cost. WWF is involved to raise the maximum, launching information campaigns and determining awareness.

## CONCLUDING COMMENTS

Under certain conditions, PES can create parallel markets for environmental externalities which may be traded, and their functioning is more efficient than other forms of government intervention. In practice, national and international actors, public or semi-public (governments, donors, development agencies, NGOs) and local government (municipalities, community organizations) are often obliged to organize payments and set prices, replacing unexpressed and less organized demand of market ecosystem services. Therefore, it is rather about the creation of quasi-markets than the markets themselves.

Involving more actors on quasi-markets for ecosystem services generates transaction costs, these include: technical studies to establish the link between ecosystem structure and services they provide; creating an organization to manage, monitor and support the program; strengthening institutional capacity to enforce the law, especially property rights; and current operating costs for monitoring and renegotiating contracts, other costs related to seeking buyers and sellers, conduct negotiations and establish agreements and certification. Reducing transaction costs is considered an important condition for the success of these programs. One way is by creating monopsony and reducing monopoly power in organizing payments. The necessary institution to create a monopsony and allowing capture of benefits depends on the spatial distribution and characteristics of ecosystem services. Monopsony must be made on a scale that reflects the manifestation of benefits from ecosystem services.

When a person or entity has monopsony power because it is the only beneficiary and potential buyer of a service, propensity to pay can be calculated on the basis of its welfare service. The existence of monopsony determines the avoidance of non paying beneficiaries (free-rider) of a public good. Direct payments for ecosystem services are justified when the marginal cost of ecosystem damage and the opportunity cost of supply are low. If these conditions are met, the formation of a monopsony should be ensured by institutions operating at the scale at which ecosystem services manifest.

Giani Gradinaru is an Associate Professor of the Statistics and Econometrics Department, Academy of Economic Studies Bucharest. Giani held didactic activity both undergraduate and post graduate level. Giani received the title of doctor in cybernetics and economic statistics in 2004. Postdoctoral scientific research aimed environmental statistics field, objectifying in books, articles and scientific communications (work paper). He is an expert evaluator and research project manager.

# BUILDING A NATIONAL ACCOUNTING MATRIX WITH ENVIRONMENTAL ACCOUNTS

Laia Pié Dols, Universidad Rovira i Virgili

## ABSTRACT

*The objective of this paper is to construct a social and environmental accounting matrix. A NAMEA (National Accounting Matrix using Environmental Accounts) is simply a double-entry table in which the rows contain the origins of the economic resources and the columns show the uses that economic agents give to the resources concerned. In a NAMEA, this information is linked to the environmental consequences of economic activity such as pollution and the use of natural resources. A NAMEA, therefore, enables to visualize the network of direct interconnections found in the economy and in society, i.e. between branches of activity and institutional sectors, and between the former and the environment.*

**JEL:** M40, Q50.

**KEYWORDS:** Social and environmental accounting, greenhouse emissions, regional income.

## INTRODUCTION

The escalation of the greenhouse effect and consequent warming of the planet have generated great concern. This is reflected in the number and scale of scientific projects and international conferences that have been carried out since the 1980s to analyse the problem and propose solutions. For example, the Toronto Conference on the Changing Atmosphere was held in 1988. This was the first high-level meeting where scientists and politicians debated measures to be taken to fight climate change. In 1990, the Second World Climate Conference was held in Geneva (Switzerland).

At the Rio Summit in 1992, the United Nations Framework Convention on Climate Change was drawn up. By signing this treaty, the developed countries (which are responsible for approximately 60% of the world's annual carbon dioxide emissions) promised to reduce their greenhouse gas emissions to their pre-1990 levels by 2010. Despite this breakthrough, it became evident that a stricter agreement was needed. In 1997, a legally binding protocol was reached in Kyoto in which the developed countries promised to reduce by 5.2% their collective emissions of six greenhouse gases, three of which were of human origin (carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), and nitrous oxide (N<sub>2</sub>O)), and three of industrial origin (hydrofluorocarbons (HFC), perfluorocarbons (PFCs) and sulphur hexafluoride (SF<sub>6</sub>)). They were to do this between 2008 and 2012, taking the 1990 levels as a reference.

This document, known as the Kyoto Protocol, came into effect on 16<sup>th</sup> February 2005, after it had been ratified by Russia. But the Kyoto Protocol expires at the end of 2012. At the 18th Summit of the UN Climate held in Doha on climate change, in which nearly 200 countries, they agreed to extend the 2020 Kyoto Protocol. However, the second phase covers only 15% of global emissions after Canada, Japan, New Zealand and Russia withdrew. United States has never acceded to the pact in part because neither is China and other developing nations and rapid growth. Countries try to adopt in 2015 a broader pact that would apply to all nations and take effect upon expiry of the extension of the Kyoto Protocol.

The rest of the paper is organised as follows. The next section describes the literature review. Section 3 presents the structure of a SAM. Section 4 describes the structure of a NAMEA. The paper ends with a conclusions section.

## LITERATURE REVIEW

Economic activities use natural resources and generate pollutant emissions, which mean that economic and environmental information need to be analysed jointly. For this to be done, in 1993 the United Nations published its System of National Accounts (United Nations, 1993). For the first time, this handbook formulated an accounting framework for assessing national accounts and environmental statistics, which determined how economic and environmental information was to be integrated but did not define a comprehensive method for doing so. In 1998, this integrated system was revised and published in a handbook (United Nations, 2003). The common framework described for economic and environmental information enabled the environment's contribution to the economy and the economy's impact on the environment to be consistently analysed.

In addition to the efforts by the United Nations to integrate economic and environmental accounts, several studies have analysed the interaction of economic and environmental information. Studies on incorporating pollution emissions and environmental impacts into the social accounting matrix (SAM) framework were first made in the 1990s. For example, Keuning (1992, 1993 and 1994) proposed a national accounting matrix that would include environmental accounts (that is, an environmentally extended SAM system). It would include both economic variables and pollution information, and economic variables would be expressed in monetary terms and environmental ones in physical terms. Pollution originating from production, consumption or import activities would appear in an emissions account.

Xie (1995) constructed an environmental SAM for China that took into consideration polluting emissions (liquid waste, solid waste and suspended dust). The SAM considered the dejection activities of different sectors, payments to avoid emissions, taxes paid for emissions, subsidies for controlling emissions, and industrial environmental investment (waste treatment plants and control teams). These activities were differentiated by production type, and resulted in a consistent database with which to initially calibrate a model with dejection activities. This SAM was therefore able to use real data on dejection costs to evaluate environmental policies.

The first pilot National Accounting Matrix that included Environmental Accounts (NAMEA) developed for the Netherlands (de Haan and Keuning, 1996) was an attempt to embed indicators for economic and environmental performance into one information system. The first NAMEA showed the environmental stress of production and consumption in a consistent format with the economic figures in the national accounts, by extending the national accounts matrix with environmental accounts expressed in physical units. Keuning, Dalen and De Haan (1999) described an aggregated NAMEA and compared the contribution of economic activities to economic indicators with their contribution to environmental indicators, both based on the information in the NAMEA. The cumulative contribution of economic activities to economic and environmental indicators is also given, thus taking into account the relations between production activities. Finally, they described a number of recent applications and extensions of the NAMEA in the Netherlands.

Ike (1999) described a NAMEA for Japan which provides a comprehensive and consistent picture of the interrelationship between the economy and the natural environment, a basis for applying cost-benefit analysis and the necessary information for policy planning. It not only gave environmental pressures from domestic pollutant emissions and transboundary flows from the rest of East Asia, but also focused on pollutant emissions in East Asia in relation to future growth potential. On the other hand, Vaze (1999) described the background to the work carried out on environmental accounts in the UK and explained how these accounts were calculated. Results from the pilot accounts were reproduced in a NAMEA framework, so that they could be compared with the NAMEAs constructed by other countries.

Xie and Saltzman (2000) constructed a numerical version of the environmentally extended SAM using Chinese data from 1990. Multiplier and structural-path analyses were applied to this database to assess environmental impacts of pollution-related economic policies. Xie (2000) then extended the SAM to capture the relationships among economic activities, pollution abatement activities, and pollution emissions. The author presented a numerical example of the environmentally extended social accounting matrix (ESAM) using Chinese data from 1990. The multiplier and structural path analyses were applied to the ESAM to assess the environmental impacts of pollution-related economic policies. The results showed that an ESAM can be a useful tool for environmental policy analysis.

De Hann and Keuning (2001) showed how environmental issues can be incorporated into macroeconomic accounting by constructing and using a National Accounting Matrix that includes Environmental Accounts (NAMEA) for the Netherlands. The paper firstly elaborated a number of conceptual issues on the harmonisation of environmental statistics and national accounts. Specific attention was given to the consistent allocation of pollution to production and consumption activities and the importance of aggregated environmental indicators.

Manresa and Sancho (2004) conducted the first example of integrated economic and environmental analysis for Catalonia, taking 1987 as the base year. The paper analysed the sectorial power intensity of the Catalan economy using a regional SAM that differentiated between polluting emissions originating from production and those originating from final consumption. The authors observed that the energy sectors themselves use energy sources with the greatest intensity. On the other hand, Rodríguez, Llanes and Cardenete (2007) showed that a SAM with environmental accounts can be used to analyse economic and environmental efficiency. They used a database with Spanish data from the year 2000, and applied it to water resources and greenhouse gas emissions. The matrix was used as a database for a multisectoral model of economic and environmental performance, which made it possible to calculate the domestic multipliers and their decomposition into direct, indirect and induced effects. These multipliers were used to evaluate the economic and environmental efficiency of the Spanish economy. The study demonstrated that there is no causal interrelation between those sectors with greater backward economic linkages and those with greater environmental deterioration.

Finally, Flores and Sánchez (2007) analysed and assessed the major environmental impacts on the economy of Aragon, relating the main economic dimensions to the uses of resources and levels of pollution. To carry out this analysis, they first constructed a SAM for Aragon for 1999. With this SAM, they then constructed a Social Accounting Matrix including Environmental Accounts (SAMEA) for 1999, which included water resources and several types of aquatic and atmospheric pollution. Using these matrices, they constructed an open Leontief model that revealed the association of water and pollution with to final demands, and the role these demands play in the exploitation of water resources and the generation of pollution. The imported flows of resources and pollution are also estimated.

## **STRUCTURE ACCOUNTING OF A SAM**

A SAM can be defined generically as a database that shows all transactions made between the agents of a specific economic system and the interrelation between income distribution, consumer patterns and production structure. It reflects how income is obtained and how all economic agents spend their money by representing the full circular flow of income. Databases of this sort provide a considerable amount of numerical information, which makes them very useful for economic modelling.

SAMs were proposed in the pioneering papers of Stone (1978) and Pyatt and Round (1979). Subsequently, Pyatt and Round (1985), Pyatt (1988) and Keuning and Ruijter (1988) systematised their structure and accounting definitions. In the late 1970s and throughout the 1980s, SAMs were constructed for an increasing number of countries, but it was not until 1993 that they were grouped together by the

United Nations System of National Accounts and in 1995 by the European System of Integrated National Accounts.

A SAM reflects all the economic transactions and monetary flows between economic agents during a period of time, generally a year. It presents the accounts in rows and columns in a square matrix. Each cell simultaneously represents the monetary income (in rows) and the payments or expenditure (in columns) of agents and institutions. The equilibrium between income and expenditure means that the total value of each row must be the same as the total value of the corresponding column. Economically, this implies that total saving is the same as total investment that expenditure is the same as income, and that demand is the same as supply.

## **STRUCTURE ACCOUNTING OF A NAMEA**

A NAMEA can be represented as a set of matrices containing data from national accounts (SAM) and environmental accounts. These accounts are linked to the measurement of environmental problems such as air pollution, water pollution and waste generation; they describe the pressures and flows that economic activity exerts on the environment (emissions), use of physical natural resources (environmental inputs) and steps taken by society to reduce or eliminate such pressures (recycling, reuse or depuration). Thus, environmental accounts are statistical data matrices with relations to certain environmental aspects, assessed in monetary terms and/or physical units; the only requirement is that the information take into account the established definitions and classification standards from economic statistics.

The SAM expresses the flows associated with the economic sphere in monetary units; in other words, it shows how flows are related to production and consumption activities, and subsequent income distribution and redistribution. In contrast, environmental accounts are represented in flow matrices expressed in physical units, which in turn are broken down into submatrices that show flows of natural resources used as inputs by the productive system, flows of atmospheric emissions, etc. The data included in NAMEA databases are not unique, as they may concern atmospheric emissions, waste, woodland surface area, active ingredients of subsoil, use of energy and consumption of natural resources. They may also include energy balances and product flows. Methods involving material and energy balance sheets have been developed for the physical accounting of product flows and have already been applied in some countries. These methods use physical input-output tables, extractions of environmental resources, the transformation of these materials within the economy, and waste generation from production and consumption activities (excluding transformations that occur in the natural environment). For example, see Stahmer et al. (1997) and Strassert (2000).

## **CONCLUSIONS**

The starting point of this paper was the construction of a social accounting matrix for. This matrix enables the interdependence between agents and sectors to be understood by providing a complete representation of the circular flow of income. However, we must bear in mind that SAMs include neither environmental variables (such as emissions of air, water or soil pollutants, toxic waste etc.) nor natural resources or environmental quality. For this reason, in order to have a more detailed database of the interconnections between branches of activity and institutional sectors and, in turn, between these and the environment, we have added environmental information to a SAM (which contains economic information) in order to obtain a Social Accounting Matrix with Environmental Accounts. A NAMEA is simply a double entrance table in which the origin of the resources in the national or regional economy can be observed in the rows and the uses of these resources made by economic agents can be seen in the columns.

Table 1. Structure accounting of a NAMEA with emissions accounts

		DOMESTIC ECONOMY							Total	ENVIRONMENT					
		Firms	Labour	Capital	Consumption	Public Sector	Saving-Investment	Foreign Sector		CH <sub>4</sub> (t)	CO <sub>2</sub> (kt)	N <sub>2</sub> O	SF <sub>6</sub> (kg)	HFC (kg)	PFC (kg)
		<i>A</i>	<i>0</i>	<i>0</i>	<i>C</i>	<i>G</i>	<i>I</i>	<i>X</i>		<i>E<sub>P</sub></i>	<i>E<sup>P</sup></i>	<i>E<sup>P</sup></i>	<i>E<sup>P</sup></i>	<i>E<sup>P</sup></i>	<i>E<sup>P</sup></i>
DOMESTIC ECONOMY	PRODUCTION	Firms	<i>A</i>	<i>0</i>	<i>0</i>	<i>C</i>	<i>G</i>	<i>I</i>	<i>X</i>	Total uses	<i>E<sub>P</sub></i>	<i>E<sup>P</sup></i>	<i>E<sup>P</sup></i>	<i>E<sup>P</sup></i>	<i>E<sup>P</sup></i>
		Labour	<i>W</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	Total earned income	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>
		Capital	$\Pi$	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	Total profit income	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>
		Consumption	<i>0</i>	<i>W</i>	$\Pi$	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	Total private income	<i>E<sub>C</sub></i>	<i>E<sup>C</sup></i>	<i>E<sup>C</sup></i>	<i>E<sup>C</sup></i>	<i>E<sup>C</sup></i>
	INSTITUTIONS	Public Sector	<i>T<sub>1</sub></i>	<i>0</i>	<i>0</i>	<i>T<sub>2</sub></i>	<i>0</i>	<i>0</i>	<i>0</i>	Total public revenue	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>
		Saving-Investment	<i>0</i>	<i>0</i>	<i>0</i>	<i>S</i>	<i>D</i>	<i>0</i>	<i>-F</i>	Total saving	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>
REST OF THE WORLD	Foreign Sector	<i>M</i>	<i>M</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	<i>0</i>	Foreign payments	<i>T<sub>m</sub></i>	<i>T<sup>m</sup></i>	<i>T<sup>m</sup></i>	<i>T<sup>m</sup></i>	<i>T<sup>m</sup></i>	<i>T<sup>m</sup></i>
TOTAL		Total resources	Total earned income	Total profit income	Total private expenditure	Total public expenditure	Total investment	Income from foreign sources							

This table shows the structure of a NAMEA database that represents only pollutant emissions. The table shows six greenhouse gases, but could perfectly show other emissions. The six gases we analysed are those that must follow the guidelines of the Kyoto Protocol: carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrogen monoxide (N<sub>2</sub>O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulphur hexafluoride (SF<sub>6</sub>). *A* is intermediate consumption, *C* is private consumption, *I* is gross capital investment, *G* is public expenditure, and *X* is sectorial exports. Additionally, *W* is the payment of earned income,  $\Pi$  is gross operating surplus or profit income, *S* is private saving, *D* is public sector deficit, *F* is trade balance, *T<sub>1</sub>* are net taxes on production, *T<sub>2</sub>* are direct taxes and, finally, *M* are sectorial imports of equivalent products.

*Note that the units of measurements are not unique and depend on the type of gas. In our example, they are tons, kilotons, and kilograms. In the environmental account of Table 2, the first row contains the column vectors  $E^p$  that show the emissions of each gas made by sectors of production. Similarly,  $E^c$  are column vectors of physical emissions made by private agents, and  $T^m$  are the emissions due to the external relations of the economy. Source: Alcántara (2003).*

A NAMEA has been used because it allows information about monetary flows stemming from the regional or national accounts to be integrated with the physical measuring of various polluting gases emitted into the atmosphere. The inter-connections between economic accounts and environmental accounts are thus revealed, and clear insight is provided as to whether or not there is a causal relation between activities of greater economic influence and those which cause greater harm to the environment.

# AUDITING TECHNOLOGICAL INNOVATION IN DEVELOPING COUNTRIES

Duha S. Alsanad, Arabian Gulf University, Bahrain  
Refaat H. Abdel-Razek, Arabian Gulf University, Bahrain

## ABSTRACT

*Most Arab countries fall far behind developed countries in terms of technology and innovation and there is little current published literature that evaluates innovation and suggests ways to improve it in these countries. The objective of this paper is to audit innovation management in one of the largest Saudi petrochemical companies in order to identify the company's strengths and weaknesses from an innovation perspective. An audit survey was carried out. The results showed that there is top management commitment and support for innovation; learning is very well managed; the company is committed to the development of its employees worldwide; the innovation system is flexible enough to allow specified small projects to be fast-tracked and the linkages and innovation process ranked in the middle. On the other hand, the innovative organization and strategy ranked lowest; the strategy is impacted negatively by the company's inadequate analysis of new technological and market developments; completing innovative projects on time and within budget also received a lower rank and the company's structure does not make provision for rapid decision-making. The audit results were compared with those of companies in Brazil and China. This comparison supported the audit results. Carrying out regular auditing and responding appropriately to the findings should progressively improve the company's innovation capabilities.*

**KEYWORDS:** Developing Countries, Technological Innovation, Innovation Audit, Innovation assessment.

## INTRODUCTION

A World Bank Institute report described the innovation climates in developing countries as problematic, characterized by poor business and governance conditions, low educational levels, bureaucratic climate and mediocre infrastructure (Aubert, 2004). The World Bank (2010) recommended that governments need to pay attention to innovation, particularly in the developing world, because innovation is the key driver of economic development and it is the main tool to cope with major global challenges. A report made by UNESCO (2010) stated that even oil-rich-Arab states like Saudi Arabia need innovation. Despite the need for innovation, literature shows that Saudi Arabia lags far behind developed countries in terms of Science and Technology (Sanyal & Varghese, 2006; UNESCO, 2010) and there are few published works that evaluate technological innovation in Saudi Arabia. The objective of this paper is to audit innovation in one of the largest petrochemical company in Saudi Arabia in order to analyze and evaluate how well the company manages innovation.

### Innovation Measurement And Auditing

In the modern business world, innovation is considered an engine of growth, but surprisingly many companies still don't measure their innovation performance and look at the innovation process as something that is mysterious and difficult to master (Skarzynski & Gibson, 2008). Wetter (2010) categorized the main measurable characteristics of innovation into hard and soft. Hard measures refer to the ones that are linked directly to the innovation process such as the number of patents. Soft measures, like productivity improvements, may be direct but are less clear due to their influence by other factors such as managerial factors. Innovation could also be categorized according to the scope and place to be measured. It could be measured at the company level, sector level and even country level. Each has its own characteristics and calls for different types of metrics. Another categorization of innovation measurement is by using quantitative measures such as the input output model or qualitative measures by using an innovation audit. Innovation audit is defined as "a tool that can be used to reflect on how the

innovation is managed in a firm” (Lima, 2011). Innovation audit is different from financial audits, which are based on quantitative measures (Goffin & Mitchell, 2005). Innovation audit is a significant breakthrough in the area of technological innovation management (Liao et al. 2011). There are several tools and frameworks to audit innovation management. Blankley et al. (2006) explained two examples of innovation audits. One framework was suggested to audit innovation against a core process model which consisted of concept generation, product development, process innovation and technology acquisition (Chiesa et al., 1996). Another framework, "inventory for organization innovativeness", was proposed by Tang (1999) and intended to measure organizational effectiveness in innovation. Mentz (1999) developed what he called a "competence audit for technological innovation", the aim was to check the organization's abilities relative to best practices in innovation. Radnor and Noke (2002) presented a self-diagnostic tool referred to as the "innovation compass" to pinpoint gaps between current and desired performance of organizations regarding innovation. Another innovation audit framework was suggested by Goffin and Mitchell (2005) for identifying strengths and weaknesses using the "Pentathlon Framework". A recent audit tool was presented by Tidd and Bessant (2009) who have identified the factors that influence the success and failure of innovation and used these factors to develop an audit tool for assessing innovation performance in organizations. It focuses attention on five key areas of innovation management: strategy, process, organization, linkages and learning.

## AUDITING TECHNOLOGICAL INNOVATION

This study is implemented in a large public petrochemical company based in Riyadh, Saudi Arabia. Its main manufacturing facilities are located in two industrial cities: Al Jubail on the east coast and Yanbu on the red sea coast of Saudi Arabia. It is counted among one of the pillar of the Saudi Arabia economy (Oxford Business Group, 2009). Today, it operates in more than forty countries with more than thirty three thousand employees across the world and is composed of six business units. These are: Chemicals, Polymers, Performance Chemicals, Fertilizers, Metals and Innovative Plastics. It has seven technology centers distributed around the globe. The company has ownership rights or licenses to about 3,760 active patents and 3,394 pending patent applications around the world and received many awards for its innovativeness. One of these awards was from the European Polycarbonate Sheet Extruders (EPSE). As petrochemicals play a vital role in economics and also in our everyday lives, the demand on it grows day after day making it one of the most competitive and innovative industries.

### The Audit Tool

The selected tool to audit innovation was developed by Tidd and Bessant (2009). It was used in different studies such as Duin (2006), Ye and Zhou (2009), Pang and Qu (2010), Lima (2011) and Karlsson et al. (2011). The questionnaire composed of five audit dimensions: strategy, learning, linkages, processes and innovative organization. It consists of forty statements which describe "the way we do things around here". For each statement, a score between 1 to 7 is determined. The scores determine the respondents' degree of agreement or disagreement that the statements are true. Strongly agree has a value of 7, agree 6, somewhat agree 5, undecided 4, somewhat disagree 3, disagree 2 and strongly disagree 1.

### The Participants

All fifty employees from one of the company's technology centers that is the closest to innovation activities were surveyed using the audit questionnaire. Two thousand audit statements were answered by all the 50 employees in the Technical Services Lab, a part of the company's Technology Center in Riyadh, Saudi Arabia. The surveyed employees were categorized according to their job title as shown in Table 1. The table shows that the highest percentage of participants are engineers (36%), followed by scientists (20%), followed by both administrators and technicians with (22%) each. Employees were also categorized into four levels according to their educational qualifications. Table 2 shows that four of the respondents (8%) are Ph.D. holders, eight (16%) are Master degrees holders, eleven (22%) are Post Graduate Diploma holders and twenty seven (54%) are Bachelor degree holders.

Table 1: Participants' Job Titles

Job Role	No of Employees	No of Participants	Percentage	Response Rate
Scientists	10	10	20%	100%
Engineers	18	18	36%	100%
Administrators	11	11	22%	100%
Technicians	11	11	22%	100%
Total	50	50	100%	100%

*This table shows the categories of the surveyed employees according to their job title.*

Table 2: Respondents' Educational Qualifications

Degree	No of Respondents	Percentage
Ph.D.	4	8%
Master's	8	16%
Bachelor	27	54%
Diploma	11	22%
Total	50	100%

*This table classifies the surveyed employees according to their qualifications.*

## DATA ANALYSIS AND RESULTS

### Overall Auditing Results

The data were collected and analyzed. The average scores given by the respondents to each of the auditing statement of the five audit dimensions are summarized in Table 3. The results showed that the average score of the learning dimension is the highest, 5.04, which indicates that the employees are satisfied and agree that the company is managing the learning aspect very well. The linkages and process dimensions ranked in the middle while the innovative organization and strategy aspects received the lowest scores, as shown in Table 3.

Table 3: The Company's Audit Results By All Employees

Strategy		Process		Innovative Organization		Linkages		Learning	
Statement No.	Mean	No.	Mean	No.	Mean	No.	Mean	No.	Mean
1	4.46	2	4.54	3	4.58	4	5.68	5	4.84
6	4.30	7	4.30	8	4.64	9	4.82	10	5.38
11	4.42	12	4.58	13	4.48	14	3.86	15	5.86
16	4.48	17	4.36	18	3.98	19	4.78	20	5.22
21	4.34	22	4.94	23	4.38	24	4.22	25	4.92
26	5.10	27	4.32	28	4.96	29	4.84	30	4.62
31	4.22	32	4.40	33	4.16	34	4.46	35	4.82
36	4.82	37	5.12	38	5.04	39	5.04	40	4.62
Total	36.14	Total	36.56	Total	36.22	Total	37.70	Total	40.28
Score	4.52	Score	4.57	Score	4.53	Score	4.71	Score	5.04
Rank	5	Rank	3	Rank	4	Rank	2	Rank	1

*This table summarizes the respondents' scores to auditing statements.*

**Learning:** This dimension stands out as the highest ranking among the five dimensions of the audit as shown in Table 3. The results showed that the company has established itself as a learning organization. An in-house teaching structure has been established which focuses on learning the real, day-to-day challenges that managers and teams face in order to develop new skills which allow them to reach their full potentials. The average score of 5.04 out of 7 signifies that the employees agree that the company is managing the learning aspects well. Among all of the 40 audit statements, statement number 15: "We learn from our mistakes" received the highest score. The results also showed that the company works closely with its customers and end-user. Statement number 10: "We are good at understanding the needs of our customers/end-users" received a relatively high score of 5.38.

**Strategy:** Strategy received the lowest average score of 4.52 among the five dimensions of innovation

audit and was ranked the fifth and last. This indicated that strategy could be considered one of the company's weaknesses from an innovation audit view. Statement 31 of the strategy dimension: "We have processes in place to review new technological or market developments and what they mean for our firm's strategy", received the lowest score of 4.22 among all the eight strategy statements. This showed that employees think that there is a lack of processes to analyze new technological or market developments which affects the firm's strategy negatively. However, the results also showed that the participants mostly agree that there is top management commitment and support for innovation, as statement number 26: "There is top management commitment and support for innovation" received the highest score of 5.1 among the eight strategy statement.

Process: The process ranked third out of the five dimensions with an average score of 4.57. Statement 37 of the survey: "There is sufficient flexibility in our system for product development to allow small 'fast-track' projects to happen", received the highest score of 5.12 among the eight statements that are concerned with the process dimension. Therefore, the positive element in this aspect is that the company has flexibility in their innovation system. However, statement number 7: "Our innovation projects are usually completed on time and within budget", received the lowest score of 4.3 which implies that there are some flaws in the process.

Innovative Organization: The innovative organization dimension ranked fourth out of the five innovation audit dimensions, with a 4.53 score. Table 3 shows that the highest score in the eight statements of the organization dimension was 5.04 and was given to statement number 38: "We work well in teams" (5.04). The lowest score was 3.98 and was given to the statements number 18: "Our structure helps us to take decisions rapidly". This lowest score statement is linked to deficiency and problems in the innovation organizational structure which doesn't allow, among other things, taking decision rapidly. The second lowest score was 4.16 and was given to statement number 33: "We have a supportive climate for new ideas – people don't have to leave the organization to make them.

Linkages: This dimension ranked second among the five audit dimensions. It implies that this dimension is managed relatively well. The highest score in this dimension was 4.7 and was given to statement number 4: "There is a strong commitment to training and development of people". This score and other statements scores showed that the company is committed to training its employees. The organization invests in its employees worldwide in terms of training and education, both in-house and in partnership with academic institutions in order to achieve its vision. However, the lowest score was 3.86 and was given to statement number 14: "We work well with universities and other research centers to help us develop our knowledge". This problem is more emphasized by knowing that this statement was given the lowest score among all forty statements in the 5 dimensions. This is most probably due to the fear of leaking their projects to others.

#### Innovation Audit by Job Titles

The Technical Services Lab (TSL) employees were classified according to their job titles: scientists, engineers, administrators and technicians. The results showed that scientists are the most satisfied group with how well the company manages innovation. They gave the highest scores in matters related to strategy, process and learning, with average scores of 5.03, 4.93 and 5.48 out of 7 respectively. Engineers are the second most pleased group about how well the company manages innovation. They gave the highest score to the innovative organization dimension among the four employee groups with a score of 4.78. Administrators gave the highest score of 4.86 for linkages dimension, their view to the strategy dimension is better than engineers and technicians. Technicians on the other hand, are the least satisfied group with the way the organization manages innovation. They gave the lowest score among the four groups in strategy, innovative organization and learning.

#### Comparing the Company's Innovation with Chinese and Brazilian Companies

The audit tool (Tidd and Bessant, 2009) was implemented in some organizations in different countries. Ye and Zhou (2009) and Pang and Qu (2010) applied the questionnaire on Chinese firms. Lima (2011) also used the questionnaire for auditing Brazilian firms. The scores given by the Saudi company are compared to the ones received by companies in China and in Brazil because according to the International Monetary Fund's (2012) report, Saudi Arabia, China and Brazil are considered developing economies. Table 4 shows the scores given by the Saudi company, two Chinese companies (Huangong Tools Company and Guizhou YiBai Pharmaceutical Co. Ltd) and two Brazilian companies (Poly Easy and Arinos).

The comparison is made in order to examine how well the Saudi company manages innovation in relation to other companies based in other developing countries such as China and Brazil. The comparison showed that the Saudi company is not managing innovation as well as the other overseas companies. It didn't score highest in any of the innovation dimensions. Among the five companies, it ranked the lowest in the strategy and innovative organization dimensions. It ranked forth out of the five companies in process, linkages and learning. The Brazilian company Poly Easy is doing best in strategy, linkages and learning dimensions, while the Chinese company Huangong Tools is leading in the process and innovative organization dimensions. The percentage differences between the Saudi company's score and each of the foreign companies' was also calculated for each of the five dimensions and are given in Table 4.

The results revealed that the largest difference was between the Saudi company and "Huangong Tools" with a difference of 25.79% in the process aspect. The smallest difference on the other hand, was between the Saudi company and the Brazilian company Arinos in the process dimension by 0.43%. The Saudi company however was doing better than some companies in various aspects as indicated by the negative sign in the difference Difference between the Saudi Company and Guizhou YiBai in the process dimension and Difference between the Saudi Company and Arinos in the linkages and learning aspects. Its score was higher than Arinos by 10% in the linkages aspect and by 0.57% in the learning aspect. It also obtained 6.7% higher score than Guizhou YiBai Pharmaceutical Co. in the process aspect.

Table 4: Percentage Differences Between Innovation in the Company and Four Other Companies

Company	Strategy	Processes	Innovative Organization	Linkages	Learning
The Saudi Company	4.52	4.57	4.53	4.71	5.04
Score as a percentage (%)	64.57	65.29	64.71	67.29	72.00
Huangong Tools Company (Chinese firm)	4.75	6.38	5.50	5.18	5.32
Score as a percentage (%)	67.86	91.07	78.57	74.00	76.02
Difference between the Saudi Company and Huangong Tools (%)	3.29	25.79	13.86	6.71	4.02
Guizhou YiBai Pharmaceutical Co. Ltd (Chinese firm)	4.90	4.10	5.10	5.40	5.30
Score as a percentage (%)	70.00	58.57	72.86	77.14	75.71
Difference between the Saudi Company and Guizhou YiBai (%)	5.43	-6.71	8.14	9.86	3.71
Poly Easy (Brazilian firm)	5.60	5.50	5.30	5.50	5.60
Score as a percentage (%)	80.00	78.57	75.71	78.57	80.00
Difference between the Saudi Company and Poly Easy (%)	15.43	13.29	11.00	11.29	8.00
Arinos (Brazilian firm)	5.50	4.60	4.90	4.00	5.00
Score as a percentage (%)	78.57	65.71	70.00	57.14	71.43
Difference between the Saudi Company and Arinos (%)	14.00	0.43	5.29	-10.14	-0.57

*This table shows the percentage differences between the Saudi company's score and each of the foreign companies' for each of the five dimensions.*

The average scores of the two Chinese companies and the average scores of the two Brazilian companies are calculated and compared with the Saudi company's scores as shown in Table 5. The comparisons showed that the Chinese companies have the highest scores in processes, innovative organization, linkages and learning dimensions whereas the Brazilian companies received the highest score in the strategy dimension. The Saudi company, on the other hand, ranked lowest in all dimensions. The percentage differences between the Saudi company score and the Chinese and Brazilian scores were also calculated for each of the five dimensions and are also given in Table 5. The results showed that the differences are small and range between 0.57% and 14.71%. The comparison between the Saudi and

Brazilian companies showed that the greatest gap of 14.71% was in the strategy dimension. Whereas, the smallest gap of 0.57% occurred in the linkages dimension. The comparison between the Saudi and Chinese companies was also analyzed and showed that the greatest gap of 11.04% was in the strategy dimension. Whereas, the smallest gap of 3.87% occurred in the linkages dimension. The results also revealed the Saudi company has similar strengths and weaknesses as the average of the Chinese firms. They both showed strength in learning and weakness in strategy. While the Brazilian firms show strength in the strategy and weakness in the linkages dimensions.

Table 5: Comparison Between The Company's Innovation And The Averages Of The Chinese And Brazilian Companies

Company	Strategy	Processes	Innovative Organization	Linkages	Learning
Saudi Company	4.52	4.57	4.53	4.71	5.04
Score as a percentage (%)	64.57%	65.29%	64.67%	67.29%	72.00%
Average of Chinese Firms	4.83	5.24	5.30	5.29	5.31
Score as a percentage (%)	68.93%	74.82%	75.71%	75.57%	75.87%
Average of Brazilian Firms	5.55	5.05	5.10	4.75	5.30
Score as a percentage (%)	79.29%	72.14%	72.86%	67.86%	75.71%
Average difference (Saudi and Chinese firms)	4.36%	9.54%	11.04%	8.29%	3.87%
Average difference (Saudi and Brazilian firms)	14.71%	6.86%	8.19%	0.57%	3.71%

*This table summarizes the percentage differences between the Saudi company score and the Chinese and Brazilian scores.*

## CONCLUSIONS

The objective of this paper is to audit the management of innovation in one of the largest Saudi petrochemical companies. An audit survey was carried out which consisted of five dimensions: strategy, processes, innovative organization, linkages and learning. The results showed that those most satisfied with the company's innovation management are researchers, while technicians are the least content. The results further revealed that there is top management commitment and support for innovation. One of the auditing dimensions, learning, is well managed and stands out as the highest ranking among the five dimensions. The company is committed to the development of its employees worldwide. In addition, the innovation system is flexible enough to allow specified small projects to be fast-tracked.

On the other hand, the innovative organization and strategy dimensions ranked lowest. The strategy dimension is impacted negatively by the company's inadequate analysis of new technological and market developments. Completing innovative projects on time and within budget also received a lower rank. Moreover, the company's structure does not make provision for rapid decision-making. The audit results of the Saudi company were compared with 2 companies in Brazil and 2 in China, it was revealed that the Saudi company lags behind the foreign companies regarding the way it manages innovation. Special attention is needed in aspects related to strategy and innovative organization dimensions. However, some of the gaps between the Saudi company and the Chinese firms and the Brazilian firms could easily be closed. For example, the Saudi company's results are almost equal to the average of the two Brazilian firms regarding the linkages dimension with only 0.57% difference.

**BIOGRAPHY**

Dr Refaat Abdel-Razek is Professor and Director of the Technology Management Program, College of Graduate Studies, Arabian Gulf University, Bahrain. He obtained his PhD in Engineering Management from Loughborough University, UK. He has more than sixty five papers published in several prestigious international journals and conferences; some are on the Top Ten download lists of the Social Science Research Network (SSRN) <http://ssrn.com/abstract=2148065>.. He is also a reviewer in some of these journals, and a consultant to a number of international organizations. He has supervised and accomplished more than fifty PhD and MSc theses. He can be contacted at Arabian Gulf University, email: [refaathar@agu.edu.bh](mailto:refaathar@agu.edu.bh)

Doha AlSanad obtained her MSc in Technology Management from the Arabian Gulf University and is currently working in ARAMCO, Saudi Arabia. She can be contacted at Arabian Gulf University, email: [dohass@agu.edu.bh](mailto:dohass@agu.edu.bh)

# MAPPING TECHNOLOGICAL INNOVATION: METHODOLOGY AND IMPLEMENTATION

Refaat H. Abdel-Razek, Arabian Gulf University, Bahrain

Duha S. Alsanad, Arabian Gulf University, Bahrain.

## ABSTRACT

*Technological innovation is the underlying driving force of economic development, both in a nation's economy and in an organization's competitiveness. The first objective of this paper is to map the innovation space available in the Saudi Arabian Basic Industries Corporation, one of the largest petrochemical companies in the Middle East. The second is to suggest modifications to an innovation mapping tool and apply the modified tool to the same company. First, data were collected over a three-year period. They were analyzed and mapped using the 4Ps innovation mapping model. Second, modifications were suggested to eliminate the weaknesses associated with this model. The results showed that the company introduced a total of forty four innovations that were all incremental; the majority fell in the product and process. The implementation process of the 4Ps model showed that it has deficiencies in some cases, due to not having clear dividing lines between pure and combined innovations. It does not allow for mapping innovations that combine product-with-process or position-with-paradigm innovations; furthermore, radical and incremental innovations cannot always be clearly positioned. A modified model was developed that overcomes these weaknesses. A modified model was developed and successfully implemented to map the innovation space in the same company.*

**KEYWORDS:** Innovation Management, Innovation Assessment, Innovation Measurement, Mapping Innovation, Modeling Innovation.

## INTRODUCTION

Over the past few years, technological innovation management has become one of the most attractive and promising areas of studies. Nieto (2004) confirmed this fact as the number of academics who oriented their research towards this field of study has increased, the number of new scientific journals concentrating on the study of innovation has also increased and every year there is consolidation of different academic associations concentrating on innovation. Governments need to pay attention to innovation, particularly in the developing world, because it is the key driver of economic development and is the key instrument in overcoming major global challenges. In spite of the relatively high expenditure on education in some Arab countries such as Saudi Arabia, whose expenditure on education as a percentage of GDP was 5.6% in 2008 (UIS, 2009), the literature shows that Saudi Arabia lags far behind developed countries in terms of science and technology (S&T): most S&T indicators reveal weak performance (Nour, 2005).

Moreover, a UNESCO report (2010) noted that there is weak co-ordination between public and private funding for R&D in the Arab states and there is often insufficient capacity within the R&D system to absorb fresh graduates seeking to work in the research fields, especially female graduates. Funding for research and development in the Arab countries remains far below that of most other regions (UNESCO, 2010). Table 1 demonstrates the expenditure on R&D as a percentage of their GDP in some Arab states and other countries from 2007 to 2009 (The World Bank, 2012). It shows that in 2009 expenditure on R&D as a percentage of GDP in Saudi Arabia and Egypt was 0.08 and 0.21 respectively, while in Israel and Finland it was 4.27 and 3.96 respectively. The first objective of this paper is to map innovation space in one of the largest petrochemical companies in Saudi Arabia in order to determine the dominant types of technological innovation produced by the company and to make recommendations for improving innovation. The second objective is to modify and improve a current model for mapping innovation.

Table 2: R&amp;D Expenditure as Percentage of GDP In Selected Countries (The World Bank, 2012)

Country	2007	2008	2009
Egypt, Arab Rep.	0.26	0.27	0.21
Finland	3.47	3.72	3.96
France	2.08	2.12	2.23
Israel	4.80	4.66	4.27
Saudi Arabia	0.05	0.05	0.08
Sweden	3.40	3.70	3.62

*This table shows R&D expenditure as percentage of GDP in some selected countries*

## INNOVATION CLASSIFICATIONS

Innovation is classified according to its degree of novelty, continuity, form and many other characteristics. There are different degrees of novelty associated with innovation. Previous studies (Dosi, 1982; Dewar & Dutton, 1986) divided innovation into two categories, radical and incremental. Radical innovation is extremely risky and uncertain, which is why it is harder to explore; it is, however, seen as a source of long term growth. Incremental innovation on the other hand is easier as it is a continual process of making additional improvements. Dosi (1982) and Tushman & Anderson (1986) distinguished between innovations according to whether they affect existing ways of doing things (continuous) or develop new products, services or processes, individually or in combination (discontinuous). Continuous innovations happen in stable routines under clear rules, whereas discontinuous innovations are competence-destroying and very ambiguous. Innovation is also classified according to its form (OECD & Eurostat, 2005; Tidd & Bessant, 2009). Both publications classified innovation into four primary forms. They both named two of the forms as ‘product’ and ‘process’ innovations; the other two forms differ, the former categorized them as organizational and marketing, and the latter as position and paradigm.

### Mapping Innovation

Mapping is defined as “a graphic pictorial tool to arrange key concepts” (Bradshaw & Lowenstein, 2007). Bailey and Martin (2009) state that visual models help visualize how something functions within the real world by providing some graphic or visual outputs. The literature has several tools with different objectives that are used to map innovation. Some of these tools are used to check the state of innovation across the world such as (McKinsey, 2009; O’Rourke, 2007); some are used to analyze innovation performance, such as the one proposed by Cutter (2012), while others are used to determine the dominant types of innovations presented by organizations, like the tool proposed by Sniukas (2010) and Tidd & Bessant (2009). Francis & Bessant (2005) introduced an approach to identify innovation types.

They suggested a diamond shape model to map innovation space which classifies innovation into four types that all start with a “P” and called them the 4Ps of innovation, these are: Product, Process, Position and Paradigm. Francis and Bessant (2005) tested the framework in five different companies in the pharmaceutical industry and found that it was useful. As the diamond shape model only allowed mapping innovation activities under a steady state of “do what we do, but better”, Tidd, Bessant & Pavitt (2005) changed its shape into a circular model to show the degree of novelty of an innovation in addition to the 4Ps classification. The mixture of the degree of novelty with the 4Ps of innovation resulted in a map of innovation space. The area indicated by the circle in Figure 1 is the potential innovation space within which an organization can explore. The model helps organizations identify where they currently have innovations and where they might move in the future. It also helps explore different types of innovation instead of focusing on only one or two types. Another useful way to apply this concept is by comparing maps for different organizations competing in the same market, to determine where they might find innovation opportunities by looking at unexplored spaces. The framework has since been mentioned in several books and studies.

## Mapping Innovation in the Saudi Arabian Basic Industries Corporation

### Petrochemical Industry in Saudi Arabia

Petrochemicals are making their impact worldwide as they are an essential part of our everyday lives. There is a wide range of petrochemicals products, such as cables, book covers, rubber, plastic and a multitude of everyday items. Two decades ago, Saudi Arabia appeared an unlikely location for a major industrialization drive (Ramady, 2010). Today the Saudi economy is controlled by two key sectors, oil and petrochemical (AlRajhi Capital, 2010). A report published by the Oxford Business Group (2007) stated that Saudi Arabia is one of the largest petrochemical-producing countries in the world, and that in recent years it has managed an output almost equal to China's. Another report stated that Saudi Arabia is supplying over one hundred countries and accounting for about seven percent of the worldwide supply of basic petrochemical products (SAMBA Financial Group, 2009). An AlRajhi Capital report (2010) declared that, nowadays, the petrochemical industry is a crucial driver in the Saudi market as it accounts for 5% of Saudi GDP and 34% of the value of the stock market.

Figure 1: Mapping Innovation Model 4Ps (Tidd & Bessant, 2009)

Figure 1 shows the traditional illustration of the potential innovation space within which an organization can explore.

### Saudi Arabian Basic Industries Corporation (Sabic)

SABIC is a public company based in Riyadh and was established in September 1976 to produce commodities such as chemicals, polymers and fertilizers for export, in order to create new industries to help Saudi Arabia to diversify and develop. The Saudi Arabian government owns 70% of its shares, and the remaining 30% are held by private investors in Saudi Arabia and other countries of the Gulf Cooperation Council (SABIC, 2011). The company's main manufacturing facilities in Saudi Arabia are located in two industrial cities: Al Jubail on the east coast and Yanbu on the Red Sea coast. According to a report by Oxford Business Group (2007), SABIC is often called the second pillar of the Saudi Arabian economy, after Saudi Aramco. It is now a regular on the Fortune Global 500, Fortune Magazine's list of the 500 largest world corporations by revenue, and ranked 210<sup>th</sup> in 2011, with revenue equal to around \$41 billion (Cable News Network, 2011). A report by SAMBA Financial Group (2009) indicated that SABIC is the largest listed company in the Middle East. Another report stated that SABIC alone represents 21.6% of the market capitalization of the Saudi stock market and 64% of the market value of the petrochemicals sector (AlRajhi Capital, 2010). Today, the company operates in more than 40 countries with more than 33,000 employees across the world. It has ownership rights or licenses to about 3,760

active patents, and 3,394 pending patent applications around the world. In one year it has submitted more than 18 papers for publications or to be presented in conferences (SABIC, 2009). SABIC has received many awards for its innovativeness. One of these was from the European Polycarbonate Sheet Extruders (EPSE), which honored SABIC Innovative Plastics with its 2009 Best Project and Innovation Award for the contribution of SABIC's technology to Dublin's Aviva Stadium.

#### Data Collection

The company consists of six Strategic Business Units (SBUs) organized by products: Chemicals, Performance Chemicals, Polymers, Innovative Plastics, Fertilizer and Metal. The data needed for the mapping model for each of the SBUs for three years, from 2008 to 2010, were gathered from the company's website and from primary sources such as the company's reports and accounts (SABIC, 2008, 2009, 2010 and 2012). The data were then analyzed and categorized into the four forms of innovation for the company and for each SBU. This was done for each of the three years from 2008 to 2010 (AlSanad, 2012).

#### Mapping Overall Company Innovation

The innovations by all the six SBUs, from 2008 until 2010 are mapped in the 4Ps model in Figure 2. The total number of innovations is forty four. The model shows that the company's focal area was in products, with twenty nine out of forty four innovations. Point number (27) is both a product and a position innovation, which is why it was positioned in the area between them. Likewise, point 7 is both a process and a product innovation, but it was positioned in the process area because the model does not have an area that combines these two types. It is clear from Figure 2 that all the innovations made by the company are incremental, which indicates that the company lacks the necessary capabilities to undertake radical and revolutionary innovations that are risky, yet can change the rules of the game and are a source for long term growth. The trend of the company's innovations was also investigated. The results showed that the number of innovations increased by 100% from 2008 to 2009, and by only 25% from 2009 to 2010. The breakdown of all innovations was analyzed. The results indicated that the strength of the company lies in product and process innovations, as 64% of its innovations are in the product area, 32% in the process area, 2% fall in the area between product and process, and the remaining 2% are a combination of product and position innovations. There are, however, weaknesses in the position and paradigm innovation, as none of the innovations fell into these areas.

Figure 2: Mapping SABIC Innovation (2008 To 2010)

*This figure shows the mapping of the innovations by all the six SBUs, from 2008 until 2010 in the original 4Ps model.*

### Mapping Innovations of the Company's SBUs

The innovations by each of the company's six SBUs were analyzed and mapped. The results showed that most of the innovations were produced by the two units which specialize in plastics, Polymers and Innovative Plastic. These two SBUs each produced around 36% of the company's total innovations. Product innovations dominated, followed by process. The Chemicals Unit ranked third in producing innovations, with a total of five during the three years; 80% of its innovations fell in the process area, and 20% fell in the area between product and position. The Metals Unit came slightly behind the Chemicals Unit, producing only three innovations that all fell in the product area. The Performance Chemicals and Fertilizers Units produced the least number of innovations, with only four in the three years. The innovations of the Performance Chemicals were in the process area, whereas the Fertilizers produced one in product and the other in process innovation. The innovation trend was assessed for each SBU in each of the three years from 2008 to 2010. The results showed a steady increase in the performance of both the Chemicals and Polymers Units. The Innovative Plastic Unit ranked best among the six units in the first two years in terms of the number of innovations produced. However, the number of its innovations decreased in the following year. The Metals Unit performance was stable during the three years, as it presented one innovation each year. The SBUs with the weakest performance were the Performance Chemicals and Fertilizers, as they only produced two innovations each during the three years. The Performance Chemicals contributed to the company's innovation portfolio with one innovation in 2009 and another in 2010, while the Fertilizers presented two in 2008 and none in 2009 and 2010.

### Suggested Modified Model For Mapping Innovation

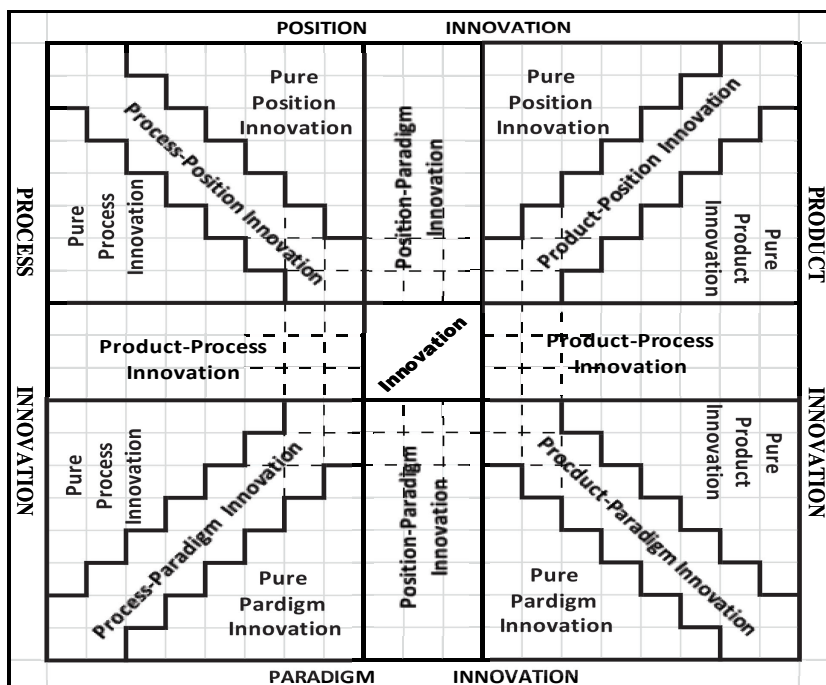

The original 4Ps model has some weaknesses that were revealed in the process of the mapping explained above. For example, with reference to Figure 1, the innovation presented as point number 7 is both a process and a product innovation, but it was positioned in the process area because there is no location for these types of innovation and the model does not have an area that combines these two types. Likewise, point 27 is both a product and a position innovation, so it was placed between them since there is no defined location for these types of innovation on the model. The modified model is used to map the innovation of SABIC using the same data collected during the three years 2008-2010. A square-shaped

model was designed using Excel. It is divided into ten areas and called 10Ps. It has four pure types of innovation: Product, Process, Position and Paradigm. In addition, six clearly defined areas were created, each representing a combination of two types of innovation: Product-Process, Product-Position, Product-Paradigm, Process-Position, Process-Paradigm and Position-Paradigm.

Figure 2 illustrates the 10Ps areas of innovation. The 10Ps modified model overcomes the shortcomings of the original one by having the following three features. First, it is easy to apply, as it is used through a simple computer program that asks users to enter the innovation, its number and type into a table and then automatically places them in their matching spaces on the model. Second, the 10Ps model allows mapping a combination of Product-Process innovations and Position-Paradigm innovations. The 4Ps does not enable the user to map Product-Process or Position-Paradigm innovations. The 4Ps model does not have an area that combines these two types while the 10Ps model does. Third, in the modified 10Ps model, it is easy to distinguish the degree of novelty of an innovation by looking at its background color instead of looking at the axis. If the color is black it is radical, otherwise it is incremental. Note that the confusion regarding the degree of novelty that might arise in some cases when using the 4Ps model is overcome.

Figure 2: The Modified 10ps Mapping Model

*This figure illustrates the modified model (!)P with ten areas of innovations.*

## CONCLUSIONS

An innovation mapping model, known as the 4Ps, was used to map innovation in one of the largest Saudi petrochemical companies (SABIC). The implementation process of the 4Ps model showed that it has deficiencies in some cases, due to not having clear dividing lines between pure and combined innovations. It is weakened by the fact that it does not allow for mapping innovations that are combined product-with-process or position-with-paradigm innovations; furthermore, radical and incremental innovations cannot always be clearly positioned. A modified model was developed that overcomes these weaknesses and makes the implementation easier with the help of a computer program. The modified model was tested and used to map the innovation space in the same company. It succeeded in eliminating

the confusion caused by the deficiencies of the original model. It is concluded that the modified mapping tool is valid, successful and useful.

The results showed that the company produced a total of forty four innovations, mainly in the areas of product and process, with 60% and 35% of total innovations respectively. However, the company has neglected position and paradigm innovations. Furthermore, all innovations fall in the incremental area with none in the radical. A major increase in the number innovations occurred in 2009, as total innovations increased by 100% of what they were in 2008. However, the number decreased by 25% in 2010 compared to 2009. Mapping of innovations was also done for each of the Company's six SBU's. The results revealed that the most innovative SBUs were the Polymers and Innovative Plastic. Together they contributed over 70% of total innovations. The Chemicals and Metals units participated with 11% and 6.82% of total innovations respectively. The Performance Chemicals and Fertilizers units produced together less than 10% of the total innovations. Product innovations were dominant as they accounted for 63%, 82% and 100% of the Polymers, Innovative Plastic and Metals SBUs' innovations respectively. The Chemicals and Performance Chemicals SBUs focused on process innovation, which accounted for 80% and 100% of their total innovations respectively.

## BIOGRAPHY

Dr Refaat Abdel-Razek is Professor and Director of the Technology Management Program, College of Graduate Studies, Arabian Gulf University, Bahrain. He obtained his PhD in Engineering Management from Loughborough University, UK. He has more than sixty five papers published in several prestigious international journals and conferences; some are on the Top Ten download lists of the Social Science Research Network (SSRN) <http://ssrn.com/abstract=2148065>. He is also a reviewer in some of these journals, and a consultant to a number of international organizations. He has supervised and accomplished more than fifty PhD and MSc theses. He can be contacted at Arabian Gulf University, email: [refaathar@agu.edu.bh](mailto:refaathar@agu.edu.bh)

Doha AlSanad obtained her MSc in Technology Management from the Arabian Gulf University and is currently working in ARAMCO, Saudi Arabia. She can be contacted at Arabian Gulf University, email: [dohass@agu.edu.bh](mailto:dohass@agu.edu.bh)

# **EXPLORING ENTREPRENEURSHIP IN AFRICA: KENYA AND NAMIBIA**

Wilfred Isak April, University of Namibia

## **ABSTRACT**

### **INTRODUCTION AND HISTORICAL BACKGROUND**

Africa seems to be poised for continuing growth, predicated at 5.25 percent, faring better than Europe, but it has one chief enemy in conflict and fragility. This is the view of the International Monetary Fund. The IMF Chief Christine Lagarde said in early January 2013, that emerging economies such as Ivory Coast “are the engine drivers for world economic growth”. However, security seems to be too fragile in a number of African countries, especially in West Africa. African nations are faced with instability due to conflict, and if this continues people will not have the confidence or courage to invest in their own future, neither will the foreign investors.

Despite the issues mentioned above, there is still hope for this continent, and the authors of this paper deemed it critical to explore the entrepreneurial initiatives in East and Southern Africa, namely between Kenya and Namibia respectively. This paper will first look into the historical background of Kenya and Namibia; thereafter the changing way of life amongst indigenous people and what entrepreneurship means in the indigenous context. Thereafter the justification and the key research problems will be discussed; followed by the review of related literature, methodology and conclusions.

#### Changing Way Of Life Among Indigenous Communities

For centuries, some indigenous people of Kenya and Namibia lived under a clan based communal system. During recent years indigenous people in these nations started to embrace private ownership of their own land resources. This is a significant change for African people as it affects their semi-nomadic way of life, which is very similar with the movement of livestock as seasons change. As we are aware land is costly and today it is divided into group ranches, schemes and also privately owned in small parcels. With independence of the African nations there are new land management laws and these laws restrict the movement of indigenous people; which they were able to do freely before land was owned privately.

Prior to privatization indigenous people were free to roam around throughout the land trying to find pasture. In the African tradition one cannot deny anyone access to natural resources such as grazing land and water. However, the introduction of the socialist approach to life often puts some African groups in conflict with their neighbors. It is the understanding of the African people, when Mother Nature takes away the rains; everyone is expected to understand the concept of caring and sharing, especially for protecting their wealth – livestock. At times Privatization of land resources in African cultures is seen as a source of all problems people who are wealthy seem to accumulate most resources, thus limiting access to water and grazing for less fortunate communities. Although the revenue generated from tourism is supposed to benefit communities, at times it fails it fails to trickle down to the bottom. If we carefully study the parks in Kenya and Namibia, priority is given to wild animals, thus reducing grazing for animals. For most indigenous farmers they have realized that it is difficult to keep livestock as a main source of income, and farmers are looking for ways to supplement their wealth. Most indigenous farmers both in Kenya and Namibia consider settings up their small micro-enterprises wither in retail or commercial farming, by selling milk or karakul pelts.

### Justification Of This Research

Both the Namibian and Kenyan governments places a lot of emphasis on the development of micro-enterprises as a tool that will enable the respective economies to eradicate poverty. Both governments are trying the best they can to roll out national development initiatives and programmes that could improve the livelihoods of the people through entrepreneurial initiatives. It is very important that the government of Kenya and Namibia always seek opportunities for their people; while ensuring that indigenous people remain intact with their cultures, as only through culture they can improve their livelihoods completely.

### The Key Problem

The burning problem facing the nations of Kenya and Namibia is poverty resulting from high levels of unemployment and development. The author can attest to this fact. As this study is been African nations are fearful about the outcome of the election results in Kenya. In southern Namibia is weekly faced with incidences of “passion killing”. People engage in activities because they fail to identify entrepreneurial opportunities, which will make them productive citizens of the main economy. Thus African people are in dire need of entrepreneurial education which will enable to take part fully into the global economy.

## **REVIEW OF RELATED LITERATURE**

According to Desta & Coppock (2003) the Maasai people of Kenya are perhaps the most studied pastoral group in East Africa. The transition from pastoralism to entrepreneurship has not really received the attention it deserves. It can be noticed that there are strong economic links between pastoral households and local towns, in the form of wage employment or petty trade, appeared to be limited and reflected in general isolation of the pastoralists from the development process.

## **METHODOLOGY**

This paper covered 15 (fifteen) rural Kenyan entrepreneurs in the Limuru region and 15 (fifteen) rural entrepreneurs in southern Namibia. This is an effort to understand indigenous enterprise characteristics in relation to what are considered normal attributes of Small and Micro Enterprises. A triangulation of methods will be applied for this paper name; in-depth interviews focus groups and questions.

## **RECOMMENDATIONS AND CONCLUSION**

This paper gave an introduction to Namibian and Kenyan entrepreneurs and their involvement in community. With advanced training and skills development initiatives the nations can become entrepreneurial nations.

# AN EMPIRICAL STUDY OF THE IMPACT OF LOCAL GOVERNMENT REGULATION ON ENTREPRENEURSHIP

Yi Sun, California State University San Marcos

## ABSTRACT

*The goal of this paper is to evaluate the differences of local government regulations of startup companies and their impact on entrepreneurship and propose a framework to improve public services to facilitate entrepreneurial activities. Currently, California's unemployment rate is 9.8 percent, ranking one of the highest in the U.S. One approach to help recovery in job market is to encourage startups to provide employment opportunities. However, aspiring entrepreneurs are often hampered by policy obstacles and regulation's ambiguities due to lack of resources for professional assistance and financial support. They are required to comply with various complicated government business regulations.*

*To start a new business, they have to study various regulations and visit multiple agencies to obtain permits and licenses, pay fees, prove insurance, verify certifications, conform to labor and health code, and etc. If they plan to provide contract services to local or state government, more compliances and screenings will be required. To make things worse, different cities and towns have different requirements and procedures in addition to those required by the state. Opening the same business in different cities may require going through different applications processes and meet different requirements unique to cities where the applications are filed. This create extra burden on the entrepreneurs to figure out the feasibilities of doing business in different municipalities. Government has been regulating startups largely through traditional venues, such as publications, telephone and in-person services.*

*Academic researchers and industry leaders have long been advocating for electronic-government solutions to simplify the approval process by offering most, if not all, transactions online. However, our earlier research indicated that state and local public information systems are especially lacking in this area. Their online presence is typically to catalog regulations and policies. When they do offer online transactions, these transactions are limited and buried in different websites from different agencies. Furthermore, many of their online services are generic and one-size-fits-all despite the fact that businesses in different industries need different processes to get approved. In addition, there is a lack of integration of the state and local information systems that afford a convenient, one-stop shopping experience for entrepreneurs. There have been many researches on the relationship between government policies and the entrepreneurship/small business activities. However, few focus on the differences of local regulations and information infrastructures and their impact on startups in different industries.*

*We will first identify the differing policies and licenses required for different business sectors in different municipalities. It will also evaluate the level of readiness of public information systems in helping entrepreneurs manage these complexities. In addition, it will investigate the differing local regulations and compliances to sustain the businesses once started. These data will be obtained through empirical studies may suggest that local governments have very different policies and regulations and their information systems are not ready to assist entrepreneurs to start business in their jurisdictions, as our preliminary investigation suggested, we will propose a framework of customized public services through electronic information systems to accommodate different policies and regulations in all local municipalities. They can be implemented to allow easy comparison of the public services and procedures in different municipalities.*

# THE CONTINUING CONGRESSIONAL CALENDAR EFFECT ON MARKET PERFORMANCE AND VOLATILITY

Kevin Krieger, University of West Florida  
R. Daniel Pace, University of West Florida

## ABSTRACT

This paper principally investigates if the effect of congress on stock returns has persisted since an association was noted in the popular press (Singer, 1992) and formally investigated (Lamb, Ma, Pace, Kennedy, 1997). We then further extend the study by testing the VIX, often referred to as the “fear index,” for congressional effects. We find evidence that the congressional calendar does indeed persist and is partially detectable in the VIX.

**JEL:** G14

**KEYWORDS:** Market Efficiency, Risk, Congressional Calendar

## INTRODUCTION

This paper principally investigates if the effect of congress on stock returns has persisted since an association was noted in the popular press (Singer, 1992) and formally investigated (Lamb, Ma, Pace, Kennedy, 1997). We then further extend the study by testing the VIX, often referred to as the “fear index,” for congressional effects. We find evidence that the congressional calendar does indeed persist and is partially detectable in the VIX.

## DATA AND METHODS

All data are from publicly available sources. S&P 500 data are from Yahoo! Finance. Congressional calendar data are from the Library of Congress. We consider our analyses separately for meetings of the United States House of Representatives (“House”) and the United States Senate (“Senate”). VIX data are from the CBOE website. Our sample period is from 1990-2011 as our study is partly focused on the link between Congressional sessions and the VIX volatility (or “fear”) index, and calculations of the VIX were first made in 1990. For portions of the analysis we consider the proportion of the next 30 calendar days that the House or Senate will meet as the VIX calculation is based on characteristics of options on the S&P 500 index which will expire in the next 30 days.

We first present summary statistics regarding Congressional meetings by session (year) and market performance relative to Congress’ status as either in session (open) or in recess (closed). Results are shown separately for the House and the Senate. We provide a variety of basic statistics for S&P 500 performance, as a proxy for the market, based on Congress’ status. We provide results for the entirety of observation days in our sample (5,547 days) as well as after we remove the top and bottom 1% of S&P 500 returns days from the sample. We next conduct regression analyses to determine whether evidence exists for the proposition that market returns are driven by the performance of the market when Congress is in session or in recess. We also acknowledge that Congress is often in recess for a large portion of the month of January, especially the opening trading days of the month which are commonly believed to drive the oft-mentioned “January Effect.”

Finally, we seek to determine whether the VIX index, which measures the anticipated volatility of the S&P 500 over the next 30 calendar days, is influenced by the proportion of those calendar days that Congress will be in session

Initial Results (tables 1, 2, 4, 5 Omitted For Conference Abstract)

Table 3: Market Return Regression Results For US House Sessions

Panel A: Relationship Between Annual Market Return and Returns in Recess		
$AnnRet_m =$	$\beta_1 OutRet +$	
where OutRet is the market return when House is in recess		
$AnnRet_m = 0.007$	$\beta_1$	$OutRet$
$(-0.24) \quad (2.31)$		
F-value = 5.33 p-value = 0.0318		
Panel B: Relationship Between Annual Market Return and Returns in Session		
$AnnRet_m =$	$\beta_1 InRet +$	
where InRet is the market return when House is in session		
$AnnRet_m = 0.032$	$\beta_1$	$InRet$
$(1.77) \quad (0.83)$		
F-value = 0.69 p-value = 0.416		

This table presents regression results linking truncated market returns (removing high and low 1% S&P 500 return days, each year) and periods where the US House is in and out of session. In Panel A we regress each year's annual return,  $AnnRet$ , on the year's return only on days where the House is in recess,  $OutRet$ . In Panel B we regress each year's annual return,  $AnnRet$ , on the year's return only on days where the House is in session,  $InRet$ . t-statistics are presented in parentheses. Market returns are those of the S&P 500. Only days with open US trading markets are considered.

Table 6: Explaining Volatility (Fear Index) With Upcoming Congressional Status

Panel A: Relationship between next 30-day House sessions and VIX	
$VIX = 19.98 + 0.71HouseProp$	
$(52.70) \quad (0.76)$	
Panel B: Relationship between next 30-day Senate sessions and VIX	
$VIX = 19.48 + 1.87SenateProp$	
$(49.31) \quad (2.07)$	

This table presents regression results linking the volatility index  $VIX$ 's level on a given day ( $VIX$ ) to the proportion of the next 30 days in which the House of Representatives ( $HouseProp$ ) or Senate ( $SenProp$ ) are in session. This proportion is utilized as  $VIX$  is constructed based on ratios of S&P 500 futures contracts prices over the next 30 days. Results are truncated to exclude  $VIX$  observations in the highest and lowest 1% of observations. Newey-West standard errors are utilized to control for the overlapping data problem inherent to using daily observations. The sample period is from 1990-2011. t-statistics are presented in parentheses. Only days with open US trading markets are considered as observations because  $VIX$  will change only when markets are open.  $VIX$ , however, is based on futures contracts covering the next 30 calendar days, not trading days, thus the appropriate independent variable is a proportion based on calendar days.

## CONCLUSIONS

Our initial findings confirm that the congressional effect continues as a detectable variable in US stock returns. Further we find evidence, at least for the Senate, that the congressional calendar is detectable in the  $VIX$ . At this time, we continue to find support that when congress is out of session there is a reduction in uncertainty, favoring market returns.

## EXPORT CAPACITY: MULTI-CRITERIA-BASED PRIORIZATION USING FUZZY LOGIC

Jorge Aníbal Restrepo, Universidad Autónoma de las Américas

Santiago Medina Hurtado, Universidad Nacional

Juan Gabriel Vanegas, Universidad Nacional

### ABSTRACT

*Measure the firms export capacity and their potencial for approach to international markets is not an easy job. The globalization tendency and searching new markets currently have increased their concern and importance in order take decisions which improve the competitive position. This analysis sometimes is difficult to achieve because there are multiple factors interlinked represented by tangible and intangible factors, subjective or quantative variables and for lack data and measurements. In this sense, we propose a logical framework integrating different qualitative variables that define export capacity as human talent, infrastructure, innovation strategies, the free trade agreements, marketing strategies and finance. Then we propose a Fuzzy Inference System to modelling the determinants of export success considering the most relevant qualitative and quantitative variables within each of the components expressed. The model proposed has also been illustrated through a case study from the textile-clothing cluster in the city of Medellín, Colombia.*

**JEL:** G31, D22, D81

**KEYWORDS:** Fuzzy Logic, Export Capacity, International Trade, Empirical Analysis

### INTRODUCTION

Colombia is widely acknowledged for its significant strengths as producer of textiles and clothing. This industry represents 8% of industrial Gross Domestic Product (GDP) and 3% of national GDP, contributes with 13% of manufacturing exports, and generates 24% of sector employment. The textile and clothing industry comprises approximately ten thousand factories located in seven cities, especially in Medellín with about 40%, which puts it at the top of the textile industry in Colombia, generating more than 6% of sectoral GDP (Inexmoda, 2009). The poor effectiveness that the firms under review have achieved in their efforts of internationalization, create the need of rethink the business strategy under the light of empirical evidence of success critical factors, which permit support and drive the economic growth and welfare that might be achieved under new circumstances arisen from economic globalization, where the textile-clothing sector firms are facing further challenges and hard competition.

The methodology proposed in this paper, will allow to represent both economic and sectorial quantitative information as entrepreneurs' perception in order to create a assessing model of firms export capacity using a Fuzzy Inference Systems (FIS) as flexible approach analysis. FIS, has been proposed and reported in literature to take decisions analysis. The purpose of this proposal is perform an integral assessment of firms export capacity in a systematic way. The relations between explanatory variables are screened using expert criterium which take into account different information sources as, marketing, the logistic infrastructure, planning process, human and financial resources, in order to get a higher degree of objectivity in measurement. Each of these critical factors are evaluated by mean of specific variables whose relations are defined using the entrepreneurs' perception into the assessment system. We use FIS to modelling the explicit relationship between variables and adjust the system information in order to assess export capacity of small and medium-sized enterprises' (SMEs) in the textile manufacturing sector in the city of Medellín-Colombia. This paper was structured as follows: section 2 gives a literature review about the process of internationalization of FIRMS and the state of art on management issues addressed through the fuzzy logic perspective. Section 3 present the Fuzzy Inference System Methodology. Section

4 has a case study for the textile/clothing sector where this method was applied and section 5 presents conclusions.

## LITERATURE REVIEW

### Internationalization Background

The firm's internationalization process is neither linear nor unidirectional (Bell and McNaughton 2000, 179), with respect to this process, it can be viewed from several points of view. A first approach considers it as an incremental process, which moves initially within the domestic market and then explores new foreign markets sequentially (Vernon, 1966, Johanson and Vahlne, 1977). A second approach is concerned with optimum spotting of production looking economic advantages (Dunning, 1981). A third approach puts forward that export capacity is characterized and influenced by the existence of inter-organizational and social networks, which have been created around firms (Christensen, 1991). One last viewpoint suggests the existence of born-global companies, which reach international markets rapidly (Knight and Cavusgil, 1996). Maybe the process is impregnated by the combination of all viewpoints. In the first approach, this process follows a product's temporal development, in which the product is introduced to the local market and, after having reached a maturity phase, foreign markets are explored. On the other hand, the internationalization by steps, the product-cycle model and the Uppsala Internationalization Model (Johanson and Wiedersheim-Paul, 1975). suggests that the process of entering new markets by firms is more closely related with physical distance and such a process begins with those markets which perceived physically closer.

Besides, Dunning's eclectic paradigm provides a framework that integrates three theoretical approaches: industrial organization, costs transaction, and localization and international trade, to explain the existence of multinational firms. The Christensen's network approach intends to link the dynamic component of internationalization by incorporating business relationships by networks supporting decision-making from a strategic standpoint. That approach helps reduce reliance on small organizations' own resources, and thus can provide the leap towards internationalization. Seems that the globalisation trends involving further economic integration, changing production conditions, cost and quality, the emerging of new information and communication technologies, as well as a reduction in transport and communication costs which provide an appropriate operation setting for emerging companies with a comprehensive approach and with clearly identified niches in the global market are keys factors for a successful internationalization process of companies.

### Empirical Research

The empirical approach by Luostarinen et al. (1994), propose that the critical factors in internationalization are: ownership of relevant knowledge about foreign markets, handling techniques of international transactions, knowledge on how to conduct business in different countries, the funding, laboral aspects and marketing resources available. On the empirical level, Vazquez and Vazquez (2007) found that studies on internationalization exhibit six different approaches, namely: stages and a firm's life cycle, networks and relationships, strategies, resources, knowledge and information, culture and multinationality and economic conditions. Mintzberg et al. (1988) found, in the 90's, that companies with a global strategy can exhibit one of more of the following benefits: cost reductions, improved product quality and programs, increasing customers' preferences and competitive power.

Hitt et al. (2007) discussed the importance of an internationalization strategy as a source of strategic competitiveness and above-average returns, when a company decides to compete in the international arena must choose its strategy and select a way to entry to international markets.

Johnson et al. (2008) argue that the international diversification allows companies to access and develop resources and capabilities in a way that is not possible in their country of origin, and thus they improve

their competitive advantage and their position over competitors. Lugo (2007) has stated that a suitable export process is both a proof of success and a strategy to increase profitability and diversify market risk. As the export process can provide businesses with flexibility, learning and prestige. Martínez (2004) confirms the importance of having the export process carried out through cluster communities, when stating that the export process has moved from an individualistic rationale towards network membership that transcends borders, thus replacing the path to a direct international projection by new cooperation methods. Cruz (2010) shows how some authors argue that in the 21st century having access to global markets will be critical to establish a company's success or failure.

This includes the provision of a new paradigm, in the sense that companies are created and operate in interconnected markets where national boundaries are disappearing. According to this rationale, companies consider the world as a big market, and, therefore, their strategies would be deployed under this internationalization premise. Moreover of identify the relevant factors of internationalization, like was previously exposed for different researchers, another problem is related with measure level of internationalization process. The analysis of socio-economic phenomena, poses some difficulties, first many times there are no periodical records and second the character cualitative and subjetive of some explanatory variables. Then, ¿how we can develop indicators which permit measure the state of phenomena and include all available informations? Many problems with these characteristics, has been trated through artificial intelligence techniques as fuzzy logic (Medina, 2006).

Fuzzy Inference Systems are being used widely to modelling problems where the analyst have information vague, subjective and besides of cuantitative information as the medical diagnostic, pattern recognitions, decisions analisys, robotic control, risk evaluation and so on. The potential use of FIS has been extended to entire field of the social sciences (Kaufman 1990, Kulkarni 2001, Medina 2007, Glykas et al. 2004, Xirogiannis et al. 2008), it no mean that Fuzzy Logic may be able to replace the statistic methods analisys, but provide a rigorous theoretical scheme for the treatment of many socio-economics problems and support the decisions making. FIS could be an administrative tool that allows measuring the state of process and helps us to make better management. Currently, literature has not provided any methodological approach to assess the export capacity of cluster communities, even though there are approaches that identify and considering both quantitative and qualitative variables. However qualitative variables have been quantified using traditional logic methods, as:

- Statistics, which considers the probability of occurrence of certain events.
- Scoring models by items, such as Kaplan and Norton's balanced scorecard.
- Rating methods of factors by points and expert judgment.

In most cases, the variables explaining the export process are treated isolatedly, without any rigor or depth in the methodological aspects associated to the relationships of its structure and their quantification. The previous facts highlight the importance of advancing an export capacity measurement model through a fuzzy inference system in order to assess the critical success factors in export, taking into account the qualitative and quantitative most relevant variables inside each of the expressed components.

We use an advanced logical framework, which integrates different qualitative variables defining export capacity as human talent, infrastructure, innovation strategies, free trade agreements, marketing strategies, among others. Each of these factors are evaluated by mean of specific variables whose relations have been defined through expert knowledge, we use FIS to modelling the explicit relationship between variables in order to obtain an exportation capacity indicator.

## METHODOLOGY

### Design Of Research

The objectives of the study were limited to city Medellín's scenario as the leading producer of textiles as well as an international fashion center in Colombia. This is an analytical research with a qualitative-quantitative mix orientation, intended to measure export capabilities and resources of textile-clothing SMEs, from a set of endogenous variables, chosen through the Delphi method by a group of experts from the textile-clothing sector. Methodologically, the work was split in two stages:

1. Building an affinity diagram, focused on the capabilities of technological innovation, following conceptualizations by Yam et al. (2004), Cheng et al. (2006), and value chain dimensions exposed by Porter (1985).
2. Designing a Mamdani Fuzzy Inference System, based on works by Medina (2006) and proposed by Kosko (1994), Jang et al. (1997) and Kasavov (1998).

### Fuzzy Sets And Fuzzy Inference Systems

A fuzzy logic system, unlike what its name suggests, is a reasoning alternative to the classical logic seeking to describe fuzzy variables, was formalized by Zadeh in 1965 and it is based on Fuzzy Set theory. Permit describe facts that are not completely true or completely false, allows us use relative concepts of reality, defining the grades of membership and following the reasoning patterns similar to the human thought (Kosko, 1995). In the managerial environment, there is a broad knowledge dissonant with reality, that means, imprecise and vague knowledge, ambiguous and of uncertain or probabilistic nature. Thus, one of the main drawbacks arising from the poor capacity of expression by bipolar classical logic is the classification of membership to given analysis categories. The expression 'fuzzy' refers to a situation in which there are both ambiguity and vagueness (Bellman and Zadeh, 1970). The mathematical representation departs from a universal set of objects  $x$ ,  $U = \{x_1 . . . x_n\}$ , where a fuzzy set  $A$  is defined by equation ordered pairs (equation 1):

$$A = \{x, \mu_A(x)\}, \forall x \in U \quad (1)$$

Where  $\mu_A(x)$  is  $x$ 's membership degree to fuzzy set  $A$ , and  $\mu_A: U \rightarrow M$  is a membership function from  $U$  to space  $M$ , which is associated to a real number in the interval  $[0, 1]$ . Thus, a value close to the upper limit denotes the  $x$ 's highest degree of membership to  $A$  (Zadeh, 1965). The Mamdani Fuzzy Inference Systems FIS, (Mamdani, 1977, 1981) was the first system proven in a practical way as universal approximator of functions. Later Kosko and Wang (1992) formally settled that any relationship among input and output variables can be approximated by means of FIS, built in linguistic terms with a high grade of accuracy (universal approximator). The steps to build a FIS are indicated in Figure 1, a details of all development process can be found in Jang, 1997, Kosko, 1995 and Medina 2010:

*Fuzzyfication:* Define the inputs and outputs of system (linguistic variables), their linguistic terms (fuzzy sets) and their membership functions  $\mu_A(x)$ .

*Knowledge base:* Define the fuzzy rules If-then which specify the relationship among input and output of system.

*Composition operations:* Define operations of union, Intersection, Complementation, the Cartesian product and the Cartesian Co-products between fuzzy sets.

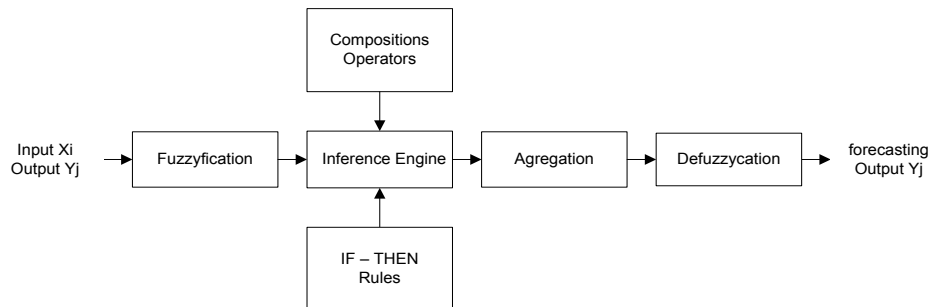

*Inference Mechanisms (Approximate Reasoning):* Define the procedure to derive conclusions from fuzzy rules type IF-THEN and values that take the inputs  $X_i$  of systems applying composition relationships.

*Aggregation:* Define the output fuzzy set as the aggregations of activation strength of each rule defined for the system.

*Defuzzification:* in the last step you get a crisp value from the output fuzzy set. Provides the solution, permit evaluate the system performance and decisions making.

Figure 1: Steps To Building A FIS

*This figure shows the steps to building a Fuzzy Logic Inference System.*

### Limitations of Fuzzy Systems

Rajendra et al. (2009), describe as limitations of fuzzy logic system the following:

The fuzzy logic systems lack the capabilities of machine learning, as well as a neural network-type memory and pattern recognition. Therefore, hybrid systems (e. g. , neurofuzzy systems) are becoming more popular for specific applications.

Determining exactly membership functions and fuzzy rules is a difficult task. The most cases is impossible to predict how many membership functions it required even after wide testing.

Validation and verification of a fuzzy knowledge-based system usually requires extensive testing with hardware in the loop. Sometimes this is an expensive affair.

System stability is an important concern for fuzzy control.

## **RESULTS AND DISCUSSIONS**

### Defining the Knowledge Base Or Fuzzy Rules

The exercise of the affinity diagram allowed to obtain five factors critical to measure export capacity: 1) marketing, 2) logistics, 3) planning, 4) human resources, and 5) finance. Then in brainstorming sessions with international trade experts, 18 sub-factors were found (Figure 2) which act as a proxy to explain SMEs' export capacity. The figure shows how each critical success factor ( $FCE_i$ ) with  $i = 1 \dots 5$ , will be explained by sub-factors  $F_{ji}$  with  $j = 1 \dots 18$ .

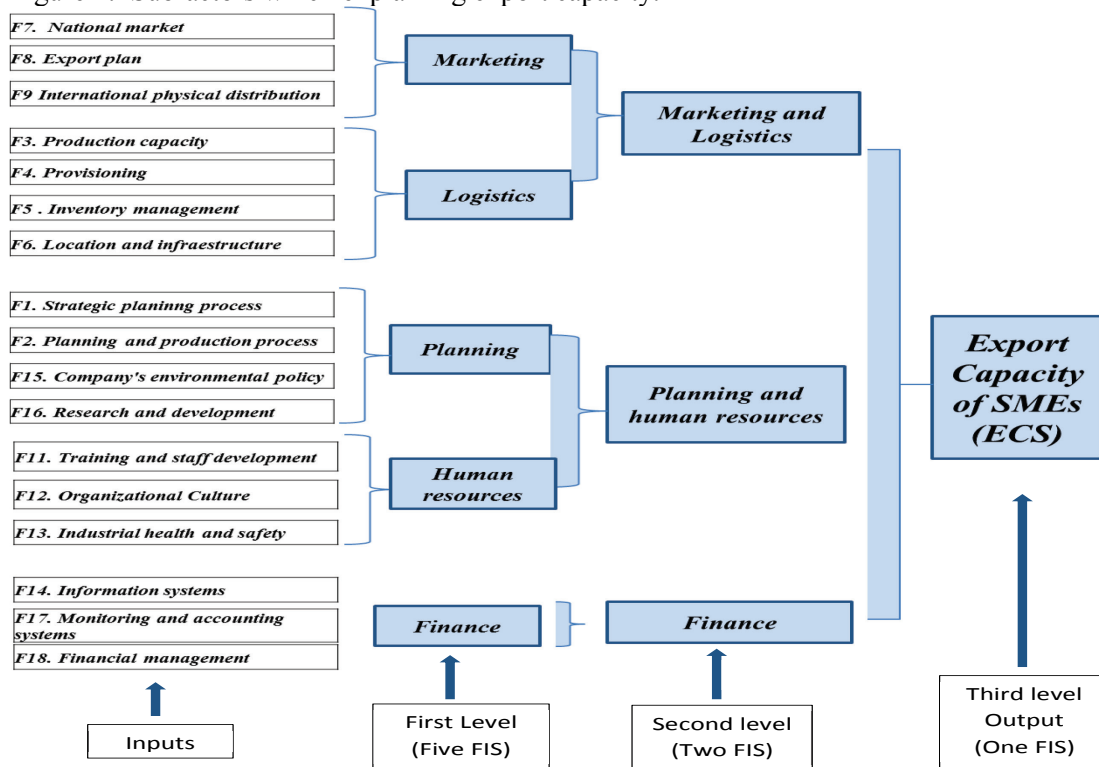

Subsequently, following the same rule of formation, each sub-factor  $F_{ji}$ ,  $j = 1 \dots 18$  can be explained by the set of variables  $V_{kji}$ ,  $k = 1 \dots 157$ , which are divided into each of the 18 factors in order to assessment the export capacity. It should be noted that those 157 explanatory variables arose from a comprehensive analysis and discussion by a team of expert, who after evaluating initial proposal of 250 variables obtained an end range of 157 variables. Such a large set of information has a highly imprecise component, so we should seek a solution through fuzzy sets.

The analysis was made through two steps: The first one we weighting these 157 initial explanatory variables ( $V_{kji}$ ) through assigned scores to each depending their level according to the experts assessment. This process get qualify the level of each sub-factors  $F_{ji}$  ( $j = 1 \dots 18$ ).

The second step used the previous qualification to develop an FIS in order to assessment the export capacity. The 18 inputs will be used to qualify each of five critical success factor: marketing, logistic infrastructure, planning process, human and financial resources and each represent a FIS, these are the first level of system. We must to develop five FIS and the outputs of these level are the inputs of the level following. Then these variables are aggregated into bigger level variables (second level: Marketing and Logistic, Planning and Human Resources, two FIS more) and the third level aggregate all information derived of previos systems. The total number of fuzzy systems developed is represented by eight FIS connected between them, represented in Figure 2 by the main variables (squares in Blue), in order to get an integral evaluation the Capacity of SMEs (ECS).

Figure 2. Subfactors which explaining export capacity.

This figure shows the subfactors which explaining export capacity: 18 sub-factors which explain 5 factors determining export capacity.

The following four fuzzy sets were assigned to each inputs and outputs system: greater fortress (FMy), minor fortress (FMn), minor weakness (DMn) and greatest weakness (DMy), we selected a range for each variable between [0-40], as it be represented in Figure 3.

Figure 3. Fuzzy sets for input and output variables

This figure shows the fuzzy sets for input and output variables which were assigned to each inputs and outputs system.

To build the knowledge base or FIS's fuzzy rules, we apply the heuristic procedure indicated in Medina 2010, used in cases where we considering large number of input variables. A summary is present to following:

- i. The first step is pondering each input  $X_i$ , according to effect that each  $X_i$  has on output  $Y_j$ . Let  $P_i$  weights assign to each input (relative importance of the input variable).  $P_i \in [0, 1]$ .  $i=1, \dots, n$  and  $n =$  FIS input variables.  $j=1, \dots, m$   $m$  is fuzzy sets defined for input  $i$ .

$$\sum_{i=1}^n P_i = 1$$

- ii. Ponder the importance of each fuzzy set (linguistic label) assigned to each input "Xi". Then "Cij" is the weight assigned to each fuzzy set of the input  $X_i$ , and indicates the effect on the output  $Y_j$ .  
for all  $i=1, \dots, n$

- iii. The experts must qualify any scenarios of the knowledge matrix, that is, the experts should define a set of "reference rules", that allows to later, validate the FIS output. In general extreme and middle escenarios are evaluated easier for qualifying when the system is very big. The rules type Mamdani are expressed by:

If  $X_1$  is  $A_1$  and  $X_2$  is  $A_2$  and..... and  $X_k$  is  $A_k$  Then  $Y$  is  $B$

- iv. The score for each cell of matrix knowledge is calculated by the relationship following:

$$K_{ij} = \sum_{i=1}^n C_{ij} \cdot P_i \quad \text{for all } j=1, \dots, m$$

- v. The next step is correlating all scores in each cell of the score matrix with the fuzzy sets assign to output variable  $Y_j$ . This procedure is carried out by obtaining the maximum and minimum value of the scores matrix,  $K_{max}$  and  $K_{min}$  respectively.  $K_{max} - K_{min}$  determine the scores range that can take the output  $Y_j$ , therefore, the fuzzy sets must be assigned to this range. The score on the intersection of fuzzy sets ( $L_1$  and  $L_2$ ) determine the score from which is assigned a fuzzy set (low, middle, high) to each cells into the matrix.

The system response can be modified by changing the position of the limits  $L_1$  and  $L_2$  such that the system response is adjusted to the referenced fuzzy matrix, Figure 4 (Compared the score of each cell with the score on the intersection) rules qualified by the experts previously. This process permits us to obtain the fuzzy rules matrix.

- vi. Finally the validation should begin with the fuzzy rules matrix suggested on previous step to adjust the system. All cells are evaluated by experts, first it needs verified that the "reference rules" are obtained and then it needs to be verified that all other rules proposed are consistent, otherwise, the limits  $L_1$  and  $L_2$
- vii.  $L_2$  must be moved to adjust the system response After applied the procedure we obtained the fuzzy rules matrices of each fuzzy systems (eight FIS, eight rules matrices). The Table 1 shown the fuzzy rules matrix of third level which qualify the export capacity of SMEs and use as input variables: Marketing and Logistic, Planning and Human Resource and Finances with 64 rules ( $4 \times 4 \times 4$ ). The rules are expressed as:

IF "Marketing and Logistic" is "DMn" and "Planning and Human Resource" is "FMn" and "Finance" is "DMn" THEN "Export Capacity" is "DMn"

Figure 4. Triangular fuzzy set to output  $Y_j$ 

This figure compared the score of each cell with the score on the intersection and shows the rules qualified by the experts previously. This process permits us to obtain the fuzzy rules matrix.

### Validation Model

This section presents verification and consistency of the developed model realized through experts work sessions. We contrast expert judgment versus the simulating model, verifying their functionality compared with projected results. Three focal groups were taken account, sorted as optimistic, normal and pessimistic escenarios by experts. We checking that the systems output was congruent in each scenario.

The FIS adjustment process, modify basically both, IF-THEN rules and change the fuzzy sets position in the defined ranges, looking a consistent output with the expert judgment about the export capacity of SMEs (ECS). The entrepreneurs or expert group consultants, are members of Colombian Association of Small Industries (ACOPI) with expertise in international markets, which were interviewed and helped us in all standardization process.

Another validation process uses the fuzzy surfaces, which shows relationships and consistency between input and output. An example of a fuzzy surface is shown in Figure 5. If the behaviors are not consistent we review the rules, suggest the use of another fuzzy set to the input or output variables or move the fuzzy sets in the variable range of each variable. The surface are rough when the qualification is better and indicate no lineal relationship between variables also. The application was developed in Matlab.

Figure 5. Surface charts for variables at level I. (Matlab toolbox)

This figure shows the surface charts for variables at level i. It was building un Matlab toolbox.

Figure 6 shows the rules editor and fuzzy surfaces to evaluate the export capacity of the SMEs company, the surfaces indicate no lineal relationship between variables, when the inputs increase their qualification (planning and HHRR, Marketing and Logistic and finances), then improves the export capacity of company. The evaluation allows identify which aspect must be improved, where administrative action must be taken to accomplish a better export capacity. The qualifications for Planning and HHRR=27.6, Marketing and Logistic=28.7, and finances=28.1; qualify the export capacity in 26.7 which is equivalent to “Minor Fortress” (FMn) qualification. We obtained this qualification after of evaluate the previous fuzzy systems (first and second system level).

After verifying the algorithm’s consistency and validity, an experimental application and adjustment was carried out with the methodology proposed. This application was carried out in 13 pilot companies members to ACOPI (Colombian Association of Small Industries) Table 2. The interviewees identified several benefits in this instrument for the diagnosis of ECS, as well as the relevance of its implementation in any manufacturing sector company. Consequently, an approach and acceptance of the model was observed among respondents, along with its subsequent learning and awareness that textile-clothing companies need design and implement programs, projects and strategies to strengthen compete capacity and achieve success in region Innovation processes.

Figure 6. Rules Viewer and Fuzzy surface of export capacity

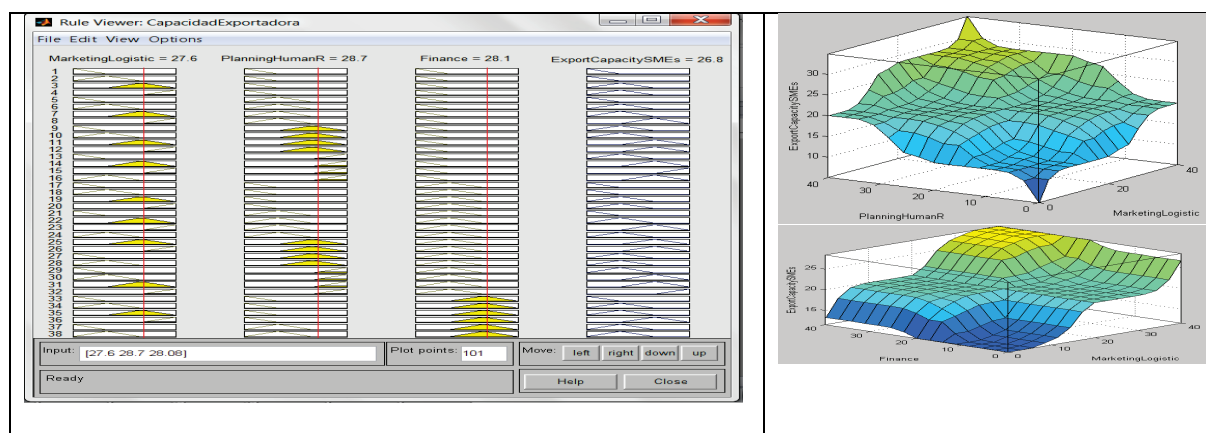

Figure 6 shows the rules editor and fuzzy surfaces to evaluate the export capacity of the SMEs company, the surfaces indicate a no lineal relationship between variables

## CONCLUSIONS

The application of methodology in textile-clothing cluster was found to have a particular value of 29.5 in their export capabilities. The above result reflects weaknesses on factors like R&D, logistics, finance and marketing, and strengths in factors as production, environmental management, information systems and human resources.

Acopi's managers, owners and experts identified some attributes to determine the export capacity of SMEs and advantages to apply the model in different companies and manufacturing sectors, due to the flexibility and wide treatment of the variables evaluated. On the other hand, the model produced some concern among participants about the economics relevance and priority of SMEs and the effects that would have the launch of a free trade agreement - FTA with the U.S., to formulate and implement programs, projects and strategies to strengthen their export capacity and manage to introduce themselves successfully in the globalization processes and its dynamics of innovation.

The SMEs, as those found in the city of Medellin, need to leverage their export processes, making inroad into scientific and technical aspects by making alliances with the national R&D network. The methodology proposed in this paper provides a flexible and simple way to measure and assess their internal position in order to undertake export processes. Also, to learn which factors demand intervention, change or the improvement of skills and resources in order to promote an internal organizational environment making possible to compete on the international sphere decently.

Table 2, shows pilot testing from 13 ACOPI's companies, every expert proceeded to qualifying those five factors that comprise export capacity of SMEs. Evaluations are weighted according the weighting given to each factor, then proceed to calculate average value and export capacity. Columns 3 through 13 present experts' evaluation, column 16 presents average scores and column 17 weight for each factor. The Marketing value factor is 28, results from the weighted sum of every subfactor as follows:  $30.4 \cdot 30 + 26.4 \cdot 35 + 25.2 \cdot 35 = 28$ , which correspond with a "Minor Fortress (FMn)" at experts judgement. If we repeats the process for every factor, we get 28.2 as a final qualification of export capacity corresponding with a "Minor Fortress (FMn)" also. This result are congruent with FIS model results, figure 6.

Table 2. Export capacity results of level III.

		Evaluation Matrix the Export Capacity for SMEs																				
28.2	The Export Capacity for SMEs		Expert's Evaluation													Score	Weight	10	20	30	40

	Financial Management		25	24	23	24	26	27	26	27	24	23	27	26	28	25.4	25%	FMn	0.15	0.85		

This table shows pilot testing from 13 ACOPI's companies, every expert proceeded to qualifying those five factors that comprise export capacity of SMEs.

Methodology emerges as an innovative management tool, linked to internal organizational spheres and their different abilities. A set of strategic variables were incorporated and identified screened with technical and methodological rigor: on the one hand, by reviewing literature and on the other hand by consulting experts, in order to assess SMEs export capacity. The selected variables were passed through various filters suggested by consultants, entrepreneurs and experts in the sector. The variables explaining export capacity, which were examined in this paper, are of linguistic type, with highly inaccurate quantitative and qualitative dimensions, and very difficult to quantify. Given this, the Fuzzy Logic theory proves to be a clear tool to face this kind of events, since it allows to address—with an indeterminate linguistic statements focus—the classification of information on actual events in an infinite value scale in the interval  $[0,1]$ , representing the functions of membership and solving the bipolarity in the classical logic. One of constraints identified in use the fuzzy inference systems lies on the difficulty of identify the relationship between the input and output variables, this process take time and it is based on the experts work and it is more difficult when the number of input increase. The graphic analysis is a good form to see the relationship between variables but is limited to 3D, the Fuzzy inference systems are multidimensional.

# EVENT MANAGEMENT: A STUDY OF PROBLEMS AND PROSPECTS

Sunita Dakle, Annasaheb Magar College Hadapsar

## ABSTRACT

*Events have long played an important role in human society. The tedium of daily life, with its constant toil and effort, was broken up by events of all kinds. In most societies, the slightest excuse could be found for a good celebration. India has roughly 5000 fairs and festivals. Adding to the tally are the numerous weddings, parties, engagements and other personal events that are a part and parcel in the life of an average Indian. Traditionally these events were organized by the host but with the increasing scale and demands of events the need for professional event management has crept in. Event managers can supervise diverse corporate events, such as product launches, press conferences, corporate anniversary parties, meetings, conferences, and marketing programs such as road shows and grand opening events. The professionals working in the relatively recent field of Event Management face a number of problems in their day to day workings. The researcher through this research article aims to highlight some of the key problems faced by event management professionals and give a few suggestions to solve the same.*

## INTRODUCTION

The world 'event' is derived from the Latin word 'eventus' and was originally used to describe big happening out of the ordinary. Today the concept of events includes a large variety of social gatherings, meet-ups, sports, shows and performances. One of the most important things about events is that it often plays an important role in the image building of an individual/organization/country. This occasion cannot be taken lightly. A birthday, wedding, celebration party or a conference hold so much importance to the main participants that nothing must go wrong. Earlier it was a tradition for the host to oversee the arrangements and family members/colleagues helped in the management of the event. However nowadays with the increase in the sheer size and scale of events the need for professional event management is catching up. In recent years, the number of events has grown rapidly and industry around events has evolved. This event industry has seen significant growth over the last three decades, which has made it hard to complete an overview of all the facets of events and management. While several companies in this growing trade have good organizational structures and management processes in place a rather confusing picture evolves when looking at entire event industry. Nevertheless despite that confusing structure remaining in place, the international special society states that the event industry is still one of the world's fastest growing economically lucrative industries. Through this submission the researcher aims to give a snapshot of the infant event management industry in the city of Pune, India. The researcher also aims to understand the problems faced by the professionals working in this industry and provide certain suggestions to alleviate these problems.

### Classification of Events

According to National Institute of Event Management the common events in India that can be classified as Hall Mark Events are as follows:

- Celebrations: includes festivals like Navaratri, Ganesh Utsava, Pongal, Diwali etc.
- Concerts: International/National artist shows artist shows like Elton John Concert, Bryan Adams Show, etc.
- Educational Events: like Seminars, Conferences, and Exhibitions etc.
- Marketing Events: leading to Promotions, Road Shows, Ad campaigns, Contests, Product launches etc.
- Hospitality Events: include Hotel events like Conferences, Food Festivals, etc.
- Others: Tourism events, Huge sports events, retail events and contests etc.

One can understand from the above list that there are a large number of events being held daily and many of these require the aid of a professional event management team. Thus the event management sector can be considered as an economically important and viable sector.

### Events and the Economy

Events and particularly special events are typically regarded as major generators of economic activity and jobs. Over and above marketing angle the economy benefit to the region hosting the event is also positive aspect. Countries like India should not only invest in information technology but also other communications infrastructure to be ready in this millennium to host similar mega events. The singular importance of mega events in driving an economy into growth phase has already been emphasized.

A festival, either one time or annual, can provide the kind of economic stimulate required to perk up a lagging economy. The economic objective of the event should be both to circulate cash within your community and bring in cash from outside. Throughout the process, goodwill and community spirit will be generated. A successful and well-planned event stimulates community pride and also it will leave found memories with visitors, encouraging them to come back again.

The event management business in India is poised to grow by 50% in the coming 2 years. The industry will reach to Rs. 4375 crore in 2013-14 up from Rs. 2800 crore now (Ernst and Young and Event and entertainment management association.) It has been observed that mega events like the Sydney Olympic Games 2000, involved at total of 2700 paid and 47,000 volunteers. India too is an upcoming destination for major sporting events. Event management companies will play an important part in their smooth organization and can also help boost the nation's economy.

### **REVIEW OF LITERATURE**

According to a study carried out by Ernst & Young and Event & Entertainment Management Association (EEMA) (2012) which interviewed CEOs of 32 Indian events and activation companies the organised events and activation market in India is expected to grow more than 50% over the next two years, powered by weddings, sports and higher spends on below-the-line promotional events. The industry is expected to reach Rs 4,375 crore in 2013-14, up from Rs 2,800 now. 57% of survey respondents believed that the share of total marketing spends attributable to BTL activities including events and activation is likely to grow by around 10% over the next two years to reach nearly 20% of total marketing spends. In addition, increase in overall event production costs; growth in revenues across regional activation, increase in the number of intellectual properties launched (particularly for luxury brands) and increasing upper-middle and rich classes will boost revenues

A study titled "Identifying and analysing existing research undertaken in the events industry: a literature review for People1st" done by Glenn A J Bowdin and Dr Gayle McPherson (2006) for Association for Events Management Education (AEME) aims to undertake a thorough literature review of existing research into event management industry specially the main two areas covered are the definition, size and scope of the event industry, skills and skills development. The scope was identifying existing research undertaken in the event industry in the following area- Definition, Occupation, Size, Influences, Current and Future skill needs employment practices etc. The project identified gaps in the current research base in order to make recommendations for future research requirements. This report has provided a snapshot from this industry. Shone and Parry(2004) In this research the authors presented the different definitions of event like personal events, leisure events, organizational and cultural events Silvers (2009) mentioned that in event coordination, the coordinators visualised, organised, and synchronised the different elements of the event. In addition, in this process, the coordinator also identified the purpose, scope, and the program of the event by means of identifying its intent, extent, and content.

### Objectives Of The Study

- To study the profiles of event management organizers.
- To study the educational background of event management professionals and mirror it in terms of the requirements of their job.
- To study the employment opportunities arising from the field of event management
- To evaluates the progress, performance of event management professionals belonging to the city of Pune, India and highlight their problems.

### Hypothesis

The research for this submission is based on the following hypotheses:-

- The field of event management is still in its infancy and lacks any formal organization of the various players. There are a many problems faced by the individuals working in this field which are less known and can be addressed
- A formal training plays an important part in the success of an event management enterprise
- The field of event management is doing an important job in creating new and diverse employment opportunities and contributing to the economy in a variety of ways.

### Scope

This scope of the research was limited only to the event organizers operating in Pune district of the state of Maharashtra, India.

## **METHODOLOGY**

For the present study both secondary as well as primary data were used. A questionnaire was developed to collect the necessary information from Event Management professionals. A sample space of 50 respondents was obtained through Random Sampling Method. The respondents were selected from different areas of pune city. All the respondents were personally interviewed to understand their problems, progress etc.

Table 1: Profile of the respondent

Category	Basic Data	Number	Percentage
Age(in years)	Below20	-	-
	21 to 30	28	56
	31 to 40	15	30
	41 to 50	05	10
	Above 50	02	04
Gender	Male	45	90
	Female	05	10
Education	Undergraduates	08	16
	Graduates	15	30
	Postgraduates	16	32
	Professional	11	22

Table 1 the Socio- Economic Conditions of event organisers covering aspects like Education, Age etc.

It can be observed from the above table that maximum numbers of event organizers 28(56%) are from the age group 21 to 30. Most of the event organizers are Male 45(90%). Only 11(22%) respondents received professional education related to event management.

Table 2: Information Related to Event Organizer's Business

Category	Basic Data	Number	Percentage
Capital investment	Below 50,000	05	10
	50,001 to 1,00,000	15	30
	1,00,001 to 2,00,000	23	46
	Above 2,00,000	07	14
Yearly income	Below 25,000	-	-
	25,001 to 50,000	2	04
	50,001 to 1,00,000	7	14
	Above 1,00,000	43	86
Office	Own	30	60
	Rented	15	30
	No	05	10
Establishment of business	Before 1990	-	-
	1990 to 2000	11	22
	2001 to 2010	39	78
Training Taken	Yes	35	70
	No	15	30

Table 2 shows business related information about the event management enterprise.

Most of the respondents 23(46%) invested Rs 1,00, 000 to 2,00,000 as capital for starting up their enterprise. The terms of the current income it was observed that 43(86%) respondents have an income above Rs. 1,00,000. It was also observed that most of the respondents i.e. 39(78%) had established their business after 2001. Also a majority i.e.(70%) of the event management professionals had taken a formal training regarding event management.

Table 3: Employee Details

Category	Basic Data	Number	Percentage
Employees at the beginning	Male	431	77.79
	female	123	22.20
Employees at present	Male	1145	64
	female	640	35
Types of employees	Skilled	489	28.02
	Unskilled	1299	74.44

Table 3 shows details regarding the employees of these Event Management Enterprises.

It was observed that at the start of the business majority of the employees were male 431(77.79%). The number of female employees was 123(22.20). The number of employees at present time was male 1145(64%) and Female 640(35%). Skilled employees were only 489(28.02) while 1299(74.44%) employees were unskilled.

Table 4: Problems of Event Organizers

Category	Basic Data	Number	Percentage
Financial	Yes	21	42
	No	29	58
Employees	Yes	44	88
	No	06	12
More competition	Yes	13	26
	No	37	74
Mental and physical stress	Yes	18	36
	No	32	64
Infrastructure problem	Yes	44	88
	No	07	14

Table 4 summarises the various problems faced by the respondents.

21(42%) event organisers faced various financial problems like higher interest rates, inadequate finance etc. Problems related to competition were faced by only 13 (26%) event organisers whereas 44(88%) event organisers faced problems regarding labour i.e. problems like unavailability of skilled employees, shortage of manpower. Mental and physical stress related problems were faced by 18(36%) respondents. Lastly infrastructure related problems were faced by 44(88%) respondents. These are problems related to unavailability of proper event venues, hotel rooms, technology service providers, transportation etc.

*Suggestions:* The researched would like to put forth a few suggestions to the above mentioned problems faced by event management professionals:-

- It was observed that formal training does play an important part in the success of an event management enterprise and thus training should be provided to individuals through means of academic/professional training.
- There is a need for greater organization and communication between the various event management enterprises. This can open new areas of cooperation in terms of better knowledge of available venues for events, contact details of suppliers etc.
- Onerous Regulations:- Most respondents believed that regulatory hurdles such as varying taxes, numerous permissions/clearances required were a consistent problem. There is a need to rethink/streamline such procedures.
- There is also a need for the Event Management professionals to be updated with the latest trends/customer requirements. This can aid in improving the customer satisfaction

## CONCLUSION

Through the course of the submission we have seen that there are exiting times to be in the emerging field of Event Management. There are innumerable business opportunities for an event management enterprise. It was observed that as hypothesized a formal training does play an important role in the success of an event management enterprise. Also the event management companies did generate employment for a diverse set of individuals. It was also seen that the engagement of female employees was to a lesser extent currently, though this number is steadily increasing. But along with the opportunities there are a few problems face by the event management enterprises. The solutions/suggestions put forth in the submission are not very difficult to be implemented and can go a long was in gearing the growth of professional Event Management.

# SMALL-DOLLAR CREDIT USE IN UNDERSERVED POPULATIONS: EVIDENCE FROM TACOMA, WASHINGTON

Lynda S. Livingston, University of Puget Sound and Four Horsemen Investments

Hiroki Tokuyama, University of Puget Sound and Four Horsemen Investments

## ABSTRACT

*We present results from a survey of credit use among people potentially underserved by mainstream banking. We characterize small-dollar credit use among low-income residents of Tacoma, Washington, and among students at various types of colleges in that city. These sorts of populations are potential victims of predatory lending. We wish to consider the suitability of peer-to-peer (P2P) loans as a credit resource for these groups. Our results show that P2P lending has the potential to provide a new source of credit for some underserved borrowers. Students' familiarity with technology and social networking make them especially likely beneficiaries, once they learn that P2P lending exists. For working people who might otherwise use payday loans, P2P can be a viable option if a way can be found to speed up the loans' funding process.*

**JEL:** G21, G23, G10

**KEYWORDS:** Peer-to-Peer Lending, Payday Loans, Fringe Credit

## INTRODUCTION

There is an old joke that says you can only get a loan if you do not need one. People deemed deficient on capital, capacity, collateral, or character, or facing adverse conditions, can be cut off from traditional credit. If we accept the view that basic financial services are essential for wealth creation, then a population's lack of access to credit is a social problem. In this paper, we present results from a survey of credit use among people potentially underserved by mainstream banking. Our goal is two-fold. First, we wish to characterize small-dollar credit use among low-income residents of Tacoma, Washington, and among students at various types of colleges in that city (private liberal arts universities, vocational schools, and public colleges). This focus is in keeping with the research agenda promoted by the U.S. Department of the Treasury's 2010 convening *Developing a Research Agenda on Small-Dollar Credit and Financial Empowerment*, which identified these sorts of populations as potentially lacking access to traditional banking. Without access to mainstream financial services, these groups may resort to fringe lenders like payday loan shops, which many consumer advocates consider predatory. We wish to investigate whether students and other at-risk Tacoma populations actually need or use short-term, small-dollar credit, and, if so, they types, sources, and costs of the loans they employ.

Second, we wish to consider the suitability of peer-to-peer (P2P) loans as a credit resource for these groups. Traditional banks generally have been unwilling or unable to enter the small-dollar market. One explanation is cost: making small-dollar loans is expensive, both because of relatively high fixed set-up costs and because of potentially high default rates. The P2P lending process may mitigate both of these challenges—for example, by streamlining the application process and by subjecting defaulters to “social stigma.” Our results show that P2P lending has the potential to provide a new source of credit for some underserved groups. Students' familiarity with technology and social networking make them especially likely beneficiaries, once they learn that P2P lending exists. For working people who might otherwise use payday loans, P2P can be a viable option if a way can be found to speed up the loans' funding process. The paper proceeds as follows. In the next section, we briefly review the relevant literature on fringe and peer-to-peer lending. We also introduce a not-for-profit, Four Horsemen Investments, which

we hope will be our vehicle for implementing a P2P alternative to payday loans. In the third section, we describe our survey and results. The final section concludes.

## BACKGROUND AND LITERATURE REVIEW

The reluctance of some small-dollar consumers to borrow from banks is mirrored by most banks' unwillingness to lend to them. However, a partnership of for-profit and not-for-profit groups could work. Buckland, *et al.* (2006) suggest having community-based organizations identify people who may need help managing their credit. These people are given short-term loans to substitute for fringe credit, then are educated and moved toward a traditional banking relationship. The key to this "stepped" plan is a partnership among community charities, governments, and banks, which allows some of the relatively high costs of small-dollar lending to be borne by not-for-profits. Four Horsemen Investments (4HI) is an educational charity that we hope to employ in a stepped plan. 4HI is a student-run 501(c)(3) not-for-profit that promotes financial education through experience, research, and outreach (4HI, 2013). The unique feature of the fund that we manage is that is comprised solely of peer-to-peer (P2P) loans.

We believe that formal peer funding could be an alternative source of small-dollar credit for payday borrowers. Four Horsemen Investments has been making microloans since 2009, and have developed the processes and experience necessary to make good loans. (See Freedman and Jin, 2008, for evidence of the efficacy of lenders' dynamic learning on the Prosper P2P platform.) We may be able to use our reputation as a long-time lender to endorse the listings of borrowers we have prescreened with our community partners. Our experience, activity on the platform, and ability to monitor our group's loans make our endorsements more credible than other sorts of friendship signals (Lin, *et al.*, 2011). As more fixed-income investors move into P2P loans out of frustration with low interest rates on traditional instruments and out of a desire for diversification (Namvar, 2013; GAO, 2011), useful signals will become increasingly valuable. Our participation can improve the outcomes for both the borrower (getting funded) and the other lenders (getting paid back).

In addition, 4HI does need to take large positions in these loans in order to have an impact. In general, friends lend less than 5% on loans they fund—95% of 95% of successful loans are funded by strangers. (See Lin, *et al.*, 2011.) This financing pattern is consistent with a model developed by Lee and Persson (2012), which suggests that some projects are feasible only given a combination of insider funding (the *trust* capital, which can mitigate agency problems) and outsider funding (the *risk* capital, which imposes a formality that may obviate the social awkwardness inherent in insider financing). Moreover, even if we do not win a bid, our participation should still significantly decrease the loan rate. (Lin, *et al.*, 2011. See also La Ferrara, 2003, who shows that lower loan rates within groups can spill over into non-group loans.) Thus, we are in a position to help facilitate group loans on our peer-to-peer platforms. Our first step toward this goal was to determine whether borrowers in our target demographic—students and low-income residents of Tacoma, Washington—needed the sorts of loans we could make. Our ongoing survey of these groups suggests that there is an opportunity for us to help.

## THE FINANCE SURVEY

Our survey was motivated in part by a convening held by the United States Department of the Treasury in 2010, *Developing a Research Agenda on Small-Dollar Credit and Financial Empowerment*, whose goal was to "inform policymaking that can address the challenges related to meeting the small-dollar credit needs of underserved populations." To frame our study, we chose nine of the "demand-side" questions identified by the convening's participants. These questions concerned the relationships among various financial products; the ability of certain populations to access traditional banking services, and to accumulate savings and build wealth; and propensity for certain groups to rely on informal lenders, like friends and family, to meet their credit needs.

Our survey focused on students and relatively low-income people from Tacoma, Washington, the largest city in Pierce County. Both of these groups could be at risk for negative outcomes from fringe credit use, as discussed in the Treasury Department's convening. The student sample consists mainly of a 185-respondent sample from a small, liberal arts undergraduate university. The rest of our respondents, whom we will call the "community" sample, came primarily from surveying at financial assistance events held in downtown Tacoma. (See Table 1.) This is not a random sample. Thus, our results are simply suggestive, and we draw no statistical conclusions.

Table 1: Sample Characteristics

	STUDENTS	COMMUNITY	VITA SURVEY	PIERCE COUNTY/TACOMA
<b>SEX</b>				
male	57%	30%	38%	49.4% (2011)
female	43%	70%	55%	51%
<b>AGE</b>				
< 23	89%	4%		
23-30	11%	9%		35.1 (2011 median)
31-39		4%		
40-49		30%		
50-59		26%		
60+		26%		
<b>INCOME</b>				
less than \$15,000 per year	2%	52%		
\$15,000-\$50,000 per year	17%	48%		\$48,673 (2009 median)
above \$50,000 per year	81%	0%		
<b>HOME OWNERSHIP</b>				
own	94%	41%	26%	
rent	6%	59%	49%	
<b>HAVE CHILDREN</b>				
yes	1%	86%		
no	99%	14%		
<b>MARITAL STATUS</b>				
never married	96%	23%		29.3% (ages 15+)
separated	0%	0%		2%

widowed	0%	14%		7%
married	3%	36%		47%
<b>ETHNICITY</b>				
Caucasian	77%	48%	41%	61%
Black or African American	2%	24%	30%	11%
Hispanic	5%	8%	9%	11%
Asian or Pacific Islander	15%	8%	11%	8%
American Indian or Alaska Native	0%	12%	4%	2%

*This table characterizes our sample and compares it to earlier community surveys. Our sample has two parts. The student sample has over 200 respondents, the vast majority of whom came from an undergraduate liberal-arts university. The community sample came from financial outreach events at a downtown Tacoma, Washington Goodwill. The VITA (Volunteer Income Tax Assistance) and Pierce County samples are from earlier studies of the local populations, and are presented for comparison. There are significant differences between the student and community sample. The community sample reflects the type of demographic characteristics that are common among payday loan users.*

There is evidence of financial distress in our community sample. Almost half are unemployed. Perhaps not coincidentally, almost half answered affirmatively to each of a series of credit rationing and liquidity issues. These responses suggest their vulnerability to the sales pitch of payday lenders, who assert that they help consumers meet liquidity shocks and smooth consumption. In fact, 38% of our community respondents have used payday loans (compared to less than 1% of our student sample). The majority used their loans for rent; the next largest category was utilities. Respondents were more likely to consider asking friends or family for money than to try traditional alternatives such as banks loans or credit card advances; they ultimately chose payday loans for their speed and privacy. While reporting overall that they were "neither satisfied nor dissatisfied" with their payday loans, they did complain about their high cost and their making it "too difficult to get out of debt."

Only one of our students used a payday loan. He was atypical of our student sample: married, with children, renting his home, and earning between \$15,000 and \$50,000 per year. Thus, demographically, he was much closer to the community sample than to our student sample.

Unlike the community respondents, students did turn to friends and family for help. Almost half of the students in the initial sample noted that they had borrowed money from their families over the past year. For the most part, they borrowed for same sorts of nondiscretionary expenses for which they used parent credit cards—textbooks (13% of the number of borrowings), transportation (11%), and groceries (12%). The biggest differences were for rent and emergencies: students were much more likely to borrow for rent, but to use a parent's credit card for emergencies. Overall, the family results are consistent with Lee and Persson's (2012) identification of insider financing as a last resort, subjecting the borrower to negative social consequences of default.

When students borrowed from friends (as 26% did), however, the results were very different. Fifty-nine percent of the time, these loans were for eating out or entertainment. (Groceries and transportation were the only other significant categories, at 10% each.) For every other category of expenditure, students were less likely to borrow from friends than family; for some categories—textbooks and school supplies—they never borrowed from friends. Ours is the only small-dollar survey that we are aware of that separates inside financing into friends and family categories (a suggestion for which we thank our focus group members). Especially among students, this distinction appears to be important. Their different uses of friends and family loans suggest that the dichotomy between inside and outside (arms-length) financing is too crude, at least for small-dollar loans.

Overall, our results suggest that students and low-income people, while both in groups potentially underserved by mainstream banking, are unlikely to be helped with a common P2P solution. Students in our sample had much better access to traditional credit and to informal lenders like friends and family. A peer-to-peer loan could be helpful for their small-dollar credit needs, but—given that almost none of our sample respondents had ever heard of P2P lending—not without a significant education effort by the peer platforms. The community sample, on the other hand, had more need and fewer options for credit. However, the current structure of P2P loans—most notably the approximately three-week funding process—make them a poor substitute for payday loans for this group, who identify speed as the most important reason they turn to fringe credit.

## CONCLUSIONS

Many consumer advocates consider payday loans to be debt traps. Payday lenders, however, assert that they offer a needed service to people with urgent cash flow shortages. In this paper, we present the early results of a survey of students and relatively low-income people from Tacoma, Washington, two groups who may lack both the financial resources and experience to access alternatives to fringe loans. We wish to determine whether these groups need short-term, small-dollar loans, and, if so, if they could meet their needs with peer-to-peer loans. These loans may not only meet borrowers' demand for a streamlined process, but also improve funding probability and repayment rates by subjecting defaulters to "social stigma." We found significant differences between our student and community samples.

The students had much more access to credit, but were fairly ignorant of how to use it effectively. The community sample's respondents evinced much greater financial distress and fewer options for loans. For students to use P2P effectively, they would need to learn that these loans exist. The bar for lower-income people is much higher. They appreciate the speed and anonymity of payday borrowing. For them, not-for-profits like Four Horsemen Investments can help, by screening and certifying listings by members of their groups.

# THE IMPACT OF EXCHANGE RATE VOLATILITY ON COMMODITY TRADE BETWEEN THE UNITED STATES AND SPAIN

Carlos Moslares, IQS School of Management, Universitat Ramon Llull, Spain  
E. M. Ekanayake, School of Business, Bethune-Cookman University

## ABSTRACT

*In this paper we analyze the effects of the real exchange rate volatility on disaggregated sectoral data on the trade flows between the United States and Spain. This study uses monthly trade flows on United States exports to and imports from Spain over the period from January 1993 to December 2012 and the method of bounds testing or the Autoregressive Distributed Lag (ARDL) approach to cointegration analysis. Our results reveal that exports depend positively on the levels of foreign economic activity but negatively on relative prices. However, the exchange rate volatility tends to provide mixed effects. In addition, imports depend positively on the levels of domestic economic activity but negatively on relative prices. As in the case of exports, the exchange rate volatility tends to provide mixed effects. Furthermore, in the case of both exports and imports, the effects of exchange volatility are found to yield mixed effects in the short-run and in the long-run.*

**JEL CLASSIFICATIONS:** F14, F31

**KEYWORDS:** Spain, imports, exports, exchange rate volatility

## INTRODUCTION

There are a large number of studies in the area of exchange volatility and trade. Despite the sizeable number of studies conducted, no real consensus about the impact of exchange rate volatility on trade has emerged. While a large number of studies find that exchange rate volatility tends to reduce the level of trade, others find either weak or insignificant or positive relationships. On the other hand, some researchers find evidence for a positive effect for volatility on export volumes of some developed countries because exchange rate volatility makes exporting more attractive to risk-tolerant exporting firms. However, other scholars have reported no significant relationship between exchange rate volatility and exports. This study focuses on disaggregated trade flows between the United States and Spain to uncover the nature and sensitivity of the relationship between exchange rate volatility and trade flows.

We use the method of bounds testing or the Autoregressive Distributed Lag (ARDL) approach to cointegration analysis for this purpose. Using this approach we investigate the effects of exchange rate volatility on United States sectoral exports to and sectoral imports from Spain over a period of 20 years using monthly data from January 1993 to December 2012. We lay the empirical framework of our study by specifying our model. In the section following that we discuss variable definitions and outline our data sources. Empirical results from the bounds testing approach to cointegration, and error-correction model estimates are presented in the penultimate section. The final section presents a summary and conclusion of the results obtained in this study.

## METHODOLOGY

### Model Specification

The objective of this study is to assess the effects of exchange rate volatility on the trade flows disaggregated at the 2-digit Harmonized System (HS) industry level. The study uses trade data on U.S. exports to and imports from Spain. Drawing on the existing empirical literature in this area, we specify

that a standard long-run export demand function for commodity  $i$  to take the following form (see, for example, Ozturk and Kalyonku, 2009; Choudhry, 2005; Arize, 1998, 1996, 1995; and Asseery and Peel, 1991):

$$\ln X_{it} = \beta_0 + \beta_1 \ln Y_t + \beta_2 \ln P_{it} + \beta_3 \ln VOL_t + \varepsilon_t \quad (1)$$

Where  $X_{it}$  is the real export volume of commodity  $i$  in period  $t$ ,  $Y_t$  is the real income of Spain in period  $t$ ,  $P_{it}$  is the relative price of exports of commodity  $i$  in period  $t$ ,  $VOL_t$  is a measure of exchange rate volatility, and  $\varepsilon_t$  is a white-noise disturbance term.

Economic theory posits that the real income level of the domestic country's trading partners would have a positive effect on the demand for its exports. Therefore, *a priori*, we would expect that  $\beta_1 > 0$ . On the other hand, if the relative price of exports rise (fall), domestic goods become less (more) competitive than foreign goods, causing the demand for exports to fall (rise). Therefore, *a priori*, one would expect that  $\beta_2$ , which measures the competitiveness of U.S. exports relative to Spanish domestic production, is negative. The last explanatory variable is a measure of exchange rate volatility. Various measures of real VOL have been proposed in the literature. Some of these measures include (1) the averages of absolute changes, (2) the standard deviations of the series, (3) the deviations from the trend, (4) the squared residuals from the ARIMA or ARCH or GARCH processes, and (5) the moving sample standard deviation of the growth rate of the real exchange rate. Since the effects of VOL on exports have been found to be empirically and theoretically ambiguous (Bredin, *et al.* 2003),  $\beta_3$  could be either positive or negative.

Equation (1) shows the long-run relationships among the dependent and independent variables in our model. Given the recent advances in time-series analysis, in estimating the long-run model outlined by equation (1), it is now a common practice to distinguish the short-run effects from the long-run effects. For this purpose, equation (1) should be specified in an error-correction modeling (ECM) format. This method had been used in many recent studies including Bahmani-Oskooee and Hegerty (2009), Bahmani-Oskooee and Wang (2008, 2009), Bahmani-Oskooee and Mitra (2008), Bahmani-Oskooee and Kovryalova (2008), and Bahmani-Oskooee and Ardalani (2006). According to Bahmani-Oskooee and Wang (2008), such an approach is warranted given that the measure of exchange rate volatility is a stationary variable (see, for example, De Vita and Abbot, 2004; Bahmani-Oskooee & Payesteh, 1993; and Doyle, 2001), whereas the other variables in equation (1) are non-stationary. Therefore, following Pesaran, Shin, and Smith (2001) and their method of bounds testing or the Autoregressive Distributed Lag (ARDL) approach to cointegration analysis, we rewrite equation (1) as an error-correction model in equation (2) below.

$$\begin{aligned} \Delta \ln X_t = & \alpha_0 + \sum_{i=1}^n \beta_i \Delta \ln X_{t-i} + \sum_{i=0}^n \gamma_i \Delta \ln Y_{t-i} + \sum_{i=0}^n \delta_i \Delta \ln P_{t-i} \\ & + \sum_{i=0}^n \varphi_i \Delta \ln VOL_{t-i} + \lambda_0 \ln X_{t-1} + \lambda_1 \ln Y_{t-1} + \lambda_2 \ln P_{t-1} + \lambda_3 \ln VOL_{t-1} + \omega_t \end{aligned} \quad (2)$$

Where  $\Delta$  is the difference operator and the other variables are as defined earlier. Pesaran, Shin, and Smith's (2001) bounds testing approach to cointegration is based on two procedural steps. The first step involves using an F-test or Wald test to test for joint significance of the no cointegration hypothesis  $H_0: \lambda_0 = \lambda_1 = \lambda_2 = \lambda_3 = 0$  against an alternative hypothesis of cointegration,  $H_1: \lambda_0 \neq 0, \lambda_1 \neq 0, \lambda_2 \neq 0, \lambda_3 \neq 0$ . This test is performed using equation (2). The advantage of this approach is that there is no need to test for unit roots, as is commonly done in cointegration analysis.

Pesaran, Shin, and Smith (2001) provide two sets of critical values for a given significance level with and without time trend. One assumes that the variables are stationary at the levels or  $I(0)$ , and the other assumes that the variables are stationary at the first difference or  $I(1)$ . If the computed F-values exceed the upper critical bounds value, then  $H_0$  is rejected signaling cointegration among the independent variables.

If the computed F-value is below the critical bounds values, we fail to reject  $H_0$ . Finally, if the computed F-statistic falls within the boundary, the result is inconclusive. After establishing cointegration, the second step involves estimation of the long-term elasticities and the error-correction model. Similar to the export model, the import model is also specified drawing on the existing empirical literature in this area. We specify that a standard long-run import demand function for commodity  $i$  to take the following form (see, for example, Ozturk and Kalyonku, 2009; Choudhry, 2005; Arize, 1998, 1996, 1995; and Asseery and Peel, 1991):

$$\ln M_{it} = \theta_0 + \theta_1 \ln Y_t + \theta_2 \ln P_{it} + \theta_3 \ln VOL_t + \varepsilon_t \quad (3)$$

Where  $M_{it}$  is the real import volume of commodity  $i$  in period  $t$ ,  $Y_t$  is the real income of the United States in period  $t$ ,  $P_{it}$  is the relative price of exports of commodity  $i$  in period  $t$ ,  $VOL_t$  is a measure of exchange rate volatility, and  $\varepsilon_t$  is a white-noise disturbance term. Economic theory posits that the real income level of the domestic (importing) country would have a positive effect on the demand for its imports. Therefore, *a priori*, we would expect that  $\theta_1 > 0$ . On the other hand, if the relative price of imports rise (fall), foreign goods become less (more) competitive than domestic goods, causing the demand for imports to fall (rise). Therefore, *a priori*, one would expect that  $\theta_2$ , which measures the competitiveness of Spanish exports relative to the U.S. domestic production, is negative.

The last explanatory variable is a measure of exchange rate volatility. Since the effects of VOL on imports have been found to be empirically and theoretically ambiguous (Bredin, *et al.* 2003),  $\theta_3$  could be either positive or negative. Equation (3) shows the long-run relationships among the dependent and independent variables in our model. As it was done in the case of the export model, in estimating the long-run model outlined by equation (3), in order to distinguish the short-run effects from the long-run effects, equation (3) should also be specified in an error-correction modeling (ECM) format. Therefore, following Pesaran, Shin, and Smith (2001) and their method of bounds testing or the Autoregressive Distributed Lag (ARDL) approach to cointegration analysis, we rewrite equation (3) as an error-correction model in equation (4) below.

$$\begin{aligned} \Delta \ln M_t = & \psi_0 + \sum_{i=1}^n \theta_i \Delta \ln M_{t-i} + \sum_{i=0}^n \rho_i \Delta \ln Y_{t-i} + \sum_{i=0}^n \sigma_i \Delta \ln P_{t-i} \\ & + \sum_{i=0}^n \omega_i \Delta \ln VOL_{t-i} + \mu_0 \ln M_{t-1} + \mu_1 \ln Y_{t-1} + \mu_2 \ln P_{t-1} + \mu_3 \ln VOL_{t-1} + \omega_t \end{aligned} \quad (4)$$

Where  $\Delta$  is the difference operator and the other variables are as defined earlier. Pesaran, Shin, and Smith's (2001) bounds testing approach to cointegration is based on two procedural steps. The first step involves using an F-test or Wald test to test for joint significance of the no cointegration hypothesis  $H_0 : \mu_0 = \mu_1 = \mu_2 = \mu_3 = 0$  against an alternative hypothesis of cointegration,  $H_1 : \mu_0 \neq 0, \mu_1 \neq 0, \mu_2 \neq 0, \mu_3 \neq 0$ . This test is performed using equation (2). The advantage of this approach is that there is no need to test for unit roots, as is commonly done in cointegration analysis. Pesaran, Shin, and Smith (2001) provide two sets of critical values for a given significance level with and without time trend. One assumes that the variables are stationary at the levels or  $I(0)$ , and the other assumes that the variables are stationary at the first difference or  $I(1)$ . If the computed F-values exceed the upper critical bounds value, then  $H_0$  is rejected signaling cointegration among the independent variables. If the computed F-value is below the critical bounds values, we fail to reject  $H_0$ . Finally, if the computed F-statistic falls within the boundary, the result is inconclusive. After establishing cointegration, the second step involves estimation of the long-term elasticities and the error-correction model.

## DATA SOURCES AND VARIABLES

Our export and import data series span a 20-year period from January 1993 through December 2012, leading to 240 monthly observations. Monthly data on real export volume and prices are taken from the

Global Trade Information Services, *World Trade Atlas Database*. Monthly data on real export and import volumes and prices have been converted into export volume indices and export price indices with 2005 serving as the base (=100). The study focuses on the top twenty export commodities and top twenty import commodities defined at the 2-digit Harmonized System (HS) codes level, and selected based on their average export and import values between 1993 and 2012. The top 20 export products from the U.S. to Spain are: Pharmaceutical Products (HS30); Miscellaneous Grain, Seed, Fruit (HS12); Mineral Fuel and Oil (HS27); Machinery (HS84); Organic Chemicals (HS29); Edible Fruit and Nuts (HS08); Aircraft and Spacecraft (HS88); Electrical Machinery (HS85); Optical and Medical Instruments (HS90); Passenger Vehicles (HS87); Iron and Steel Products (HS73); Paper and Paperboard (HS48); Plastic (HS39); Miscellaneous Chemical Products (HS38); Woodpulp Etc.

(HS47); Food Waste and Animal Feed (HS23); Perfumery, Cosmetic, Etc. (HS33); Iron and Steel (HS72); Copper and Articles Thereof (HS74); and Rubber (HS40). These 20 export products accounted for 83.1% of total U.S. exports to Spain in 2012. The top 20 import products of the U.S. from Spain are: Mineral Fuel and Oil (HS27); Machinery (HS84); Pharmaceutical Products (HS30); Organic Chemicals (HS29); Electrical Machinery (HS85); Beverages (HS22); Iron and Steel Products (HS73); Rubber (HS40); Preserved Food (HS20); Plastic (HS39); Passenger Vehicles (HS87); Optical and Medical Instruments (HS90); Edible Fruit and Nuts (HS08); Iron and Steel (HS72); Footwear (HS64); Aircraft and Spacecraft (HS88); Miscellaneous Art of Base Metal (HS83); Ceramic Products (HS69); Precious Stones and Metals (HS71); and Leather Art, Saddlery, and Bags (HS42). These 20 import products accounted for 72.8% of total U.S. imports from Spain in 2012.

The real income variable for Spain is proxied by the industrial production index (2005=100) of Spain while the real income variable for the U.S. is proxied by the industrial production index (2005=100) of the U.S. The underlying series are obtained from the International Monetary Fund's *International Financial Statistics database* and from the Organization for Economic Cooperation and Development's online database. The relative price ratio for U.S. exports is calculated as the ratio of the export price index of each commodity to the price level, proxied by the consumer price index (2005=100) of Spain. The export price index for each of the export products is computed using the unit prices taken from the Global Trade Information Services, *World Trade Atlas Database*, while the consumer price index is also obtained from the International Monetary Fund's *International Financial Statistics database*.

Following Bahmani-Oskooee and Wang (2008, 2009), and Sekkat and Varoudakis (2000), the real exchange rate,  $RER_t$ , is constructed as:

$$RER_t = \left( \frac{ER_t^{US-SP} \times P_t^{SP}}{P_t^{US}} \right) \quad (3)$$

where  $RER_t$  is the real exchange rate,  $ER_t^{US-SA}$  is the bilateral nominal exchange rate between the United States and Spain at time  $t$ ,  $P_t^{SP}$  is the consumer price index (2005=100) of Spain at time  $t$ , and  $P_t^{US}$  is the consumer price index (2005=100) of the U.S. at time  $t$ . The monthly data on nominal exchange rates are taken from the IMF, *International Financial Statistics database*. Finally, our measure of volatility is constructed following Bredin, Fountas, and Murphy (2003), Weliwita, Ekanayake, and Tsujii (1999), Chowdhury (1993), Lastrapes and Koray (1990), and Koray and Lastrapes (1989). Following these authors the real exchange rate volatility measure is constructed as:

$$VOL_t = \left[ \frac{1}{m} \sum_{i=1}^m (\ln RER_{t+i-1} - \ln RER_{t+i-2})^2 \right]^{1/2} \quad (6)$$

where  $VOL_t$  is the volatility of real exchange rate,  $RER_t$  is the real exchange rate and  $m = 4$  is the order of the moving average. According to Koray and Lastrapes (1989), this measure can capture general movements in real exchange rate volatility and exchange rate risk over time.

## EMPIRICAL RESULTS

Applying the ARDL approach to cointegration to monthly data from January 1993 to December 2012, we assess the top twenty U.S. export products to and the top twenty U.S. import products from Spain. First, we estimate equations (2) and (4). Following Bahmani-Oskooee and Mitra (2008) we impose a maximum of four lags on each first differenced variable and employ Akaike's Information Criterion (AIC) to select the optimum lag length. Choosing a combination of lags that minimizes the AIC, we then test whether the variables for each industry are cointegrated. Our results reveal that fifteen of the twenty export industries encompass an F-statistic above the upper bound of 4.35, implying that these industries' four variables are cointegrated. The other five industries reveal an F-statistic below the lower bound of 3.23, indicating no cointegration among variables. Therefore, only those fifteen industries that exhibit cointegrating relationships among variables are used to analyze the effects of volatility on exports. Similarly, estimated results reveal that fourteen of the twenty import industries encompass an F-statistic above the upper bound of 4.35, implying that these industries' four variables are cointegrated. The other six industries reveal an F-statistic below the lower bound of 3.23, indicating no cointegration among variables. Therefore, only those fourteen industries that exhibit cointegrating relationships among variables are used to analyze the effects of volatility on imports.

*Short-Run Effects of Exchange Rate Volatility on Exports:* The short-run estimated coefficients on exchange rate volatility reveal a mixture of negative and positive signs. There is also a significance variation of the exchange rate volatility on exports among industries in the short-run. Some of the coefficients are positive and statistically significant. These industries include miscellaneous grain, seed and fruit, mineral fuel and oil, etc., machinery, electrical machinery, iron and steel products, and paper and paperboard. The products that have negative coefficients show that these coefficients are statistically insignificant in the short-run.

*Long-Run Effects of Exchange Rate Volatility on Exports:* As economic theory postulates, the real income variable renders a positive sign in all cases. This coefficient is statistically significant at the 1% level in ten of the industries and significant at the 5% level in one industry. The relative price variable displays the expected negative sign in all industries and is statistically significant at the 1% level in eight of the fifteen industries, and at the 5% level in three industries. This result is similar to those of Bahmani-Oskooee and Harvey (2011), Bahmani-Oskooee and Mitra (2008), Bahmani-Oskooee and Kovryalova (2008), and Bahmani-Oskooee and Ardalani (2006). Finally, the estimated coefficients on VOL show a mixture of negative and positive signs and only seven of the fifteen are statistically significant. Our findings are somewhat similar to those of Bahmani-Oskooee and Hegerty (2009) and Bahmani-Oskooee and Wang (2008, 2009). In general, in the long-run, exchange rate volatility appears to have mixed effect on the U.S. exports to Spain.

*Short-Run Effects of Exchange Rate Volatility on Imports:* The short-run estimated coefficients on exchange rate volatility reveal a mixture of negative and positive signs. There is also a significance variation of the exchange rate volatility on imports among industries in the short-run. Some of the coefficients are positive but only two of the coefficients are statistically significant. These industries include optical and medical instruments and footwear. The products that have negative coefficients show that these coefficients are statistically insignificant in the short-run. However, precious metal and stones industry shows a negative and statistically significant effect in the short-run.

*Long-Run Effects of Exchange Rate Volatility on Imports:* As economic theory postulates, the real income variable renders a positive sign in all cases. This coefficient is statistically significant at the 1% level in seven of the industries and significant at the 5% level in two industries. The relative price variable displays the expected negative sign in all industries and is statistically significant at the 1% level in eight of the fifteen industries, and at the 5% level in two industries. This result is similar to those of Bahmani-Oskooee and Harvey (2011), Bahmani-Oskooee and Mitra (2008), Bahmani-Oskooee and Kovryalova (2008), and Bahmani-Oskooee and Ardalani (2006). Finally, the estimated coefficients on exchange rate

volatility show a mixture of negative and positive signs and only three of the fourteen are statistically significant. Our findings are somewhat similar to those of Bahmani-Oskooee and Hegerty (2009) and Bahmani-Oskooee and Wang (2008, 2009). In general, in the long-run, exchange rate volatility appears to have mixed effect on the U.S. imports from Spain.

## SUMMARY AND CONCLUSIONS

In this paper we have examined the dynamic relationship between exports, imports, and exchange rate volatility in United States' trade with Spain, in the context of a multivariate error-correction model. Estimates of the long-run export and import demand functions were obtained by employing the bounds testing approach to cointegration using monthly data for the period January 1993 - December 2012.

The cointegration results clearly show that there exists a long-run equilibrium relationship between real exports, real foreign economic activity, relative prices, and real exchange rate volatility, in fifteen of the twenty commodities selected. Similarly, the cointegration results clearly show that there exists a long-run equilibrium relationship between real imports, real domestic economic activity, relative prices, and real exchange rate volatility, in fourteen of the twenty commodities selected.

In the long-run, all the specifications yielded expected signs for the coefficients. Most of our estimated coefficients are statistically significant either at the 1% or 5% levels. There is also a significance variation of the exchange rate volatility on exports among industries in the short-run. Some of the coefficients are positive and statistically significant. These industries include miscellaneous grain, seed and fruit, mineral fuel and oil, etc., machinery, electrical machinery, iron and steel products, and paper and paperboard. The products that have negative coefficients show that these coefficients are statistically insignificant in the short-run. There is also a significance variation of the exchange rate volatility on imports among industries in the short-run. Some of the coefficients are positive but only two of the coefficients are statistically significant. These industries include optical and medical instruments and footwear. The products that have negative coefficients show that these coefficients are statistically insignificant in the short-run. However, precious metal and stones industry shows a negative and statistically significant effect in the short-run. These results point out to the decreasing competitiveness of U.S. exports in the global economy despite the depreciating value of the dollar over time. It underscores the degree to which a developed country such as Spain has succeeded in finding alternative markets in Europe and especially in Asia in the last decade.

## ABSTRACT

*Auditors use professional judgment to collect and evaluate evidence to issue an opinion on the fairness of a company's financial statements. While globalization has eliminated trade barriers between countries, cultural diversity has emerged as a challenge in the work environment. According to Tan and Hau-Sin (2009), business decisions should consider the economic and political environment of the host country. This research examines how experience could affect the professional judgment of auditors in an audit planning environment. The study consists of different situations considering four of Hofstede's (1980, 2001) cultural dimensions: individualism/collectivism, power distance, uncertainty avoidance and short and long-term vision to determine if experience influences the decision making process. After auditors (with different years of experience) made decisions about the audit planning process in different countries, the results obtained using the Kruskal-Wallis test suggests that experience did not affect their decisions when these decisions are based on professional judgment.*

**KEYWORDS:** Experience, Culture, Internal Control, Fraud, Visitor auditor, Individualism/collectivism, Power distance, Uncertainty avoidance and Short and long-term vision

## INTRODUCTION

The auditing literature identifies fraud risk assessment as one of the most important steps in an audit engagement of a firm's financial statements. If the audit client is located in another country, an independent auditor (with or without experience) will have to make decisions based on professional judgment. The country where an auditor works is one of the factors that will be used in the decision-making process, especially in those cases where the client is located in a country with specific cultural characteristics. According to Husted (1998), Getz and Volkman (2001), Davis and Ruhe (2003), and Sanyal and Guvenli (2009), national culture may have a relationship between corruption and bribes in firms that are located in specific countries.

This information is helpful when an auditor is in the planning stage of an audit. The results of this study are important because of the increasing professional liability currently faced by Certified Public Accountants (CPAs) who participate in audit engagements. Their work in a global environment has been tarnished in recent years by accounting fraud scandals. Independent auditors are responsible for procedures aimed at obtaining reasonable assurance that an entity's financial statements are not materially misstated. This implies that auditors must be alert to fraud risk factors ("red flags") that may affect the fairness of the entity's financial statements, which could be related to material weaknesses in a firm's system of internal controls. The literature in this area is characterized by the identification of differences in audit environments and the performance of multi-cultural analysis between countries using accounting students or auditors in countries like USA, Canada, Asia, and Mexico.

Hofstede's cultural dimensions (1980, 2001) are frequently used to predict the effects of cultural differences: individualism and collectivism, power distance, masculine and feminine, uncertainty avoidance, and long versus short-term vision. Prior research describes the use of auditors with different levels of experience, the most common being the use of students. Several studies have examined the effect of the auditor's experience on professional judgment and the decisions made (Ashton and Brown, 1980; Hamilton and Wright, 1982; Bedard, 1989; Bonner and Lewis, 1990; Libby and Frederick, 1990; Ho and May, 1993; Davis, 1996). However, these studies do not address how the experience of the

auditors could affect their professional judgment in their assessment of the possibility of fraud and on the reliability of a firm's internal control system in environments with different characteristics.

The objective of this investigation is to examine whether experience affects the professional judgment made by auditors during the planning stage of an audit. We use four of Hofstede's (1980, 2001) cultural dimensions (individualism and collectivism, power distance, uncertainty avoidance and long or short-term vision) to examine the effects of cultural differences and whether experience has any effect on the professional judgment used by auditors in making decisions related to internal controls and the assessment of a client's fraud risk potential.

## CONCLUSIONS

Our study examines whether the number of years of experience of auditors working in CPA firms, including students in their final (senior year) of university studies, has an effect on their assessment of a firm's internal controls and fraud risk in a client that operates in different countries with different cultural characteristics. Our analyses suggest that experience does not seem to affect the judgment decisions made by auditors. The results obtained also suggest that the use of university accounting students or auditors with limited experience does not seem to have a significant difference on audit-related research.

This study has several limitations. First, the data for this study presents a self-selection bias from the participants who decided to respond to the study's questionnaire. Second, we did not obtain the same proportion of participants for the different types of categories in the sample. Third, the questionnaire had several leading questions wherein the participants could anticipate the desired response. Finally, most of the auditors who responded did not have experience working in companies located in other countries. Future research could incorporate participants from other countries, including internal auditors (of public and private) multinational companies who have had the experience of working in other countries.

# DIFFERENCES BETWEEN AUDITOR'S CLIENT ACCEPTANCE AND CONTINUANCE DECISIONS

Mohamed Drira, University of New Brunswick

## ABSTRACT

*Auditor's Client Acceptance Decision (CAD) and Client Continuance Decision (CCD) have been drawing a growing interest from academics since Arthur Andersen failure in 2002. However, no study addressed the issue of the difference between the two decisions. In the extant auditing literature, CAD and CCD are seldom differentiated and if differentiation is made, the distinction between the two decisions is often obscure. Though the two decisions have some commonality yet, an approach of considering them similar is simplistic as it omits all the professional and relational variables characterizing a continuing audit engagement. In this paper, I develop novel mathematical models of the CAD and the CCD based on the decision theory framework and the audit fee model introduced by the seminal paper of Simunic (1980) and extended by Houston et al. (1999) and Houston et al. (2005). Analyses of the two models show that the CAD is more conservative than the CCD, and that this difference between the two decisions increases as the legal liability regime becomes stricter. In addition, given a legal liability regime, the difference between the CAD and the CCD is more pronounced within the Big4 audit firms as compared to non-Big4. Finally, as the audit tenure increases, the increase in the difference between the CAD and the CCD due to the decrease in audit costs is tempered by the increase in the expected liability costs.*

# FISCAL POLICY RULES : AN EVALUATION BASED ON CHILEAN ECONOMY EXPERIENCE

Ryszard Piasecki, University of Lodz .Poland  
 Erico Wulf B , University of La Serena. Chile

## ABSTRACT

*Resource-rich countries in general (like copper-rich Chile), are at a critical juncture, facing the challenge of revamping their fiscal policy institutions and their conduct on the road towards financial stability, economic growth and socio-economic development. A **budget surplus** arises in a country when the total revenue earnings surpass expenditure in a particular financial year. Budget surplus is very important in the sense that at the time of covering the budget deficit it brings about a decrease in the net public debt. With high copper prices, public revenues increase which ignite expectations about future higher spending. However, this additional spending pressure the fundamentals to such extent that it will not take too long to increase inflationary pressures. From that situation on, it is when troubles begin. Fiscal rules instead means to kept spending discipline, no matter the higher public incomes, the whole performance of the economy and its positive impact on welfare ,will its main beneficiary.*

**JEL:** H5 E62

**KEYWORDS:** Rules, Budget Surplus,Coordination

## INTRODUCTION

Resource-rich countries in general (like copper-rich Chile or oil exporting Saudi Arabia) are at a critical juncture, facing the challenge of revamping their fiscal policy institutions and their conduct on the road towards financial stability, economic growth and socio-economic development. Experience shows that fiscal and monetary pro-cyclicality is more likely in highly corrupted states with poor fiscal governance, low fiscal credibility and weak integration into world financial markets. At the heart of good fiscal and political institutions are good governance, transparency and accountability and strongly-enforced incentives faced by politicians – which ultimately translates as democracy. A **budget surplus** arises in a country when the total revenue earnings surpass expenditure in a particular financial year. Budget surplus is very important in the sense that at the time of covering the budget deficit it brings about a decrease in the net public debt. Like budget deficit budget surplus also exerts indirect influence on tax payers.

Normally, it is not essential on the part of the government to maintain a budget surplus, though it needs to be very useful at the time of running the budget deficit, to have the proper buffer. Under normal circumstances, economists have a tendency to remain concerned about the consequences of the situation when government debts undergo a sharp increase as a proportionate part of the country's Gross Domestic Products (GDP). This is indeed a matter of serious concern, as the government debts are the sole means to fund financial deficits arising in a country. Moreover, the amount paid as interest also increases in proportion to the GDP, which imposes an additional burden on the country's risk level, until there is enough reduction in the average rate of interest paid on the debts on governmental level. A rise in the interest load indicates that government revenues will be utilized for payment of financial costs, rather than being used for the country's production, reducing its economic growth potential.- This analysis poses number of key questions to be addressed in this paper:

- 1) What are the main advantages of such a policy?
- 2) Does the policy of budget surplus make any sense in a country with huge social needs?
- 3) Which countries can have budget surplus rules (e.g. Norway, Saudi Arabia etc.)?
- 4) In times of globalization, is such policy workable?

## Part I.

Budget Surplus And The Chilean Economy Experience

## The nature of fiscal policy and justification for fiscal policy rules

Fiscal Policy is a key and strong component of macroeconomic tools, more so when it comes to support the recovery of economic growth or to smooth business cycle fluctuations. Although tax income drops while the economy is in a recession this is a transitory situation. Deficit will arise because the pace of expenditure is maintained, making recession smoother and social costs and welfare losses lower. Tax revenues will adjust later to their previous level, closing the gap with expenditures. This is the basic textbook case for countercyclical macroeconomic policy (Gordon 1983).

Unfortunately, public revenues and expenditures do not react with the same pattern. While tax revenues follow the output trend (tax revenues output elasticity is around 1), public expenditure elasticity is lower (less than one), which means that it takes more time to adjust down expenditure after the recession is over. Consequently a deficit situation may last longer than necessary with huge cost involved (crowding out effect, efficiency losses because of resource misallocation, productivity and competitiveness losses). In the integrated world, these costs are not trivial, and it is better to be well aware of them and their consequences (capital outflow, inflationary expectations, increasing debt, higher country risk perception and uncertainty). Thus, while fiscal policy might help to obtain economic recovery (assuming a healthy financial system), it might become a constraint for keeping a sustainable economic growth pattern (Pasten and Cover 2010). Besides, there are lags in fiscal policy reactions, both from lack of information and legislature procedures, which makes the situation more complicated to handle. A reasonable alternative, is to have the fiscal policy rule which Gordon (1983) called the Natural Employment surplus, or as we have called it in this paper, the structural budget surplus.

Fiscal policy rules, like structural budget surplus, focus on the political commitment to control the fiscal situation, as soon as the need for fiscal boost disappears. However, this does not mean that the structural budget surplus becomes a fixed target. The Chilean experience worked out the structural budget surplus in two phases: the first one (2000-2008) with 1% budget surplus and the second one (2009-2010) with 0,5-0% structural fiscal surplus, which signals the importance of flexibility because of economic growth scenarios, the proposed objectives might be wider than at the beginning, or it is convenient to improve the institutional framework, which surrounds its implementation ( Vergara, 2002; Rodriguez, 2007; Frankel, 2011; Larrain, 2011; Schmidt-Hebbel, 2012).

**PART II : IS IT POSSIBLE FOR ALL COUNTRIES TO HAVE FISCAL POLICY RULES?**Different Cases And Experiences Concerning The Structural Budget Surplus Rule

Few countries can fully meet the requirements of policy rules. Even so, since the nineties a growing number of countries have implemented different fiscal policy rules starting with 10 countries in 1990 and up to 51 in 2011. However, only 10 countries have rules aimed at stabilizing cyclically adjusted balances, for implementing counter cyclical fiscal policy or at least avoiding pro-cyclical policy bias (IMF 2009). The fiscal rules implemented by the EU have a key weakness: according to current evidence, when the economy goes into recession, there is no way to keep the rule in place. Monetary or fiscal policy rules are subject to some constraints and institutional conditions, which go beyond short run evaluations. For instance, the 11 Arab countries which account for 55% of oil and 29% of world gas reserves get 80% of government revenue from these sectors, but many of them do not have fiscal policy rules. Instead, they have pro-cycle fiscal policy, RER misalignment and macroeconomic volatility (Schmidt-Hebbel, 2012).

### Positive externalities of budget surplus

Running a budget surplus carries a number of advantages and positive externalities such as: increased flexibility, lower interest costs, the ability to invest in future growth, lower output volatility and more flexible monetary policy: Greater Flexibility. When the economy falters, governments often use stimulus spending projects as a way to jump-start the country and put people back to work. Countries that run budget surpluses in good times have a lot more flexibility when it comes to stimulate spending in a recession. If the country has a budget surplus in place, it can spend part of that surplus to stimulate the economy and hopefully shorten the duration of the recession. But when the country goes into recession already in debt, it has fewer options to stimulate the economy. Any stimulus spending must be borrowed from future generations, and that simply makes a bad financial situation even worse. Lower interest rate costs. In the Chilean case, the gross debt/GDP ratio goes from 23% (1990-2000) to 9% (2001-2011).

Before the fiscal policy rule Chile was a net debtor by 9% of GDP. After the fiscal policy rule it became a net creditor by 4% of GDP. As a consequence borrowing costs went down from 7% in 1999 to 3.35% in 2011 (Larrain, 2011). Having a responsible fiscal policy demonstrates fiscal discipline. That reputation for fiscal discipline and sound financial planning can translate into the ability to borrow money at favorable (lower) rates, since lenders look at the overall health of the company and its ability to manage its resources wisely. Investment opportunities. A company or government that is flush with cash, has the opportunity to jump on a promising investment opportunity when it comes along. But if the company does not have extra cash, those investment decisions are a lot harder. In that case every investment decision means adding to an already heavy debt burden, and that can reduce the company's options significantly. At a government level, a budget surplus which allows the increase of investment in social areas, needs to provide it with more sustainable financing than just increasing taxes.

*Less output volatility:* As it has been demonstrated with other policy rules, a fiscal policy rule also brings about lower output volatility. The Chilean economy is an interesting case in point, because in the period 1999-2005 and after the budget surplus was implemented output volatility decreased by 32-33%. Besides, coupled with other policy decisions (such as changing the exchange rate regime from a crawling peg to a flexible exchange) made the impact stronger, pushing down volatility even further by 25-27% (Larrain and Parro, 2006; Kumhof and Laxton, 2010). Thus, budget surplus also contributes to the efficiency and effectiveness of macro-economic policy as a whole.

*Tri lemma implications:* It has been argued that the tri lemma is an impossible situation: free capital flows, exchange rate regime (fixed or flexible) and autonomous monetary policy cannot work freely along the economic cycle. Sooner or later one of them has to be modified in relation to the effectiveness of the monetary policy and its space for maneuvering. The argument goes as follows: capital flows have an undoubted effect on exchange rates especially in smaller economies, pushing rates up or down depending on whether there is capital inflow (appreciation) or outflow (depreciation). These exchange rate variations are not neutral. Leaving aside distributive effects, they affect both banks with heavy foreign currency denominated debt and the competitiveness of the export sector. With exchange rate fluctuations monetary policy should change the interest rate, but as long as it operates on its own it has to deal with key constraints which affect its independence and effectiveness. Whether the options are increasing (depreciation) or reducing (appreciation) interest rates, we cannot fully apply these options without risking a severe aggregate demand contraction in the former case (increasing interest rates), or an overexpansion of aggregate demand in the latter case (reducing interest rates). Thus, monetary policy is limited in its ability to correct the distortion arising from exchange rates fluctuations. However, a fiscal policy rule (budget surplus rule) can make the difference because in the case of a recession, due to contractive monetary policy (higher interest rate), it allows self-stabilizing factors to take place. In this scenario, previous savings are available for counter cyclical spending. In the other case (lower interest rate), the fiscal rule compensates for expansionary pressures in aggregate demand. With this fiscal policy rule, monetary policy has a back up for increased flexibility and independence. The Chilean experience in

this area shows that fiscal policy became less correlated with the economic cycle after the structural budget surplus was applied, decreasing from 0.77 (1990-2000) to 0.57 (2001-2011). Therefore, a fiscal policy with a smaller pro-cyclical profile complements monetary policy in such a way that output volatility decreases (Larraín, 2011).

### Part III

#### The Chilean Case (2000-2008) And Other Experiences

Since the year 2000, Chile fiscal policy, has been applied following a structural surplus rule of 1% (Marcel, 2001). The introduction of this rule, confirmed and intensified Chile's commitment to fiscal responsibility implemented since the mid-1980s by introducing a more explicit medium-term orientation (Vial, 2001; Arellano, 2005). The rule was initially not regulated by law. However, this changed with the 2006 Fiscal Responsibility Law which also introduced new rules on the investment of accumulating assets. The structural surplus rule only covers the central government and deals only with income, keeping expenditure on its mid-term trend. It also assumes that the tax structure is neutral in relation to distributive effects, assuming an output tax elasticity of 1.0. An alternative case would be to have a progressive tax rate, in which case this elasticity would be higher (1.5 - 1.6), or at least greater than 1. In the Chilean case, the elasticity ranges from 1.0 - 2.4 depending the tax source, although for the structural budget proposal, it was considered to be close to 1 (1.05). The implications of this progressiveness, is to have a higher impact on government revenues when output grows (Gordon, 1983). This makes the structural budget surplus more cautious in the growth path, and more countercyclical in recessions, which seems to suggest that structural budget surplus policy impact is not neutral in relation to the tax structure. The main elements of the public sector left outside the rule are: the central bank, public non-financial enterprises, the military sector and municipalities.

#### Institutional and Economic Conditions for Implementing The Target

The existence of additional conditions – both institutional and economic –, were relevant to the implementation of this target (Marcel, 2001; Vial, 2001; Arellano, 2005). These conditions pertained to:

- a.- An independent Central Bank, which set an inflation targeted monetary policy at an annual level of 3%.-
- b.- Macro policy consistency. Without a fiscal policy rule monetary policy is aimed at exchange rate objectives, breaking down the Tinbergen rule. Besides this, it adversely affects policy coordination.-
- c.- A crossover political commitment to steadily improve the macroeconomic institutional framework.-
- d.- The level of openness in the Chilean economy. Global economy fluctuations require economic policy tools to be fully disposed to deal with the impact of shocks. In fact, the Asian economic crisis makes it evident that inconsistencies in macroeconomic policy matter (Elbadawi, 2011; Schmidt- Hebbel 2012). The structural surplus rule implies a counter-cyclical behavior of ex-ante expected government surpluses. In Chile this was the case for expected higher copper prices. It could also be the case for higher oil prices or agricultural goods prices. It states that the central government's overall structural balance should in every year equal a surplus of 1% (0.5% effective since 2008) of actual GDP. The structural balance equals structural revenues plus interest on net government assets (which are positive in Chile) minus actual expenditures on goods and services. Structural revenue is determined by two independent panels of experts and reflects what tax revenue would have been if the economy had operated at potential rather than actual output, and what copper revenue and other derivatives would have been at a long-term reference of world copper price, rather than the actual price.

The rule therefore specifies permissible annual expenditures on goods and services as a residual, given the values of the target structural revenues, the level of government assets, interest rates, and GDP. The resulting counter-cyclicality of government deficits isolates government expenditures on goods and services from the cycle and keeps them growing with trend output. No distinction is made between government consumption and investment expenditures, because this is difficult to do in practice. This positive fiscal rule was supported by certain features that are not intrinsic to it, but optional in its implementation. A key feature was the level at which the structural balance is targeted.

During the first years a structural surplus target equivalent to 1% of GDP was set with the aim of ensuring the accumulation of assets with which to reduce the liabilities inherited from the debt crisis in the 1980s and to meet future public sector commitments, including, in particular, the contingent liabilities generated by the guaranteed minimum pension and older-age beneficiaries, arising from the pension reforms implemented in 1980. In addition, another argument for maintaining a structural surplus was the structural operating deficit of the Central Bank of Chile, as a result of losses arising from the bailout of the private banking system during the 1980s.

A positive surplus target implies significant asset accumulation by the government. However, when it was adopted it pretended to provide for future social commitments and to address contingent liabilities. The 2006 Fiscal Responsibility Law formalized this by establishing rules for the investment of surpluses. These rules envision investment in a government pension fund, gradual central bank recapitalization, and a Fund for Economic and Social Stabilization (FESS). In May 2007, following an expert panel recommendation, a reduction in the surplus target from 1% to 0.5% of GDP was announced, effective in 2008. The additional resources that thereby become available for current spending, will be devoted primarily to education. There were important reasons for this change in the target from 1% to 0.5%:

a.- The initial target of 1% implied that government asset accumulation over time (2007-2016) was 10% of GDP on average, which is hard to justify when it comes to meet social demand arising from growth (Engel, Marcel, and Meller, 2007). Besides, the welfare gains from following this rule are lower (18%) than those obtainable by implementing fiscal policy rules with a flexible clause to break the transitory rule down (Engel, Neilson and Valdes, 2011).

b.- Most of the initial justifications for such a target were fulfilled at that time. In 2005, Central Bank operational deficit was equivalent to 0.005% of Chilean economy GDP, down from 1% at the end of the nineties. Further government efforts to reduce its liabilities with the Central Bank improved its capitalization, and its independence.-

c.- The 2006 Fiscal Responsibility Law formalized the financial resources to support contingency liabilities arising from the pension reforms, creating a government pension fund with resources equivalent to a minimum of 0.2% and up to a maximum of 0.5% of GDP, which will be ready for spending only after 10 years of interest rate gain accumulation.

d.- Other contingency liabilities arising from private sector investment in public infrastructure, based on state guaranteed income, were estimated at US\$ 5 billion (2006), but with new institutional developments aimed to improve the quality of contracts and better arbitration procedures, these were expected to decrease substantially.

e.- After some years of strong fiscal saving owing to the constant boom in commodity prices the Treasury became a net creditor to the rest of the world, with growing stabilization funds. By late 2008, the Economic and Social Stabilization Fund (successor to the Copper Buffer Fund) and the Pension Reserve Fund had accumulated the equivalent of 18% of GDP, while fiscal liabilities were negligible after significant amortizations made with previous surpluses in the fiscal balance. The socially beneficial allocation for that 1% of GDP was to finance social investments and productive development, such as better quality of education, labor and small entrepreneurs training, innovation support, regional

infrastructure, and incentives for long-term financing of SMEs and new entrepreneurs. Consistently, the structural surplus target for 2008 was reduced to 0.5% of GDP.

The contagion of the global crisis led to further reduction of the balance to 0% in 2009 and the earthquake of 2010 moved the target into negative territory, at -1%. At the same time, Chile moved sharply from a rather cyclically neutral approach to a strong counter-cyclical one. In 2009 Chile is expected to reach 0.4% structural fiscal deficit and 4% measured deficit, with a 15% rise in fiscal public investment. An expert panel was appointed in 2010 to propose recommendations to improve the quality of the rule (for a detailed analysis see Schmidt-Hebbel, 2012).

### Evaluations of The Targeted Fiscal Policy Rule and Implications

The Chilean fiscal policy has evolved in the last two decades combining discipline, transparency and macroeconomic management within an institutional framework designed to improve the quality of signals for investment and growth, reducing the sources of instability and uncertainty. Since 2001, in spite of several shortcomings (such as insufficient intensity of countercyclical effects) the rule has served to avoid pro-cyclical bias and has given stability to public expenditure. As the concept of the structural budget has gained credibility, it has been easier to introduce improvements and discretionary windows, for example allowing for an unprecedented expansive reaction to the 2009 crisis in a context of fiscal sustainability. Overall the Chilean experience shows the importance of both the introduction of structural budgeting as a principle, and the value of learning in policy making, paying attention to local structural specificities.

Better coordinated and consistent macroeconomic policies mean less output volatility (Larrain and Parro, 2006), less efficiency and welfare losses (Kumhof and Laxton, 2009), less interest rate volatility (Rodriguez, 2006), and less exchange rate volatility (Velasco, 2010), and therefore increasing the effectiveness of the institutional framework for economic policy design. A small economy, highly integrated to the global economy gets strong benefits from these positive externalities, as long as it reduces the financing cost of new investment projects, whether they are social or private.

In fact, Chile has become a low risk country which allows it to secure better financial conditions than many of its Latin American counterparts. Key challenges for the future are a greater understanding of and further guiding principles for the macroeconomic effect of fiscal policy on economic activity, prices and exchange rate determination, and the stabilizing and complementary support role of monetary policy. In particular it is important to achieve management of public savings that efficiently serves both short-term macroeconomic policy and long-term economic development (Larraín, 2011).

Progress in fiscal policy has contributed to improvement in counter-cyclical capacity for management of aggregate demand and exchange rate fluctuations, which in recent years have become quite unstable in response to both pro-cyclical capital flows and high copper prices. In the 1990s Chile had outstanding and successful experience with counter-cyclical regulation of financial inflows and achievement of comprehensive real macroeconomic balances, which although well fitted to confront the capital inflow pressures, were not effective enough to solve the real side shocks arising from the Asian economic crisis (1997-1998). Chile's strong recovery lost some momentum at the beginning of the 2000s as the world economy slowed, weakening copper prices (2000-2003), capital inflows and consumer confidence.

### **CONCLUDING REMARKS**

1. Given the political nature of fiscal policy, it helps to have policy rules to improve the effectiveness of macroeconomic policies as whole, and the stability of growth in particular. The positive externalities linked to fiscal policy rules reinforce a virtuous circle of growth, as long as volatility decrease and welfare levels improve.

2. Social needs considerations should go beyond the short-term objectives. These overlap generations, which means they influence sustainable long run economic policy. Thus, in light of these needs, the issue is not necessarily to have or not to have policy rules, but how to make those rules more effective throughout time. Therefore, it is very important to apply fiscal policy rules with flexibility clauses. Otherwise, welfare gains are lower, and social needs harder to satisfy.

At the same time tax progressiveness is also an important variable, as long as it fulfills efficiency criteria, meaning minimal welfare losses. Somehow the need for public saving (budget surplus rules), might be complemented by the proper (progressive) tax policies such that given a public saving target, the range of budget surplus does not need to be substantial one.

3. Although, there has been an increasing number of countries which apply fiscal rules, just a few of them follow a structural budget surplus rule. In the case of the Chilean economy, on the one side it helped quite a lot a combination of political, economic and institutional settings, but on the other hand, it also helped to have specific financial demands arising from past Government compromises, hard to solve without important increases in public savings. Other countries might implement such policy rules, but it is a matter of political will, government action, accountability, and having modern institutions.

4. As long as the global economy is risk averse, policy rules help to implement a more consistent and efficient policy framework, suitable for productive resources flows (instead of speculative ones) to take the lead for global growth. Productive resources need to know the rules they are submitted to. The 'no rules' alternative means speculative forces flourish and economic agents make their bets for what comes next within the accompanying uncertainty. Thus, the global economy needs not only better policy, but also better rules for policy implementation and global resource flows, making the real side of economy more relevant than its financial side, thus reducing volatility and welfare loss.

# ANALYTICS-BASED MANAGEMENT OF ORGANIZATIONAL INFORMATION SYSTEMS

Peter Géczy, National Institute of Advanced Industrial Science and Technology (AIST)  
Noriaki Izumi, National Institute of Advanced Industrial Science and Technology (AIST)  
Kôiti Hasida, National Institute of Advanced Industrial Science and Technology (AIST)

## ABSTRACT

*Information technologies penetrate virtually every division in contemporary organizations. Organizations deploy a spectrum of information technologies with aim of alleviating operating efficiency. Knowledge workers increasingly depend on deployed information systems to accomplish their tasks. Well-deployed and managed information systems have a potential to increase effectiveness and efficiency in organizations; whereas poorly deployed and managed systems may have significant negative impact. Strategic deployment and management of organizational information systems play the key roles in attaining beneficial impacts of organizational information systems. Conventionally, information technology managers have relied primarily on tacit knowledge. Such knowledge and experiences have been accumulated over a course of years. However, information technologies progress at a rapid pace and early adopters gain considerable strategic advantages. Information technology managers cannot afford spending years accumulating tacit knowledge. Viable solution to this problem is to adopt an analytics-based management.*

**JEL:** M15; M21; O32; O33; O22; O43; L15; L21; L25; L86;

**KEYWORDS:** information technology management, analytics-based management, information systems, actionable knowledge, tacit knowledge, explicit knowledge.

## INTRODUCTION

Proper management of information technologies is important (Turban and Volonino, 2011). Inappropriate management of information systems may have numerous adverse effects. Conventionally, management of information systems relied on valuable experience accumulated by managers over a number of years (Hunter, 2007). As technology progress has gradually become faster, the traditional experience-based management style has been met with challenges. Increasing pace of development and availability of novel information technologies has led to shortening periods between successive technology generations (Devarajan, 1996). This trend presented new challenges for managers of information systems.

### Analytics-Based And Experience-Based Management Symbiosis

A solution to the challenges inherent in the experience-based management has been a transition to analytics-based management (Davenport et al., 2010). Utilization of analytics permits transformation of tacit to explicit knowledge and extraction of actionable knowledge from data in a timely manner. Analytics-based management has a potential to reach higher management efficiency of information systems more quickly. Thus, greater value and utility can be extracted faster and novel technologies can replace older ones sooner. Consequently, the increasing gaps between availability and deployments of technologies do not increase, but may eventually decrease. Analytics-based and experience-based management styles are not mutually exclusive. They are symbiotic. Managers can reasonably rely on actionable knowledge provided by analytics if they do not have proper experience with the difficulties they face. In such case, analytics have greater weight. On the other hand, if managers have a suitable experience, then analytics may still provide valuable additional information. However, greater weight is

placed on experience. This balancing of analytics-based and experience-based approaches allows addressing broader range of managerial issues with greater efficiency.

## CONCLUSIONS

Analytics-based management of information systems facilitates improved management efficiency over the traditional experience-based management. Analytics present a new dimension in management of information systems that suitably complement experience. Actionable knowledge extracted by analytics from collected data substitutes the absence of viable experience—particularly in the early deployment stages of new technologies. Proper utilization of analytics facilitates transformation of tacit to explicit knowledge, permits automation of managerial tasks, and allows reaching higher management efficiency faster. These effects enable shortening of lifetimes of deployed technologies and earlier adoption of new technologies. Deployment of analytics requires proper data acquisition, processing, analysis and knowledge extraction. These requirements are associated with costs. Well-managed deployment of analytics minimizes associated costs while maintaining benefits of analytics.

# FAITH-BASED ARBITRATION CLAUSES AS A GLOBAL ALTERNATIVE TO DISPUTE RESOLUTION

Albert D. Spalding, Jr., Wayne State University

## ABSTRACT

*DynCorp International, LLC, a U.S. company, and Aramco, a Saudi-owned corporation, entered into a contract for a computer system which was to be manufactured in the U.S. and installed at Aramco's facilities in Saudi Arabia. The contract contained a "choice of law" provision requiring the application of Saudi Arabian law even though the contract was entered into and significantly performed in the United States. The contract also contained an arbitration clause, requiring that any disputes be resolved using Sharia law as implemented through an arbitration panel. When a dispute over the ownership of funds arose, DynCorp attempted to bring the matter into the Texas judicial system. In its opinion in the matter (*In re Aramco Servs. Co.*, No. 01-09-00624-CV, 2010 Tex. App. LEXIS 2069, 2010 WL 1241525, Tex. App. Houston 1st Dist. Mar. 19, 2010), the Texas court refused to take up the matter, and effectively upheld the arbitration clause. This paper explores the increasing use and enforceability of faith-based arbitration clauses in international contracts and transactions in light of the *Aramco* case. The paper concludes that global finance is augmented when parties learn about other faiths (in particular, Islam) so that they can effectively negotiate and, where appropriate, adopt such clauses as a way of making use of alternative dispute resolution.*

**KEYWORDS:** Faith-based, alternative dispute resolution, arbitration, contracts, Sharia

## INTRODUCTION

*Arbitration* is method of dispute resolution involving one or more neutral third parties who are usually agreed to by the disputing parties and whose decision is binding (Garner & Black, 2004, p. 112). Arbitration is one of several systems of *alternative dispute resolution* (ADR), that is, procedures for settling dispute by means other than litigation (Garner & Black, 2004, p. 86). Arbitration is not a judicial proceeding that necessarily originates under any particular constitution, statute, regulation, court rule or the common law, but is instead a proceeding which is intended to occur outside of the normal judicial process. By contrast, *mediation* is an ADR where one or more impartial persons assist the parties in reaching a settlement but do not make a binding determination (Lipsky & Seeber, 1998, p. 134).

Arbitration can in some cases be called for or required by statute or other authority, but is often simply agreed to by private parties as part of their negotiated contracts and transactions. In the former case, there may be formal legal requirements that establish the conditions and parameters of such arbitration. In the latter case, arbitration is the creature of contract and the parties can decide among themselves the range of issues that will be subject to arbitration, the choice of substantive and procedural laws or rules, the extent and scope of possible relief, and any and all other aspects of the agreed-to arbitration. In the former case, arbitration is a required process that is prescribed by law; in the latter, the contracting parties waive their rights to seek redress in traditional processes of law. Arbitration is often less expensive than traditional civil judicial proceedings, because discovery can be more efficient, the use and cost of attorneys can be minimized, and the proceedings can be structured so that they are less formal and time-consuming. This paper focuses on those arbitration clauses and systems that draw from religious texts and traditions for their jurisprudence and procedures. Particular attention is given to the growing use of *Sharia* (Islamic law) within the jurisdictions of the United States legal system. A study of the case of *In re Aramco Servs. Co.* (2010) helps to illuminate the systemic tensions that can arise when Sharia-based arbitration clauses are employed within that legal system. In doing so, this paper expands on the extant literature on faith-

based arbitration in the United States. Specifically, it supplements and updates the general observations about faith-based arbitration made by Shippee (2002), Rashid (2004), Kutty (2006) and Wolfe (2006).

### Faith-Based Arbitration Clauses

Ordinary contract principles determine who is bound by written arbitration provisions. When parties to a contract execute the contract containing an enforceable faith-based arbitration provision, they are consenting to that provision. Two aspects of religious-based arbitration take into account private contracting autonomy: the choice of arbitrators who are versed in the religious law, and the choice of rules of law that align with the expectations of the parties (Dessemontet, 2012, p. 558).

*Christian Conciliation:* Faith-based arbitration clauses tend to reference the religious laws and principles of the three most widely held monotheistic religions: Christianity, Judaism and Islam. In the Christian religious tradition, over three hundred churches, ministries, and organizations are a part of Peacemakers Ministries, making it is the largest, multi-denominational Christian dispute resolution service in the country (Shippee, 2002, p. 243). The Peacemakers organization emphasizes mediation but will utilize arbitration on occasion. An example of a Peacemakers “conciliation clause” (that allows for arbitration in the event that mediation does not succeed in resolving an issue) is as follows:

*[T]he parties agree that any claim or dispute arising out of or related to this agreement or to any aspect of the employment relationship, including claims under federal, state, and local statutory or common law, the law of contract, and law of tort, shall be settled by biblically based mediation. If the resolution of the dispute and reconciliation do not result from mediation, the matter shall then be submitted to an independent and objective arbitrator for binding arbitration (Peacemaker Ministries, 2013).*

*Jewish House of Judgment:* The most well organized, geographically broad, and widely used religious arbitration system is the *Beth Din* (literally, “House of Judgment”) system employed by Jews (Wolfe, 2006, pp. 437-438). Beth Din of America, for example, is an extension of the Rabbinical Council of America, which was established in New York in 1960. The organization regularly arbitrates a wide range of disputes among parties, ranging in value from small claims to litigation involving several million dollars. According to their website, these cases can include: commercial (such as employer-employee, landlord-tenant, real property, business interference, breach of contract, breach of fiduciary duty, investor mismanagement, defective merchandise and unfair competition disputes), communal (such as rabbinic contract disputes and other congregational issues) and familial (such as family business, inheritance and matrimonial) disputes (Beth Din of America, 2013a). A sample arbitration clause reads as follows:

*Any controversy or claim arising out of or relating to this contract, or the breach thereof, shall be settled by arbitration by the Beth Din of America, Inc. currently located at 305 Seventh Avenue, New York, New York, in accordance with the Rules and Procedures of the Beth Din of America, and judgment upon the award rendered by the Beth Din of America may be entered in any court having jurisdiction thereof (Beth Din of America, 2013b).*

*Sharia Pathway to Submission:* *Sharia* (or *Shari’a*) is the Islamic legal system of legal principles that delineates the pathway to submission to God (Esposito 2003, p. 111). The primary source of *Sharia* is the *Qur’an*, the sacred text of Islam (Kutty 2006, p. 583), which strongly advocates amicable settlement of disputes in an equitable and fair manner and promises divine blessings to those who do so (Rashid, 2004, p.97). Under most interpretations of Quranic legal principles, parties in dispute are strongly encouraged to resort to arbitration only after negotiations and mediation have first been attempted (Rashid, 2004, p.105). Although both substantive and procedural law under *Sharia* tends to be somewhat informal, parties to contracts and commercial arrangements can elect arbitration as an ADR by including an arbitration clause that points to a particular Islamic forum such as a local mosque, Islamic center, or *Sharia* judicial organization. An example of such an arbitration clause is as follows:

*Any dispute, controversy or claim arising out of or in connection with or relating to this Agreement or any breach or alleged breach hereof shall, upon the request of any party involved, be submitted to and settled by arbitration before the Arbitration Court of an Islamic Mosque located in the State of Minnesota pursuant to the laws of Islam (or at any other place or under any other form of arbitration mutually acceptable to the parties so involved). Any award rendered shall be final and conclusive upon the parties and a judgment thereon may be entered in the highest court of the forum, state or Federal, having jurisdiction. The expenses of the arbitration shall be borne equally by the parties to the arbitration, provided that each party shall pay for and bear the costs of its own experts, evidence, and counsel (Abd Alla v. Mourssi, 2004, p. 570).*

### Deference to Arbitration Clauses In The U.S.

*Deference to Arbitration Decisions Generally:* Arbitration clauses of any kind are not explicitly upheld as a matter of routine by the courts in the United States. Although courts do not routinely review arbitration awards for conformity to substantive or procedural law, they will occasionally vacate or set aside arbitration awards that are contrary to public policy (Helfand, 2011, p. 1256). Generally, courts will consider vacatur of an arbitration award only if allowing it to stand would violate a strong public policy, would result in a manifest disregard of the law, would be irrational, or would not manifestly exceed a specific, enumerated limitation on the arbitrator's power (*Action Box Co. v. Panel Prints, Inc.*, 2004, p. 252). Judicial review for manifest disregard of federal law necessarily requires the reviewing court to do two things: first, determine what the federal law is, and second, determine whether the arbitrator's decision manifestly disregarded that law (*Greenberg v. Bear*, 2000, p. 27).

Despite the considerable deference traditionally afforded to the decisions of arbitrators, courts have conducted a more searching review of arbitral awards in certain circumstances. In most U.S. jurisdictions, arbitration can be properly vacated if it violates an explicit Constitutional, legislative or judicial expression of public policy, or when granting finality to the arbitration would be inconsistent with a party's unwaivable rights. Judicial review and vacatur of arbitration award is proper when upholding arbitrator's decision would be inconsistent with the protection of a party's clear rights.

*Deference to Faith-Based Arbitration Decisions:* Arbitration decisions rendered by faith-based tribunals are generally treated in the same manner as other arbitration decisions, but they present additional complexity as a result of their connection to religion. Religious laws and customs do not necessarily correspond to or comport with secular rights and traditions. When this occurs, the secular courts must determine how to sort out religious freedoms from secular requirements. This tension between the sacred and the secular has been addressed by the U.S. Supreme Court on several occasions. In the case of *Employment Division v. Smith* (1990), for example, the Court concluded that religious freedoms do not extend to the point where Native Americans may smoke ceremonial peyote in complete disregard of drug laws. Similarly, the *Court in Board of Education v. Grumet* (1994) determined that a school district may not redraw its coverage map so that it encompasses only members of the Satmar Jewish community. Faith-based arbitration decisions, similarly, do not enjoy complete immunity from judicial oversight. This is especially true in cases where the procedural rights afforded by the religious legal system (such as the right to cross-examine witnesses or the right to an attorney) are not followed (*Mikel v. Scharf*, 1981), or in cases where the decisions of arbitrators exceed their authority (*Neiman v. Backer*, 1995). Some issues and some subject matter that as a matter of public policy the government reserves to itself, such as child custody, may also be considered outside the jurisdiction of faith-based arbiters (*Stein v. Stein*, 1999). In short, the deference toward secular arbitration, as generally shown by the U.S. legal system, extends to faith-based arbitration. But just as this deference is not unlimited in regard to secular arbitration, it has its limits in the context of faith-based arbitration. And as more and more Sharia-based arbitration decisions are brought before U.S. courts for judicial review, it becomes necessary to consider whether the same

judicial demeanor will be employed as has been the case when arbitrations pursuant to Jewish and Christian protocols have come under judicial review.

### The Aramco Services Company Case

*The DynCorp-Aramco Arbitration Agreement:* When considering the evolving relationship between Western jurisprudence and Sharia, the case of *In re Aramco Servs. Co.* (2010) is instructive. The facts set forth in the court's ruling in this case indicate that DynCorp International, LLC, a U.S. company, and Aramco, a Saudi-owned corporation, entered into a contract for a computer system which was to be manufactured in the U.S. and installed at Aramco's facilities in Saudi Arabia. The contract, written in English, contained an arbitration agreement which provided, in part:

*The laws of Saudi Arabia shall control the interpretation and the performance of this Contract and any other agreements arising out of or relating to it, regardless of where this Contract shall be entered into or performed. Any dispute, controversy or claim arising out of or relating to this Contract . . . which is not settled by agreement between the parties shall be finally settled in accord with the Arbitration Regulations, Council of Ministers Decision No. 164, dated 21 Jumada II 1403 ("the Regulations") and the Rules For Implementation of the Arbitration Regulations effective as of 10 Shawal 1405 ("the Rules") and any amendments to either then in force, by one or more arbitrators appointed in accordance with the Regulations, the Rules and this Contract (In re Aramco Servs. Co., 2010, p.2).*

The "Regulations" as referred to above were a separate document, written in Arabic. These Regulations required that any arbitration decision made by the arbitrator(s) must comply with Sharia. The regulations also provided, in part:

*The Arbitrator must be a Saudi national or a Moslem foreigner chosen amongst the members of the liberal professions or other persons. He may also be chosen amongst state officials after agreement of the authority on which he depends. Should there be several arbitrators, the Chairman must know the Shari'a, commercial laws and the customs in force in the Kingdom... Arabic is the official language and must be used for all oral or written submissions to the arbitral tribunal. The arbitrators as well as any other persons present shall only speak in Arabic and a foreigner unable to do so must be accompanied by a sworn translator who shall sign with him the record of his oral arguments in the minutes (In re Aramco Servs. Co., 2010, pp. 5-6).*

The translation of an additional provision of the Regulations (known as "Article 10") from Arabic into English appeared to be somewhat unclear. This provision had to do with the procedure for appointing one or more arbitrators in the event that a dispute arises but, after some delay, arbitrators are not yet appointed. Aramco's translation of this provision reads as follows:

*If the parties have not appointed the arbitrators, or if either of them fails to appoint his arbitrator(s) . . . and there is no special agreement between the parties, the Authority originally competent to hear the dispute shall appoint the required arbitrators upon request of the party who is interested in expediting the arbitration, in the presence of the other party or in his absence after being summoned to a meeting to be held for this purpose. The Authority shall appoint as many arbitrators as are necessary to complete the total number of arbitrators agreed to by the parties; the decision taken in this respect shall be final (In re Aramco Servs. Co., 2010, p. 5).*

DynCorp's translation of Article 10 of the Regulations from Arabic into English was slightly different, as follows: If the disputants fail to appoint the arbiters . . . the authority originally responsible for looking into the case shall appoint the necessary arbiters in response to a request by the party who is interested in expediting the procedure. . . . (*In re Aramco Servs. Co.*, 2010, p. 5, n.4).

*Trial Court's Assumption of the Power to Appoint Arbitrators:* DynCorp sued Aramco in Houston, Texas, asserting entitlement to certain funds in a letter of credit opened pursuant to the Contract. In response, Aramco filed a motion to compel arbitration in accordance with the arbitration agreement as set forth above. Subsequently, DynCorp filed its own motion to compel arbitration. Specifically, DynCorp sought arbitration before JAMS/Endispute, Inc. ("JAMS"), a private, for-profit dispute resolution company, or the American Arbitration Association ("AAA"). In other words, DynCorp sought to avoid the Sharia-compliant arbitration process to which it had agreed, while Aramco sought to enforce that contractually prescribed process. In its initial ruling on the competing motions to compel arbitration, the trial court ruled in favor of Aramco, but with a twist. The court agreed that the contractually prescribed arbitration should proceed, but the court interpreted Article 10 so as to inject itself into the process. That is, the Texas trial court specifically determines that it was, as set forth in Article 10 (above) "the authority originally responsible for looking into the case." After all, it reasoned, both companies effectively acknowledged the Texas court's authority when they filed competing motions to compel arbitration. Therefore the court determined that it was the authority originally responsible for looking into the case, and assumed to itself the authority to appoint arbitrators. Aramco disagreed, and filed a motion for clarification and reconsideration, and attached an affidavit of Mohammed Al-Sheikh, an attorney practicing in Riyadh, Saudi Arabia with expertise in Saudi Arabian law. The affidavit provides, in part:

*The paramount body of law in The Kingdom of Saudi Arabia is the Shari'ah. The Shari'ah is comprised of a collection of fundamental principles derived from a number of different sources, which include the Holy Qur'an and the Sunnah... Saudi Arabian law, including its Arbitration Law, contemplates that the authority originally competent to hear the dispute is a Saudi Arabian court. Council of Ministers Decision No. 221, dated 6 Ramadan 1423 (corresponding to 11 November 2002) grants to Board of Grievances jurisdiction over any Saudi Aramco commercial disputes (including arbitration). . . . Thus, in my opinion, the Saudi Board of Grievances is the authority originally competent to hear this dispute. . . (In re Aramco Servs. Co., 2010, p. 8-9).*

In the meantime, Aramco designated Dr. Sherif Hassan, a Muslim, as an arbitrator. DynCorp proposed Ted Akin, Levi Benton, and Trey Bergman, all non-Muslims, as arbitrators. Aramco filed an objection to DynCorp's designation of arbitrators on grounds that the arbitrators proposed by DynCorp were unqualified to serve under the Regulations and Rules because they were neither Muslims nor Saudi nationals. In response to Aramco's objections, the trial court signed an order that overruled Aramco's objections and appointed Dr. Sherif Hassan, Ted Akin, and Trey Bergman as arbitrators. That is, two non-Muslims and one Muslim were appointed.

*Appellate Court's Reversal of the Trial Court:* In response to the trial court's appointment of a non-Muslim majority of arbitrators, Aramco appealed the matter to the Court of Appeals in Texas. In its appeal, Aramco contended that the trial court should not have designated itself as the "Authority" referenced in Article 10 of the Regulations. Specifically, Aramco asserted that because the term "Authority" is not expressly defined in the Regulations, resort to other Saudi law was necessary to determine its meaning. Aramco states that the term "Authority" is referenced in the Regulations and Rules in a context that did not anticipate application to an American court. Aramco also asserted that the trial court should have relied on, but instead disregarded, Mohammed Al-Sheikh's affidavit stating that the Authority is the Saudi Board of Grievances. Finally, Aramco contended that the trial court could not designate arbitrators because neither party had requested it to do so.

DynCorp responded by claiming that that the trial court properly determined that it was the "Authority" referenced in Article 10, that DynCorp had, in fact, requested the trial court to designate arbitrators in its motion to compel arbitration before JAMS or the AAA, and that Texas procedural laws should apply to the Contract. DynCorp also contends that the Contract is ambiguous and therefore it would be improper for the Texas court to enforce it as written. The appellate court agreed with Aramco. In its opinion, the appellate court noted that other terminology in the Regulations, like the word "Secretariat" and the expression "clerk of the Authority" seemed to imply that the "Authority" had to be a court of Saudi

Arabia. And since the trial court could not act as the “Authority,” it did not have the power to appoint arbitrators after all.

#### Lessons From, and Implications of, the *Aramco* Case

From the standpoint of the US legal system, this case reflects a growing trend toward a respect for, and an unwillingness to interfere with, faith-based arbitration. The Texas court in this case clearly intended to inject itself and “protect” DynCorp from having its dispute over the ownership of funds arbitrated under Sharia as interpreted and enforced by Muslims of Saudi Arabian nationality in accordance with Saudi Arabia law. There are a number of reasons why the Texas trial court might have been motivated to make this attempt, and it would be both dangerous and pointless to guess at what those motivations might have been. Nevertheless, when it reversed the trial court, the Texas appellate court did what courts are increasingly willing to do in recent years: grant deference to arbitration clauses that point to Sharia law (even though Sharia law essentially involves the interpretation of the Qur’an, a religious sacred text).

From the standpoint of DynCorp, this case serves as a reminder that arbitration clauses, including faith-based arbitration clauses, ought not be entered into lightly. In hindsight, it is likely that the owners and managers of DynCorp now realize that they should have been more careful about agreeing to an arbitration clause (in English) that incorporates by reference rules and regulations written in Arabic. Even if they had been willing to agree to Sharia law as the choice of law, they might well have been better served if they had been more careful to allow for a broader pool of possible arbitrators (rather than the narrow pool of Muslims of Saudi Arabian origin). Finally, the vagueness about which authority was empowered to appoint arbitrators in the event that the parties were not able to agree to arbitrators, should have been clarified. These are all good lessons for companies doing business with companies from the Middle East whose preference for choice of law is Sharia.

#### CONCLUSION

Some might argue that the Western legal tradition still carries with it a Judeo-Christian heritage. Others might suggest that that heritage has largely been left in the past, and that the Western legal tradition is now truly secular. Either way, there is within Western jurisprudence, a lack of familiarity with legal institutions like those in Islamic countries in which there is no separation of church and state. This is particularly true in countries where Sharia is the basis for law.

As Western companies interact increasingly with countries and companies for whom Sharia forms the basis of law, they will more frequently find themselves faced with negotiations over arbitration clauses that point directly to the Qur’an. This can be both a challenge and an opportunity. It is a challenge, because it involves and requires a significant learning curve about Islam, the Qur’an, and Sharia law and procedure. But it is also an opportunity, because without going through the effort to learn about, and become conversational about, the Muslims faith, contract negotiations, for which arbitration clauses can serve as a solution to possible problems, will be neither more robust or more successful.

# FINANCIAL LITERACY AND RETIREMENT PLANNING: EVIDENCE FROM PUERTO RICO

Karen C. Castro-González, University of Puerto Rico

## ABSTRACT

*This study evaluates knowledge regarding financial and retirement planning in Puerto Rico. Most people seem to be unprepared to take charge of financial decisions and retirement. Lusardi and Mitchell (2006) study shows that many households are unfamiliar with even the most basic economic concepts needed to make savings and investment decisions. This study uses a questionnaire to evaluate financial knowledge and retirement planning in Puerto Rico. For the most part, this questionnaire was developed using Lusardi and Mitchell (2007, 2001a, 2011b) questionnaires. The results suggest a lack of knowledge in these matters; although respondents answered they get informed about financial and retirement matters. Most of them state they prepare a household budget but results suggest they do not use them appropriately. Many respondents are unfamiliar with even the most basic economic concepts needed to make savings and investment decisions. When asked about retirement, near 60 percent have tried to estimate the amount needed for retirement but less than 50 percent of them have tried to design a plan for their retirement. Of those who have made plans, less than 40 percent have met their goals and only 14 percent are very confident that they will have enough resources at retirement.*

**KEYWORDS:** retirement planning, financial literacy

## INTRODUCTION

In March of 2006, the Special Commission on Puerto Rico Government Pension Systems published a report that describes how knowledgeable government employees are about the services and benefits of the retirement system. Some questions in the survey asked whether the employees knew about financial planning, pension benefits, social security benefits and health costs during retirement. Between 64 and 79 percent of the employees assured they did not have information about these matters. Years later, in October 21, 2010 the Commission on Puerto Rico Government Pension Systems Reform submitted for the consideration of the Governor of Puerto Rico a report on the situation of the Puerto Rico Government Retirement Systems. It discussed issues such as the actual funding and cash flow situation, factors that are contributing to the actuarial liability cash flow problem and their recommendations.

The members of the Commission included recommendations such as changes in the employers and employees contribution requirements, modifications to special laws that enhanced retiree benefits, changes to the benefit structure and retirement age, to stop temporarily early retirement programs, to modify personal and mortgage loans made against the retirement savings funds, changes in governance and other ideas. Ironically, in the last section, the section called “Other Ideas”, the commissioners recommended that education for retirement planning should be given on a regular basis to employees. This suggestion made clear that there is a need to educate people about retirement and other financial matters. This study evaluates knowledge regarding financial and retirement planning in Puerto Rico.

## LITERATURE REVIEW

First, past literature about the existence and effectiveness of retirement planning programs in Puerto Rico, the United States and other countries are reviewed. Also, studies presenting a model on how to evaluate knowledge concerning financial and retirement planning was reviewed. Lusardi and Mitchell (2006) study shows that many households are unfamiliar with even the most basic economic concepts needed to make saving and investment decisions. They found that this is not a matter of age. Young and older people in the United States and other countries appear inescapably under informed about basic financial computations necessary to make savings, retirement planning, mortgages and other decisions.

In a recent study Lusardi and Mitchell (2011a) report on a purpose-built survey module on planning and financial literacy for the Health and Retirement Study. It measures how people make financial plans, collect the information needed to make these plans, and implement the plans. They show that there is a lack of knowledge among older Americans. Women, minorities and the least educated tend to be the most lacking but the financially savvy are more likely to plan and succeed in their planning. They found that this last group relies on formal methods such as retirement seminars, retirement calculators and financial experts not family or co-workers.

As for other countries, Bucher-Koenen (2011) examines financial literacy in Germany. Results seem similar. They found that knowledge of basic financial concepts is deficient among women, less educated, and those living in East Germany. Compared to West Germans, East Germans have little financial literacy, especially those with lower income and low education. Differences based on gender were not observed in the East. They also found a positive impact of financial knowledge on retirement planning. Alessie, Lusardi and Van Rooij (2011) results for the Netherlands concur. Also, Almenberg and Säv-Söderbergh (2011) found similar results for a study conducted in Sweden.

## **DATA AND METHODOLOGY**

Based on the results and suggestions of past studies, a questionnaire was be design and distributed to the employees of the University of Puerto Rico-Río Piedras to assess their knowledge in financial and retirement related matters. A random sample of 300 out of 3,133 employees was selected out of the total number of employees working for the campus at the moment. 146 questionnaires were collected and tabulated. Based on these results, a description on the level of knowledge is presented and analyzed.

## **RESULTS**

Results suggest a lack of knowledge in this matters, although respondents answered they look for information regarding financial and retirement matters. Most of them state that they prepare a household budget but when asked if they have covered their living expenses during the past 12 months, most answered they have not. They had to cut expenses or used part of their savings. Incongruous results are observed when asked about savings. The majority answered they have saved in the last year. But when asked how long will they be able to keep covering their living expenses if they were to lose their jobs, about 80 percent will be able to do it for less than three months. Many respondents are unfamiliar with even the most basic economic concepts needed to make savings and investment decisions.

When asked about retirement, near 60 percent have tried to estimate the amount needed for retirement but less than 50 percent of the respondents have tried to design a plan for their retirement. Of those who have made plans, less than 40 percent have met their goals and only 14 percent are very confident that they will have enough resources at retirement.

## **CONCLUSION**

Results suggest a lack of knowledge in financial and retirement planning, although respondents answered they look for information regarding financial and retirement matters. These results concur with Lusardi and Mitchell (2006). They reflect lack of knowledge and planning and/or mistaken plans. Apparently, there is a need to create conscience about the importance of knowing how to adequately manage financial matters and how to prepare for the years to come during retirement.

As an observation, while administering the questionnaire, when the respondents were asked to perform basic mathematical operations, they just refused. They did not want to think about how to solve the operation. This attitude towards analytical or mathematical operations made us think about the possibility that people do not want to engage in simple or elaborate calculations, and if this was the same attitude

when signing a debt contract or when making their budget. The results at this point are worrisome. If people think they know how to manage their financial and retirement matters but they are actually not being successful, who is going to care of them during retirement? The government, future generations, or will they live in poverty?

# LUXURY BRANDS ON THE INTERNET: A FOURFOLD TYPOLOGY

Angy Geerts, University of Mons – Belgium

## ABSTRACT

*The aim of this paper is to shed light on the way luxury brands use Internet in their communication strategy. The research is based on a literature review of luxury brands and Internet concepts as well as the way luxury brands use the Internet as a media. After the implementation of an analysis grid based both on academic and managerial perspectives, a content analysis of web sites is realized to propose a typology of luxury brands in four categories: Traditional E-shops; Artistic E-shops; Luxury Interactive; Traditionalists.*

**JEL:** M31

**KEYWORDS:** Internet, luxury brands, Typology, web sites

## INTRODUCTION

The first articles to have explored the position of the Internet as a communication tool for luxury brands were published in the late 90's (Nyeck and Houde, 1996; Nyeck and Roux, 1997). At that time, there was a shared reluctance to use this method from both the luxury brand manager and consumer's point of view. The study of Nyeck and Houde (1996) had nevertheless underlined the importance and the growth of the Internet media, and had pinpointed the necessity of integrating the Web into communications strategies. Very few research were conducted on this subject in the following years (Dall' Olmo Riley and Lacroix, 2003; Seringhaus, 2005). Their conclusions highlighted that managers saw the Internet as an inevitable development for their brand, offering both opportunities and threats. Regarding websites content analysis (Nyeck and Houde, 1996 ; Dall'Olmo Riley and Lacroix, 2003), the studies revealed that website suffered from a lack of both interactive functions and originality, with the focus set on brand image only. More recently, the question of luxury brand ecommerce was raised (Seringhaus, 2005; Kapferer and Bastien, 2008; Okonkwo, 2009). Authors agreed on the inappropriateness of this channel regarding luxury products.

The reality, however, reveals a different perspective considering the success of the luxury sector in 2010 (Xerfi, 2011). Considering the current economic climate, conciliating luxury and Internet is a growing necessity to ensure a supplementary source of income. More than 30% of the 77 Colbert Committee brands are subsequently offering e-commerce. From then on, we notice that the reality took a wide advance on the researches conducted in this field of study.

The behavior of the brands on the Internet is far from homogeneous. Some are using e-commerce (Louis Vuitton, Tiffany), others use interactive tools (Chanel, Cartier) and others are still "passive" actors with websites simply displaying images such as Fendi or Versace. The aim of this research will be to understand how luxury brands use the Internet tool in their communication strategy, despite earlier reservations of its efficacy. The objective of this study is subdivided into two sub-objectives on base of which we will build our research process.

O1 : Identifying online luxury brand communication strategies;

O2: Creating a typology allowing to classify luxury brands regarding their online communication behavior.

To reach these objectives a literature review focusing on luxury brand is realized. Communications concepts in the luxury and more particularly the use of the Internet tool are developed. From this review, an analysis grid is implemented to audit the Web sites of luxury brands. Finally, a principal components analysis is completed, followed by a cluster analysis on the data collected from the audit. This allows a classification of luxury brands according to their behavior on the Internet.

## LITERATURE REVIEW

### Luxury Brand

The luxury brand is consubstantial with the luxury product but not with the luxury concept which is abstract (Kapferer and Bastien, 2008:151). The luxury brand was defined according to several perspectives. The economic vision of the luxury brand was developed through the research of Mc Kinsey (1990) who defined the luxury brand as that being at the top of the price pyramid, by category of products, that is at the prices appreciably superior to products presenting comparable tangible features. Rather close to this very pragmatic vision, Nueno and Quelch (1998) as well as Dubois and Laurent (1993) consider luxury brands in a descriptive way with concepts such as the functional utility, the price and the socio-demographic characteristics.

Kapferer (1998) criticized Mc Kinsey's definition (1990), and blamed it for not dissipating the confusion over what is the minimum threshold below which we go out of the luxury category (Phau and Prendergast, 2000). This can also be said regarding the definitions proposed by Nueno and Quelch (1998). In the dichotomous perspective of the luxury, the authors define luxury brands by contrast to non-luxury brands (Lipovetsky and Roux, 2003), because any specificity defines itself by difference. In their first works, Vigneron and Johnson (1999) defined the specific difference between a prestigious brand and a non-prestigious brand. In 1899, Veblen, in his famous "Theory of Leisure Class", argued that we cannot classify products / brands in luxury or non-luxury categories. These must be put back in their socioeconomic context. According to him, luxury means what is the most desirable socially.

The dichotomous perspective set the luxury brand against the non-luxury brand. Nueno and Quelch (1998) went further by integrating the concept of continuum into the luxury by saying that not all luxury brands are considered equal. This is to say that a brand can be a luxury brand in certain categories of products and not in others (Kapferer, 1996; Vigneron and Johnson, 2004).

The research on luxury can further integrate concepts of needs and symbolism. This is what is called the "symbolist perspective of the luxury". Indeed, there is a tacit agreement in the literature to define luxury products as products for which the simple fact of using them give the owners special status above the functional utility of the product itself. The product satisfies both functional and psychological needs and it suggests that these psychological benefits provide the key distinction between luxury products and non-luxury products or counterfeits (Vickers and Renand, 2003).

According to Roux (1991), a luxury brand is characterized by a symbolic, imaginary or social added value, which differentiates it from the other brands. The luxury brand meets symbolic needs because it has a strong image, remains very consistent in all its components, conveys asserted values and shares an ethics and an aesthetic with the consumer. We propose a synthesis of these perspectives in the table 1.

The Internet is not only a mean of communication, but it is also an unprecedented phenomenon in history. Nowadays, the Internet is an important part of brand communication strategies for ordinary consumer goods as well as luxury products (Dall' Olmo Riley and Lacroix, 2003). With the increase in the number of brands specific websites, an increased interest in the literature has been recorded (Chen, 2001; de Chernatony, 2001).

The Internet has its specific characteristics. We note essentially the interactivity (Hoffman and Novak, 1996; Ind and Riondino, 2001; Chaffey and al., 2003), the intelligence (Chaffey and al., 2003), the

individualization (Chaffey and al., 2003), the speed and the accessibility, the absence of contact (de Chernatony, 2001), and the loss of control (Viot, 2009).

Table 1 : Summary of the perspectives in the luxury brand definition

Perspective	Auteurs	Eléments de définition
Economic	Mc Kinsey (1990)	Luxury brands are those which have comparable tangible features to other brands but are sold at a higher price A luxury brand is defined by contrast to non-luxury brands
Dichotomous	Nueno and Quelch (1998) Kapferer (1996 ; 2006)	
Luxury Continuum	Vigneron and Johnson (1999, 2004)	Within the luxury category, brands divide up along a continuum expressing the degree of luxury contained in each of them a luxury brand is characterized by a symbolic, imaginary or social added value, which differentiates it from the other brands
	Kapferer (1996 ; 2006)	
Symbolisme	Vigneron and Johnson (1999, 2004) Roux (1991) Roux et al. (1996 ; 2003) Vickers and Renand (2003)	

We can see appearing the different perspective of the luxury brand definition

### Luxury Communication on The Internet

All these characteristics make Internet an adapted channel of distribution and communication to the mass consumption (Okonkwo, 2009) and consequently we understand the reluctances of luxury brands to use it. If we confront these characteristics with those of the marketing of luxury brands, it is obvious that they are not compatible as can be seen in table 2.

Table 2 : Luxury features versus Internet characteristics

Luxury marketing features	Internet features
Communication : Elitist support, limited use of mass media, events, sponsoring etc. (Allères, 1991,1997 ; Chevalier and Mazzolovo, 2008)	as communication tool : Very wide target → few or no targeting Globally accessible (Chaffey et al., 2003 ; Okonkwo, 2009)
Distribution : (Allères, 1991, 1997 ; Okonkwo, 2009) Point of sale experience, Service, Consumption experience, individualized sales, Only in prestigious venues or Capital cities Price rarely displayed	As distribution channel : international, accessible, few or no contacts, limited service, limited buying experience → focus is set on consumption experience (Chaffey et al., 2003 ; Okonkwo, 2009)

We thus see appearing in table 1 the antagonism between both concepts, Internet dedicated to the mass market and luxury brands reserved for an elite.

In order to pinpoint the challenges of introducing the Internet to brand management, A.T. Kearney developed the theory of the 7C's which aims at creating a high impact digital consumption experience (Atwal and William, 2009). The following categories are to be considered: Content, Customization, Customer care, Communication, Community, Connectivity and Convenience. Constantinides (2004) describes the Web experience according to three major factors: Functionality, Psychology and Contents. According to different authors, we highlight in the table 3 the key elements of the digital experience in the field of the luxury: the brand identity and its aesthetics, the usability and the interactivity.

In conclusion, it appears there is a clear division between the academic considerations to moderate the use of the Internet as a communication tool for luxury brands and their effective presence on-line. An audit of luxury brands websites has now to be completed in order to bring about a better understanding of the positions adopted by luxury brands on the Internet.

Table 3: Key elements of the digital experience of the luxury brand

Brand Identity & Aesthetics	Usability	Interactivity
Online consistency (Ind and Riondino, 2001) Design/Aesthetics (Isaac and Volle, 2008)	Functionality (Chen, 2001) Rapidité (de Chernatony, 2001)	Communities (Casalo et al., 2008) Interaction with the brand (Constantinides, 2004)
Level of service (Constantinides, 2004) : Product (Personalization) (Clauser, 2001) Price (Chen, 2001) Place (E-commerce) (Okonkwo, 2009) Trust (Constantinides, 2004) Communication (Larbanet and Ligier, 2010)	Search engine/ accessibility (Chen, 2001 ; Isaac and Volle, 2008)	

*This table highlights the key elements of the digital experience in the field of the luxury brand.*

## METHODOLOGY

In this research, our main purpose aims at understanding how luxury brands utilize the Internet as a communication tool. To do so, content analysis of selected websites were undertaken applying classic data analysis techniques. Firstly, qualitative data such as the marketing-mix used within sites, technologies implemented to create Web interactive and quality interfaces, were collected. In order to do it, we built an analysis grid allowing scoring web sites. Secondly, all the sites listed in our sample were audited in order to proceed to the data analysis.

### Creation Process of The Analysis Grid

Our empirical research is based on a web sites audit. An analysis grid, based on an iterative process consisting of round trips between the literature, the ground and the experts, was created. Firstly, a rough draft was established, taking into account the completed literature review. Pretesting was then conducted on variables initially retained on a selection of luxury brand websites providing the grid with additional observations. Then we analyzed the analysis grid implemented by Pr. S.Galloway ( NYU) to establish the scoring of the websites. This stage provided us the opportunity to complete and to correct our original grid. Finally experts 'opinion were asked regarding the completed grid. These experts were from such luxury brands as Chanel, Van Cleef and Arpels, Francis Ferent, Delvaux but also from Internet communication agencies like Emakina, SCS, Genius. Following their recommendations, analysis grid was improved and finalized. During the websites audit, the assessment method consisted of a binary coding process, which estimates either the presence (1) or the absence (0) of the variables tested. This technique presents a major interest for the objectivity of the research undertaken. Indeed, whatever the researcher is analyzing, identifying whether the variable is present or absent is an objective fact. It confers on the analysis the characteristic of inter-coder reliability or of reproducibility (Gavard-Perret and al ., 2008: 274). The results of coding are comparable between two coders within the framework of a qualitative approach.

### Sample

At this stage, it is useful to specify that in order to maintain a systematic approach and to avoid certain sectorial biases effects, the research focused on brands belonging to " personal luxury goods ". This sector includes ready-to-wear clothing, leather accessories and watchmakers and/or jewelers. A set of luxury brands was first listed in the personal luxury goods sector. To this end, French luxury brands listed by the Colbert committee and those listed in the top 15 " luxury brands " of Interbrand (Interbrand, 2008) were used.

Then, brands belonging to famous luxury groups were included: LVMH, PPR-GUCCI and PERNOD RICARD. Finally, these lists were completed with the brands often referred to in the literature, retaining only those from the personal luxury goods sector. Authors whose works focused on and provided a clear vision of the brands belonging to this luxury industry were chosen (Phau and Prendergast, 2000; Dubois and Laurent, 1993; Dubois and Paternault, 1995; Kapferer and Bastien, 2008; Lipovetsky and Roux,

2003; Okonkwo, 2007, 2010; Chadha and Husband, 2006). Furthermore, authors from different origins were chosen, thus ensuring the international recognition of the selected brands. The final sample included 78 luxury brands websites.

### Data Collection and Analysis

The data collection from the website audit of the selected sample with the analysis grid lasted four weeks and took place between 01-10-11 and 01-11-2011. Once all the data was collected, the analysis was conducted using the SPAD software. According to the variables used, the appropriate exploratory approach varies. Jolliffe (2002) indicates that a Principal Components Analysis (PCA), built to handle continuous data, can be used on qualitative data. It is necessary to note that the PCA of binary variables provides the same results as the Multiple Correspondences Analysis (MCA) (Meyer and al., 2010). The principal components analysis aims at identifying, from a set of  $k$  variables, an underlying structure in the collected data. If such a structure exists, identifying it allows to simplify the gross information contained in a database, by substituting in  $k$  initial variables, a smaller number of  $m$  factors. These factors are trained by linear combinations of the initial variables (Gavard-Perret and al., 2008).

Once the principal components analysis was conducted, the cluster analysis was completed using the factors resulting from the principal components analysis (by default SPAD retains the first ten factors). In terms of proximity measure, the distance usually used is the Euclidian distance (Thiétart et al., 1999; Gavard-Perret et al., 2008; Jolibert and Jourdan, 2011), it is also the one used by SPAD.

Based on the hypothesis, that an individual can only belong to a single group, methods of partition were applied, simplifying the analysis of the obtained results (even if it could provoke a certain distortion of the data structure).

Polythetic methods were chosen, those are forming groups based on the proximity of the subjects. This means that all the variables retained for the typology were taken into account in order to establish the distance between the subjects (Gavard-Perret et al., 2008; Jolibert and Jourdan, 2011). Within the polythetic methods, SPAD, by default, applied the hierarchical ascending classification, because the number of groups to be obtained was not fixed in advance. The algorithm used by SPAD is Ward, which is one of the most precise methods when an indicator of Euclidian distance is used (Jolibert and Jourdan, 2011).

## **RESEARCH RESULTS**

### Principal Component Analysis

After having established that variables were factorisable by examining the values tests matrix, and examined the communities table to make sure that these were equal to at least 0,5, a principal components analysis was undertaken. The KMO equals 0,665, and is considered satisfactory according to Jolibert and Jourdan (2011). The Barlett test of sphericity is also significant (approximate Chi-square = 1025,253; Ddl = 300). No rotation was performed.

Regarding the number of factors retained, the criterion of the explained variance was used. This method led to retaining two factors, which correspond to 36,04 % of the restituted variance. However, an additional factor was retained to increase the variance. This amounted to 42,76 % of the restituted variance, a more satisfactory result. This was confirmed by the use of the Catell criterion, which also requires the preservation of three factors.

The analysis of the components matrix (table 3), showing the correlations between variables and factors indicates extent to which every initial variable finds itself in each factor, allowing interpreting axes in the following manner: Factor 1 (26,11 % of restituted variance) is related to the E-shopping aspect of the website, namely if the website has an E-Shop and related features such as the possibility to return the

product, various delivery services, after-sales service etc. Factor 2 (9,93 % of restituted variance) represents the Interactive aspect of the website, namely if the site proposes interactive interfaces such as privileged access to a club, RSS feeds, forum etc. Factor 3 (6,72 % of restituted variance) represents the usability of the website in particular the ease and speed with which the Internet user is able to find the information which he is interested in.

Table 4 : Components Matrix or variable-factor correlation

Components	Factor 1 26.11%	Components	Factor 2 9.93%	Components	Factor 3 6.72%
E-shopping	,942	club/privileged access	,669	Easy access to information	-,611
Product return	,924	Product sheet	,548	Forum	,550
Product prices	,882	RSS feeds	,540	Brand	,496
				Interaction	
Contact means	,858	Forum	,515	Wishlist	-,421
Integrated E-shopping	,853	Mobile Application	,464	Music	,348
SAV	,774	Brand Interaction	,393	Newsletter	,323
Various delivery services	,566	Social website links	,341		
Wishlist	,521				
Newsletter	,475				
Search engine	,470				
Online Exclusivity	,456				
Product sheets	,442				
Products Personalisation	,356				

According to Jolibert and Jourdan (2011) the interpretation of the aforementioned factors which leans towards a theoretical approach familiar to the researcher, is the best method in reaching a final decision.

### Cluster Analysis

SPAD identifies partitions by using an automatic search for the best ones and improves them by applying mobile center iterations called consolidation. The process results in a partition of four classes. As identified in table 5, classes 1 and 4 provide significant sizes 33 and 23 notably, whereas classes 3 and 2 provide inferior numbers, with the latter reaching only 6. The weights of the classes are identical to the sample sizes because all the sites have a weight equivalent equal to 1. The intra-classes inertia quotient calculated after consolidation of the partition is 0.45 %, which is considered satisfactory for an exploratory research (Thiétart et al., 1999).

Table 5: Four-Class partition

Class	Size	Weight
1	33	33.00
2	6	6.00
3	16	16.00
4	23	23.00

Partition Description and Interpretation\_Class 1 : Traditional Eshops

Table 6: Class 1 Characteristic Variables

Test V.	Proba	Mean		Characteristic Variables
		Class Class ¼ (Weight – 33.00	General Size – 33)	
7.32	0.000	1.00	0.51	14. E-SHOPPING
7.06	0.000	0.97	0.50	22. PRODUCT RETURN
6.87	0.000	0.97	0.51	17. CONTACT MEANS
6.47	0.000	0.85	0.42	15. INTEGRATED E-SHOPPING
6.41	0.000	0.94	0.51	12. PRODUCTS PRICE
5.31	0.000	1.00	0.67	23. CUSTOMER SERVICES
4.86	0.000	0.48	0.22	21. VARIOUS DELIVERY SERVICES
4.35	0.000	0.64	0.36	39. WISHLIST

3.04	0.001	1.00	0.86	10. PRODUCT SHEET
2.86	0.002	0.94	0.78	32. NEWSLETTER
2.54	0.006	1.00	0.90	30. EASY ACCESS TO INFORMATION
2.38	0.009	0.61	0.45	31. SITE MAP

The 33 websites constituting Class 1 offer an E-shopping service. A majority accepts product returns and provides its customers with the possibility to contact the company. Generally, the E-shop is integrated into the website, eliminating the need to open a new window. All the Class 1 websites offer customer service, however, only half propose various delivery options. Most offer the opportunity to place products in a "wishlist" independent of the purchase basket. This option allows customers to show their preferences for certain products and also refer them to their contacts as gifts idea for example. Further to their established retail products, several websites offer online exclusive products together with detailed product descriptions including different views and characteristics of the product.

In terms of interactivity, all the sites propose a newsletter. However, no other variable of interactivity significantly defines this class. Regarding usability, the Class 1 websites are straightforward, with access to information readily available. Furthermore, a site map is provided in a majority of the sites, thus facilitating the Internet user's search. The Class 1 websites comprise of luxury brands offering a user-friendly, on-line purchasing experience, albeit with an average level of interactivity. In this category, the aesthetics of the brand is visible and the codes of the luxury are respected. Nevertheless, the emphasis is put on the E-shopping aspect whilst maintaining traditional communication codes. Table 7 presents the illustrative variables of the Class 1 websites.

Table 7: Class 1 illustrative Variables

Test V.	Proba	Percentage		Modality	Variables
		CI/Mod	Mod/CI		
				Global	name
3.81	0.000	59.18	87.88	42.31	CLASS 1/4
-3.19	0.001	6.25	3.03	62.82	RtW/LG Sector
				20.51	SWISS Brands Origin
-3.81	0.000	13.79	12.12	37.18	JW Sector

As illustrated here above, the Traditionalist E-shops are essentially represented by ready-to-wear clothing and Leather Goods brands, with 87,88 % of the Class 1 websites active in this sector. However, the Swiss and watch-making brands (which are often one in the same) have a significantly lower representation in the Class 1 framework.

Class 2: Artistic E-Shops

The Class 2 category also includes websites that offer E-shopping services, however, unlike its predecessor, information is not readily available and the sites are difficult to use. Class 2 is characterized

by its extremely weak “Easy Access to Information” variable. Despite its limited size, Class 2 provides an interest regarding its usability.

Table 8: Class 2 Characteristic Variables

Test V.	Proba	Mean	Characteristic Variables
		Class	General
		(Weight – 6.00	Size – 6)
2.53	0.006	1.00	0.50
2.47	0.007	1.00	0.51
2.47	0.000	1.00	0.51
-7.49	0.000	0.00	0.90
			Name
			22. PRODUCT RETURN
			14. E-SHOPPING
			12. PRODUCT PRICE
			30. EASY ACCESS TO INFORMATION

Although the Class 2 websites prove to adhere to the importance of aesthetics very much valued in the luxury sector, they neglect to appreciate the significance of clarity for its users. Cautious of damaging their brand image by establishing an E-shop, the emphasis is put on creating an aesthetic website rather than a functional one. With an average level of interactivity, this category does not distinguish itself from the previous one. Regarding the illustrative variables, no variable is significant.

### Class 3: Luxury Interactive

Table 9: Class 3 Characteristic Variables

Test V.	Proba	Mean	Characteristic Variables
		Class	General
		(Weights – 15.00	Size – 15)
3.65	0.000	0.33	0.09
3.27	0.001	0.53	0.22
2.68	0.004	0.80	0.49
2.38	0.009	0.20	0.06
2.35	0.010	1.00	0.77
			Name
			35. RSS FEEDS
			33. CLUB/PRIVILEGE ACCESS
			29. SEARCH ENGINE
			38. FORUM
			26. NEWS/EVENT
-3.67	0.000	0.00	0.42
-4.28	0.000	0.00	0.50
-4.39	0.000	0.00	0.51
-4.39	0.000	0.00	0.51
-4.39	0.000	0.00	0.51
			15. INTEGRATED E-SHOPPING
			22. PRODUCT RETURN
			14. ESHOPPING
			12. PRODUCTS PRICE
			17. CONTACT MEANS

The main characteristic of this Class is that no E-shopping service is provided. Rather, communication is key; promoting interaction with the user by exploiting the possibilities offered through the Web 2.0. Needless to say, class 3 is characterized by the interactivity variables. Indeed, the sites have RSS feeds, forums and clubs with open or limited access to privileged customers. These variables are characteristic of the interactive aspect and translate a will of the brand to use the Internet as a platform where communication is bilateral. The brand gives information to its Internet users but also collects it.

The Class 3 websites are comparable with those of the Class 1, in that both have an average level of usability. Most of the websites in this category also have a search engine. These brands do not choose to sell on-line but they are not "passive" actors either. The Internet is used for its interactivity and this aspect is more developed than on the websites belonging to the Traditionalist E-shop class. Indeed, while the latter has an average level of interactivity, a high level categorizes Class 3. The illustrative variables show that Class 3 is widely represented by the jewelry brands with 93,33 % of the luxury interactive websites representing Jewelers/watchmakers. Furthermore, this class is widely constituted by Swiss brands, which is logical considering all the Swiss brands in the sample are watch-making brands. By contrast, only 6.67 % are active in the ready-to-wear clothing sector.

Class 4: The Traditionalists

Table 10: Class 4 Characteristic Variables

Test V.	Proba	Mean	Characteristic Variables	
		Class	General	Name
		Class 4/4	(Weights – 24.00	Size – 24)
-2.37	0.009	0.04	0.21	36. MOBILE APPLICATION
-2.62	0.004	0.00	0.17	11. PRODUCTS PERSONNALISATION
-2.83	0.002	0.21	0.45	31. SITE MAP
-3.00	0.001	0.04	0.27	18. FAQ
-3.09	0.001	0.00	0.22	21. VARIOUS DELIVERY SERVICES
-3.87	0.000	0.04	0.36	39. WISHLIST
-4.00	0.000	0.50	0.78	32. NEWSLETTER
-4.54	0.000	0.13	0.51	12. PRODUCT PRICE
-4.54	0.000	0.13	0.51	17. CONTACT MEANS
-4.63	0.000	0.58	0.86	10. PRODUCT SHEET
-5.01	0.000	0.00	0.42	15. INTEGRATED E-SHOPPING
-5.36	0.000	0.04	0.50	22. PRODUCT RETURN
-5.51	0.000	0.04	0.51	14. E-SHOPPING
-5.70	0.000	0.00	0.49	29. SEARCH ENGINE
-6.72	0.000	0.13	0.67	23. CUSTOMER SERVICES

Most of the sites belonging to Class 4 do not provide an E-shopping service. The characteristic variables including price display, customer service, possibility to return the product or a means to contact the company are very limited or, in some cases, absent. Furthermore, a very small number provide the option to create a wish list. The Class 4 websites have a low level of interactivity, as reflected by the variables “mobile application” and “product customisation”. With no means of interaction with the consumer, these websites are limited to traditional communication functions; Since the 2.0 features have not been applied, the Internet is only used as a “basic media” without any further utility.

Regarding usability, no significant difference can be made with Classes 1 and 3. Class 4 websites have no search engines and the site maps are used infrequently. It may, therefore, be inferred that the level of usability of the Class 4 websites are inferior to Classes 1 and 3 but superior to Class 2. No illustrative variable has proven to be significantly characteristic of Class 4.

The Class 4 websites are considered traditional, given their position of using the Internet solely as channel of enhancing brand image. With the absence of E-shopping services and customer interactivity, it is clear that the emphasis is put on aesthetics, a core value of the luxury industry.

Table 11: Key elements structuring the principal component analysis

Category	Eshop (F1)	Interactivity (F2)	Usability (F3)
Traditionalist E-shops	Yes	Medium	Medium
Artistic E-shops	Yes	Medium-Weak	Weak
Luxury Interactive	No	High	Medium
Traditionalists	No	Weak	Medium-Weak

*This table is summarizing the four characteristics identified on the three factorial key elements structuring the principal component analysis.*

Results Discussion

After completion of the principal component analysis, three factors were considered: E-shopping, interactivity and usability as exposed in Table 2. These factors are linked to the three key elements ascertained in the literature review: brand identity and aesthetics, usability and interactivity (Constantinides, 2004; Okonwo, 2010), highlighted in the table 2.

Interactivity and usability are directly related to 2 factors that we have identified (axes 2 and 3), whereas the main factor, namely E-shopping, is to be related to one specific component of the axis brand identity and aesthetics.

The key elements identified in the literature review are considered essential components when analysing websites. However, it must be taken into consideration that since all websites use the Internet as a communication tool, the defining difference is not the transfer of the brand on-line but the website's overall performance for retail purposes through the presence or absence of an E-shop. The research constituted in drawing up a typology of luxury brand websites. These have implications in terms of theoretical and managerial perspectives. In the literature review, it was noted that many luxury brand typologies have already been proposed from a theoretical perspective (Alléres, 1991; Castarède, 1992; Kapferer, 1998; Twitchell, 2002; Sicard, 2003; Vernier and Ghewy, 2006). By way of reminder, it was previously accepted that a luxury continuum exists, as well as the coexistence of several levels of luxury within the continuum itself. The problem met with these types of theories is that they raise the following question "to what level of luxury does each brand belong? And as is known, there is limited consensus in this regard. Moreover, according to Kapferer (1996), Vigneron and Johnson (2004), the level of brand varies depending on the category of its product. Returning to the example of Chanel, whilst it is at the top of the pyramid regarding its haute couture and exclusive jewelry products, its positioning is considerably lower when assessing its cosmetics and sunglasses.

The typology in this research focuses on brands using their websites as part of their communications strategy. Four categories were identified based on three discriminate key elements: E-shopping, interactivity, and usability. Unlike the previous results, this typology does not require tackling the challenging problem of defining the luxury level. In this case, the classification is defined by examining the three key elements of the website. Flores and Volle (2005) have also proposed a classification of the brands websites in order to achieve the best possible understanding of the use a brand could make of it. For this purpose, five types of websites were identified (corporate, relational, promotional, tribal and transactional site). As this classification is dealt with from a generalist perspective, it was more difficult to apply it to this particular case of luxury brands. With that said, there are obvious similarities between the two. Indeed, the E-Shopping aspect is a characteristic feature in both cases. However, this study delves deeper in that it differentiates Traditionalist E-shop websites from Artistic E-Shops, which have a rather ineffectual usability factor.

Furthermore, the key element of usability is lacking in the generalist classification proposed by Flores and Volle (2005), which seems inappropriate since this concept is considered essential in the literature review (Constantinides, 2004; Okonkwo, 2010). Comparisons may also be made between the Traditionalists category and the "institutional websites" class pinpointed by the both authors (Florès and Volle, 2005), since both act as a simple communications platform presenting the brand and its products. Finally it can be stated that the Luxury Interactive class may be found, to a certain extent, in both relational and tribal classes, due to its interactivity characteristic. The difference lies again in the luxury specificities, as the interactive aspect is under the control, much more than in mass market brands. In this analysis, no brand community has led to an official website linked with the brand website.

To date, on-line communications strategies considered from a theoretical point of view have been neglected in literature. It was thus deemed important for this paper to shed light on this subject matter.

The typology provided helps to recognize the different types of E-Shopping websites available and to also get a good grasp of their usability and interactivity levels. This study has the advantage of being complete and well adapted to the specificities of the investigated industry.

However, implications of this typology should be considered not only at a theoretical but also at a managerial level. Firstly, it must be stressed that the typology does not aim to determine the characteristics of a "good" luxury website. It enables to place a communicational strategy in relation to the others with each category's inherent strengths and weaknesses. This is of fundamental interest to the luxury brand, as it allows it to situate itself amongst the four classes with a view to appreciating which aspects should be focused and improved upon. This typology also allows the brand to situate itself amongst direct competitors, providing it with the opportunity to compare and evaluate its communicational strategies against those pursued by its competitors. Even though luxury is deemed

superlative and, not meant to be compared (Kapferer and Bastien, 2008), it is clear that just like any other brand, it is market-driven, and the actions of one can affect the other. Moreover, it is likely that luxury brands established themselves on the web by imitating each other, despite warning from literature. Once the Internet was engaged by one luxury brand, it opened the floodgates of online presence from its counterparts.

It should also be noted that none of the four identified classes incorporate both the E-shop and interactivity characteristics. There might exist an opportunity in this respect. Luxury brands that want to differentiate themselves can use the typology in order to identify a new market position that combines, for example, presence of the E-shop as well as a high level of both interactivity and usability. Thus, as a tool, the typology provides a challenge by reconsidering online strategies from an internal perspective.

#### Limitations and Future Paths of Research

Of course, this research is not boundless. Limits are methodologically related to the exploratory nature of the data analysis. In fact, the research undertaken is in a field where literature is obviously lacking and its very purpose is to clarify the situation rather than attempting to explain it with cause-effect relationships. Identifying on-line communicational strategies of luxury brands constitutes a first step in better understanding this subject matter. With respect to the sample, brands belonging to three sectors, namely, ready-to-wear, leather and jewelry/ watch making were selected. It is understood that once applied to several other sectors, the study could lead to the creation of additional categories.

It should also be noted that websites must be considered as units of research, in constant flux. Therefore, there is no doubt that the results provided are time restrained. The descriptive character of our research could be seen as a weakness. Indeed, this research is based more on the “how” and the specific depiction of the relevant subject matter rather than an all-inclusive explication of a phenomenon. However, given the current state of the literature, this perspective should not be considered as a weakness but a necessary step in building theoretical foundations, which may later form the subject of research of an explanatory nature. In conclusion, the identification of limits leads to the assumption that there remains a relatively significant potential for investigation in this field. In a fragile economic climate when luxury brands are the only ones in good financial health, it is likely that it will still raise many new questions in the future.

# EVOLUTIONARY MODEL FOR THE MEASUREMENT OF THE LOGISTICS PERFORMANCE OF NO-TRANSNATIONAL SUPPLIERS

Marisol Reyes Alcantar, Universidad Tecnológica de Puebla  
María Beatriz Bernabé Loranca, Benemérita Universidad Autónoma de Puebla

## ABSTRACT

*Given the wide variety and complexity to select evaluation metrics of the logistics performance that allow the organizations to monitor their own advance towards the improvement of their activities in finished products supply, storage and delivery, in this work we present a needs escalator model for its application in systems of logistics performance measurement in first tier supplier, no-transnational and Small and Medium Enterprises (SMEs). This model suggests the application of logistical metrics by stages, in an evolutionary way, escalating from one state to another gradually, moving the conduct, the purpose and the attitude towards the application of metrics. Each one of the metrics indicates another set of metrics with determined pertinent qualities to the stage of evolution to which they are parallel to with activities to extend in each one of the stages. A revision of the literature to identify pertinent logistical metrics to each stage has been necessary for the proposal of the model.*

**KEYWORDS:** Performance Measurement Systems Logistics, Sustainable Supply Chain.

## INTRODUCTION

Since two decades ago, the organizations have started to consider the concept of supply chain to get a competitive advantage. Knowles et al. 2005, mentions that the performance of the supply chain is a very important topic in organizations nowadays and that has been much activity within the academic and industrial circles destined to the generation of improvements in this matter. Equally, Gunasekaran et al. 2001 acknowledge that there have been many efforts over diverse aspects and areas of SCM, but until recently attention has been paid to the performance, and its corresponding metrics. To evaluate the performance of the supply chains, performance measurement systems have been designed, focused to the inside and outside of each of the organizations that form the supply chains, a topic noted by many authors according to Knowles et al. 2005, who also tells us that the measurement of the logistics performance plays an important role in the quality and the improvement of the productivity.

At present we can see that many providers have different ranks of logistical metrics utilization to evaluate the performance of its participation within its supply chains. Many organizations are willing to initiate changes in their organizations, but they don't know where to start these changes. Bhagwat & Shama (2007), comment that "the enterprises that are found in troubles to identify what measure is the most important to follow an order and achieve the improvement of the logistics performance". On the other hand, Beamon (1999), says that the great amount of performance measures, makes hard the selection of these. About the progress of the measurement of the logistics performance, Novack & Thomas (2004) show how it has been evolved from an approach of individual measurements of functionality oriented to distribution costs (internal approach) to an emphasis of multiple measurements of process oriented to logistics costs and services output (external approach). But the author lightens to us that the current challenge is what to measure. Therefore, this author says, that the following evolution step is to unite the performance to another success indicator, both internal and external. Another problem with the metrics of performance measurement, says Beamon (1999) is that the performance measurement systems are insufficient because they are based in a great level on the use of the cost as key element and they aren't pertinent with the objectives and strategies of the organization and they don't take into account the effects of the uncertainty in a future (flexibility). On the other hand, there haven't been found in the literature performance measurement systems implantation procedures for first and second level providers of the

supply chains in general, but on the other hand Subramani (2004), says that “most of the studies done, have examined the benefits for the network leaders, but little attention has been paid to the providing enterprises”. In face of this situation a logistical metrics implantation model is presented that allows the organizations that have started or that have the intention to increment their internal efficiency, Technological Innovation and later to be prepared for the next regulations that will be mandatory in a near future due to the scarcity of raw material resources and the care of the environment. In the first part of this paper describes some aspects of the performance measurement systems logistics, subsequently mentioned authors have classified the variety of logistics metrics, after this recapitulation presents the evolutionary model for measuring logistics performance in non-transnational providers and SMEs. Finally, some conclusions and future work of this paper are written.

## LITERATURA REVIWE OF METRICS DESCRIPTION

Several authors have classified and defined the great variety of metrics related with the activities of supply and logistics: Lambert & Harrington (1989), Harding (1998), Beamon (1999), Gunasekaran et al. 2001, Chan 2003, Gunasekaran et al. 2004, Bask & Kuula (2010), Hassini et al. 2012). However, one of the most distinguished classifications has been the one by Harding (1998), cited by Novack & Thomas (2004), that build a logistics performance measurement matrix using three areas of importance: 1) Importance of the client, 2) Performance of the company, 3) Improvement cost/time. Their idea was to let the companies to identify those areas of logistics performance where they should improve, meanwhile the cost/time elements were resources that are needed to be spent to improve the service. Later in 1999, Beamon defines that the strategic objectives involve key elements that include the measurement of the resources, the productivity and the flexibility. Resources Measures (generally the cost) and output measures (generally the response of the client) have been widely used in the models of supply chain. Therefore, according to Beamon, a supply chain of the measurement system must put emphasis in three different types of measures: resources performance measures (R, high level of efficiency), the output measures (O), and the flexibility measures (F). Each one of the types of performance measures has different objectives.

### Evolutionary Model for the Measurement of the Logistics Performance

In this article when we talk about needs, we understand that they are lacks that the current performance measurement systems have for their easy implementation, some of these areas need help soon, since it is impossible to evolve if basic supply supports aren't created. This evolutionary model of needs for the measurement of the logistics performance is directed to first and second level providers that supply the OEMs (Original Equipment Manufacturers). Specifically the needs of those “providers of the great leaders, that doesn't have the same benefits of the leaders. For example, when programs are created to give quick response to the manufacture of automobiles frequent deliveries are created, which incur in high inventory handling expenses to the providers” (Subramani, 2004).

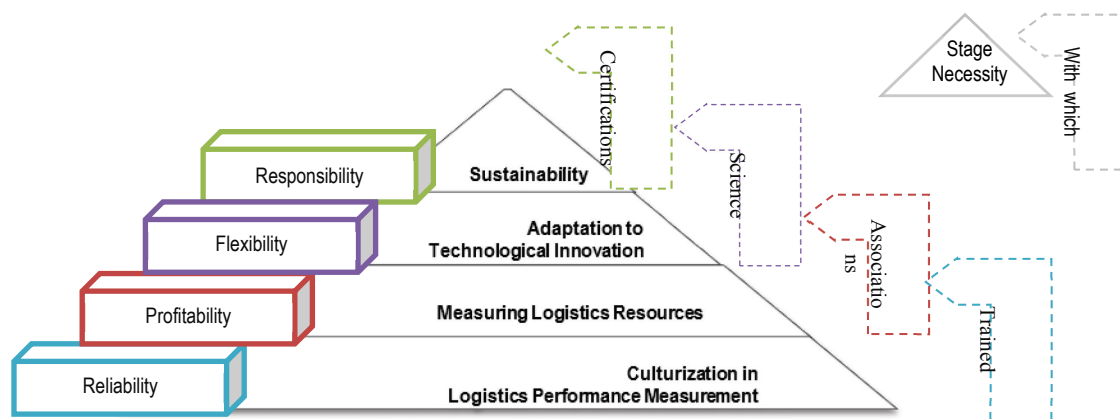

Each one of the stages must select the metrics most adequate to the system, but it must not be forgotten that they must have the characteristics of the effective measurement systems suggested by Beamon (1999): These characteristics include: inclusiveness (measurement of all the pertinent aspects), universality (allow the comparison under different operation conditions), measurability (the required data are measurable) and consistency (measures compatible with the organization's goals).

The inspiration of the model is based on the needs pyramid of Maslow (1943), since according to this author, the human being has certain needs that will be able to be satisfied once a previous need is satisfied, is like this that in that scale of needs, it starts with basic needs like are the *physiological*: breathing, feeding, rest, etc.; just until this needs are covered, the ones of the next level will be able to be satisfied like the *safety needs*, later the needs of *affiliation*, *acknowledgement* and *self-fulfillment*.. Is because of that that this model, presented, presented in figure 1, is sustained as a base, on a needs hierarchy: the first metrics must have the quality of *Reliability* in the metrics that the provider must fulfill

(see table 1). Then, in order for a company that wishes to show reliability, it must first create a culture of logistics metrics acceptance among its personal, we'll call this stage *Culturalization*, since it is very common that in the manufacturing industries is very acceptable the measurement in the tangible productive processes that add value to the product and in the quality inspection of the same; however, there is little habit about the intangible logistics operations related to the activities mentioned by Christopher (1992): the procedures of orders, purchases, inventory handling, picking, packing, shipment, invoicing and transport processing, etc. Once that a way of life is created and the habit of measurement in every activity, a second stage will be able to be recognized, a set of knowledge will be able to exist that allows the organization the *Logistics Resources Measurement*, identifying the financial and not financial benefits proposed by Gunasekaran et al. 2001. It must be noted that in this model is proposed to cover the basic logistics not financial metrics in the first stage of reliability. The set of metrics for the stage of logistics resources measurement must have the *Profitability* quality, this is, performance indicators that allow measuring economically the logistics operations (table 2).

Figure 1: Evolutionary Model for the Measurement of the logistics performance of SMEs supplier.

In this figure, shows an evolutionary model for measuring logistics performance of supplier tier 1 of Small y Medium Enterprise's and non-transnational OEMS. This model suggests the application of logistical metrics by stages, in an evolutionary way, escalating from one state to another gradually, moving the conduct, the purpose and the attitude towards the application of metrics. Each one of the metrics indicates another set of metrics with determined pertinent qualities to the stage of evolution to which they are parallel to with activities to extend in each one of the stages. Source: Authors

The third stage called *Technology Innovation Adaptation* will be able to be measured by the *Flexibility* (metrics quality, see table 3) that the organization has to adapt to sudden environment changes (Beamon, 1999). This stage has this name, because in order for an organization to quickly respond to the needs of their clients, it must be a certain degree of adaptation to technological innovation to be able to respond to the requirements of the client quickly. The technology has had an important impact in the supply chain as a change facilitator, since the enterprises have transformed their processes due to their adaptation to Technological Innovation (Coyle et al. 2009). The last stage of the needs for the performance measurement is the *Sustainability*, Hassini et al. 2012, defines the sustainable business as the ability to conduct businesses with long term goals to maintain the wellbeing of the company, the environment and the society. The set of metrics for this stage has the quality of *Responsibility*, given that, beyond the legal obligations, these metrics need to guarantee the care of the environment through the sustainable supply. The providers must consider the anticipated preparation to deal with the pressures of the preservation the environment, now that in a not so distant day, when the natural resources scarce, this will be the production system. The current systems of protection of the environment certification, only control the pollution side, this is, they watch the pollution that the enterprise can generate, for example, hazardous residues handling, CO2 emission, residual waters treatment, etc. (Bask & Kuula, 2010). But not the related to the supply of materials classified as non-renewables, as a preventive measure for the long term supply. Added this, we have that the supply chains must take care of the future scarcity of raw materials

or non-renewable resources, according to Jadghey and Browne (1998), cited by Bhagwat & Shama (2007), who say that the supply chains are like extended enterprises, they are the responsible of the Life cycle of the product, since the materials acquisition and the supply management, the production and fabrication, and of the product distribution and client service, and finally the recycling and product elimination at the end of its life. Is because of this that in table 4, a set of metrics is proposed that the supply chains should start to implement in their organizations.

Table 1: Proposed Indicators to Measure the Reliability of Supply

Metric	Impact on the customer	Calculation
% Fill Rate (FR)	It covers the need to immediately filling the number of orders required by the customer	$\% FR = (\text{Number of Orders immediately delivered in a time period} / \text{number of orders required by customers in a time period}) * 100$
% On Time Delivery (OTD)	Determines supplier's ability to deliver on time the customer requirements.	$\% OTD = (\text{Number of Orders delivered before o in time, in a time period} / \text{number of orders required by customers in a time period}) * 100$
Lead Time (LT)	Time is waiting for a client to receive your product	LT = is the summation of amount of time since entering the request of a customer order to delivery accordingly.
Cycle Time of the Order (CTO)	Improving this metric can reduce the response time of the supply chain.	CTO = The amount of time required to supply, produce, picking and delivering a product or batch.
Backorders (BO)	Customer dissatisfaction is not to deliver your requirements on time.	BO = The number of non-delivered or pending deliver because the lack of existence in a certain period of time.
% Invoiced Deliveries Without Failure (IDWF)	Is customer satisfaction by invoices delivered without mistakes	$\% IDWF = (\text{This is the number of customer invoices delivered without failure in a period of time} / \text{number of deliveries in a period of time}) * 100$
% Perfect Order (PO)	It is total customer satisfaction through without failure deliveries.	$\% PO = (\text{Number of orders delivered on time, with quantity and product correct, free from damage and without errors in invoicing in a time period} / \text{number of orders delivered in a time period}) * 100$

*These metrics to measure the performance of the orders are delivered immediately, on time deliveries, the lead time, the cycle time of each order, the number of items not yet delivered and the percentage of perfect orders. Source: authors*

Table 2: Proposed Indicators to Measure the Profitability Internal of Logistics Activities

Metric	Impact on the supplier	Calculation
Distribution costs	The lack of reduction in these costs, directly impacting the sales price to the customer.	It is the sum of the costs associated with the transport, collection, packing and local delivery of a particular order, divided by the number of units of that order. <i>Transport</i> : shipping costs by distance and location <i>Collection</i> : labor costs for the time of picking <i>Packing</i> : labor and material costs for packing <i>Local delivery</i> : viatical costs
Inventory carrying costs	The lack of reduction in these costs, directly impacting the sales price to the customer.	The addition of insurance costs, robberies, damage and waste, in a specific period of time.
Inventory turn	The number of times that the inversion recovery in existence for a period of time. The percentage of covered sales inventory. The percentage of units per SKU which covered sales in a certain time.	$RI = (\$ \text{Income from sales} / \text{inventory } \$) * 100$ If greater than 90%, the level of inventory agrees $RI = \text{Number of units sold per SKU, in a period of time} / \text{number of units per SKU in stock, in a time period}) * 100$
Cash to Cash of the inventory	Let's look at the impact of inventory changes in cash flow from inventory.	$\text{Cash to cash} = \$ \text{inventory} + \$ \text{accounts receivables} - \$ \text{accounts payable}$

*These metrics to measure the impact internal of supplier's logistics activities, ranging from determining the cost of distribution and inventory management, inventory returns and inventory capacity to convert cash to cash. Source: authors and some other referenced.*

Table 3: Proposed Indicators for Measuring the Flexibility Of Supplier.

Metric	Impact on the supplier	Calculation
Rapid response to changes in the order (RRCO)	Produce value to the customer, because measured ability to respond to changing customer needs.	RRCO = Sum of time required to meet the changes of an original order  RRCO = (number of orders with changes as perfect orders fulfilled in a time period / number of orders with changes in the same period) * 100  Saving time response to changes in orders = Current Time – New Time <i>New Time</i> : time resultant from investments in activities, equipment and systems to be flexible to enable changes in orders.
Rapid introduction of new products (RINP)	Capturing new customers	RINP = The sum of times to change product specifications and reprogram all the activities of a supply chain. Saving Time to response to New Products = Current Time – New Time <i>New Time</i> : time resultant from investments in activities, equipment and systems, which allows flexibility to manufacture new products.
Reduction in time, by the use of Information Technologies (ITs, EDI, Internet, SAP)	Facilitates rapid response to the control system and share information	Saving Time with ITs = Current Time - Time new <i>New Time</i> : time resultant from investments in systems, which allows flexibility to sharing information.
Speed to respond to the needs friendly products environment.	Create reliability and tranquility in consumption	Percent of Products Friendly with Environment (PFE) "n" year = (number of products friendly with the environment / product number) * 100  $\Delta$ Annual increase of PFE = % PFE <sub>n</sub> - % PFE <sub>n-1</sub>

*These metrics to measure the speed of response to the need for changes required by customers, due to shifts in orders, product features, needs to share information and speed to respond to care of the environment.*

Table 4: Indicators to Measure The Sourcing of Environmentally Friendly Products

Dimension	Economic	Environment	Social
<b>Objective</b>	Maximize the utilities of the supply chain	Minimize the environment impact	Maximize The social well-being
<b>Indicators</b>	% of Increment in sales as consequence of offering environment friendly products.	% of recycled material in a product (recycle). % of types of products with recycled material (recycle). % of types of products with disassembly design for the end of life of the product (recycle). % of products that have ecological materials again (reduce). % of products or packages with end of life, which are submitted again to the same process (recycle). % of products with environment friendly packing (reduce). % of finished products that can be used by third parties (reuse). % of collected packages or products at the end of its useful life (reduce). % of products that doesn't exceed the allowed hazardous substances limits according to the norms RoHS and WEE (reduce).	% of increment of clients that are willing to pay an extra cost or the same cost for an environment friendly product. % of increment of local providers, developed as well in sustainable terms.

*In this table, we can see the principal metrics relatives to Sustainable Supply Chain. Source: authors and other authors.*

## CONCLUSION

This work proposes a sequence to implant logistics metrics by evolutionary stages, directed specially towards those providers that haven't evolved yet in the way of measuring their internal and external logistics performance, to guarantee the satisfaction of the logistics service provided to their clients, this model also works as a preventive tool to compete in the market, because it foresees in a structured way the short and long term needs. In this work is summarized a series of performance indicators of the supply chains proposed by several authors, which were grouped by diverse qualities, for example, Reliability, Profitability, Flexibility and Responsibility. Later, a comparative table of statistical tools was presented as well that have analyzed diverse supply and logistics metrics for the supply chains. Finally, the set of

metrics to apply in each stage were presented, in a simple and reduced way, since a great number of metrics is hardly accepted and understood by the labor force. In each one of these stages, a series of contributions were included that would help the need of every stage. As future prospects remain the application of this model in some SMEs to validate the model, just like the instruments design for the information collection in each one of the metrics in a way that is easy in their application and evaluation.

## **HARNESSING SYSTEMNESS: SOPPORTING REGIONAL INNOVATION AND PROGRESS**

Rafael F. Romero, SUNYIT

Eradicating extreme poverty is one of our greatest economic challenges. It is a necessary condition for sustainable development. In particular, governments in developing countries must provide access to a wide variety of social services, since they contribute to the consolidation of development gains. Systemness, using higher education systems to harness the collective contributions of a diverse group of individuals to impact economic growth and prosperity, is an effective way to promote universal access to social services. This paper discusses how diverse higher educational institutions contribute in improving economic outcomes. In particular, it evaluate these institutions influence local governments, international organizations, the private sector, and all other major groups to enhance their efforts to achieve sustainable changes in patterns of consumption and production and improving living standards.

# BUSINESS EDUCATION AS A CATALYST FOR SOCIAL REFORMS AND MANAGEMENT OF INDIAN GOVERNMENT

Kanchan Shridhar Fulmali, Mumbai University India

M. L. Dahanukar, Mumbai University India

## ABSTRACT

*In India, the backward classes' movement has passed through various stages and each stage characterized by different aims and objectives. Shudras are the deprived people those were not acquired education in those days. They were lagging behind in education so they did not get proper job, it loses their income and image in the society. Indian government has taken initiative to teach these backward classes at grass root level. However, primary education cannot help them to come up at par with other upper casts. Business education is must for them to walk and mix with the upper casts. It depicts in Indian history that all social reformers like Ambedkar, Phule, Gandhi etc, were highly educated and started the movement of eradication of castism in India. The paper focused on the two most deprived casts SC and ST, which are suffering from castism in rural as well as urban areas. It explicated that how the education rally round deprived people to come out from their poverty and untouchability with the help of management of Indian Government. It shows business educational opportunities and challenges for these classes and trying to prove that the business education is helping to social reforms and their development.*

**KEY WORDS:** Business Education, Deprived class, SC/ST students, Social Reform, Management of Government

## INTRODUCTION

In India, the backward classes' movement has passed through various stages and each stage characterized by different aims and objectives. During the medieval period i.e. before the advent of the British regime, the caste system was so rigid that mobility within it was very difficult. Sanskritisation was the only means for their upward social mobility. However, by this means they could only adopt the religious customs, practices and style of life. Regarding education, \*Manu said, "The first-born Brahmins, who took birth on this earth, have imparted education of character to all human beings." The ^Vedas occupy place among ancient text that provides knowledge about ancient Indian education and society. (P. Annie Amala: 2004:37). Likewise, P. Annie there is many researchers agreed that, education has started from the very birth of the most ancient Vedic epics; Dr. Radha Mukerjee and others find that, the Indian literature was profoundly influence by religion. It is factual the Indian Vedas told that four #Varnas have been four different position in the world, reminiscent of Brahmins can educated, Kshatriyas can fight, Vaishyas can do business and Shudras can do cleanliness. These Shudras are the deprived people those were not acquired education in those days. They were lagging behind in education so they did not get proper job, it loses their income, money, wealth, property and apparently their image in the society.

In ancient period of India, education was not accessible to all casts and creeds and some regions were more developed than the others were as far as education was concerned likely urban and rural areas. There were underprivileged people in every region of India. Here the population was socially and educationally backward because of socio-cultural and economically reasons. In India Shudras were abandoned by society and it was an impediment for social reforms. In some of the areas untouchability remain and upper casts hate them and giving them inferior treatment. Now they are far behind from the others in most of the rural Indian regions. It is necessary to educate, improve and develop them.

(Kumaran: 1992: 138) The paper is highlighted the educational situation of these deprived group especially SC/ST Casts of India and how an education is developing social position of them, help them to come up, erect their own identity in the society and as a tool of social reforms in India.

*Need And Importance Of Study:* The establishment of British rule in India gave a new stimulus to the backward classes' movement and the post independence period Indian gets success in the field of education but the inequalities and disparities are continued. The Constitution of the India, promulgated in 1950, recognizes the Scheduled Castes (SC) and the Scheduled Tribes (ST) as the two most backward groups needing special protection. Indian Constitution's Article 46 states that, "The state shall promote with special care the educational and economic interests of the weaker sections of the people, and in particular, of the Scheduled Castes and the Scheduled Tribes and shall protect them from social injustice and all forms of exploitation." It is true that education reducing the differences in between cast and castism in India but not removing traditional thoughts of the Indian people. Untouchability remains in Indian rural areas on large scale and in urban people's mind in intangible way. Business education may be reducing this intensity from urban and rural areas. Therefore, this study is important for the following aspects:

*To eradicate the social gap between the various casts in India*

*To educate the large number of deprived section of the Indian society*

*To develop the regions from the rural areas that has maximum castism.*

*To find out the literacy, dropout and enrolment of the deprived section of the society in the business education in India*

*To see that how much development taken place in these areas or there is a social reform just for the namesake!*

## LITERATURE SURVEY

There are various literatures available in India on business education and SC/ST by various renowned people like Sukhdeorao Thorat (Chairman of UGC, India), Suma Chitnis (Socialist and Professor in Tata social science Institute), Narendra Jadhav (Member of Planning Commission, India) etc. There were many interviews taken by **Mamta Rajawat** the author of "Scheduled Castes in India", where she has mentioned about the views of the class I officers from SC category. These class I officers were concluded that "For the upliftment of the depressed classes, reservation is not only means but educational facilities along with proper financial help by the Government is also required and it should continue till the people of these community can walk, talk and sit at par with the upper castes Hindus". (Rajawat: 2003:250) P M Foundation's report shows the comparative study of SC students' educational scenario, where exactly they stand in business educational study and unfortunately, the data depicts that only 4.1% SC students are having education of higher secondary compared with the general category students that is 21.9% (The NSSO data of 61st Round 2006). Its highlighted business educational study of Maharashtra where there is a number of SC population and the State Government expenses are just Rs. 1500 per SC student that is low compared to the other states like AP and UP having expenses of Rs. 2194 and Rs. 2393 respectively. (Source: Ministry of Social Justice and Empowerment, Govt. of India)

### Objectives of the Study

The main objectives of this study are:

1. To find out the factual position of the Indian deprived group in business education.
2. To verify the literacy rate of SC/ST students are increasing in business education.

3. To find out, that education is helping to deprived section of the society for removing cast disparities, their poverty and untouchability from the society.
4. To find out the challenges faced by the deprived section of the society in business education
5. To scrutinised their opportunities in the field of business education
6. To provides suggestions for the development of SC/ST students in the society.

## HYPOTHESIS

$H_0$ -- Business education is helping to improve the deprived section of the society in India.

$H_1$  – Business education is not helping to improve the deprived section of the society in India.

## METHODOLOGY

Information collected through primary and secondary data. With the help of simple random sample, from 20 Management, Medical and Engineering colleges, 200 SC/ST students from Mumbai University selected for collection of primary data through questionnaire and interview. Chi square and Standard Deviation statistics are apply to test the above hypothesis. The formula use for

**Chi Square is =**

$$\begin{aligned} X^2 &= \sum \frac{(\text{Observed frequencies} - \text{Expected frequencies})^2}{\text{Expected frequencies}} \\ &= \sum \frac{(F_o - F_e)^2}{F_e} \end{aligned} \quad (1)$$

**standard deviation equation =**

$$\sigma = \sqrt{\frac{\sum (x - \bar{x})^2}{N}} \quad (2)$$

## Data Analysis

*Higher Education In India:* In every five-year plan, the growth rate of business educational institutes shows the interest and the careful management of the Government of India. In the 10<sup>th</sup> plan 2005-06 in India, we had 216 State Universities, 20 Central, 101 Deemed Universities and 155 National and Research Institutes which means in all there were 492 Universities/Institutes, which has increased in 2010 in the 11th, plan i.e. 600 Universities/Institutes including 40 Central, 255 State, 130 Deemed Universities and 175 National and Research Institutes. As on 31.03.2011, the number of Universities had gone up to 43 Central, 265 State, 80 State Private, 130 Deemed to be Universities, five Institutions established under State Legislation and 33,023 colleges in the higher education sector.

Source: Self compiled chart (statistical data by MHRD-India) It shows that in India, the business education institutes are increasing day-by-day to facilitate business education to students of all categories. These also include private institutes, where the students are getting very expensive education; it is not affordable by specially SC/ST students because maximum numbers of these people are not financially sound. It shows that State level Universities augment at a much fast rate, these increased from 216 to 255. If number of institutes are increasing then they will accommodate more number of deprived section people but they need finance from the government hence the Government must increase the financial aid for these people, so that they can pursue the Business education effectively in India.

SC/ST:

Scheduled Castes ("SC"s) and Scheduled Tribes ("ST"s) are Indian population groupings that explicitly recognized by the Constitution of India, previously called as the "Depressed Classes" by the British. SCs/STs together comprise over 24% of India's population, with SC at over 16% and ST over 7.50% as per the 2001 census and 16.2% (166,635,700) SCs and 8.2% (84,326,240) of STs population is recognising in the census of 2011. It shows the proportion of Scheduled Castes and Scheduled Tribes in the population of India has steadily risen since independence in 1947. In 1950, the Constitution (Scheduled Castes) Order of India has given the list of 1,108 for Scheduled Castes from 25 states. However, after 1990 again Indian Government included few castes' in SCs that is up to 1,221 and some tribes in STs that is up to 678. It shows that the Government tried to consider the various groups of these classes and gives them various facilities including financial aid so they will educate themselves and walk with the upper-group of the society. The amount of financial aid depends on the number of castes and tribes in the list and their number of population in the States.

Source: Self compiled chart (statistical data by MHRD-India)

**Literacy Rates Of Sc/St:** Literacy is developing poor and underprivileged people through knowledge, information, data and wisdom. They can get a job through education thereby income and high standard of living; which is eliminating castism and reduces the gap in between cast for future generation which is one of the reasons for social reforms. Following figures shows the development in their literacy rate.

Table 1

State/UT	SC	ST	Open
Years	Total	Total	Total
1961	10.27	8.53	28.30
1971	14.67	11.30	34.45
1981	21.38	16.35	43.57
1991	37.41	29.60	52.21
2001	54.69	47.10	64.83

Figure 1

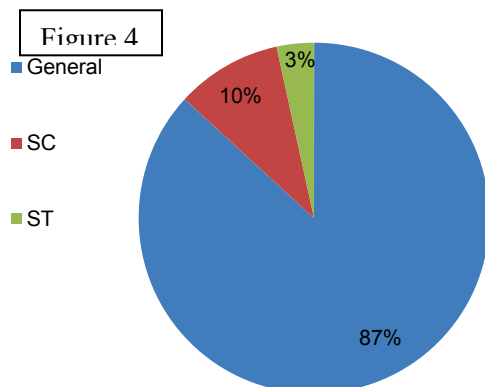

Source: census 1961 to 2001 India

From Table 1 and Figure 3, the literacy rate of SC and ST students are growing as compared to 1961 literacy rate, which was SC-10.27 percentage and ST-8.53 percentage as compared to open category-28.30 percentage. In 2001, it reaches up to SC-54.69 percentage and ST-47.10 percentage and open-64.83 percentage. Figure shows that there is growth in literacy rate of SC/ST people due to several reasons and one of reasons is that, the Government efforts towards these deprived sections of the society and various schemes of Scholarship/Freeship and reservation announced by them, work done by the social Reformers like Dr. Ambedkar, Mahatma Phule, Mahatma Gandhi and so many. The Management of the Government and financial aid bestowed to SC/ST students for their business education.

**Enrolment And Social Reforms:** In 2001, the Government has given fee concession and scholarships to some professional courses, therefore the enrolment ratio of the students increased from 6.9% to 13.6%, i.e. increased by 6.7% which was a good sign for SC girl students. So far in other courses male or female enrolment ratio was not upgrading, it just improved by 1% to 4% only. In 2005-06 in Engineering, the total number of enrolment was 16,68,000 against SC/STs were 1,62,498(10%) and 57,190(3%) respectively. Likewise in Medicine 3, 06,000 against SC/STs were 44,575(15%) and 19,316(6%) respectively. All over India in some of the business educational courses, the enrolment was deplorable for instance, in PhD the enrolment of SC/ ST students were 6,329 and 1,520 respectively. In M.Sc. the enrolment of SC and ST students were 23,087 and 4,540 respectively. In the same manner in M.Com and in B. Ed, the enrolment of these students was very low. The poor enrolment percentage of SC and ST students in universities and colleges brought to the fore by a nationwide survey conducted by a government-appointed task force for the academic year 2010-11. According to the provisional results of the survey conducted for the first time in the country, the enrolment of SC students in business educational institutions stood at 10.2% of the total while the percentage of ST students came at just 4.4%. The data includes enrolment of students in business educational courses conducted in distance mode.

Enrollment of engineering 2005-06

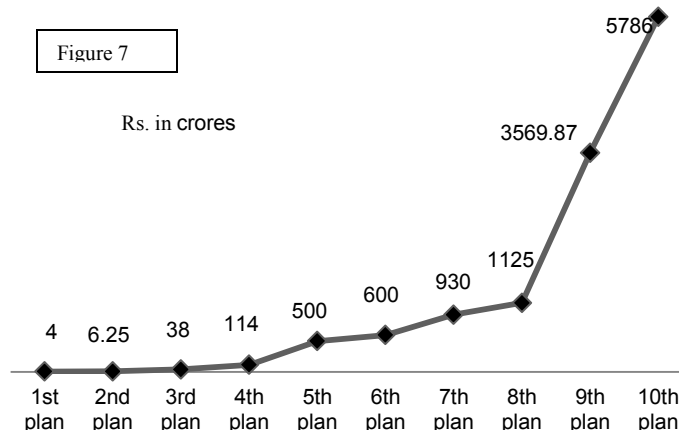

Enrollment of medicine 2005-06

Enrollment of students in Business education in 2010-11

Budget of funds under five year plan

Education changes the mind of the people and provides development for deprived classes. This data shows that, poor enrolment is one of the reasons for backwardness of these people and it is one of the barriers for the development of these sections. The Economic Survey 2009-10 released by the Finance Minister on 25/2/2010 in the parliament, points out that implementation of schemes for SC/ST have not met the targets. Out of total annual expenditure Rs. 10,20,838 Cr for the financial year 2009-10, spent only 13.36% in Social Service Sector in both Plan and non-plan budgets. It shows that Government cannot manage financial aid flawlessly. The above illustration is showing an increasing trend of the budgeted funds for SC/ST students for their business education under SCA, SCP and TSP plan provided by Government. In the first five years plan the budget was Rs. 4 Cr. which is intensified in every five years plan and it had reached up-to Rs. 5786 Cr. in 10<sup>th</sup> five-year plan.

Above mentioned Secondary data proved it various ways that deprived classes education is improving in term of figures but according to their increasing number of population these improvement is still lower. Rural areas students are migrating here for business education and they are facing many challenges, which are the obstacles for their development. In India, the enrolment of SC/ST students is much better at primary level, where our Government has encouraged them in various ways but dropout rate is very high. In 2001 literacy rate is amongst SC 54.69% and amongst ST 47.10% compared to general literacy rate which is 64.84%. There are **following problems** of the less enrolment and high dropout of these SC/ST students in India:

- Parents dislike business education because they are illiterate

- They have casual approach towards education
- Poor financial position, In rural areas, though few people have good financial condition, they don't understand the importance of education
- They don't get proper information about educational courses
- Traditional approach of them refused to send girl child in school
- Ignorance of upper classes students
- Refuse to sit along with them, Refuse to share Tiffin
- High cost of business education, Low amount of scholarship
- Negligence of the Government towards professional courses, Ignore by the society and the upper cast
- Forlorn Moral and disappointment and do not get higher post job.

These reasons are increases the dropout rate at Pre-Matric level. Hence Government has providing various facilities to these people so they can reach to higher or professional educational level, which provides following **opportunities** to them: a) They get job easily, b) Income will increase, c) Financial soundness, d) Create image in the society, e) High profile job, f) Reducing castism, g) Easily mix with the upper casts

## Business Education and Social questions to the SC/ST students

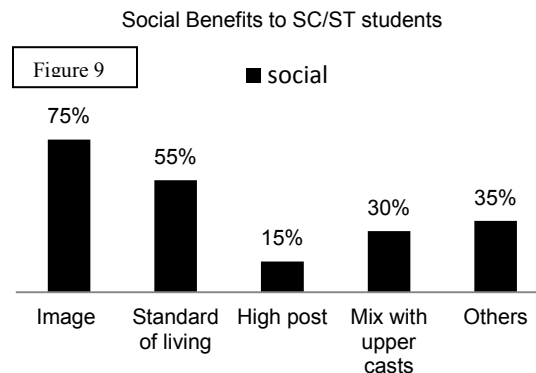

Table 2

Is Business education helping them to get job?						
Casts	Observed	Expected	O-E	(O-E) <sup>2</sup>	(O-E) <sup>2</sup> /E	Total of $\chi^2$
SC/Yes	60	57.5	2.5	6.25	0.108

ST/No	20	17.5	2.5	6.25	0.3571	
Total Chi-Square	200	200	0	25	0.8656	0.865
Is Education breaks castism?						
SC/Yes	85	82.5	2.5	6.25	0.0757	
SC/No	15	17.5	-2.5	6.25	0.357	
ST/Yes	80	82.5	-2.5	6.25	0.0757	
ST/No	20	17.5	2.5	6.25	0.357	
Total Chi-Square	200	200	0	25	0.8654	0.865
Total Chi-Square is =				10.132		

Level of significance =  $\alpha 0.05$  Degree of freedom = (number of rows-1)\*(number of columns-1) =  $7*1 = 7$  Therefore  $\chi^2_{tab} = \chi^2_{7, 0.05} = 14.067$   
 Therefore  $10.132 < 14.067$  D.C. -- Accept  $H_0$  if  $\chi^2_{cal} < \chi^2_{tab}$  therefore we accept the  $H_0$  "Business education is helpful to improve the deprived section of the society in India"

Following questions asked to the SC/ST students to find out that the Business Education is helping them to come up and improve themselves in the society. Which financial and social benefits do you availed in the business educational field? Following chart shows that these categories are getting benefits of Government mostly in admission i.e. 85% then in freeship (40%), then Scholarship (20%) and lowest facility they are getting in educational loan. These people are also getting other facilities like Book Bank scheme etc. In addition, they are getting social benefits like improving image i.e. 75% of students, for standard of living 55% and Mix with other casts 30% of students have given their acceptance or in smaller way high post in the services.

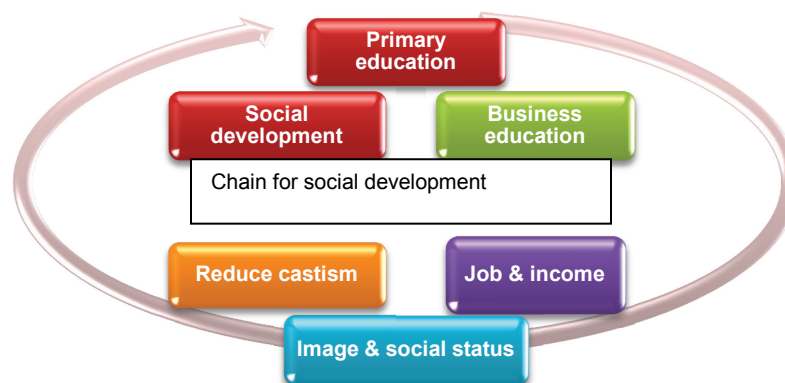

What expenses do you need for the higher studies? Following chart is showing the Expenses/fees and scholarship amount differences of SC/ST students for business education:

Table 3

Faculty	Expenses + Fees (Rs.)	Scholarship Amt.(Rs.)		(total- Average fees) <sup>2</sup>	
		Hosteller	Day Scholar	hosteller	Day scholar
BA/B Com/B Sc	30000+420	5700-420	3000-420	9486400	577600
MA/M Com/M Sc	30000+610	8200- 610	5300-610	336400	2371600
Engineering	30000+5000	12000-5000	5500-5000	10368400	3027600
Medical	36000+5000	12000-5000	5500-5000	7728400	18147600
MBA	30000+5000	12000-5000	5500-5000	10368400	3027600
<b>Average Fee</b>		<b>21220</b>	<b>26240</b>	<b>Deviation: 2767.237</b>	<b>Deviation: 1042.152</b>

It can concluded from the Table 3 that, on an average a hosteller has to pay 21220±2767 Rs and a Day scholar has to pay 26240±1042 Rs as annual expenses. This table shows that there is lot of difference between expenses and scholarship amount; especially for professional courses, scholarship amount is very low. Students have given information about Fees that want to fill besides tuition and exam fee and Expenses (It includes lodgings, boarding and books expenses approximately). For instance MBBS education, student required in all Rs. 36000 which included Rs. 2500 X 12 = 30000 for meal, Rs. 2000 for hostel and Rs. 4000 for books expenses but excluding other expenses. Therefore, it proves that the amount of scholarship is not enough for the expenses, which is just Rs. 20000 including Rs. 12000+ Rs. 8000 maintenance allowances. This amount is very less than the average expenses as above mentioned. Cent percent students said that Government could not cope-up with the expenses and scholarship in the business education. It creates effect on their education, which they cannot take according to their wish and lost image in the society.

How Education is responsible for social development? All 80 to 90% deprived class students have given same answer that business education is providing sort of image in the society but at the same time they agreed that elementary education is the base of literacy and push them for business education. This can create a chain for social development.

## CONCLUSION AND SUGGESTI

The above study shows blotchy picture of this research that business education obliging to social reforms and development of deprived class somehow. Government is trying for social reforms through education but unfortunately in rural areas, they do not get success but in urban areas, somehow they are managing the task on “Tips and Toes.” Here the hypothesis tested that Business Education is helpful for social reforms through Management of Government some extent, if Government followed few **suggestions** it will help to everyone more effective way.

- *Increase amount of Scholarship*
- *Keep watch on primary schools of rural areas*
- *Promote Business education at rural areas*
- *Reduce the fees of Business education for these people*
- *Provide easy educational loan on low interest rate.*
- *Give information on importance of education to the parents*
- *Generate employment opportunity for them at rural level.*

## LIMITATIONS

In this paper there is limitation of collection of data that collected from urban areas students not from the rural areas students and both places circumstances are different therefore likelihood that the conclusion will be different.

## BIOGRAPHY

Mrs. Kanchan S. Fulmali is Associate Professor in M. L. Dahanukar College of commerce, Mumbai University, Mumbai, State- Maharashtra, India from last 19 years. I am Member of WGC of NCERT, MHRD, India. Presenting and published many papers in International and National conferences. For two papers, I got best paper award. I am Pursuing PhD on the same topic from Mumbai University that is near to completion. Prof. Kanchan Shridhar Fulmali, M. L. Dahanukar College of Commerce, Mumbai University, Mumbai – 57 State-Maharashtra; India, E-mail – [kfulmali@gmail.com](mailto:kfulmali@gmail.com), Contact No. +919322245598

## ELLIPSIS

SC: Scheduled Casts, ST: Scheduled Tribes, SCP: Special Component Plan, SCA: Special Central Assistance, TSP: Tribal Sub-Plan \***Manu**: **Manu** is a title accorded to the progenitor of humanity and the very first king to rule this earth, who saved humanity from the universal flood. ^**Vedas**: The **Vedas** are a large body of texts originating in ancient India. Composed in Vedic Sanskrit, the texts constitute the oldest layer of Sanskrit literature and the oldest scriptures of Hinduism. #**Varna**: It refers to the categorization of the Hindu society by four castes. The four varnas, or chatur varna, are mentioned in ancient texts in the following (stratified) order a) The Brahmins: Vedic priests. b) The Kshatriyas: they were kings, governors and soldiers. c) The Vaishyas: they were the cattle herders, agriculturists and merchants. d) The Shudras: they were labourers, artisans and service providers. The first three varna are considered *Arya*, and thus allowed to participate in Vedic rituals from which the non-Arya Shudra Varna is excluded. These Shudras were "Untouchables" such as the Dalit and the Chandal separate and shunned by society. **Dalits**: A Dalit formerly known as untouchable or achuta — is a person outside of the four Varnas, and considered below of all. Dalit Panthers defined this word in their 1972 manifesto as: "A member of Scheduled Castes and Tribes, neo-Buddhist, the working-people, the land-less and poor peasants, women, and all those who are being exploited politically, economically, and in the name of religion." **SC: Scheduled Castes**: 'Scheduled Castes' are defined in Article 366(24) of the Indian Constitution, as - "such castes, races or tribes or parts of or groups within such castes, races or tribes as are deemed under article 341 to be Scheduled Castes for the purpose of the Constitution." **ST: Scheduled Tribe**: The term has not defined in the Constitution of India. The form 'Scheduled Tribe' inserted in the constitution vide Article 342(i), which empowered the President of India to specify the tribes of tribal communities by public notification. According to Article 366 clause 25 and Article 342(i) lays down that 'The president may by public notification, specify the tribes or tribal communities or part of or groups within the tribes or tribal communities or parts which shall, for the purposes of this constitution, be deemed to be Scheduled Tribe. # EXPORTS AND ECONOMIC GROWTH: SOME EMPIRICAL EVIDENCE FROM THE U.S. METROPOLITAN AREAS

E. M. Ekanayake, Bethune-Cookman University

Mihalis Halkides, Bethune-Cookman University

Graham Bowcher, Bethune-Cookman University

## ABSTRACT

This paper investigates the causality between the real exports and real GDP in the U.S. metropolitan areas. The study is based on a panel data set covering the period 2005-2011 and 360 metropolitan areas. This paper uses annual data on real exports, real GDP, and employment and employs panel cointegration and error-correction models to analyze the causal relationship between export growth and economic growth. In order to identify any regional differences in this relationship, the study also carries out analyses for each of the eight U.S. regions. The empirical results show that there is some evidence of causality running from export growth to economic growth in the U.S. metropolitan areas. However, there is no strong evidence for short-run causality running from export growth to economic growth.

JEL: F14, O40

**KEYWORDS:** Exports, economic growth, panel cointegration, metropolitan areas

## INTRODUCTION

The relationship between export growth and economic growth in developing countries is a question that continues to be of considerable theoretical and empirical interest. Cross-country trade flows, and interpreting the importance of these activities towards economic growth lie at the heart of the debate on economic development policy since the early literature on import-substitution to the current literature on openness and economic growth. Recent literature has been mixed about the role of exports on economic growth. During the 1990s an immense empirical growth literature has developed, which regresses growth in real per capita GDP on its initial level and a wide variety of control variables of interest. Within this literature many papers have included various measures of trade or trade policy among these control variables. The export-led growth hypothesis states that exports are the main determinants of overall growth.

The objective of this paper is to investigate the causality between the real exports and real GDP in the U.S. metropolitan areas using panel cointegration and error-correction models. These techniques, as successfully applied in studies by Serletis (1992), Bahmani-Oskooee and Alse (1993), Dutt and Ghosh (1996), Rahman and Mustafa (1998), Islam (1998), Cuadros, Orts and Alguacil (2001), and Trevino, Daniels, Arbelaez & Upadhyaya, (2002), demonstrate their econometric robustness and their ability to root out spurious relationships.

So far, to our knowledge, there is no study undertaken to study the causal relationship between export growth and economic growth in the U.S. metropolitan areas. Given that this is the first study of this area, we expect that this paper will contribute to the expanding body of literature. The rest of the paper is organized as follows. Section 2 explains the methodology of the panel cointegration and error-correction models and a description of the data sources. Section 3 contains the empirical results and comparison of

our results with previous studies. Finally, Section 4 provides a discussion about the implication of the results and some conclusions.

## METHODOLOGY

### Model Specification

This section discusses the model specifications to examine the relationship between tourism development and economic growth. The model is derived, in conventional manner, from a production function in which tourism receipts is introduced as an input in addition to labor and domestic capital.

In the usual notation the production function can be written as follows:

$$Y = f(L, X) \quad (1)$$

where Y is the real gross domestic product (GDP) in constant 2005 dollars, L is the labor force in millions, and X is the real exports in constant 2005 dollars. Though the traditional production function includes stock of capital as an independent variable, it was dropped from the model since there is no information available on stock of capital at the metropolitan area level in the U.S.

The data is compiled within a panel data framework in light of the relatively short time span of the data. Assuming (1) to be linear in logs, the estimated model can be written as:

$$\ln Y_{it} = \alpha_i + \delta_i t + \beta_{1i} \ln L_{it} + \beta_{2i} \ln X_{it} + \varepsilon_{it} \quad (2)$$

where  $i = 1, 2, 3, \dots, N$  for each metropolitan area in the panel and  $t = 1, 2, 3, \dots, T$  refers to the time period. Our panel data set includes 365 metropolitan areas and covers 15 years from 2005 to 2011. According to economic theory, the expected sign of the coefficient  $\beta_1$  is positive. If exports is expected to contribute to economic growth, the expected sign of  $\beta_2$  is positive. The parameters  $\alpha_i$  and  $\delta_i$  allow for country-specific fixed effects and deterministic trends, respectively while  $\varepsilon_{it}$  denote the estimated residuals which represent deviations from the long-run relationship.

### Panel Unit Root Tests

Before proceeding to cointegration techniques, we need to verify that all of the variables are integrated to the same order. In doing so, we have used panel unit roots tests due to Im, Pesaran, and Shin (2003) (hereafter, IPS). These tests are less restrictive and more powerful than the tests developed by Levin and Lin (1993) and Levin, Lin, and Chu (2002), which do not allow for heterogeneity in the autoregressive coefficient. The tests proposed by IPS permit to solve Levin and Lin's serial correlation problem by assuming heterogeneity between units in a dynamic panel framework. The IPS test will be considered

more important because it is appropriate for a heterogeneous regressive root under an alternative hypothesis. The basic equation for the panel unit root tests for IPS is as follows:

$$\Delta y_{i,t} = \alpha_i + \beta_i y_{i,t-1} + \sum_{j=1}^p \rho_{ij} \Delta y_{i,t-j} + \varepsilon_{i,t} \quad i = 1, 2, 3, \dots, N \quad t = 1, 2, 3, \dots, T \quad (3)$$

where  $y_{i,t}$  stands for each variable under consideration in our model,  $\alpha_i$  is the individual fixed effect, and  $p$  is selected to make the residuals uncorrelated over time. The null hypothesis is that  $\beta_i = 0$  for all  $i$  versus the alternative hypothesis that  $\beta_i < 0$  for some  $i$ . The IPS statistic is based on averaging individual Augmented Dickey-Fuller (ADF) statistics and can be written as follows:

$$\bar{t} = \frac{1}{N} \sum_{i=1}^N t_{iT} \quad (4)$$

where  $t_{iT}$  is the ADF t-statistic for country  $i$  based on the country specific ADF regression, as in Eq. (3). IPS show that under the null hypothesis of non-stationary in panel data framework, the  $t$  statistic follows the standard normal distribution asymptotically. The standardized statistic  $t_{IPS}$  is expressed as:

$$t_{IPS} = \frac{\sqrt{n} \left( \bar{t} - \frac{1}{N} \sum_{i=1}^N E[t_{iT} | \rho_i = 0] \right)}{\sqrt{\frac{1}{N} \sum_{i=1}^N \text{Var}[t_{iT} | \rho_i = 0]}} \quad (5)$$

#### Panel cointegration tests

We investigate the existence of cointegrating relationship using the standard panel tests for no cointegration proposed by Pedroni (1999, 2004). These tests allow for heterogeneity in the intercepts and slopes of the cointegrating equation. Pedroni's tests provide seven test statistics: Within dimension (panel tests): (1) Panel  $\nu$ -statistic; (2) Panel Phillips–Perron type  $\rho$ -statistics; (3) Panel Phillips–Perron type  $t$ -statistic; and (4) Panel augmented Dickey–Fuller (ADF) type  $t$ -statistic. Between dimension (group tests): (5) Group Phillips–Perron type  $\rho$ -statistics; (6) Group Phillips–Perron type  $t$ -statistic; and (7) Group ADF type  $t$ -statistic. These statistics are based on averages of the individual autoregressive coefficients associated with the unit root tests of the residuals for each country in the panel. All seven tests are distributed asymptotically as standard normal. Of the seven test statistics, except for the panel  $\nu$ -statistic, the other six Pedroni test statistics are left-tailed tests. In order to find evidence for long-run relationship between the variables, the null hypothesis of no cointegration for these tests should be rejected. If the null hypothesis cannot be rejected, there is no long-run relationship between the variables.

#### DATA SOURCES AND VARIABLES

The data is compiled within a panel data framework in light of the relatively short time span of the data. The multivariate framework includes the metropolitan area real GDP in constant 2005 U.S. dollars, the metropolitan area real exports in constant 2005 U.S. dollars, and the metropolitan area labor force in millions. Annual data on the U.S. metropolitan area real GDP from 2005 to 2011 were obtained from the U.S. Department of Commerce, *Bureau of Economic Analysis*. Annual data on the U.S. metropolitan area

exports from 2005 to 2011 were obtained from the U.S. Department of Commerce, *International Trade Administration*. Annual data on the U.S. metropolitan area employment from 2005 to 2011 were obtained from the U.S. Department of Labor, *Bureau of Labor Statistics*.

## SUMMARY AND CONCLUSIONS

The empirical results show that there is some evidence of causality running from export growth to economic growth in the U.S. metropolitan areas. However, there is no strong evidence for short-run causality running from export growth to economic growth.

# APPLICATION OF FUZZY LOGIC IN THE AGGREGATION OF MUNICIPALITIES TOWARDS THE CREATION OF FAVORABLE SYNERGIES

Victor G. Alfaro García, University of Barcelona

Ana María Gil Lafuente, University of Barcelona

Gerardo Gabriel Alfaro Calderón, Universidad Michoacana de San Nicolás de Hidalgo

## ABSTRACT

*Through the last years, there has been an increasing interest for accelerating the economical, social and environmental development of cities through associations, organization and creation of synergies. Our investigation pretends to apply administration models for the analysis and treatment of variables, combinatory processes and affinity models, which could find the most similar municipalities of one region. The results obtained by this study pretend to support projects in order to increase the regional development of the Latin-American State of Michoacán, México. Through the model, process and results we look forward to offer a strategic proposal for associations between similar municipalities, by doing this action, we try to fill the gap that is found in the field of analysing the present frames of associations, which are mainly driven by empirical decisions. In order to achieve this task we will use tools for the treatment of fuzzy sets theory, evaluating related elements and finding similarities between municipalities under the Pichat algorithm.*

**JEL:** A12, C38, O10

**KEYWORDS:** fuzzy logic, Pichat algorithm, creative process, regional development, creative cities.

## INTRODUCTION

The investigation about the regional development of the State of Michoacán de Ocampo grows from the profound changes that the emergent economies have suffered in present years. It is in this complex reality, where different factors such as globalisation, open markets, creative economies, and innovation play different roles in the development of cities and regions; therefore the adoption of decisions under uncertainty has gained special relevance. These kinds of studies and research have been increasing since the last century, and have proven efficacy while dealing with complex phenomena. In relation to the theory of decision under uncertainty, the investigation initializes with the theory of Fuzzy Sets (Zadeh, 1965), with the appearance of the article “Fuzzy sets. Information and Control”, made by the professor Lofti Zadeh, instructor at the University of Berkeley. The theory of Fuzzy Sets has been applied in the field of the formal sciences, but in the past 43 years, researchers from all around the world have been publishing many research studies with applications in diverse fields of knowledge. The intention of this work is to classify and group, with a certain level of significance, different municipalities of the State of Michoacán de Ocampo, which could by the association, organization and creation of synergies, increase their competitiveness as a whole. The method to classify and group these municipalities will have as a basis the known Pichat Algorithm (Pichat, 1970), and the theory of fuzzy sets. These approximations allow us to create a generalized model adapted to the conditions of expectancy and instability.

## LITERATURE REVIEW

The origins of this study rely on the importance and relevance that emerging economies thus, emergent cities are exhibiting. Moreover the positive impact which studies in Regions and Mega Regions present, in which finding the connections, relations, and similarities that exist between some cities could generate

synergies and raise the level of competitiveness of the cities. These efforts in organization and synergy should exert benefits in the economic, social and environmental realm by producing greater effects than the sum of the individual efforts of the cities.

In the publication “The Creative Cities” Florida (2008) the concept of region and mega – region is described as a “new natural economical unit: it is not an artifact of political frontiers, such as the concept of State – Nation or their provinces, but the product of the concentration of innovation centers, production and consumer markets.” He also explains the technical considerations of the mega – region, which has to be an area of contiguous light with more than one city or important metropolitan region and produce more than 100,000 million of dollars in terms of LRP (Light Regional Production). In the article “Cities and Competitiveness” (Begg, 1999) the concept of *competitiveness* and its relationship with the city is analyzed. As the author describes, there are different definitions related to the concept, but what is a fact is that “the capacity of a city to compete is made by the connections between attributes of localization, strengths and weaknesses of the enterprises that reside in it”. This idea leads us to understand the link that unifies the competitiveness of a city and starts the discussion of knowing and finding the differentials that generate the diverse capacity of growth, which has been shown, varies among cities. In this investigation we maintain an approach to these theories, which will lead us to obtain the variables that will be used to formulate the model and sustain our results; we now proceed to present the studied region.

### Studied Region

32 States integrate the United Mexican States, 31 of them are free and sovereign entities, which have the right of having an own constitution and legislative powers. The last State is the federal District territory under the share dominance of the Mexican Federation and the local government entities. The State of Michoacán de Ocampo occupies the 3.0% of the National territory with a surface of 58,599 km<sup>2</sup>, it has a total population of 4,351,037 habitants from which 2,248,928 are women, and 2,102,109 are men. The State presents a distribution of 69% of urban locations and 31% of rural locations. In terms of schooling it is observed that from every 100 people: 10.7 do not have access to education, 61.8 have the primary education, 0.4 have a technical or commercial primary school, 4.8 have finalized the high school, 11.8 have concluded university, 0.5 is not specified. In the State 92% of the population is considered catholic, less than 3% of the population speaks a native language. In 2010 there were 1,066,061 private homes, from which: 87.7%, have access to potable water, 88.6%, have access to drainage 98.0% counts with electricity. The main economic indicators present that the State provides 2.5 % to the GDP being the activity of commerce the most relevant one, the primary sector provides 11.27% of the State GDP, the secondary activities provide the 19.97% to the State GDP and the third sector of economic activities provide 68.76% to the State GDP.

### Municipalities

In this study we will take 12 of the whole 113 municipalities that the studied region concentrate, we chose these municipalities due to the level of economical importance and the amount of people that reside in them. Almost 50% of the total population of the State lives in these 12 municipalities; therefore the importance of these localities and the interest in focus our attention on them. It is important to mention that this study can be expanded and could in further research add more cities to advance in the knowledge of synergies that could be applied in the whole region. The municipalities chosen to be analyzed in our methodology are: Morelia, Uruapan, Zamora, Lázaro Cárdenas, Zitácuaro, Apatzingán, Hidalgo, La Piedad, Pátzcuaro, Maravatío, Tarímbaro and Zacapu. Each of the municipalities chosen reveals different attributes, culture, population, economical drivers, education levels, etc. Those attributes are precisely what we need to analyze in order to obtain the most affine cities, and the possible connections that could raise the competitiveness of them.

## METHODOLOGY

Due to the complexity of the nature that we are trying to analyze, the use of the fuzzy sets theory and the theory of affinities are approaches that in general terms will lead our investigation. The methodology that will be employed in order to obtain the affinity between the municipalities chosen will be:

### Acquisition of Variables

In general terms is the proposition of variables that are relevant to each municipality; these variables concentrate economical, social, cultural, political and environmental data which gives a general overview of the city and its main drivers. The variables chosen are presented in section 3 of this study.

### Measurement of the Municipalities Regarding the Variables Found

Each municipality due to its inherent characteristics will be evaluated through a linguistic tag between 0 and 1 in which:

- 1,0: Excellent performance
- 0,9: Great performance
- 0,8: Really good performance
- 0,7: Good performance
- 0,6: Rather a better than a poor performance
- 0,5: Nor a good or poor performance
- 0,4: Rather a poor than a good performance
- 0,3: Poor performance
- 0,2: Really poor performance
- 0,1: Worst performance
- 0,0: Disastrous performance

### Finding distances between municipalities

In this analysis we will use a whether known concept: Hamming's relative distance. In order to obtain Hamming's relative distance between two sets of fuzzy sets, the general procedure is to subtract the existent levels in each criterion, add those differences in absolute values and divide the sum by the number of criteria chosen, so the final result would be numbers between 0 and 1.

$$\delta(\tilde{A}, \tilde{B}) = \sum_{i=1}^n |\mu_{\tilde{A}(x_i)} - \mu_{\tilde{B}(x_i)}| \quad (1)$$

donde  $x_i \in X, \forall i = 1, \dots, n$  y  $0 \leq d(\tilde{A}, \tilde{B}) \leq n$

*Matrix of Distances:* With the results obtained by the Hamming's relative distance, we now proceed to create a matrix in which the symmetrical and anti-reflexive relationship between the elements is stated.

*Matrix of similarities:* In this step we create another matrix known as the similarity relationship, in which we just state the complementarity to the unit of the matrix of differences.

*Maximum similarity associations: Pichat Algorythm:* In order to get the maximum similarity associations we will use the Pichat Algorythm (Pichat, 1970). The main products of the Pichat Algorythm are sub-matrixes, which allow us to identify the main groups of entities that reveal the greater similarities. These are the main steps to follow:

- a) The starting point comes from the existence or creation of a Boolean relation of similarity.
- b) From that relation (matrix) we consider only the part above the main diagonal.
- c) From the matrix we only take into account the zeros in each line, multiplying the elements from those columns in which zeros are presented. Then we proceed to make a Boolean addition of the element from the line with the last product.
- d) The additions have to follow the next rules: the process excludes the lines without zeros. During the process of addition, whether in the sum appears an element in two terms and one of those is isolated, the addition is substituted by the element. Therefore:

$$a + abc = a(\text{because } a + abc = a(1 + bc) = a \cdot 1 = a) \quad (2)$$

- e) Finally we get an addition of elements. For each one it is necessary to obtain the complementary element in relation to the reference of elements. Each of those complementary elements is the maximum sub-matrixes of similarity.

*Aggregation and Results:* The final step in our methodology is the process of making groups out of the similar municipalities and obtaining results, these results have to be explained.

## RESULTS AND DISCUSSION

*Introduced Variables:* The variables that were chosen, try to reflect the reality in different aspects of each municipality. As we stated before, every variable was evaluated from 0 to 1, and it is necessary to mention that the evaluation was supported by data collected from the National Database of Statistics and Regional Plans of development from the municipalities. These variables are not exhaustive and they have been treated with the same level of importance, we are presently working on further investigation, in which the nature of the variables and the importance of them affect, and apply certain weights in the model. The variables chosen are the next ones:

*Integration of the Population:* The level in which the population of the city is merged. Whether the integration is higher, the better evaluation gets. This index comprehends elements like: Native population, Level of immigrants, Number of religions professed, and Digital centers of integration.

*Infrastructures of the city:* The level in which the infrastructure of the city provides support to the communities. This index comprehends elements like: Number of schools, hospitals, health centers, sport units, airports, highways, post offices, railroads, ports, toll free roads, and telecommunication centers.

*Public Services:* The level in which the municipalities offer public services, the major coverage of the services, the higher index level it gets. This index comprehends elements like: percentage of coverage of electricity, water and drainage.

*Tourism:* The level in which the city attracts and provides services for tourists. This index comprehends elements like: Touristic centers, tourists attracted, crafts, and local festivities.

*Recreation:* the level in which the city provides special zones for the people to make sports, recreational activities and creative zones. This index comprehends elements like: Number of stadiums, sport clubs, cultural houses, museums, parks.

*Political alternation: the level in which the Political party is changed from period to period in the last 5 periods. The major changes give a higher index.*

*Education. The level in which the city enhances education policies. This index comprehends elements like: percentage of the population with a bachelors degree, percentage of the population with a postgraduate degree, level of literacy, number of teachers and amount of schools and universities in the location.*

*Active population: The level in which the population is inserted in economical activities, as a percentage of the whole working force of the location.*

*Minimum wage: Percentage of the population that aspires for more than 2 minimum wages per day of labor.*

*Marginality: Level in which the community is catalogued as a marginal zone or not.*

*Economy of the zone: Level in which the economical drivers of the city relies on the first, second or third economic units.*

*Technology: Level in which the community utilizes and develops technology. This index comprehends elements like: Number of high technology industries, number of patents registered.*

*Human development index: The level in which the UNCTAD catalogues the HDI for each municipality.*

*Security: The level in which the security is perceived in the locality. This index comprehends elements like: number of offenses presented in the municipality, rate of people with a condemnatory sentence.*

### Evaluation Matrix

We present the evaluation matrix, in which we assigned levels between 0 and 1 to the different municipalities and for the different variables that we stated before.

Table 1: Evaluation Matrix

	Integrati on	Infrastructure	Public Services	Tourism	Recreation	Political Alternance	Education	Active Population
Morelia	0.8	0.9	0.8	1	1	0.8	0.9	1

Maximum Similarity Associations: Pichat's Algorithm

Continuing with our results, we now proceed to generate the Algorithm using a significance level of  $\alpha = 0.70$ , this means we will take as part of the procedure only those elements in the similarity matrix which exceed the 0.70 level. We then obtain the next binary matrix:

Table 4: Maximum similarity associations

	a	b	c	d	e	f	g	h	i	j	k	l
a	1	1	0	0	0	0	0	0	0	0	0	0
b		1	1	1	0	1	0	1	1	0	0	1
c			1	1	0	1	1	1	1	0	1	1
d				1	0	0	0	1	1	0	0	1
e					1	0	1	0	1	1	1	0
f						1	1	1	1	1	1	1
g							1	1	1	1	1	1
h								1	1	0	0	1
i									1	1	1	1
j										1	1	0
k											1	0
l												1

Source: Self-created based on previous information.

We proceed to develop the algorithm and the next equation as we stated in the methodology.

$$S = (a + cdefghij) \cdot (b + fghij) \cdot (c + eghij) \cdot (d + hij) \cdot (e + fghij) \cdot (g + hj) \quad (3)$$

We obtain the next aggrupation:

$$S' = fhij + fgij + dfgh + cdf + bde + bcd + ab \quad (4)$$

As a way to ascertain the results obtained before, we now present the sub –matrixes of each association, in which is easy to observe that all the elements inside are above the level of significance of  $\alpha = 0.70$ .

### Aggregation and results

Consequently to the results of the Pichat algorithm, the most similar municipalities in the State of Michoacán, México are aggregated as follows:

- 1) (f, g, i): Apatzingán, Hidalgo, Pátzcuaro.
- 2) (a, b): Morelia, Uruapan.
- 3) (e, g, i): Zitácuaro, Hidalgo, Pátzcuaro.
- 4) (c, f, g, h, i): Zamora, Apatzingán, Hidalgo, La Piedad, Pátzcuaro.
- 5) (b, c, f, h, i): Uruapan, Zamora, Apatzingán La Piedad, Pátzcuaro.
- 6) (b, c, d, h, i): Uruapan, Zamora, Lázaro Cárdenas La Piedad, Pátzcuaro.
- 7) (c, f, g, i, k): Zamora, Apatzingán, Hidalgo, Maravatio, Tarímbaro.
- 8) (f, g, i, j, k): Apatzingán, Hidalgo, Pátzcuaro, Maravatio, Tarímbaro.
- 9) (e, g, i, j, k): Zitácuaro, Hidalgo, Pátzcuaro, Maravatio, Tarímbaro.

These municipalities have shown high affinity under the variables proposed. We can assure with a high level of statistical certainty that they share common aspects which could be used in order to create synergies between them, although further research is been developing in the creation of different scenarios in which their affinities could be linked and aid the growth of economical, social and environmental sectors, therefore this research pretends to be leverage for further analyses.

### **CONCLUDING COMMENTS**

Through the process and methodology stated in this study, we have obtained the most similar municipalities that share common factors, by associating, organizing and creating synergies between these municipalities the State of Michoacán de Ocampo, could increase the probability of success in major plans that associate different relative elements. By knowing the most affine municipalities, the State should be able to target specific resources to promote positive social and economical development to the region. This analysis contributes to the improvement of emergent city's economies and could be replicated in similar regions to associate different municipalities and increase the benefits of programs, plans and projects of the State.

# ACCOUNTABILITY IN DISASTERS -ISSUES RAISED

Keith Akiva Lehrer, FCA, CPA York University Toronto, Canada

## ABSTRACT

### INTRODUCTION

The concept of accountability is no longer the sole property of the accounting profession, if indeed it ever truly was. We can no longer glibly talk of a triple bottom line, and leave the analysis at that point. (Karakowski, 2011) In the past couple of decades the word has been neologized, so that financial accountability has in some contexts taken second (or third, or nth) place in any prioritization of to whom social/political/economic actors should be held accountable, and for what? This paper traces some aspects of that process of widening the mainstream accountability base (it has always held a revered place in the context of morality, ethics and philosophy). What if anything has spurred the greater concern about accountability? How if at all has this affected attitudes towards disasters; and, a different but connected question, their management?

*Some of the issues raised:* Corruption -At what points? the mitigation, aftermath and post-disaster development phases all provide different actors with different levels of opportunity to line their own pockets. . By different levels we can potentially include: petty government officials; private sector distribution agencies; major government agencies. The degree of transparency among benefactors may vary widely, as seen by the analysis of general business corruption conducted by for example the NGO Transparency International (see report: 2012). To whom the different levels are accountable, and by what means, is not so easily clarified, as pointing the finger at vanished inventories and cash balances. The discomfiture and growing demoralization of such naively altruistic projects as BandAid gives sad testimony to the phenomenon of 'donation fatigue', where both individuals and governments grow wary and weary of giving, with little adequate reassurance that the recipients 1/ will be those in most need and 2/ will be able to make use of the donation in a meaningful way; these questions are issues of accountability separate from that of blatant corruption and theft.

Globalized communication technology –the growing ease of exposure should make it easier for actors to be made accountable. In some ways this may be true. A success story was the exposure given to the recent mining near-disaster in Chile, where much of the world was riveted on the televised drama of getting the miners out. Without that intense magnification, the resources would not have been transported and concentrated in time for rescue. Compare the previous rosy scenario, with the plight of the Syrian nation during the last 2 years. “The UN reckons that 70,000 Syrians, mostly civilians, have died. The true figure is probably far higher...More than 4m Syrians now lack fuel, electricity, a telephone line and food.” (The Economist, 23/2/13, p.26). To quote Vladimir Putin, President of Russia “What is going on is a massacre, this is a disaster...It has to be stopped” (Toronto Star, 6/4/13).

What Putin omitted to comment on was who was primarily accountable for the disaster? In terms of moral culpability, Putin has a lot to answer for. It is he who has steadfastly refused to support UN ceasefire efforts. It is his country which is making very healthy profits, supplying arms to the regime while wringing his hands about the disaster. His Macchiavellian approach to political disasters would put any ancient Italian prince to the test.(Macchiavelli, c. 1650) Accountability at the political level alluded to above must take note of shifting global power bases:-political (–U.S. down in its political clout; China up; India, Brazil, and Russia making up the rest of the BRIC ‘up and comings’); economic (role of supranational corporations: asset values and turnover cf those of the majority of nation states); institutional (regional groupings like the European Union, APEC and Mercosur; global institutions like

the International Monetary Fund, and the United Nations High Commission for Refugees). Analysis at this level needs to be done, but is outside the scope of this paper, in its comprehensiveness.

### Definition of Terms

What constitutes a disaster? Scale USAID suggests the scale of human loss of life is pivotal –at least for their Agency to consider becoming involved. 20 –has been used as a minimum, by members of that Agency. However, that does arguably beg the question, rather than definitively answering it! Surely, a coal mining disaster resulting in 21 fatalities must be considered differently than the following: 200 –as occurs often in travel-related ‘disasters’, and the “smaller” earthquakes? 250, 000 –the (probably underestimated) number of “mortalities” –that sanitized and depersonalized term- resulting from the recent Haiti ‘quake? 25 million –the numbers guesstimated killed by the policies followed in Stalin’s and Mao’s respective regimes in the USSR and the PRC?).

As might be implicit in the numbers chosen, a scale approaching logarithmic might be apposite in measuring disasters in these quantified but aseptic terms. On the face of it, it might seem reasonable to consider the scale of a disaster in terms of human lives lost; but simply because ‘mortalities’ are normally the most accurate statistical record, it can be misleading, and arguably immoral, to overlook the degree of human suffering caused by physical and (more recently acknowledged) emotional injury sustained as a result of disaster. World War 1 casualties would be a significant historical case in point, again measuring in the tens of millions (Roberts, 1995).

The intergenerational effect of a genocide may be far more powerful than that suggested by the statistical enumeration of the fatalities sustained at the time (vide the Armenian Massacres; the Holocaust; Biafra.) The theologian/philosopher/moralist might be forgiven for raising the personal issue that the suffering or demise of any individual human, or possibly by extension any living organ, is an unmitigable disaster, for the victim. Scale according to that line of reasoning would be the concern of statisticians and accountants, but not of people concerned with morality! Democratic modes of government have tended to militate against that personalistic line of reasoning –rightly or wrongly. How does scale relate to accountability? Again it would be facile to argue that there is no necessary relationship.

The quintessentially American phrase “the buck stops here” encapsulates the notion of ultimate personal responsibility at the apex of any organization, business, government or other. Equally and obversely, the argument can be proffered, that the greater the scale, the more dispersed the accountability; the question raises the thorny issues of organizational responsibility, and returns to Weber’s original attempts to comprehensively classify ‘authority’(translated loosely as ‘charismatic, traditional and legitimate’). It was central to the judgements in the Nuremberg Trials, after the Second World War. The same issues must be dealt with in The Hague contemporarily, at the so-called World Court.

Personal culpability? Organizational responsibility, hiding behind the legal fiction of the essentially amoral “Corporate being”, which has for long been absolved since it is not human, and therefore not subject to codes of human morality? That veil is being gradually torn apart, as an arguably evolving sense of accountability has been gaining ground in the developed world, at least –see the unparalleled fines and criminal charges levelled against BP, pursuant to the Deepwater Horizon oil spill in the Gulf.(Economist, 2012) Environmental NGOs such as Greenpeace and WWF might argue that the permanent loss of any living species –animal or vegetable, should constitute a disaster, and be treated as such –with the highest level of moral accountability. Is it more, or less, unconscionable to slaughter millions of humans (after all, one could argue somewhat cynically that there are too many humans already!); or to perpetrate the extermination of a complete living genus on this planet? In some ways then, attempting the measurement of accountability can be thought of as taking over the role of God. At a more mundane level, it may well be considered a politically thankless task! Hence the quagmire-like quality of ascertaining accountability.

### Witch-Hunting, Scapegoating and the Atavistic Role of Sacrifices

Both witch-hunting and scapegoating were used as convenient ‘rationales’ for disasters –time-honoured and often considered consigned to the margin space of history. A ‘sacrifice’ was often needed to appease the wrath of God/the Gods, not just in Greek and other mythologies; or in the sin and guilt offerings built into the temple rituals of the Bible’s Old Testament. (The etymology of sacrifice is significant in this context: we make the object sacrificed ‘holy’, thus justifying the act, however abhorrent it might otherwise appear!) The Divine hand in major disasters reaches back to apocryphal accounts of The Flood in many ancient societies, and is immortalized in Noah’s Flood, in Genesis, the very first book of the Bible. Many of the issues can be seen to have not changed that much since then. Did the sins of our forefathers (and mothers) bring the wrath of God upon them, as recounted? Are we in the 21<sup>st</sup> century bringing planetary degradation to the now infamous ‘tipping point’ (Gladwell, 2002) of planetary destruction, through global warming, or some other cacophony of environmental despoliations? God blames Man. Man blames God. As in the universe in general, the sphere often turns full circle, but with different labels. Does culpability equal blame equal responsibility equal accountability? Or should the definition of accountability be more carefully diagnosed and honed, to serve as a useful tool for social science?

### The Variety of the Species: Towards a Typology of Disasters

Natural –e.g. earthquakes, volcanoes, avalanches, tsunamis, floods, droughts, forest fires etc.  
 ‘Man-made’ accidental A/ Public Sector – e.g. infrastructure break-downs: train derailments; fires due to Utility mishaps etc. B/ Private Sector –e.g. poisoning by manufactured products; airplane crashes and shipwrecks etc. ‘Man-made’ deliberate A/ National – e.g. Civil War B/ International –e.g. conventional war between nations Each type would give a priori indication of primary accountability: the first -natural disasters, used to be rationalized as Acts of God, and in insurance contracts this phrase is still inserted, in order to exculpate the insurer from financial liability. The concept of natural disasters, and often even other categories as beyond the power of humanity to control, is aptly summarized by the Arab phrase ‘Insha’llah’ –it is the will of God. However, that thinking is less universally accepted as technology provides increasingly comprehensive and accurate means of predicting the time and extent of disasters – e.g. in meteorological research models of weather patterns can predict the trajectory and force of storms and hurricanes, to a degree of accuracy unforeseen as little as a century ago (a ‘spit in the ocean’, given the Universe’s estimated 13-odd billion years of existence!)

With extra knowledge come the decisions necessary around distribution of resources to avoid disasters, to mitigate their consequences, and to re-construct, to more highly resistant levels of infrastructure, in order to reduce the consequences of a subsequent disaster. All these decisions could conveniently be ignored, while God was the entity responsible. In current scientific thinking, humanity can no longer so easily hide behind that; instead, social actors will be held more or less accountable. The second type: ‘Man-made accidental’ might seem to evoke axiomatic responses to primary accountability –in the public sector domain, some level of government; and in the private sector, the organization primarily responsible. However, the devil of establishing more proximate accountability will lie in the detail of each disaster. It is unlikely in any individual case that just one party will be held entirely accountable –it will often be a matter of apportioning responsibility, according to many factors, among which the following four at least would be significant in both domains:

a/ Responsibility for creating guidelines in the event of accidents

b/ Responsibility for disseminating information about availability of guidelines

c/ Updating education procedures among echelons of potential rescue crews and potential accident victims

d/ Maintaining adequacy of rescue infrastructure

As is evident, different government and corporate structures will determine different levels of responsibility and hence affect locus of primary accountability –*ceteris paribus* a decentralization of authority at least at the operational level will be beneficial: the more proximate to the disaster location, the greater the expectation of first-hand first-moment knowledge of disaster outbreak and therefore potential for fast response; (in most disaster situations time and distance constraints are of the essence).

However, large-scale redistribution of resources such as those needed for remediating catastrophic disasters cannot be taken at the decentralized level, whether private or public sector. BP's Gulf disaster could be said to have been aggravated by the CEO's reluctance to assume responsibility and take centralized control immediately. Hurricane disasters in Cuba have been contained with minimal loss of life by the President himself assuming direct control of large-scale army rescue operations.

In each scenario, the assumption of responsibility, or lack thereof, was seen to affect the disaster outcome, or at least its mitigation. (Lehrer, 2012) Scale may enter the discussion from a different perspective than just the dimension of the disaster. It has been noted recently that many of the largest corporations operate on a scale larger than that of many nation states –thus an overarching responsibility for the well-being of the globe would seem to be fast landing in the lap of the private sector, rather than the conventional polis, or even the 'global institutions' under the umbrella of the United Nations. If this is what globalization is mostly about, it is incumbent upon social scientists to re-think (again!) the role of 'super-capitalism', or whatever label one wishes to ascribe to it. The recent book by Bishop and Green ('Philanthrocapitalism' 2009) focuses on the potential role of the super-rich in tackling some of the major social ills, which may provide the backdrop for future social, economic and environmental disasters. In particular the Foundations set up by such economic stars as Bill Gates and George Soros suggest that they have taken upon themselves some level of accountability for the state of the planet.

The problem with this is that there is no guarantee that their goals will remain congruent with that of a general population –it remains essentially out of the control of the democratic political system. This is not to snub our collective noses at philanthropy. It is, however, to point our way back to ferreting out who ought to be accountable, in the complex sub-world of disasters, and how they can best be brought to account. This in no way detracts from Bill Gates largesse! It may mean international institutions with much larger teeth. Like many typologies, the blurrings among the types may be as important as the types themselves! At what point does a flood cease to be a natural phenomenon, and become 'Man-made'? The failure of dams, dykes and rivers whose course has been artificially altered, will all contribute to a greater or less extent to the physical severity and human significance of a flood disaster –thus the controversy surrounding the construction of the 3 Gorges dam, which has been deliberately shrouded in as much secrecy as possible by the PRC, despite being according to some, the most immense civil engineering project ever attempted! Some researchers have tried to make the Government accountable in advance for future disasters –their voices have been stifled by the regime. A final way of attempting to summarize at least some of the central issues involved in dealing with accountability in disasters, is to relate each disaster to the following

DISASTER: Predictability	Avoidability	Mitigability
Probability/degree		

100%

80%  
60%  
40%  
20%  
10%  
0%

Clearly one could adjust the probability parameters according to what makes sense in any context. The adage of the macro-economist Lord Maynard Keynes is apposite here: “it is better to be roughly right than precisely wrong” (Keynes 1936)

## CONCLUSION

Nature abhors a vacuum. Social organisms similarly abhor power vacuums. Consequent to a disaster there is often the tendency for a power vacuum to occur, as part of the break-down of social organization. In these situations, actor will appear to fill the vacuum –some with good intentions; others with intentions malevolent and opportunistic. It is incumbent on both social scientists and disaster practitioners to create and put into practise models of accountability which will circumscribe the actions of the major power stakeholders, in the interests of the major victims; and to constrain the ambitions of the less scrupulous, among both the benefactors and beneficiaries.

# SMILES, SCOWLS, GRIMACES AND SHRUGS VS. HUGGING, PATTING, SHOVING AND PUNCHING: NON-VERBAL CUES RE-VISITED IN ORGANIZATIONAL BEHAVIOUR

Keith Akiva Lehrer, CPA, FCA School of Administrative Studies, York University

## ABSTRACT

*Many non-verbal forms of communication are now verboten in N. American and W. European organizations. This would include most forms of physical interaction which contained any hint of coercion, intimidation or violence; even more so perhaps, anything smacking of sexual or physical intimacy. What would have been normal in the time of Roethlisberger and Dickson, and even a generation later, as Homans entered with a more anthropological lens, would be subject to social, administrative, if not legal retribution in many organizational contexts in the 21<sup>st</sup> century. The object of this paper is to ask how norms have evolved in this sphere, and whether they are becoming more standardized or more disparate, since the behaviour of organizations became an established and recognized field of study. To what extent has the study and dissemination of 'appropriate norms' in OB led to a change of behavior, to what extent merely reflected a change of societal, or organizational norms?*

## INTRODUCTION

The healing power and obversely, the threat of touch, of physical contact, has been understood, not just by the human kingdom but by the animal kingdom, at a visceral level. It was given primarily by mothers to off-spring. Research has discovered that babies left without touch for long would be far more prone to die, even with the same level of nutrition, or lack thereof, than those who have not been touch-deprived. Caring for offspring can be compared at the other end of the age spectrum by care of the elderly (and infirm/disabled), where touch again becomes a 'magic bullet' for replenishing emotional resources necessary to survival. Lions and lambs have in common their physical ability to nourish their respective offspring through the magic of touch. It appears to be a biological cornerstone to both human and animal well-being. Affection, nurturing, and protection are among the obvious positive attributes of welcomed touch. The problem arises with the obverse.

Unwelcome touch comes in different degrees and in different social contexts. Two categories are extreme forms: 1/ **torture** as a deliberate control instrument, historically resorted to in situations of victim captivity, either for entertainment of the captors and the public at large, or more selectively, for the procurement of information or confession of misdoings (or lapses of faith), from political prisoners, those accused of criminal acts and alleged religious miscreants (= 'non-believers'!); 2/ **abuse**, which could be split into a/ general physical abuse, such as physical bullying at work, either by superiors or by peers; and b/ abuse of fiduciary or high-trust relationships, such as parent-child, guardian-protectee, doctor-patient, teacher-student, priest-congregant etc.

Whilst it is tempting to classify sexual abuse as a separate category, it can also be considered as a special case of physical abuse, as opposed to being completely different. Many cases of physical abuse are abuses of the terms of intimacy which have been assumed, implied in the relationship, and considered by social norms to set up protective boundaries for the dependent, in such a power-dependent relationship. Sexual exploitation of the terms of intimacy implicit in the relationship is a specialized and exceptionally

poignant case in point, which has become even more topical in light of abuses in the Catholic Church exposed in the recent past.(12,000 pages of personnel documents of sexual abuse, since the 1940s, in the U.S. alone, resulting in out-of-court Church settlements to silence the victims, approaching \$1bn! – Economist Feb 23, 2013)

### An Evolution Of Organizational Practice?

Religious organizations have a tradition of abusing their power, for control purposes of their human ‘flock’. Jeanne D’Arc was just one of the more famous historical figures burnt as a witch, since she was judged to be a threat to the power and authority of the Church at that time (Roberts, 1995). The infamous Inquisition spanned several generations, in which any individual could be accused of infidelity, tortured and absolved or put to death, at the discretion of the religious authorities. The Inquisition was not confined to Spain.(ibid). The Catholic Church was not the only ‘super-organization’ using torture as a regular instrument of policy. Historically, the British Navy was likewise notorious in its use of such torturous instruments as the ‘cat o’ nine tails’ and the plank, to ‘enforce discipline’ on its subordinates (Keneally 1990). Totalitarian regimes such as the Nazi State of Germany used torture and murder as instruments of social control, in an attempt to completely annihilate groups which it considered socially undesirable (esp. Jews, Gypsies and homosexuals ).(A.J.P. Taylor 1967) It is not surprising then that physical touch would be viewed with suspicion in an organizational context. Business practices could be assumed to take their cues from earlier prototypical organizations, such as the Church, the Military and the Government, to ensure that workers got on with their job. Railways were built on the backs of many dead men, often imported labor. The slave trade was not an altruistic philanthropic enterprise. Although submerged and far less widespread now, than since its official ‘Abolition’, it still thrives in parts of the world, especially among the most vulnerable, such as young children and young women; abuse and coercion are still the chosen instruments of social control, in these contexts.

### What of Current Mainstream Business Organizations?

The history is patchy. Whilst Homans (1951)records that ‘binging’ (punching co-workers as hard as possible on the upper arm) was standard practice in the late 20s and 30s in the U.S., less of it would seem in evidence in the U.S. of the late 20<sup>th</sup> and early 21<sup>st</sup> century; however research suggests that blue collar culture allows for a lot more physical communication, including both affection and minor aggression, than white collar (Richardson, 1976). Since an increasing proportion of work is in white collar and service industries, one could assume that the norms at least have veered towards a/ less overt physical aggression, but possibly b/ less physical contact of any sort, lest it be construed as abuse.

The patchiness is due at least as much to cultural variations around the globe. What is considered permissible in terms of physical proximity and non-sexual touching, between employees in such public places as banks in Costa Rica, would as a matter of policy be frowned upon in similar contexts in Canada. This is far removed from the ‘rape camps’ set up in the Balkan wars, as a systemic State instrument of societal coercion, intimidation and demoralization –perpetrated not in the Middle Ages, but in the last decade of the 20<sup>th</sup> century (‘Most Rape Victims remain silent’ Toronto Star, 6/4/2013). It is equally far removed from the Japanese circumstances, where mothers are systemically refused back to work, after taking time off to have their babies, so that they are now looking to become independent entrepreneurs in order to rejoin the work force. No coercion here. No physical abuse.

But a systemic repression, deeply ingrained still in the culture (Leung, 2011) The suggestion here then is that organizations now need to walk a fine line. While they clearly are better off not needing to resort to torture and coercion to motivate their work force, with some caveats (Etzioni’s typology suggests that certain closed organizations, like prisons, do still resort to such practices as standard; Goffman’s study of

Asylums supports this suggestion ); nonetheless present-day organizations do run the risk of ‘throwing out the baby with bathwater’ –eliminating physical contact altogether would destroy the non-sexual intimacy and caring on which an increasingly ageing and physically isolated population may depend, in health care and institutional settings. The non-verbal cues suggested in the title may gain unwarranted significance, as so much else in the area of non-verbal organizational behavior has been encouraged to shut down. When my Dean forgets to smile at me, and next time looks like he’s angry, should I contemplate walking my own plank?

# THE SUSTAINABILITY OF A NATION'S ECONOMY: AN ANALYSIS FROM THE PERSPECTIVE OF INTERNATIONAL INDICATORS

Ma EnselminaMarín Vargas, Universidad Autónoma de Baja California, México  
Virginia Guadalupe López Torres, Universidad Autónoma de Baja California, México  
Luis Ramón Moreno Moreno, Universidad Autónoma de Baja California, México

## ABSTRACT

*This paper analyses the sustainability performance of the nation's economy from the perspective of three main international indexes. For the purpose of the study, information was gathered from the reports published by the international indexes used for the study: Environmental Performance Index (EPI), Global Green Economy Index (GGEI), Carbon Monitoring for Action (CARMA) and the National and Latinamerican indexes. The main objective was to determine levels of performance of México in each of the indexes analyzed and complement them with results obtained in a research study conducted in the northern part of the country. An exploratory and descriptive approach was used to analyze the information obtained from the databases used for this purpose. Among the main conclusions derived from these analyses, is the discussion in the mater of the most important programs and polices needed for the improvement of the country's performance in the sustainability issue, as a mean and primary factor of development, and a way to impell the growth and strengthening of the country's, as well as regional, economic development.*

**KEYWORDS:** sustainability performance, economy, measurement

**JEL:** O39

## INTRODUCTION

Environmental sustainability is the key factor for the development of mankind in the XXI century. All countries need to ensure the quality of its natural resources, ecosystems and species diversity, in order to maintain sustained quality of life. However, as the world population continues to grow, the consumption of materials and production technology intensifies, which, as a result, impacts in the diminishing of the quantity and quality of natural resources (Vlek, 2007). For over a decade, several international organizations have devoted a lot of efforts to measure the performance of the nations in the area of environmental sustainability. As a result, the countries selected to be part of the studies conducted by these organizations, have identified the benefits of measuring performance. One of the first benefit is that participants identify the level of compliance in the dimensions or variables of the indexes in which they participate; second, they obtain information regarding their performance in comparison with the other participants in the measurement exercise and third, the data obtained facilitates the decision makers the work of designing a public policy framework, in order to allow the country to address its strategic actions, to improve the operation of its structural programs.

The mentioned advantages have the power to trigger participation and assimilation of the dynamics of performance measurement, as well as to promote and improve the performance of the structural processes, by directing efforts in the way to make better use and management of the country's natural resources. Likewise, the country can improve its sustainability and the quality of life of the population.

### Sustainable Performance

The global economic model is in its period of decline and is requiring urgent review and reconsideration. In this context of change in the development model and precisely by the requirements that this change imposes to the co-evolution between ecosystems, human society and lifestyle within a limited time period, the local and regional approach takes a role and responsibility in the success of the process that has no precedent in the history of economic development. However, the local and regional approach requires interspatial tuning and cooperation in the path to transform a society, to mobilize it to the acceptance and incorporation of sustainable behaviors, and to be committed to the overall economic process development from the perspective of the ecological sustainability. (Pulido, 2003) From an analytical and strategic perspective, sustainable economic development is conceived as a process of global structural change involving the transformation of the economy and society, both in its means (Instrumental ) as well as its ends (values and objectives). This transformation is based on the development of strategic capabilities, both of economical as of extra-economic nature. (Carpi, 2008)

### Green Economy

In the classic model of economic development, ecosystems are not considered as scarce economic goods; therefore, the methods used by these models, are not effective for managing most of the natural resources required for the development of the welfare and quality of life of society. This limitation has given space for emerging alternative economic model. One such model is the so-called “green economy”. (Campos, 2011) The green economy concept refers to the use of a set of production model that takes into account integrated, comprehensive environmental and social variables. From this perspective, such economy produces low carbon emissions, uses resources efficiently and well and is socially inclusive. (UNEP, 2011) The ultimate goal in implementing a green economy model is to improve the living conditions of the poor and to reduce social inequality, environmental risks and ecological degradation.

According to Campos (2011), the green economy does not conflict with the laws governing the market and the free trade; it only transcends traditional production method, by means of incorporating the social and environmental variables. The concept of “green economy” is not a substitute for the concept of sustainable development, as this is much broader and is a global development model. Nowadays, there is more evidence to say that the sustainable development is not possible without a correct and appropriate economy; in that sense, the green economy could be seen as a tool to achieve the sustainable development and not a synonym or a rival. Green economy recognizes and demonstrates the value of natural capital invests in it and seeks to increase it.

## **METHOD**

An exploratory, longitudinal, non experimental and descriptive approach was used to analyze the information obtained from the reports published by the organizations responsible for the indexes used for this purpose. To achieve the objectives established for this paper, different documents were reviewed to determine the level of performance of the country. The EPI 2008, 2010 and 2012, published by the University of Yale, were reviewed as well as the 2010 report of the Carbon Monitoring for Action (CARMA) and the 2012 International Competitiveness Index (ICI), published by the Mexican Institute for Competitiveness (IMCO)

## **RESULTS**

This section presents the analysis of each of the reports reviewed. They summarize the key findings regarding the performance of México on the issue of environmental sustainability.

Epi

The Environmental Performance Index (EPI), measures the effectiveness of national protection efforts in the participating countries. The indicators focus in the measurement of the outcomes, rather than policy development. The core objectives of the EPI are: Environmental Health, which measures the stressors and their impact on human health; and Ecosystem Vitality, which measures the health of the ecosystem and natural resource management.

Table 1: Country'S Performance In EPI Core Objectives

EPI	CORE OBJECTIVES	SCORE 2008	SCORE 2010	SCORE 2012
MÉXICO	ENVIRONMENTAL HEALTH	91.3	76.63	64.1
	ECOSYSTEM VITALITY	68.3	58.06	42.7

Source: data from Emerson (2008, 2010, 2012)

The data in table 3 and 4 shows how the country have been decreasing in the capacity to measure the health of the ecosystem and natural resource management as well as in the overall performance ratio.

Table 2: México'S Ranking in the EPI 2008-2012

Year	Sample*	México's Rank	EPI Higher Score	EPI Lowest Score	México's Score
2008	149	47	95.5	39.1	79.8
2010	163	43	93.5	32.1	67.3
2012	132	84	76.7	25.3	49.1

\*Total of countries includes in the sample Source: [www.epi.yale.edu](http://www.epi.yale.edu). Accesed april 2, 2013

Imco

The Mexican Institute for Competitiveness (IMCO), in its International Competitiveness Index, 2011 (ICI), measures the performance of 46 countries from the information obtained in the review of data of the World Bank. The analyses of the ICI are presented disaggregated in ten sub-indexes. To accomplish the purpose of this paper, the analysis is focused in the results reported by the IMCO in the ICI sub-index named: Sustainable Management of the Environment (SME). According to ICI (2011:294), this sub-index evaluates environmental conservation status, as well as the rate of degradation of key environmental assets and their interaction with production and consumption activities. Therefore, this indicator considers the overall sustainability and the environment prerequisites for growth and long-term sustainable development. The following table summarizes the ICI sub-indexes and highlights the SME, given the interest of this research

IMCO	SUBINDEXES	MEXICO'S SCORE	INDICATORS	MEXICO'S SCORE
ICI 2011*	Stable Macro-economy	65.1		
	Efficient Market Factors	43.2		
	Precursors World Class Sectors	37.3

\*International Competitiveness Index 2011

According to IMCO (2011) the country has not been able to improve in 4 of the 10 sub-index measured by the ICI. The IMCO reports (2011) main declines in the performance of the Mexican economy in three of its 10 sub-index between 2007 and 2010, those declines are as follows: Functional and Stable Political System which fell 8%. Sustainable Management of the Environment which worsened by 7%. According to Emerson (2012), this decline is due to increased ecological tragedies in the country, as there was a greater loss of forest area. At the same time, México continues to increase its water consumption and the carbon dioxide emissions. These four factors are combined to worsen the county's environmental condition. Law system reliable and objective which decreased by 2%.

## DISCUSSION AND CONCLUSIONS

México's environmental performance, remains one of the ballasts for its competitiveness, the decline in this matter occurred despite that the country itself improved in some of the indicators of the sub-index. However, as it can be observed in the tables above, the country has worsened in ranking as well as score to the rest of the world. Even so, in the analysis of the four year of the reports, it shows more progress lags, which means that is not moving quickly enough to improve its competitiveness in the long term. The alert focus is the environmental development performance. In the latter matter, the IMCO (2011), consider that México will face the following challenges: reduction of the emissions intensity in CO2; adoption of more sources of clean energy; drastic and radical changes to stop biodiversity loss and better strategies in water management. However, the country's environmental future is not encouraging, it is important that immediate actions be taken to provoke the structural changes needed to accelerate the improvement of the performance in this matter,

# STRATEGY OF INVESTING IN LATIN AMERICAN EMERGING STOCK MARKET AND THE RISK-RETURN TRADE-OFF

Rishma Vedd, California State University, Northridge  
Leena Vedd, Westjet Formerly Pricewater Coopers

## ABSTRACT

*The aim of this study is to examine the strategy of investing in Latin American emerging stock markets, and the risk-return trade-off that is associated with such a strategy. In particular, the study seeks to examine whether equities from Latin American emerging markets might have offered the Canadian investor high returns for a relatively low level of risk when combined into a portfolio of Canadian shares. This study has tested the strategy of investing in Latin American emerging stock markets over the ten-year period ; specifically, it examines the risk-return trade-off that is associated with such a strategy. Optimal portfolios were derived based on historic (ex-post) observations and evaluated utilising the mean return per unit of risk (MRPUR) performance measure. In particular, the performance of the MRPUR-optimal emerging market portfolio was compared with the MRPUR of a portfolio consisting solely of Canadian shares to determine whether any benefits resulted from diversifying into the emerging stock markets over the various periods considered. The results revealed substantial differences in the risk-return characteristics of the MRPUR-optimal portfolios. This analysis is important on two accounts. First, it has been suggested that emerging markets have become more integrated into the global financial system (Bekaert, 1995; Bekaert and Harvey, 1995; Harvey, 1995; Barari, 2003; Bekaert et al., 2003), implying a diminution in the benefits from diversifying into Latin American emerging stock markets. This study provides an up-to-date analysis on whether Latin American emerging markets have continued to offer substantial diversification benefits despite having become more closely integrated with world financial markets in recent years. Second, this analysis considers the viability of Latin American emerging market equities as effective tools for diversification during times of financial crisis, several of which spanned the period of this study.*

## INTRODUCTIONS

The Canadian economy can be characterized by its growth, stability, and trade relationships. In 1987, Canada introduced significant structural changes to the financial services industry when the government recognized the need to remove barriers with respect to cross-ownership and foreign ownership. These changes in the statutes of the Canadian market have led to tremendous growth as well as increased globalisation and integration. In particular, this deregulation combined with structural change over the years has resulted in the development and technological advancement of the TSX, making it one of the leading capital markets in the world and Canada's principal market for equity trading. Its market trading activity, consistent growth and ongoing development increasingly attributed to foreign investors who, in an effort to diversify their portfolios more effectively, are tapping into foreign capital markets and buying foreign securities characterizes the TSX. As such, technology and globalization are increasingly becoming an integral part of the world's equity and debt markets, especially those in Canada (Department of Finance and Canada, 2002).

Since the 1970's, international capital markets have seen the gradual removal of restrictions on capital flows, starting with the developed economies and moving on to the developing economies. This worldwide trend initiated a degree of international capital mobility, particularly towards emerging market countries. Most emerging markets have now undergone various degrees of financial liberalization. This

chapter provides a review of the existing literature regarding the potential benefits of international portfolio diversification. The case for international diversification is even stronger when emerging equity markets are included as part of the investor's investment strategy. Such emerging markets have been shown to provide investors with excellent opportunities for high returns as well as risk reduction. Emerging markets have also attracted attention due to their high growth and high volatility. However, although emerging market returns are more volatile than the returns of their industrialized counterparts, they are relatively uncorrelated with each other and with developed markets. By holding well-diversified portfolios, these low return correlations can reduce risk and potentially yield high returns that are not available developed markets. While a substantial body of research has shown the risk reduction advantages associated with investing in countries with low returns correlations, the perceived risks and difficulties of investing in some of these emerging markets is a notable drawback which may discourage global investors from investing in emerging market equities as much as portfolio theory would recommend (Errunza and Losq, 1987; Chohan, 1994). Hence, investor's portfolios demonstrate strikingly high weightings towards home country equities. Notably, emerging market returns appear to be driven primarily by country factors which provide opportunities for diversification benefits.

## LITERATURE REVIEW

There is increasing debate as to whether the benefits of international diversification are sustainable. Since the benefits of diversification depend primarily on the degree of market segmentation, concern has arisen that these benefits have diminished as emerging markets have become increasingly integrated with world financial markets (Bekaert, 1995; Bekaert and Harvey, 1995; Harvey, 1995; Barari, 2003; Bekaert et al., 2003). As emerging markets grow and develop greater financial and trade links with each other and with developed markets, they become more correlated; some of the potential gains associated with investment in emerging stock markets, namely, risk reduction via international diversification are therefore likely to fade away. This may reduce the appetite of international investors for emerging market equities. However, despite the increasing integration of emerging markets with the rest of the world, this does not imply that the diversification benefits of investing in emerging markets have disappeared; their correlations with developed markets have remained low (Drummen and Zimmermann, 1992; Speidell and Sappenfield, 1992; Errunza, 1994; Littell, 1997). Investment in emerging market countries may provide investment opportunities which may not be available in the international investors' home country; a wider selection of securities and access to different industry sectors may be available. Investing in emerging markets also enables international investors to diversify risk, thereby achieving more effective insurance than purely domestic arrangements would provide. Also, there are emerging markets that are at incipient stages of development (for example, Eastern Europe, the Middle East and North Africa) and which are a long way from becoming integrated into the world financial system. Furthermore, there is a 'home bias' in global investors' portfolio's which prevents the full integration of emerging markets. In addition, the existence of perceived barriers to investment in these markets restricts the inclusion of emerging market equities in diversified portfolios, and hence, also limits the integration of these markets in the global market (Derrabi and Leseure, 2003).

Emerging markets will likely remain part of a diversified international portfolio. However, given the continual changes taking place in emerging markets, it would be prudent for investors in these markets to be attentive to changes in the trends of returns. In order to shed more lights on this issue, an investigation into the benefits of investment in Latin American emerging markets over a recent time period, is undertaken in this study.

The analysis conducted in this study has demonstrated that on an ex-post basis, Latin American emerging market equities offered the Canadian investor excellent opportunities for increasing portfolios returns while simultaneously reducing portfolio risk. On average, the portfolios comprised of emerging market firms had a substantially lower standard deviation of return and a higher mean return than the portfolios

made up of Canadian companies. Thus, a portfolio which included Latin American emerging market shares could have offered the Canadian investor a considerably greater MRPUR ratio than a similar investment strategy in which the choice was limited to include only Canadian equities in all test periods examined.

The growing linkages of emerging stock markets into the global financial market due to the relaxation of barriers to entry in emerging markets, increased financial and trade links, improved access to global information, and globalization in general, have all contributed to an increase in the share return correlations between this particular grouping of emerging markets and Canada. Yet, the results from the analysis have shown that diversification efforts which include equities from Latin American emerging markets have continued to result in sizeable benefits to the international investor even in recent years; their return correlations have remained sufficiently low to attract global investors despite their integration into the global financial system.

The results presented in this study also reveal the diversification value of Latin American emerging markets during times of financial crisis. More specifically, the time period examined covered the Mexican financial crisis of December 1994, the Asian financial crisis of 1997 and the Brazilian Real crisis of 1999, and most recently the global economic crisis, all of which prompted a emerging market crisis throughout Latin America and affected emerging and developed markets globally. Furthermore, the construction of various sub-optimal emerging market portfolios displayed reward-to-risk ratios that were far greater than the optimal reward-to-risk ratios of the Canadian-only portfolios in all test periods examined, despite the financial crisis and their contagion effects on Latin American financial markets.

Third, in order to reap the full benefits from portfolio diversification, the optimal emerging market portfolio consisted of at minimum, five companies spread over four Latin American emerging markets. However, in most test periods over the ten-years, 25 to 29 firms were required to capture the optimal-MRPUR benefits associated with risk diversification in Latin American emerging market equities. The results from this analysis are consistent with Solnik (1974), Elton and Gruber (1977), Bird and Tippett (1986), Poon et al. (1992) and Newbould and Poon (1993), and contradict the results documented by Evans and Archer (1968) and Wagner and Lau (1971).

The evidence strongly suggested that diversification across country is a much more effective tool for risk reduction than diversification across industry. Thus, managers interested in investing in the emerging markets of Latin American countries should give great consideration to their country allocation process; the industry factor appears to play an inferior role as part of a diversification strategy. This finding is consistent with the results of previous academic studies which have also documented the presence of a dominant country component in the share returns of emerging and developed markets. However, it has been established that ignoring industrial factors will lead to an important loss of diversification benefits; investors should consider both cross-country and cross-industry diversification as a way to improve portfolio performance.

There is growing conviction amongst the investment community that as both developed and emerging markets have become more integrated with the rest of the world, the role of industrial effects are playing an increasingly important role in explaining return variation at the expense of country-specific factors. However, an examination of the structure of Latin American emerging market returns over a recent time period has indicated that country selection, rather than industry selection, is still the more important determinant in explaining the cross-sectional share return variation in portfolio returns for emerging market investment strategies in the Latin American region over the decade.

The results from the study confirm the previous findings reported by Sinclair et al. (1996) and Fifield (1999), which revealed the presence of a very important time factor in explaining the returns of emerging market shares. More specifically, the results have suggested that there is significant variation in the Latin

American emerging market share returns from one year to the next and from one month to the next. This strong time effect suggests that fund managers and active investors in Latin American emerging market countries should be alert to changes in share returns over time and review their portfolios regularly. Thus, the findings imply that share returns in the Latin American emerging markets considered may be difficult to forecast.

This study examines the strategy of investing in Latin American emerging stock markets from the perspective of a Canadian investor. In particular, optimal portfolios of Latin American emerging market firms were constructed and compared with portfolios consisting of Canadian shares only. This analysis was based on historic (ex-post) observations over (i) the whole ten-year period, (ii) each one-year period; (iii) each two-year period; and (iv) each five-year period, to determine whether any potential benefits from diversifying into Latin American emerging markets existed for Canadian investors. Following the Markowitz framework (1952), these portfolios were then evaluated using a measure of portfolio performance. In particular, portfolios were evaluated using the ratio of mean return to standard deviation of return (MRPUR). The mean return of a portfolio was calculated according to the formula:

$$R_p = \sum_{i=1}^N Y_i R_i \quad (5.2)$$

where  $R_p$  is the return on the portfolio,  $Y_i$  is the proportion of the portfolio invested in share  $i$ , and  $R_i$  is the return on share  $i$ . Similarly, the standard deviation of a portfolio return was computed according to the formula:

$$Std.Dev_p = \sqrt{(\sum_{j=1}^N Y_j^2 \sigma_{2j} + \sum_{j=1}^N \sum_{k=1}^N Y_j Y_k \sigma_{2jk})} \quad (5.3)$$

where  $Std.Dev_p$  is the standard deviation of the portfolio,  $Y_j$  and  $Y_k$  is the proportion of the portfolio invested in share  $j$  and  $k$ ,  $\sigma_{2j}$  is the variance of share  $j$ , and  $\sigma_{2jk}$  is the covariance between shares  $j$  and  $k$ .

Employing a selective technique, the optimal MRPUR portfolios were identified; the initial portfolio chosen was the best single firm. Subsequent firms were added to the portfolio, resulting in the highest MRPUR possible, until all 204 emerging market firms were included in the portfolio. The performance of the maximum MRPUR portfolio of emerging market equities was then compared against the MRPUR of a portfolio consisting solely of Canadian shares, as represented by the S&P TSX (Toronto Stock Exchange) Composite index to determine whether any benefits resulted from diversification into these emerging market equities over the specific period considered. Specifically, the maximum MRPUR portfolio is the set of equities which has achieved the highest MRPUR ratio possible. Consequently, a set of equities may not be included in the equally-weighted maximum MRPUR portfolio. The optimal MRPUR portfolio is the one which has achieved the highest value according to the formula:

$$S_{opt} = \frac{\text{Mean Return for Equally-Weighted Portfolios } (S_j)}{\text{Standard Deviation of Return for Equally-Weighted Portfolio } (S_j)} \quad (5.4)$$

where  $S_{opt}$  is the equally-weighted optimal portfolio based on the set of equities  $S_j$ , where  $j=1, N$ . The construction of these overall optimal portfolios reflects the maximum diversification benefits possible from investing in the Latin American market countries over a particular time period. Specifically, it is assumed that a risk-averse investor wishes to maximise the portfolio's expected return while minimising the variance of returns. Such a portfolio is considered optimal because it identifies the best risk/return combination from a financial point of view.

## MRPUR PORTFOLIO RESULTS

The tables show the risk-return characteristics of the MRPUR-optimal and sub-optimal portfolios over (i) each one-year sub-period; (ii) each two-year sub-period; (iii) each five-year sub-period; and (iv) over the whole sample period. More specifically, table 5.3 details the portfolio mean return, the portfolio standard deviation of return, and the MRPUR ratio of the optimal portfolio over the various test periods. The MRPUR ratio of the optimal portfolio comprised of equities from the Latin American emerging markets considered is evaluated against the corresponding figure for the MRPUR portfolio comprised of only Canadian shares to determine whether any potential diversification benefits existed for the Canadian investor. Table 5.4 details the size and MRPUR of portfolios that attained 95, 90, 85, 80, 75, 70, 65 and 60 per cent of the MRPUR-optimal emerging markets portfolio in the various test periods in order to determine the extent to which the portfolios comprised of emerging market shares exceeded the MRPUR-optimal portfolios comprised of only Canadian shares.

In assessing the risk-return characteristics of the portfolios detailed in table 1, it is clear that the performance of the Latin American emerging market MRPUR-optimal portfolios was considerably better than that of the Canadian-only MRPUR-optimal portfolios in each test period. The Latin American emerging market portfolio recorded the highest MRPUR-optimal portfolio in the one-year test period, where a reward-to-risk ratio of 4.2190 was achieved, primarily because of the low standard deviation of emerging market returns (0.0007). On the other hand, Canadian shares earned a reward-to-risk ratio of only 0.3908 in the same year; this is the highest MRPUR ratio achieved among all test periods for a portfolio comprised of Canadian-only equities, albeit, a value almost one-eleventh the size of the reward-to-risk ratio of its less developed counterpart. More impressively, the MRPUR ratio of the Latin American emerging market portfolio in the five-year period (0.3000) was a staggering 214 times that of the Canadian-only portfolio (0.0014). The equities from Latin American emerging markets recorded the lowest MRPUR-optimal portfolio in 1998 (0.1950), chiefly as a result of a high risk level (0.0238). Nevertheless, this ratio compares favourably with the MRPUR ratio of the Canadian-only portfolio (-0.0047).

One final point to note is that the Canadian-only portfolios recorded a negative MRPUR in some periods. For example, the negative MRPUR ratio of -0.1195 for a portfolio comprised of Canadian-only securities provided the domestic investor with the lowest reward-to-risk ratio over all test periods; a portfolio return of -0.0028 was earned in this period.

The table summarises the risk-return characteristics of the MRPUR-optimal portfolio of Latin American emerging market equities in various sub-periods and over the whole sample period. The risk-return characteristics of the Canadian-only MRPUR-optimal portfolio in each test period are included in the table in order to facilitate a comparison

In exploring the potential gains from diversification in Latin American emerging markets, the results from this mean-variance analysis clearly suggest that a portfolio which included Latin American emerging market shares could have offered the Canadian investor a considerably higher MRPUR than a parallel investment strategy in which the choice was restricted to Canadian equities only.

Table 1 Risk-Return Characteristics of the MRPUR-Optimal Portfolio Over Various Periods

Period	Latin America			Canada		
	Return	Std.Dev	MRPUR	Return	Std.Dev	MRPUR
1	0.0032	0.0007	4.2190	0.0049	0.0126	0.3908
2	0.0021	0.0012	1.6470	-0.0006	0.0171	-0.0336
3	0.0121	0.0150	0.8100	0.0021	0.0134	0.1577
4	0.0189	0.0199	0.9510	0.0043	0.0126	0.3432
5	0.0100	0.0141	0.7111	0.0021	0.0176	0.1185
6	0.0046	0.0238	0.1950	-0.0002	0.0329	-0.0047
7	0.0226	0.0159	1.4218	0.0050	0.0215	0.2315
8	0.0073	0.0104	0.7068	0.0010	0.0340	0.0308
9	0.0104	0.0118	0.8800	-0.0029	0.0274	-0.1044
10	0.0020	0.0010	1.9370	-0.0028	0.0235	-0.1195

Table 2, which highlights the risk-return characteristics of the MRPUR sub-optimal portfolios over various test periods, confirms the dominance of the Latin American emerging market portfolios over their developed market counterpart. In particular, the table displays the size and MRPUR ratio of the portfolios that attained 95, 90, 85, 80, 75, 70, 65 and 60 per cent of the optimal portfolio value in each test period. In all cases, the sub-optimal portfolios achieved an MRPUR that was greater than the MRPUR of the Canadian-only portfolios. For example, even at 60 per cent of the MRPUR-optimal portfolio, the emerging market portfolio was considerably greater than the optimal portfolio comprised of Canadian companies in every test period. For instance, over the five years, the MRPUR of the portfolio at this level was an astounding 129 times that of the Canadian-only portfolio. Clearly, an examination of tables 1 and 2 suggests that investors who diversified their portfolios internationally to include equities from Latin American emerging market countries would have achieved a significantly greater reward-per-unit-of-risk than investors who diversified within a single nation, such as Canada.

The results from this analysis therefore support the findings of Lessard (1973), De Santis (1993), Islam and Rodriguez (1998), Shachmurove (1998) and Susmel (1998), which are unanimous in their conclusion that diversification among developing countries in Latin America can yield substantial gains in portfolio performance. Moreover, although the integration process has increased correlation values between this particular grouping of emerging markets and Canada, the results from this analysis show that diversification efforts which include equities from Latin American emerging markets have resulted in sizeable benefits for the international investor in more recent years. The results also reveal the diversification value of Latin American emerging markets during times of financial crisis.

The majority of the test periods examined required between 25 to 29 emerging market firms to capture the optimal MRPUR benefits associated with diversification in Latin American emerging market equities. This is shown graphically in table 3 which depicts the results of the MRPUR-optimal portfolio for the whole ten-year sample period. The graph illustrates that increasing the number of equities in the portfolio beyond 27 reduces the overall benefits from diversifying into the shares from Latin American emerging markets. This finding contradicts the widely accepted notion that the benefits of diversification are virtually exhausted when a portfolio contains approximately 10 shares.

*The table summarises the risk-return characteristics of the Latin American emerging market portfolios in various sub-periods and over the whole sample period, 1993-2002. In particular, the table details the size and mean return per unit of risk (MRPUR) of portfolios that attained 95, 90, 85, 80, 75, 70, 65 and 60 per cent of the MRPUR-optimal portfolio in the various test periods*

For example, Evans and Archer (1968) concluded that a portfolio consisting of 10 different shares was sufficiently diversified, stating that the results of their study ‘raise doubts concerning the economic justification of increasing portfolio sizes beyond 10 or so securities. Similar results were found by Wagner and Lau (1971). However, the results reported here are consistent with those of Solnik (1974), Elton and Gruber (1977), Bird and Tippet (1986) and Poon et al. (1992), who indicated that there are considerable opportunities for reducing risk by expanding the portfolio size well beyond 10 shares. Furthermore, although Newbould and Poon (1993) do not state a specific number of shares that constitutes a well-diversified portfolio, they do suggest that the number should be greater than 20. An analysis of the tables also suggests that companies from some Latin American countries appeared more often in the optimal MRPUR portfolio than companies from other Latin American countries. This is confirmed by a chi-squared test of homogeneity which was performed for each test period. In particular, this test rejected the homogeneity of frequency of occurrence for the 1-year, 2-year and 5-year sub-periods.

Table 3 Number of Companies That Make Up the MRPUR-Optimal Portfolio in Each One-Year Sub-Period

Year	1	2	3	4	5	6	7	8	9	10	Total
Country											
ARG	2	0	0	0	0	0	0	0	1	1	4
BRA	13	8	2	8	0	1	13	2	7	5	59
CHI	15	14	5	7	3	2	15	3	16	13	93
COL	4	2	1	1	1	1	1	0	3	4	18
MEX	4	4	4	6	3	1	4	2	1	0	29
PER	5	1	0	1	1	0	3	0	2	4	17
VEN	1	0	2	2	0	0	1	0	0	0	6
Total	44	29	14	25	8	5	37	7	30	27	226

*The table summarises the composition of the MRPUR-optimal portfolios in each one-year sub-period. In particular, the table details the number of companies in each market that are included in the MRPUR-optimal portfolio in each one-year sub-period.*

For example, over the ten one-year sub-periods (p-value of 0.000), Brazilian firms (59) and Chilean firms (93) were included most frequently in the optimal portfolio, while firms in Argentina (4) and Venezuela (6) appeared least often. Colombian, Mexican and Peruvian firms appeared 18, 29 and 17 times, respectively.

Similar results were obtained for the five two-year sub-periods (p-value of 0.000) and the two five-year sub-periods (p-value of 0.000). In particular, firms in Brazil (35) and Chile (45) appeared quite frequently in the 2-year MRPUR-optimal portfolios, while firms in Argentina (1), Columbia (7), Mexico (12), Peru (12) and Venezuela (3) appeared less often than average. Similarly, firms in Brazil (12) and Chile (13) appeared most often in the 5-year MRPUR-optimal portfolio, while firms in Columbia (3), Mexico (5), Peru (3) and Venezuela (1) appeared less often than average. In fact, Argentinean firms failed to make a single appearance in the 5-year optimal portfolios. These results therefore indicate that there is a propensity for firms situated in some Latin American countries to appear more often in the MRPUR-optimal portfolio than firms from other Latin American countries. The results from this analysis are consistent with Fifield (1999) who concluded that the inclination of firms in some countries to appear quite frequently in the optimal portfolio suggests some element of persistence in the country-specific composition of the optimal portfolio.

## CONCLUSION

This study has tested the strategy of investing in Latin American emerging stock markets over the ten-year period ; specifically, it examines the risk-return trade-off that is associated with such a strategy. Optimal portfolios were derived based on historic (ex-post) observations and evaluated utilising the mean return per unit of risk (MRPUR) performance measure. In particular, the performance of the MRPUR-optimal emerging market portfolio was compared with the MRPUR of a portfolio consisting solely of Canadian shares to determine whether any benefits resulted from diversifying into the emerging stock markets over the various periods considered. The results revealed substantial differences in the risk-return characteristics of the MRPUR-optimal portfolios.

On average, the portfolios comprised of emerging market firms had a substantially lower standard deviation of weekly returns and a higher mean weekly return than the portfolios made up of Canadian shares; a portfolio which included Latin American emerging market shares could have offered the Canadian investor a significantly greater MRPUR than a similar investment strategy in which the choice was limited to include only Canadian equities. This finding is consistent with previous studies which have concluded that there are benefits to including Latin American emerging market assets in a globally diversified portfolio in the form of higher portfolio returns and/or a reduction in portfolio risk (Lessard, 1973; De Santis, 1993; Islam and Rodriguez, 1998; Shachmurove, 1998; Susmel, 1998). Impressively, despite the growing integration of emerging stock markets into the global financial market, the results from this analysis continue to support the rationale for diversification, even in recent years. Moreover, these markets were shown to provide diversification value during times of financial crisis when diversification is most valuable.

This study has followed the mean-variance Markowitz framework which assumes normally distributed data. However, it is necessary to note that one limitation of this study is that the data are, in fact, not normally distributed. Nonetheless, this study attempts to overcome the non-normality of the data by using log returns which more closely follow a normal distribution (Fama, 1965). Furthermore, the methodology follows those of previous studies; scholars have acknowledged that emerging market returns deviate from the standard distributional assumption (Harvey, 1995; Bekaert et al, 1998). In spite of this criticism, they have used Markowitz methodology. Additionally, even if the data are non-normal, the

resulting outcome from the data in this study will still provide the optimal risk-return trade-off as measured by MRPUR criteria.

There is growing conviction amongst the investment community that as both developed and emerging markets have become more integrated with the rest of the world, the role of industrial effects are playing an increasingly important role in explaining return variation at the expense of country-specific factors. However, an examination of the structure of Latin American emerging market returns over a recent time period has indicated that country selection, rather than industry selection, is still the more important determinant in explaining the cross-sectional share return variation in portfolio returns for emerging market investment strategies in the Latin American region over the decade.

# TIMING AND POSSIBLE REASONS FOR IPO OF FACEBOOK INC

Monika Janicikova, University of Economics, Prague

## ABSTRACT

*IPO of Facebook Inc. that took place on May 17, 2012 brought another wave of irrationality to the capital market. In the terms of IPO timing, the market timing theory with the explanations given by catching the window of opportunity is the most powerful explanation for Facebook's IPO timing. The analysis claims that optimism, irrationality of investors and asymmetry of information have played an important role. Facebook's IPO was under the pressure of irrational behavior e.g. home bias, illusion of magic milestones and overreaction to medial announcement. Issue price could be overpriced due to observed characteristic of other competitors in the field.*

**JEL:** G32

**KEYWORDS:** Initial Public Offering; Facebook Inc.; Irrationality on the Capital Markets.

## INTRODUCTION

Initial public offerings refer situations when companies enter to public capital market for the first time. IPOs exhibit the statistically significant anomalies in behavior of their prices during a long time. They are underpricing of the issue prices and long run underperformance. Behavior of IPOs seems to be similar to trends in capital market's behavior, but on the other hand, IPOs' development is much more volatile. GDP belongs to the most powerful variable influencing the development of IPOs. Strong connection between GDP and IPOs can be proved by statistically significant dependence of these variables measured on historical data. Due to this positive correlation, which was documented by J. Ritter (1984) between IPOs and particular sectors development, there are assumptions that IPOs could be the first indicator signaling the renewal of the capital market's performance.

One of the most discussed IPO was IPO of Facebook Inc., which was held on May 17, 2012. This IPO was fascinating by its size and it became the biggest US IPO measured by market capitalization. Success of such a large IPO at a time when markets had suffered from nervousness due to European debt crisis and uncertainty about the sustainability of U.S. fiscal policy could be a good impulse towards calming the situation at least on the U.S. market. However, Facebook's stocks were characterized by very poor performance and IPO of the company has earned attributes such as overvalued, irrational, manipulated or associated with information asymmetry or fraud. The next section focuses on the literature review of IPOs timing and IPOs anomalies as well. The Facebook's IPO analysis is situated in the third section. The aim of the text is to find out the most powerful theory suiting the Facebook's IPO and find identification of overvaluation of issue price and irrational factors and information asymmetry that were evident during Facebook's IPO and within the stock price development.

## LITERATURE REVIEW

Number of successfully subscribed IPOs is logically related to the question whether the issuers are able to estimate the timing and demand for their shares correctly. Literature review is given below.

### IPO Timing Theory – Market Timing Theory

According to the first approach – catching the window of opportunity on the market that can be named as market timing theory – companies plan their public market debut during the period of overvaluation of share prices. Investors willing to pay higher prices are influenced by positive feeling and they interpret relevant information in way that is more positive. Phenomenon connected to IPOs resulting from market timing theory could be long run underperformance that is documented e.g. by J. Ritter and I. Welch (2002). They examined long run underperformance in US capital market during the period of 1980–2001 and it was on the level of 23.4 percent within the first three years after IPO. Similar studies have been made on different national capital markets and report that long run underperformance was caused by timing of IPO during good macroeconomic conditions and optimistic investor sentiment. Issuers benefit not only from optimistic investor sentiment but also from optimistic analysts' reports. R. Rajan and H.

Servaes (1997) claim that revenues projections of issuing companies are more optimistic about 5 percent than other companies in the field. Market timing approach does not necessarily assume irrational behavior of market participants and information asymmetry but these assumptions are not rejected as well. Time to time, rational behavior arguments are not powerful to explain some anomalies e.g. stock market premium, volatility puzzle or predictability puzzle etc. Besides puzzles, some periods of extremely high levels of capital market prices are observable. These extremely high prices are not explainable for obvious fundamental reasons. R. Schiller (2005) identifies four periods, which are characterized by extremely high value of P/E ratio. These periods are in 1901, 1929, 1966 and record year 2000. Due to recorded performance, booms and busts in the capital markets there is growing interest in behavioral finance, which uses presumptions of irrational behavior of market participants. Behavioral finance claims that efficient market hypothesis fails and there are some barriers to rebalancing the equilibrium by arbitrage.

Cognitive psychology dealing with human minds and ways of thinking points out that human body makes during the thinking systematic mistakes caused by biases e.g. overconfidence, conservatism, heuristic or overreactions and short trend preference. Decision-making is influenced by the way in which information is presented. N. Barberis and R. Thaler (2002) argue that investors' behavior is affected by irrational elements such as insufficient diversification or naive diversification, excessive trading and it affects buying and selling decisions. Information asymmetry, in the context of market timing theory, is powerful in situations when issuers can catch the window of opportunity during the time of worse informational resources available to investors. For this reason, they can interpret information in overoptimistic way. These assumptions arose mainly after the technology bubble in the spring of 2000, but they are refused e.g. P. Schultz and M. Zaman (2001), they claim that insider trading was not the main reason leading to IPO timing decision during the period of dot-com IPOs.

#### IPO Timing Theory – Informational Asymmetry

According to IPO timing theories based on information asymmetry, companies try to minimize indirect costs of IPOs. These indirect costs are typically influenced by underpricing of issue price that compensate worse informational resources available to investors. Underpricing was identified on the most capital markets at statistically significant level. The level of the underpricing fluctuates across the country sample and through years as well. In 2012, issue prices were underpriced by 17.7 percent on average that J. Ritter (2013a) claims. The underpricing in 2012 leads to 2.78 billion USD indirect costs.

#### IPO Timing Theory – Informational Externality

If there is a successfully completed IPO on the market, it can result in positive message spreading through the market that signalizes that investors are interested in buying shares of companies from some segment. Companies are able to settle their issue prices more precisely. These messages and their spillovers have an important role mainly for the developing segments of the economy. An example of this can be IPOs of biotech companies in the 80's and 90's of the last century, as well as IPOs of technology companies at the

turn of the millennium. Looking at the data regarding the IPOs development we can find the relation between the first IPOs and subsequent boom in number of IPOs from the same segment. Time period between the first IPOs and subsequent boom takes about few months and essentially meets the time requirements for the preparation of IPO process. Strong relation was rather observed within a segment than market as a whole. L. Benveniste et al. (2003) focused on informational spillovers observed clustering of IPOs of companies from the same segment. If there was a negative informational spillover, it led to subsequent 43 percent unsuccessful IPOs. But on the other hand, if there was a positive informational spillover it led to only 9 percent of unsuccessful IPOs.

#### Company's life cycle and IPO timing

Although there have never been proved statistically significant relation between age of issuing company and its IPO, relatively young age companies' IPOs were observable during the dot-com bubble. Looking at the data completed by J. Ritter (2013b) average age of the issuing company was reducing from 7 to 5 years in 1999–2000. On the contrary after the bubble burst average age of the issuing company was growing to 10 years in 2001–2011. Long run average age of IPO candidate in 1980–2012 was 8 years. Different age structure can be found on individual stock exchanges. S. Paleari et al. (2007) claims that the age of companies initially issuing on NYSE or LSE was 13 and 14 years respectively whereas 7 years on NASDAQ or Deutsche Börse in 2006.

#### Anomalies in IPO valuation process

Besides the timing factors the success of IPO is affected by the correct determination of the range of issue price. The range should be compromise between issuing company, underwriters and investors. If the set issue price is too high, there will be a threat of an unsuccessfully completed IPO. Unsuccessful emission can lead to worse conditions of funding and loss of strategic information that have to be published in connection with intension of public offering. On the other hand, too low settled price results in large indirect costs. Resulting underpricing is then measured as the difference between issue price and stock market price achieved on the first trading day.

Documented underpricing prompts that issuers tend to undervalued their stocks than have to endure the threat of unsuccessful emission. This statement is backed by behavioral finance and its under risk decision making presumptions in the prospect theory. The effect of certainty claims that man is more willing to choose more certain possibility. Moreover the negative message regarding the indirect costs caused by underpricing is framed in the context of positive feeling about successful IPO, new funds obtaining and according to cognitive psychology this positive information prevails over the loss of profit.

M. Lowry and W. Schwert (2001) and T. Loughran and J. Ritter (2002) saw the underpricing in the context of remuneration belonging to investors, who previously during the road show had been revealing their interest and pricing estimations. Their studies are concentrated on the shifts in the range of issue price that are made during the period foregoing the IPO date. T. Loughran and J. Ritter (2002) pointed out that issuers do not change the range upward according to available public information. Adjustments are only partial. M. Lowry and W. Schwert (2001) examined that 10-percentage capital market decline led to minus 11.3 percentage adjustments but on the other hand, 10-percentage capital market growth was incorporated only partially into the range, and issue price was improved by 5.8 percent upward. Their study argues only partial adjustments of range again but if there was an asymmetric effect incorporated (influence of bad and good news) they found out that partial adjustments are due to private information.

IPO OF FACEBOOK INC. FB's IPO took place on May 17, 2012. During the emission, all 421,233,615 offered shares were subscribed for price at 38 USD per share. This price represented the upper limit of the range of issue price given by 34-38 USD. The subscribed capital thus climbed to above 16 billion

USD. IPO was consisted mostly of secondary shares and the share of primary shares in issue was less than 43 percent. There were some reasons that had led to idea connecting FB's IPO with the term of pioneering company in its segment but it could be a sign of better time if there was successful IPO with such a huge capital subscribed during difficult situation and European debt crisis and period of searching for U.S. fiscal cliff. In the next parts of the text there is an analysis of individual steps of IPO, analyzed period is from February 2012 when FB announced the intention to IPO to Securities Exchange Commission.

### Period Between IPO Announcing And Final Range Of Issue Price Setting

U.S. Securities and Exchange Commission published registration sheet of the company on February 1, 2012 and FB originally intended to offer its shares on the New York Stock Exchange, NYSE. Refinements of the necessary information prescribed by the SEC were taking place through 8 amendments during February to May 2012. Company accepted a replacement the proposed exchange and on April 10, 2012 announced its intention to enter the NASDAQ. Range of issue price was established in the fifth change the registration sheet on May 3, 2012 just two weeks prior to the IPO. Original issue price range was set between 28 to 35 USD. On May 15, 2012, the range was refined, there was an increase of 14 percent from the perspective of the middle of the range and issue price should be from 34 to 38 USD. Range adjustments made by issuers are not exceptional. Table 1 below presents selected either companies operating in a similar industry or companies, which IPOs were held in the nearby FB's IPO. Range of issue price has been arranged upwards by most of them. Only Google modified the range downwards by 26 percent measured by the middle of the range in September 2004.

Table 1: Issue Prices And Their Range Adjustments Of Selected Companies

	IPO date	Issue price	Issue price vs. upper level of issue price range	Adjustments in issue price range		Changes in issue price range
Netscape	08/08/95	28 USD	17%	21 USD	24 USD	80%
Yahoo	04/11/96	13 USD	0%	12 USD	13 USD	14%
Amazon	05/14/97	18 USD	13%	14 USD	16 USD	15%
eBay	09/23/98	18 USD	0%	16 USD	18 USD	0%
Google	08/18/04	85 USD	-11%	85 USD	95 USD	-26%
Baidu	08/04/05	27 USD	8%	23 USD	25 USD	20%
LinkedIn	05/18/11	45 USD	0%	42 USD	45 USD	30%
Zynga	12/15/11	10 USD	0%	8,5 USD	10 USD	0%
AVG	02/01/12	16 USD	-11%	16 USD	18 USD	0%
Facebook	05/17/12	38 USD	0%	34 USD	38 USD	14%

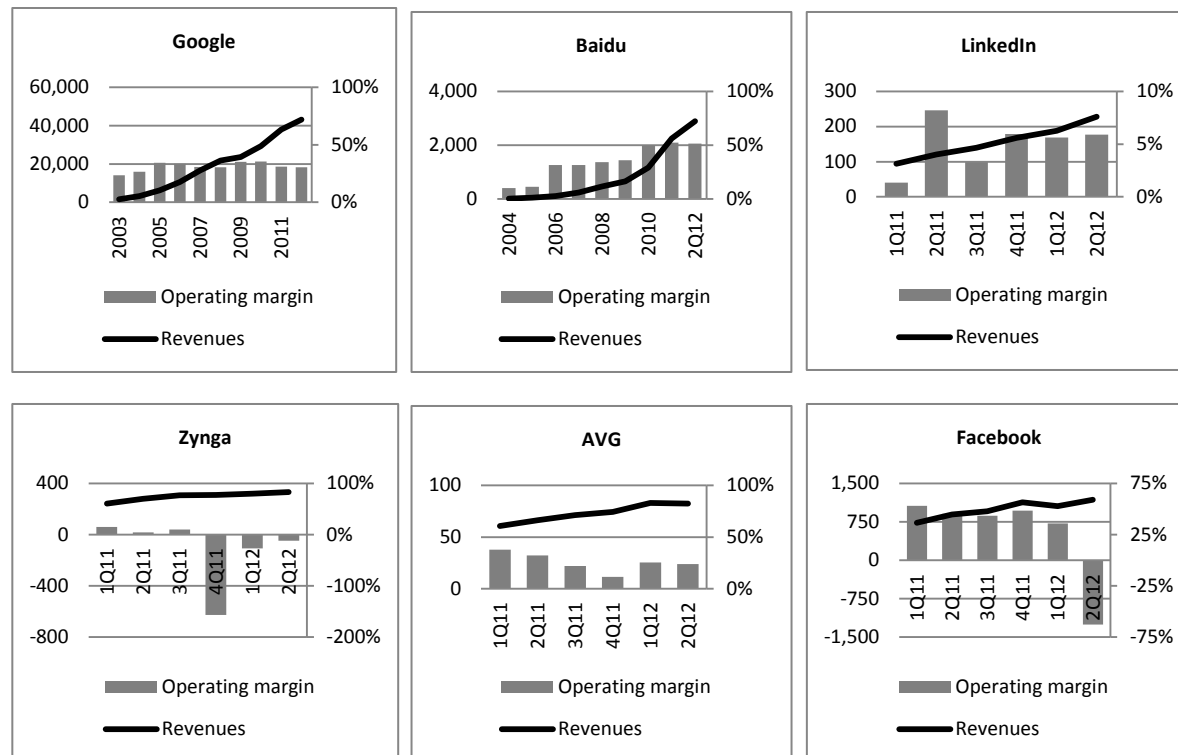

*This table shows IPO data for Facebook and selected companies similar to Facebook. There are dates, issue prices and issue price ranges and their changes during IPO process. Data comes from SEC database and own calculations.*

M. Lowry and W. Schwert (2001) but T. Loughran and J. Ritter (2002) came up with the idea of incomplete inclusion of relevant information in the adjustments in range of issue price. Both of these approaches used several days relevant profitability index in the analysis. If we use the same idea and apply this approach to the FB's IPO, it is apparent that the regulation of range increase was not in line with the performance of the NASDAQ 100 index. In the week preceding the adjustment of range of issue price, 15-day return of NASDAQ 100 was negative in the range of -3 to -1 percent. M. Lowry and W. Schwert (2001) have further analyzed that the final issue price of IPO relatively to the original emission range is best capturing (the highest value of t-test) using the return of the market during the previous 50 days. In the case of FB's IPO the performance of the index was negative at -5 percent. The estimated regression, from their study from 2001, shows sensitivity to the negative performance of 1.131. This effect should therefore adjust issue price rather down and more as -5 percent. On the contrary, positive effect is observable in company's industry – tech sector (regression coefficient 2.048) or due to the fact that FB would like to enter NASDAQ (regression coefficient 0.313). Figure 1 provides an overview of some companies' economic performance at the IPO until the 2nd quarter of 2012. Increase in the emission range is also notable for the reason of FB's published quarterly results on April 23, 2012

when FB recorded a 6 percentage quarterly decline in sales from advertising. FB was also the single company that has seen significant decline in revenues reported before the planned IPO.

Figure 1: Revenues and Operating Margins Of Selected Companies, Time Period From IPO To 2Q12

This figure consists of six segments that show development in revenues and operating margins of Facebook and selected companies. Period shown is from the date of IPO to the second quarter of 2012. Data comes from Bloomberg database.

### Issue Price and the First Trading Day on the Public Capital Market

On May 17, 2012, FB's IPO took place on NASDAQ and company's shares were subscribed on the upper level of the range of issue price at 38 USD per share. The company raised capital of 6.8 billion USD due to 180 million primary shares issued. However, the first trading day performance did not correspond to long run IPO trends especially to underpricing of issue price. The first trading day began with opening share price of 42.05 USD, which represents the price by almost 11 percent higher than the issue price. Share price climbed to the level of 45 USD but it seemed to be highly instable and then rapidly dropped to 38.23 USD. If you follow the convention of calculating the underpricing of issue price as difference between share closing price on the first day of trading and the issue price, the FB's shares did not show a significant underpricing and the closing price is higher by 0.6 percent. However, average underpricing observed during 2011 was 13.3 percent (J. Ritter, 2013a).

Extremely high issue price was discussed and some acceptable reasons on fundamental basic tried to be found in connection to company's potential. Comparable analysis can be done for example by using financial ratios of FB and selected IPOs close to the company's core business. Values are shown in Table 2. P/E and P/S ratios can explain the value the market attributes of company's economic performance. In some cases, they can be used for identification of misvalued companies. In terms of P/E and P/S ratios of company Baidu.com is significantly above average values and there is shown significantly higher enterprise value of the market capitalization in relation to economic performance. However, in August

2005, when IPO of Baidu.com took place Baidu.com appeared, there was considerable growth potential in conjunction with a very good macroeconomic situation and the rapid growth in its domestic country China, and for these reasons, recorded P/E and P/S are not surprising. FB has higher value of P/S on the day on which the shares were offered at the IPO issue price at 38 USD. Higher ratio of market price to sales per share was showed only by mentioned Baidu.com. Especially in terms of source of revenue, the most comparable company to FB is Google. Google issue price was 17 times higher than projected quarterly sales per share reported in the prospectus of the company. FB issue price was 21 times higher than the sales per share and P/S would be equal to 25 considering the possible application of option rights to purchase shares incurred prior to the IPO. The P/S ratio of companies has been already balanced during the first business day. However, FB did not exhibit significant underpricing of the issue price, on the other hand, Google's share price increased by 18 percent in one day.

To compare these IPOs, FB's issue price determined by P/S of Google should be at 31 USD. Compared with LinkedIn, which had at the IPO P/S at 11, the issue price of FB was almost doubled. LinkedIn operates like FB in the field of Internet communication. In terms of LinkedIn and its P/S, FB's issue price should be at 20 USD. Furthermore, we can observe rising trend in LinkedIn share price during the first trading day. LinkedIn share closing price rose by 109 percent. Average underpricing in 2011 was 13.3%, and in this case, the corresponding P/S at LinkedIn IPO should be 21, as FB exhibited. However, LinkedIn does not face the problem of how accurately and reliably determine the growth potential of the company, as its main source of income is providing HR consulting services to corporate clients. For these reasons, FB's P/S ratio on the level of Google's P/S at 17 times share price comparing to revenue per share should be more suitable. The average value of P/S analyzed companies at the IPO, even including the high value of Baidu.com was at 14. During the first trading day, the average P/S ratio rose to 40, however, in the case of FB, a significant increase of the closing price was not observable. On the other hand, a significant increase of the closing prices could not be found in cases of Zynga and AVG and these recent IPOs seemed to be slightly overpriced.

Table 2: Ratios at the Time of IPO of Selected Companies

	P/E	P/S	P/S during the first trading day	P/BV	Tobin's q
Netscape	n.a.	n.a.	n.a.	24	12
Yahoo!	n.a.	n.a.	n.a.	24	5
Amazon	n.a.	5	6	92	7
eBay	68	12	28	91	20
Google	161	17	20	38	12
Baidu	726	43	194	35	12
LinkedIn	512	11	24	34	16
Zynga	171	6	6	15	3
AVG	7	3	4	-7	3
Facebook	165	21	21	18	13

*This table shows ratios and Tobin's q related to Facebook's IPO and IPOs of selected companies. P/E, P/S and P/BV ratios are calculated as share price divided by earnings, sales and book value per share based on the financial data of the fiscal year preceding companies' IPO. Calculation of the Tobin's q is relation between the market value and the reproductive value of the company, q of FB is based on simplification that the value of assets given in accounting is equal to the replacement value of the company. Data comes from Bloomberg database and companies' prospectus and own calculations.*

### Irrational Factors and Insider Trading

FB's issue price was deemed unreasonably high and during the first trading day, the share price went up and down in the range of 7 USD. After the IPO, some insider trading speculations have emerged and FB's IPO was associated with at least partially exit of some owners of the company. Despite a slight recovery in June and July 2012, sharp decline occurred and FB's share price reached the lowest values under the influence of the publication of quarterly Zynga's results for the second quarter of 2012, which provides for FB gaming applications. Decline continued even after the FB's results of July 26, 2012 and early September 2012. Price of FB's shares was characterized by three-month underperformance due to

representative NASDAQ 100 index. NASDAQ 100 performance was growing up by 12.17 percent from May 18, 2012, while the price of FB's shares decreased by 50 percent from the first trading day. In the six-month horizon, the index rose by 4.73 percent, while the price of FB was lower by 40 percent considering the first trading day. Negative action influencing FB's prices was the sale of share owned by P. Thiel, who was one of the directors of Facebook Inc.

He sold his share as soon as the lock-up period expired and in case of FB's IPO, the lock-up period was uncharacteristically short and took only 3 months. Usually lock-up periods last about 6 month and free trading of crucial volume of share is limited. Panic about FB's price that was observable on the level of 20 USD per share, was calmed down by better result released for the third quarter of 2012. It claimed that FB achieved operating profit of 377 million USD. Declaration of no planned sale of privately hold shares given by M. Zuckerberg at the beginning of November 2012 had a calming effect as well and it was a much better message supporting rise in prices after selling decision made by P. Thiel or director S. Sandberg. There are several factors that evoke the evolution of FB's IPO and its shares price dynamic to be influenced by irrational factors. Firstly, there is an enormous general public interest in FB's IPO, which could lead to higher demand for share created by individual investors.

Individual investors are typically considered to be less informed and less financially literate than institutional investors. Furthermore, individual investors incline to irrational behavior when they make trading and selling decisions. Similar tendencies were found by R. Schiller (2005) who focused on the technology bubble at the end of the millennium. FB has become part of daily life, undoubtedly, there are many people, who commonly use FB for everyday communication and analogy can be found during the time when the Internet became part of the daily activities at the end of the last century. In this context, it is possible to identify possible illusions and biases that have previously been identified by behavioral finance. Firstly, we can mention home bias. It comes from preference known things to unknown things. For this reason, people tend to invest money in shares of known companies. Everyday use of the Internet as well as FB's application can cause you to feel that you know the company precisely, without focusing on the ability prediction of the future development of its price and performance.

Irrational investor behavior is often seen as excessive trading. Models based on rational backgrounds and efficient market theory claim that people reflect available information and expectations in price, however, on the markets, there are periods when significant traded volumes are observable. Investors then trade more than is justified on rational basis. B. Barber and T. Odean (2000) claimed that excessive trading is more typical of individual investors and rather men than women are. Excessive trading may originate mainly from overconfidence of ability of individual investors. Astronomically high volume of traded FB's shares is observable during the first trading day. Frequency of trades was so huge that the NASDAQ trading system was not able to enter commands to process.

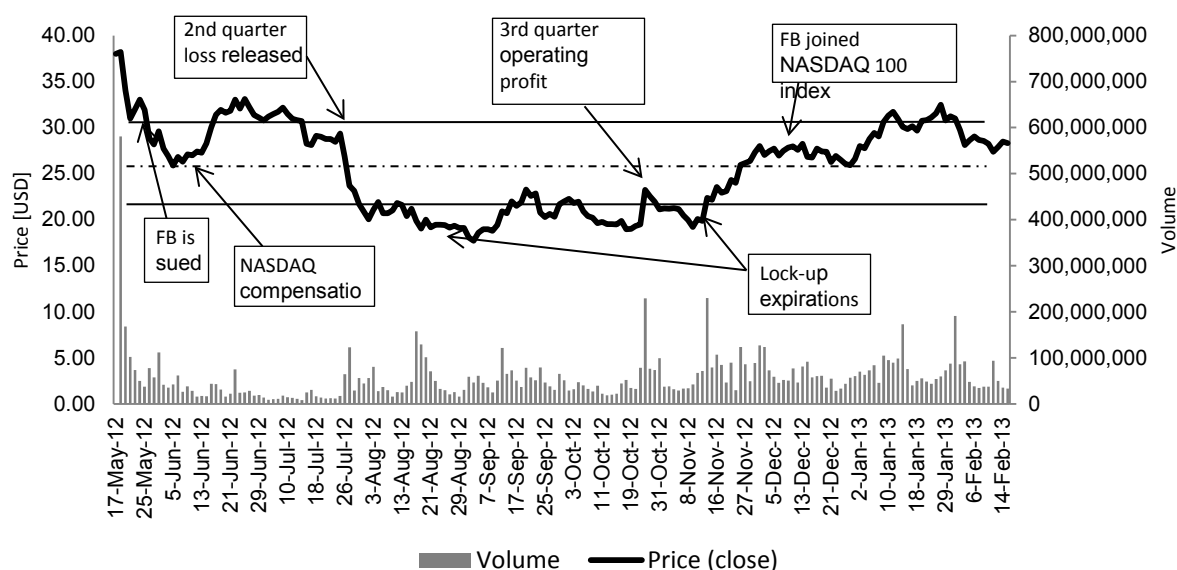

Because of money loss caused by system failure and non-execution of some commands NASDAQ will pay a millions high compensation. Behavioral finance has also come with the term disposition effect, which influences primarily selling and purchasing decisions. According to H. Shefrin and M. Statman (1985), disposition effect consists in the tendency to sell profitable shares as soon as possible, they can make profit and on the other hand, they retain shares that suffered lost. This way of thinking is influenced mainly by irrational expectations regarding the false assumption that stock market developments are mean reverting process. Mainly this tendency could maintain the average price level of 30.11 USD until the end of July 2012 but this belief was then extensively paralyzed by reporting of quarterly losses for the second quarter 2012. Besides the influence of news released, markets are often under the influence of the illusion of magic milestones. They are usually punctured ranges of share prices in whole tens or hundreds. Figure 2 below contains the development of the price and volume of traded shares, together with marked FB's relevant news, which in my opinion had a significant influence on the development of price. In addition, the levels of 20, 25 and 30 USD are marked as significant milestones. The effect of

increasing the volume traded is noticeably linked with penetration of these milestones. On the other hand, in many cases, the increase in volume may be influenced by the simultaneous effect of certain news announcement in the media. The level of 20 USD was penetrated on August 16, 2012 for the first time.

On this day, trading volumes suddenly climbed to the level of 158 million shares traded, representing an increase of 229 percent from the previous day. High volumes exceeding the level of 100 million shares remained in the next two days, when the stock price fluctuates alternately around the 20 USD. A similar situation can be observed on September 12 and October 24, 2012 when the price broke the 20 USD again. If we assume that, the behavior of investors should be rational and in accordance with the efficient market hypothesis, a severe reaction should occur only in cases of unexpected news. Deterioration in the performance of the company was already apparent before the IPO and the violent reaction to the announcement of the loss for 2Q12 seems to be exaggerated for these reasons.

Figure 2: Factors influencing the development of Facebook's share price from May 2012 to Feb 2013

*This figure shows factors influencing Facebook's IPO and they are based especially on news' releases. Data comes from Google Finance and Reuters.*

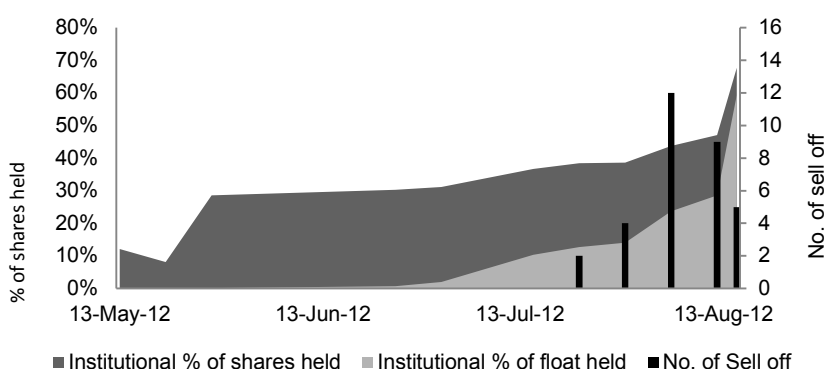

On May 23, 2012 just a week after FB's IPO and during the situation when its price was rapidly moving down and went to 30 USD per share, a group of investor sued the company for intentional damage of investors' property by saying information regarding company's performance selectively only to institutional investors and it even before the subscription of shares. Moreover, the company has been challenged for the reason of overly optimistic forecasts concerning the development of the number of users and strange kind of calculation of users not omitting false and inactive accounts. The fact of high share of secondary shares in issue could indicate that FB's IPO is associated with insider trading and abuse insider information possessed by existing investors. On May 16, 2012 just one day before IPO the number of secondary shares was increased from the originally planned 157 415 352 pieces to 241 233 615 pieces and their share rose to the level of 57 percent of totally offered shares. If it were compared with other selected companies, the majority of shares in the share of secondary emissions would be abnormal phenomenon. No company from the selected sample given in Table 1 or 2 had lower than 50 percent share of primary stocks issued. Majority IPOs was created by primary share exceeding 70 percent. You can also name investors who had increased the proportion of shares offered before IPO. They were Tiger Global Mgmt, it increased the proportion of shares offered from 7 percent to 50 percent of the 53.8 million shares totally owned, and Peter Thiel increased the proportion of shares offered from 20 percent to 50 percent of the 44.7 million shares totally owned. Goldman Sachs increased the proportion of shares

offered from 23 percent to 50 percent of the 66 million shares totally owned. DST Global increased the proportion of shares offered from 23 percent to 40 percent of the 131.4 million shares totally owned. Mail.ru Group increased the proportion of shares offered in the same manner as DST Global and it owned 56.4 million shares before the IPO. Accel Partners and Greylock Partners increased the proportion of shares offered from 22 percent to 28 or 24 percent from 201.4 and 36.7 million shares totally owned respectively. Goldman Sachs was in addition one of the leading FB's underwriters. Figure 3 below reflects the evolution of FB's shares held by institutional investors, who are generally perceived as a group better informed, but also experienced and financially capable.

If the characteristic feature of individual investors is inclination to irrational behavior during decisions making, it will be not so clear feature of institutional investors neither in terms of behavioral finance. The proportion of individual investors in share held could signalize the way of narrowing the price to the fundamental price. FB's proportion of shares held by institutional investors before the IPO is relatively low at 11 percent and there was the percentage decreases in this level during the IPO. The largest increase in the institutional share is visible at the end of May 2012, when the share price briefly dropped below 30 USD and other increase of the proportion of institutional investors is observable at a time when the share price falls below 20 USD.

Figure 3: Development Of Institutional Share Of Facebook's Shares From May To Aug 2012

*This figure shows percentage share of Facebook's shares held by institutional investors during May and August 2012. Data comes from Bloomberg database that also shows the average price at 37.58 USD at which institutional investors sold their shares within few months after IPO. It is necessary to take into account restrictive presumptions of this value and the relationships caused by highly problematic capture of all institutional trades and Bloomberg methodology used for their calculation.*

## CONCLUSION

Finally, we can say which of the IPO timing theories could be relevant for the IPO of Facebook Inc. According to the analysis of the IPO process and its individual parts I argue that the company used situation prevailing on the market and the situation where investors are subject to the illusion of the price of the company. Although Facebook's IPO do not seemed to be underpriced, in my opinion arising from the analysis, it cannot adhere to the theory of reducing information asymmetry, because the IPO was probably influenced by considerable information asymmetry. Due to given circumstances of price trends and emerging scandals around the IPO, Facebook Inc. is not attributable to either the role of pioneer in the field. In terms of age, the company is a representative issuer of IPO on NASDAQ. There were characterized individual situations and milestones in the evolution of prices of shares of Facebook, which in many cases can rely on behavioral finance, the irrationality of market participants and information asymmetry. They are especially high proportion of secondary shares in issue, the higher values of P/E and especially P/S ratio than was evident in selected IPOs of similar companies and unprecedented interest in IPOs from the general public or stock prices overreaction to reported news. Sharp traded volume growth is noticeable during the days when share price broke through the psychologically magical milestones 30 and 20 USD. There can be identified home bias, illusion of magic boundaries and

considerable influence of media reports on the development of prices. Although given analysis has shown a considerable number of examples of possible irrational fury over the price of the company, it is almost impossible to adequately test these conclusions and support them with robust statistical tests.

# THE IMPORTANCE OF ERGONOMICS IN THE TRAINING OF MILITARY PERSONNEL

Opincă Mihai, Academy of Economics Studies Bucharest

## ABSTRACT

*Military training is a complex process that includes military education, training, exercises and training with practice, and, in our opinion, it must be one unit, based on the development of critical and creative thinking. This article attempts to provide an overview of ergonomics in the military training for people working in other areas of manpower, personnel, and instructional research, and also offers further well-being consideration to human resources by revealing the impact that ergonomics via ergonomic training can have on the military organization.*

**JEL:** M11, M12

**KEYWORDS:** ergonomics; human resources; interaction; technique; training

## INTRODUCTION

To increase efficiency soldiers compete in battle, maintain exercise capacity and their health protection is necessary in order to act effectively on the military-technique-environmental system, aim to prepare and train staff, adaptation characteristics of combat technique and workstations on military possibilities.

Training is the acquisition of knowledge, skills and abilities to perform more effectively. Ideally, ergonomic training should give employees an understanding of how to use their workstations, employees should be satisfied with the ergonomic training they receive, and employees should perceive the training as practical, applicable, and useful. These desired trainee reactions, or attitudes, from an ergonomic perspective promote a higher likelihood for training transfer and reduction in injury, tension, and fatigue.

Ergonomic implementation embraces the idea that the work environments should fit people, not reverse. When a process is implemented in which military personnel do not exceed their physical capabilities, they can work without fatigue and do their jobs better, thereby increasing productivity and improving quality. If military personnel are required to perform tasks beyond their capabilities, the worker may be damaged and the production and quality may suffer for improper tool use and from tasks that are not designed to fit the military personnel. The ergonomic workstation should be designed and offer enough clearance without interference to body segment, encompass the available strength of the operator, and reduce biomedical stress.

The unique characteristics of military life and culture require new recruited military personnel to undergo some early training to prepare them for positions in operational military units. Despite the emphasis on military courtesy and discipline in this early training, a substantial body of hard-core skills and knowledge has to be mastered. As the training proceeds, it increasingly emphasizes the certification of individuals for specific military occupational specialties.

Optimizing any military action necessarily requires knowledge of the environment with its demands and structures of biological, psychological and social human. Modern battlefield subject military body to maximum requests, it requires to act relatively long duration often to his physical and mental limits.

Training is never complete. Continued growth in skill and knowledge is required as careers advance. Individuals may transfer to different military occupational specialties. They may require training to operate, maintain, or deploy specific and unique systems found in their operational units. They may train to prepare for unit-specific missions. They will certainly advance in rank and require training to prepare for new responsibilities occasioned by their growing maturity, competencies, and military stature. They may receive follow-on training from their units, from specialized training organizations to which they return, from manufacturing representatives, or from mentors in on-the-job training. The distinction between residential vs. unit training concerns whether individuals are trained by specialized training organizations or by operational units to which they have been assigned.

The rapid changes in technology, tactics, and missions that are characteristic of today's military operations require matching agility in the design and development of training and education programs. These training programs must combine the next components: training analysis is based on systematic study of the job and the task(s) to be performed. It identifies training inputs and establishes training objectives to be accomplished in the form of student flow and in the knowledge, skill, and attitude outcomes to be produced by the training; training design devises the instructional interactions needed to accomplish the training objectives identified by training analysis. It also selects the instructional approaches and media used to present these interactions; training production concerns the development and preparation of instructional materials. These materials can include hardware (e.g., simulators), software (e.g., computer programs and audiovisual productions), and databases for holding information (e.g., subject matter content and the performance capabilities of military systems ranging from tanks and airplanes to radios and parachutes); training implementation concerns the appropriate installation of training systems and materials in their settings and attempts to ensure that they will perform as designed; training evaluation reflects the outcomes of the training against its objectives. It determines if the training does things right and if it does the right things. It verifies that the training system meets its objectives, provides the validation that meeting these objectives prepares individuals to perform targeted tasks or jobs better, and improves the operation of the organization overall.

Ergonomics has the task of taking into account human factors in creating military equipment, selection of specialists, training crews, their preparation and training for military personnel waging battle action.

An important role in implementing ergonomics training program of military personnel is the relationship between human resource and management, which is very important in terms of direct effects produced in the organization. Managers admit that, their organization prosper for long term when the interests of employees are integrated into strategic decisions. To achieve organizational and its members development, you have to be promoted primarily as efficient work achieve.

To optimize cooperation between man and technique, even from conception and design phase, you have to take into account not only functional human possibilities, but also the psycho-sociological nature, experience, training, features with which man can ensure functionality and system continuity. There are two directions of actions:

- ergonomic organization of fighting positions with all requirements arising from it;
- create a complex training, dominated by intense training and systematic exercises in order to acquire skills to reflexes.

Recognized as a preventive specialty, ergonomics is concerned with examining the working conditions in order to obtain better harmony between man and the environment in which they work, and obtaining optimum efficiency and comfort. In concept of the same author, ergonomics prioritizes protection and comfort in human labor whereas, ethics ergonomics, claims, ultimately, better working conditions as that may improve without neglecting other criteria, as important as, for example:

- increasing the performance of the organization in terms of efficiency and effectiveness;

- increased safety and intrinsic interest in the task;
- increased work satisfaction and comfort.

Researching human resources within the military activity, military ergonomics aims to develop the scientific basis for optimizing the cooperation of military components in order to increase their effectiveness in battle, and finding ways and means by which the military can exploit the technical possibilities of weapons, without overloading the body. This implies a higher organization and also ergonomic of work, in which the soldier must perform their tasks with a minimum consumption of time and resources.

To provide efficient military-environmental-technique and minimize error possibilities, while reducing requests, concomitant with increasing satisfaction in work it, is necessary both for the designer and for the organizers and those who lead the training themselves, to use appropriate methods, which have to be based on knowledge of human possibilities, limitations and requirements at work. For this it is necessary to meet the following management instruction requirements:

- be planned a unit;
- be managed with competence;
- be a continuous and progressive process;
- be standardized, adopt and implement NATO standards and procedures;
- to perform modular;
- provide motivation;
- be an activity mostly practical strategies
- be a flexible activity (depending on changes that occur);
- promote requirement;
- be assessed against performance standards;

In the military, we believe that a good adaptation between man and military equipment requires consideration of the following two aspects:

- knowledge battlefield applications - both the physical, chemical and biological as well as psychological ones - knowing that they can influence directly or indirectly the military psychophysical behavior;
- knowledge reactions and behavioral manifestations of the military in response to the complex applicant conditions of the battlefield.

Military options to respond to these requests are not unlimited. There is intensity and duration thresholds of calls to which the body can handle and thus react accordingly. Exceeding these limit-thresholds it can disturb functional capacity and body strength. In these conditions disturbances may occur in physical and mental functioning of the body, which can lead to premature fatigue setting. Conditions in combat have shown that applications of high and long intensity lead systematically to decreasing physiological and psychological indices and repeating them - in a short period of time - caused occupational diseases.

Today's military pilots face significant challenges in their attempt to "train as they intend to fight". A variety of constraints makes it difficult to provide realistic training environments on a consistent basis so that new skills can be learned and existing skills can be refined. Some of these constraints include:

- reductions in flying hours that can be used for training;
- training range restrictions;
- aging aircraft that makes it more difficult to use them for training hours versus operational hours;
- safety constraints such as altitude floors below which trainees cannot fly in peacetime but they would fly during combat;
- security constraints that will not allow pilots to use their full range of tactics and electronic warfare gear on training ranges.

## CONCLUSION

In these circumstances, given the implications of the application on work capacity and efficiency and effectiveness on default activity, prevention of fatigue and its mitigation is a requirement of analysis or ergonomic design of military activities.

In this respect, the main lines of action are:

- analyze, organize and ergonomic design of military activities using assembled appropriate methods and techniques that allow diagnosis application factors and application of ergonomics principles and requirements;
- establish a rational regime of work and rest allowing fatigue, its mitigation and restoration of working capacity.

Taking into account the changes in the modern battlefield, following the development of combat techniques, ergonomics should be given more importance because it explores the problem of ensuring an action environment corresponding physically and mentally to the human body, leading to maintain and develop abilities of combat military personnel and to carry out the tasks entrusted, that allow individual, under normal effort or request, to meet any objectives.

# RBV INTEGRATED FRAMEWORK FOR EMPOWERING TAUGHT SHIPPING INWARDS

Tabacaru Dumitru S., Free International University of Moldova, Chisinau

Paul Coserin, Free International University of Moldova, Chisinau

Mihail D. Dinu Laurentiu, Free International University of Moldova, Chisinau

## ABSTRACT

*From this point of view, integrated framework shipping information reveals the major orientation linked to contribution to the green environment arrangement from which will also result the managerial efforts growth of making more pleasant the worker's labor, in the purpose of motivating them, generally speaking, in growing the labor efficiency and, especially, in growing the productivity. In conclusion, most integrated framework shipping information's field specialists consider that achieving an interdisciplinary found, in its profound sense, in all of the ergonomic researches preparation, realization and finalization phases need an significant team effort, from which depends the development of these researches itself. Such a concept implied, integrated framework shipping information, at this time, the development of a communication system in order to decentralize and lead information towards the decision nuclei. Moreover, these structures of integrated framework shipping information had to track the strategies of enterprises in order to adapt to the form, structure and nature of the market.*

**JEL:** L92, O18, R41.

**KEYWORDS:** resources, development, integrated framework, shipping, technological upward trend.

## INTRODUCTION

Supplied by the needs to adapt shipping, on the integrated framework, to the technological changes, to maintain a specialized and enhanced integrated framework labor force, and by the professional progress which joins low costs with reduced shipping time, the organizations have drawn near shipping -learning.

The shipping information is based especially on knowledge, on the generation and confrontation of technological upward trend. A country where most part of the manpower is made up of individuals operating with information and for whom information is the most important element is an shipping information.

The integrated framework shipping information has the following main characteristics:

- passage from an economic activity focused on the production of goods to a service-render oriented economy;
- preponderance, within the active population, of the professional and technical class;
- vital importance of information as source of innovation and management (guide line).

## INTEGRATED FRAMEWORK SHIPPING INFORMATION FOR MARITIME PERFORMANCE

Integrated framework shipping information becomes, at the same time, the main means of maritime performance. We have the liberalization of trade and finance, the remarkable advance in technology of information and communication and the creation of the global market on one hand, and the increase of new actors, including many transnational non on one hand – governmental organizations, active in areas of human rights, labor standards and the environmental protection on the other hand. Nowadays, the

multinational corporations are eager to pursue the opportunities of global economic integration. They have become aware of the Integrated framework shipping information that their actions induce, so they try to find strategies to be on top.

Constant integrated framework shipping information training and continuous learning seem to picture the solution so that today's employee might keep its post and at the same time maintain a competitive position on the labor market, given the fact that the upgrading of integrated framework shipping information knowledge takes place every 5 to 6 years now.

According to specialized integrated framework shipping information research, public schooling/formal instruction is what mostly determines personal income and the configuration of integrated framework shipping market.

Equally relevant for Romanian integrated framework shipping – as it results from empirical research conducted in order to assess the connection between human capital and companies' productivity- is the fact that highly trained workers are a key source for innovation and long term competitiveness.

Integrated framework shipping information expertise indicates the fact that the link between personal salary/individual remuneration and the education level of human resources grows tighter as the technology rapidly improves.

From this point of view, integrated framework shipping information reveals the major orientation linked to contribution to the green environment arrangement from which will also result the managerial efforts growth of making more pleasant the worker's labor, in the purpose of motivating them, generally speaking, in growing the labor efficiency and, especially, in growing the productivity.

In conclusion, most integrated framework shipping information's field specialists consider that achieving an interdisciplinary found, in its profound sense, in all of the ergonomic researches preparation, realization and finalization phases need an significant team effort, from which depends the development of these researches itself. This fact is mentioned because ergonomics' research team founds the organizational and institutional framework in which it develops a permanent scientifically and compartmental education, through revealing the team's cognitive, attitudinal and affective dimensions and also revealing the importance of the interdisciplinary attitude during the ergonomic research, as a premise to growing its contribution to creating a scientifically foundation of labor projection, generally, and job's projection, especially.

The long-lasting character of the integrated framework shipping information educational process during a life time represents the longevity key in an organization and the core element of the educational institutions. Holders of a serious self-educational skill will orientate the integrated framework shipping information way in future.

One of the most important desideratum of integrated framework shipping information, its apparition has been to overcome the traditional activities reserved to selling, starting from the premise that the consumers' satisfaction contains a large variety of aspects which should be taken into account, at the same time, not only the consumers' necessities and wishes regarding the structure of products and services or the distribution system, but also the presence of other similar offers on the market, their capacities and interests for integrated framework shipping information.

Such a concept implied, integrated framework shipping information, at this time, the development of a communication system in order to decentralize and lead information towards the decision nuclei.

Moreover, these structures of integrated framework shipping information had to track the strategies of enterprises in order to adapt to the form, structure and nature of the market.

The knowledge flow system in management and organization includes all resource and user subsystems involved in development and application of meaningful management knowledge. As in other disciplines, this system is comprised of several subsystem categories, such as basic or pure research; applied research and development; practice; and, ultimately, consumption. Here, consumption is used to describe the benefits accruing to some ultimate benefactor or group throughout the integrated framework shipping information.

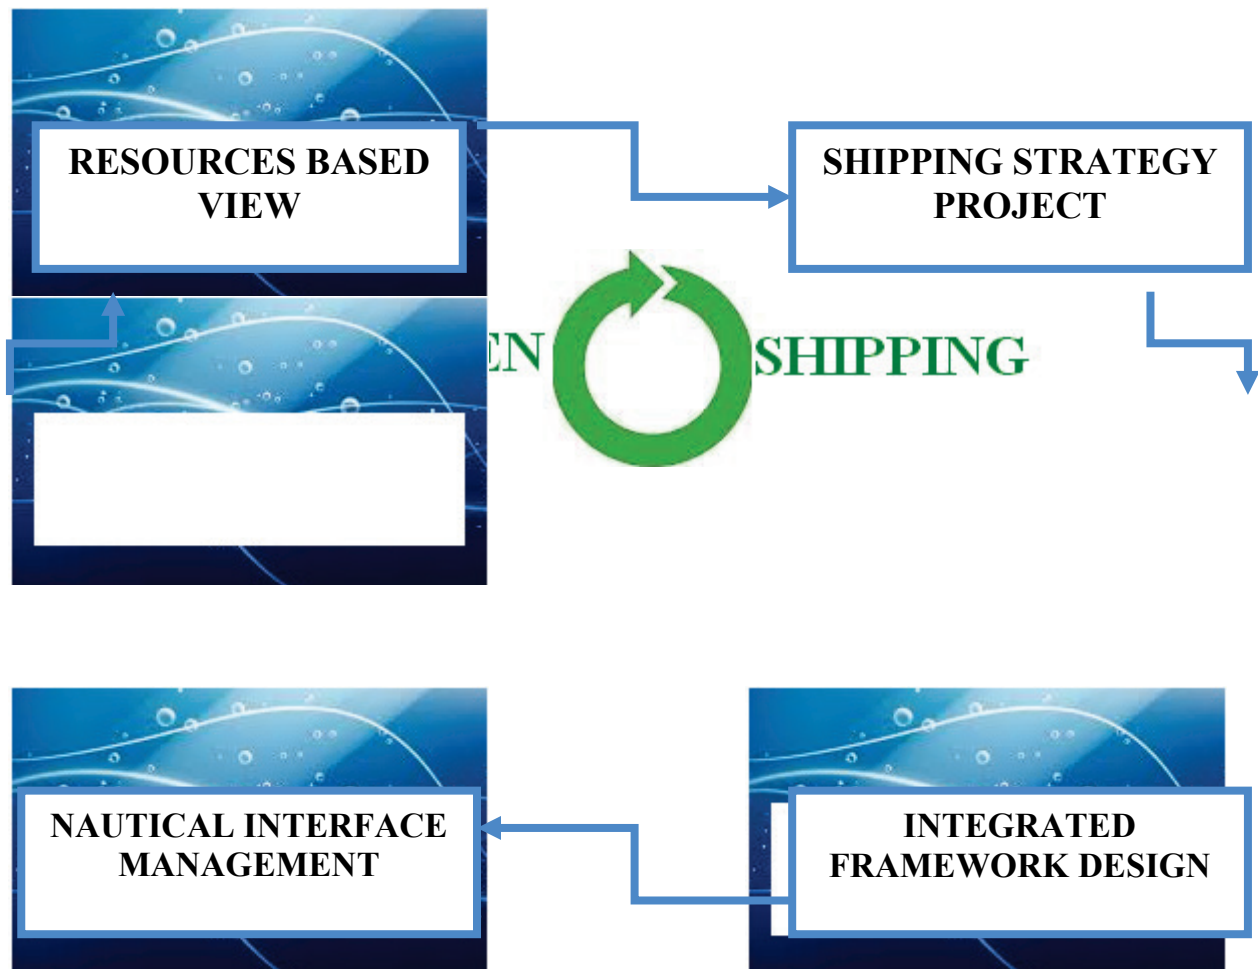

Figure 1. RBV inter-variables for boosting green shipment (author's own projection)

The resources based view for industries and organizations, goes in the system as the following elements: financial, material and human resources, information, principles, norms, managerial strategies, technologies, development policies, etc. Without the human factor that creates, produces and enhances the value of cultural products, the other resources are simple potentialities. The employed personnel represent not only a resource of the system of culture but also a relevant indicator of evaluation of every branch and cultural organization

Today's fast-moving business environment demands that the effective resources based view be both a well-organized and highly adapted in understanding shipping basic needs and empowerment in the

workplace. Gaining commitment, nurturing talent, and ensuring employee motivation and productivity require open communication and trust between managers and staff.

Benefits are as follows:

- enhancing performance and productivity by solving emerging organizational problems;
- fostering innovation and services;
- identifying knowledge flow;
- identifying knowledge assets;
- improving efficiency;
- sharing knowledge with clients.

Empowerment in business means knowing how to “humanize” the work environment so management and employees work together to enhance productivity and achieve greater personal and professional success. An empowered company understands and appreciates that the “human factor” can add or subtract from the bottom line. Empowerment is a company-wide commitment to respect all employees as intelligent and responsible human beings.

### **THE ROLE OF THE RBV: OF GREAT IMPORTANCE IN THE COMPETITIVENESS INCREASE**

The role of the RBV is of great importance in the competitiveness increase within the logistical systems used in the circuits of distribution. We take into account the fact that the reorientation from the traditional instruments to the decentralized configurations is encountered more and more often in the logistical domain.

Such a reorientation, attested by the evolutions in the conceptual approach of marketing, has as a result the apparition of some complementary concepts in relation to marketing – telemarketing, cyber marketing, etc. – which have a major impact on the management of logistical processes.

But, a further analysis of the respective concepts – technological upward trend materializations of the interference of the elements which make up the two basic concepts: marketing and logistics – and of the action models which may be used in order to ensure the enterprises’ profitability, emphasizes the necessity of increasing the personnel’s volume of knowledge and even of a structural improvement through training in the managerial activity.

Technological upward trend for RBV empowerment has different pillars than non-formal training, because trainings are based on mutual respect from trainer to participants. Trainings are based on respecting each other idea, on critique of the idea and not of the person. Everyone can share experiences that are related to the subject of discussion, and also important is the feed-back process. Feed-back is very useful because it is not a critique not an advise but a way to see your own behavior in a mirror and to reflect upon your actions. Trainers have the knowledge and the ability to stimulate participants to realize and deduce themselves the information and the good way to act.

RBV, as input in the production cycle of an economy, is attained through consumption of education services. The better the education services, the more developed the human capital. But human capital is only an input. In order to achieve high quality outputs, you actually need a functioning economy. I believe that a vibrant labor market and an economy that develops rapidly will generate the base for the human capital development

The technological upward trend has moved towards a knowledge-based society and economy. More than ever before, access to up-to-date information and knowledge, together with the motivation and skills to use these resources intelligently on behalf of oneself and the shipping as a whole.

Tabacaru Dumitru S., Free International University of Moldova, Chisinau  
Mihail D. Dinu Laurentiu, Free International University of Moldova, Chisinau

## ABSTRACT

Professional competence as well as proficiency in empowering maritime hub flexibility are sine qua non conditions for achieving effectiveness in shipping overall for it allows leadership to make predictions about further developments: organizing activities, resource management, creating incentives for employees and so on. The development of the mentioned empowering maritime hub flexibility provided various knowledge regarding the study of human activity during the labor process. It was first necessary that these sciences develop in order to contribute to the apparition of other science that is transshipping. The theoretical and practical understanding of these essential aspects created communication paths between sciences and gave a new impulse to the empowering maritime hub flexibility researches development process.

**JEL:** L92, O18, R41.

**KEYWORDS:** transshipment, technological interface, empower infrastructure, moving goods, maritime hub flexibility.

## INTRODUCTION

While keeping an equidistant and objective position towards modern transshipment, we may reach to the conclusion that globalization gives mankind the possibility to fully enjoy the advantages of the liberty of moving without any other space constraint either physical or virtual. Information can not be stopped at the border. We can easily remark the global thriving of affaires, mainly because of the rapid modern transshipment.

Working in a modern transshipment domein with people of different backgrounds involves a lot of arguments and requires increased flexibility, tolerance and openness. It asks for some efforts to understand the other's points of view and of course, the effort to make compromises. If managed well, though, the competences of different team members can complement each other and can produce excellent results. Intercultural teamwork can be a deep mutual learning experience for all team members, as well as a source of mutual support. Discussing and finding a balance between different perceptions, opinions and experiences increases the chances of finding an approach that will be useful for the company.

The benefits of modern transshipment particular approach to personal training can be easily pinned down if we are to consider the fact that these newly achieved qualifications can be put to use in order to obtain a better remunerated employment. The inherent advantages in embracing this principle are not only material, since the majority of the experts agree upon the fact that the accumulation of new pieces of knowledge also brings about personal, emotional fulfillment.

Nowadays, modern transshipment seems to matter the most, determining, as a matter of fact, the choosing and the upholding of the commercial empowerment. Thus, the need to invest in modern transshipment appears to be imperative for today's shipping.

Ensuring a basic level of professional training for modern transshipment, which is indispensable for an efficient activity at one's shipping place, (communicational skills, mathematical calculus, technology of information, democratic citizenship, critical thinking, team work, continuous learning) irrespective of his position or area of expertise, represents an important phase in improving one's adaptability to new situations through the process of continuous learning.

### **MODERN TRANSSHIPMENT INSIDES**

In these conditions, the normal and justified modern transshipment's preoccupation for the rational usage of resources appears, and the modern transshipment research acquires a special importance for the implication in creating the efficient putting into good use the human potential conditions. At the same time, developing the ergonomic research and its interfering with the practice activity regarding labor projection the connection between problems regarding the ergonomic factors of the activity's efficiency is being made.

The transition from a goods production economy to one based on data networks needs massive transfers of power and partially explains the modern transshipment for the wave of financial and industrial reorganizations throughout the shipping world, bringing forth new leaders, while the companies try to adapt themselves to the newly emerging imperatives.

There are two basic modern transshipment premises upon which this study is founded. First, although the majority of utilization studies has dealt with items such as a piece of industrial equipment, a pharmaceutical product, or a chemical fertilizer, this study assumes that similar examinations can be accomplished using more conceptual subjects, such as management concepts and practices. This assumption obviously is shared by others who have attempted to trace the diffusion of this type of phenomenon.

there is a need to more completely analyze the entire knowledge flow system. Investigations of this nature conceivably could begin with our understanding of the creative process of man and extend into various aspects of the epistemology of management and organization. Unless the knowledge developed is scientifically valid and predictive, there is little virtue in its efficient utilization.

Another trend has appeared to the level of human resources solutions and consists in a profound integration of this with the ERP systems (Enterprise Resource Planning) of the companies. So, there has been developed specialized modules, with are perfectly integrated to IT systems. The gathering of this application with the ERP system is used especially for the wage payment, determining a great level of promptness in realizing the financial and informational processes.

The comparative advantage theories suggest that each region should produce according to its endowments. Factor endowments and technology, which determines the relative opportunity costs, are the main driving forces behind industrial concentration. The Ricardo model emphasizes the differences in labor efficiencies while the Heckscher-Ohlin model emphasizes the differences in factor endowments.

These theories suggest that with constant return to scale and perfect competition, the economic activities should be evenly distributed in all relevant regions if there were no endowment differentiations.

Working in a team with people of different backgrounds involves a lot of arguments and requires increased flexibility, tolerance and openness. It asks for some efforts to understand the other's points of view and of course, the effort to make compromises.

If managed well, though, the competences of different team members can complement each other and can produce excellent results. Intercultural teamwork can be a deep mutual learning experience for all team members, as well as a source of mutual support.

Discussing and finding a balance between different perceptions, opinions and experiences increases the chances of finding an approach that will be useful for the company.

The powerful connection among human capital, salaries and productivity is clearly reflected in macroeconomic estimations, comprising total income as well as the externalities from human capital. Besides this quantitative dimension, the quality of education is equally important in matters of productivity although research has not managed so far to produce an instrument of measurement as far as these aspects are concerned.

### MARITIME HUB FLEXIBILITY: PROMOTING AND GROWING

Also, developing the interdisciplinary researches from the maritime hub flexibility's field, promoting and growing these type of researches, enforce the reputing into good use deferent's participant sciences dimensions at maritime hub flexibility's foundation and its systematic connections.

Figure 1. Container Transshipment (<http://www.mantrana.in>)

In these conditions, the normal and justified modern shipping interconnections's preoccupation for the maritime hub flexibility appears, and the empowering maritime hub flexibility research acquires a special importance for the implication in creating the efficient putting into good use the human potential conditions.

At the same time, developing the maritime hub flexibility research and its interfering with the practice activity regarding labor projection the connection between problems regarding the maritime hub flexibility factors of the activity's efficiency is being made.

Thuse modern universe of electronic maritime hub flexibility is accessed and exclusively intermediated by the human operator, always in charge of updating/suppressing ambiguous information relating to maritime hub flexibility.

### EMPOWERING MARITIME HUB FLEXIBILITY

There is a climate of trust and encouragement of expressing ideas for empowering maritime hub flexibility. In a group, the lack of trust is based on the fact that the members do not know the role of the others. If someone asks questions in a group, he is perceived as a group cracker. In a empowering flexibility team, members work in a climate of trust and are encouraged to express their ideas and to ask questions.

The empowering of maritime hub flexibility is a complex and continuous process. The intricacy of such procedure stems from the chained series of learning sessions and the aspiration towards improving oneself:

- direct training at one's workplace under the supervision of one's manager
- taking part in classes organized by one's institution or in specialized training centers
- involvement in special programs of self improvement followed by periodical session of assessment and evaluation
- taking part in specialization programs in both national and foreign academic institutions.

The present informational explosion is characterized by the simultaneity of several phenomena that the organization must confront with:

- rapid growth of the information stock;
- the setting up of unparalleled networks that facilitate access to information;
- the development of some very powerful means to process information (supercomputers).

Nowadays, the organizations are confronted with more than obvious technical realities: the accessible information stocks are growing exponentially, in direct relation with a market of adequate demands.

The beneficiaries of the information, research and development results are firstly the members of the entities, who increase, thus, their chances of professional success, then the organizations that take advantage of the exploitation

Knowledge, information and communication are new factors of development, while the industrial speed of changes is determined by a global factor, also called the technical and scientific revolution. Now, knowledge is the most important strategic resource of material wealth and social development, and the computer is the technical symbol of change

Thus the maritime hub flexibility progress, as analytical process in the life of an organization, cannot exist without its own documentary base (valuable books, newspapers and magazines in all languages), without the controlled access to the electronic information resources resident on the Internet, without the dialogue permanently institutionalized between experts, members of similar organizations.

# RETURN DEPENDENCY SWAY BY FREIGHT FLUCTUATION AND QUANTITATIVE AND QUALITATIVE INSURANCE

Mihail D. Dinu Laurentiu, Free International University of Moldova, Chisinau

Paul Coserin, Free International University of Moldova, Chisinau

Tabacaru Dumitru S., Free International University of Moldova, Chisinau

## ABSTRACT

The applications of freight fluctuation to the return dependency upon shipping profitability allow producers to supply new and flexible services that are cost-competitive with conventional mass, standardized and rigidly packaged options. Technology gives suppliers the flexibility to react to market demands and the capacity to combine it with other suppliers to provide new combinations of services and improve the return dependency upon shipping profitability effectiveness.

Today's worldwide shipping climate is characterized by hard competitions for taking hold of maritime markets, by professional rivalries that arouse the spirits and by excessive personnel mobility as per the invisible front of strategic information, that information which can eliminate the competition for ever.

**JEL:** L92, O18, R41.

**KEYWORDS:** return dependency, shipping profitability, freight fluctuation, unitary structure, risk insurances.

## INTRODUCTION

This return dependency upon shipping profitability analytical solution is characterized by a unitary structure. It combines conventional statistical methods and artificial intelligence to promote company management of insurance which comprises quantitative results and qualitative hypotheses. Return dependency upon shipping profitability is one of the many cases in which technology may be helpful in managerial.

In their return dependency upon shipping profitability, the nature and the type of relations among the persons engaged one way or another in the action, process or operation that they need to be informed about, influence the use of information. Their analysis, assessment is not just a scientific step, it is also a socio-political process, where the purpose and the intensity of the interactions between those implied govern the way in which the information is generated, transformed and used.

Taking into account the structural systems encountered within the return dependency upon shipping profitability, we are inclined to think that (when dealing with the synergetic forces of an enterprise) economic intelligence can be deemed their nucleus or at least their decisive factor. It is known that in the confrontation between the market's forces and in order to develop efficient and competitive activities, the internal forces of an enterprise (namely the human, material and financial forces) and the way in which they are exploited have an important role, phenomenon which in the literature is called "the synergy of the enterprise".

Given the fact that, conceptually, the policy of distribution is regarded as a specialized policy of commercial forms which refer to activities of locating the logistical operations, choosing the intermediary channels, locating the selling points, establishing the prices and the specific advertising activities, they form a process of major importance. Such an approach emphasizes the fact that the return dependency

upon shipping profitability as being used in the process of distribution should be involved not only because of the variety and volume of skills and techno-commercial knowledge, but also because of personal qualities.

### RETURN DEPENDENCY UPON SHIPPING PROFITABILITY

The return dependency upon shipping profitability cost and the time constraints involved in a risk analysis are very important elements in the shipping decisions. The major advantage of risk analysis is that it enables us to attack more difficult problems and to make decisions we wouldn't have felt competent to make.

Rate of Return (RR):

$$RR = \sum_{j=1}^N \frac{\sum_{i=1}^N B_{ij} - \sum_{j=1}^{N1} C_{ij}}{(1 + 0.01R)^{i-1}} = 0 \quad (1)$$

where the equation (a polynomial of (n-1) degree) is solved by successive approximation for the range - 20% to 100%. R is the discount rate the project in years.

The applications of freight fluctuation to the return dependency upon shipping profitability allow producers to supply new and flexible services that are cost-competitive with conventional mass, standardized and rigidly packaged options. Technology gives suppliers the flexibility to react to market demands and the capacity to combine it with other suppliers to provide new combinations of services and improve the return dependency upon shipping profitability effectiveness.

A minimum threshold of risk reserve can be obtained also using the inequality of Cerbasev:

$$P(|Y - M(Y)| < \varepsilon) \geq 1 - \frac{D^2(Y)}{\varepsilon^2}$$

Taking  $\varepsilon = t\sigma = R$  where  $\sigma^2 = D^2(Y)$  is obtained;

$$P(|Y - M(Y)| < t\sigma) \geq 1 - \frac{1}{t^2}$$

Because  $\{Y - M(Y) > R\} \subset \{|Y - M(Y)| \geq R\}$  results

$$P(Y - M(Y) > R) \leq P(|Y - M(Y)| \geq R) = 1 - P(|Y - M(Y)| < R) \leq 1 - \left(1 - \frac{\sigma^2}{t^2 \sigma^2}\right) = \frac{1}{t^2}$$

Taking  $\alpha = \frac{1}{t^2}$  a probability of risk accepted, results:

$$P(Y - M(Y) > R) \leq \alpha$$

Return dependency upon shipping profitability has moved the affairs towards a knowledge-based shipping economy. More than ever before, access to up-to-date information and knowledge, together with the motivation and skills to use these resources intelligently on behalf of oneself and the community as a

whole, are becoming the key to strengthening Europe's competitiveness and improving the employability and adaptability of the workforce.

Redefining the place and the role of return dependency upon shipping profitability in the present European economy triggers the characterization of the level and evolution of the macro economy of this shipping sector independently and in interaction with the other branches and sectors of activity as per the considering of freight fluctuation in terms of efficiency and effectiveness.

### **DECISION-MAKERS TO EXPLOIT THE OPPORTUNITIES AS PER THE RETURN DEPENDENCY UPON SHIPPING PROFITABILITY**

The use of information within an organization allows the decision-makers to exploit the opportunities, taking into account the organizational constraints among which the most important would be the need for information received in due time.

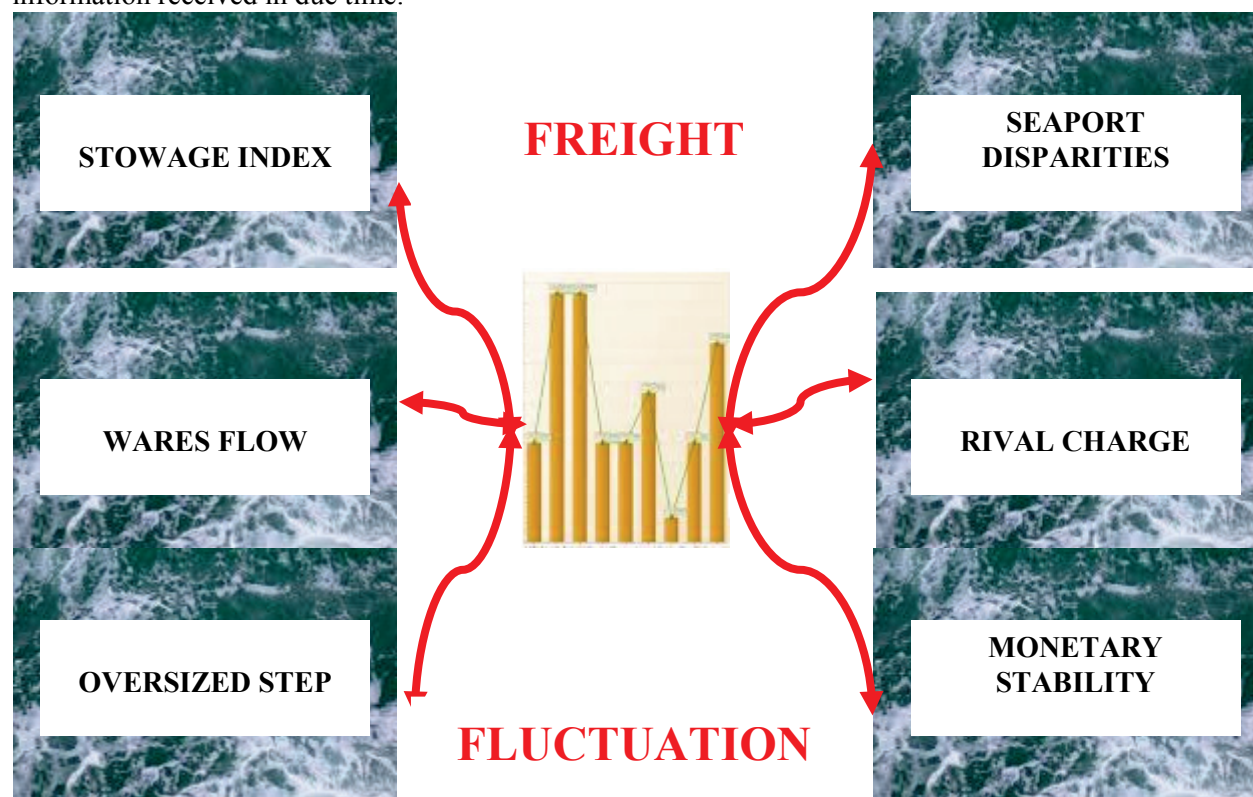

Figure 1. Freight fluctuation intercorelated dependency variables

Given the fact that the contribution of return dependency upon shipping profitability to the economic growth becomes more and more obvious, the study of shipping modernization is extremely important. Both the trade theory and economic geography literature suggest that industry characteristics affect geographic industrial concentration. Heckscher-Ohlin model finds that if differentiation in factor endowments exists between regions, the industries with intensive use of some endowments would be concentrated in regions that are rich in these factors. We take labor and technology intensities as candidate factors that affect geographic industrial concentration.

The moral hazard is given by the fact that an insured person can actuate to develop the probability of producing the insured event. Then, the moral hazard appears when the individuals have certain control over the loss of probability or magnitude, but the modifications of this control are not observed by the

insurer and not affect the risk premium. Under these circumstances there are incentives for super – ensuring. This need doesn't appear under an excessive covering with one policy, but may involve multiple policies with different companies.

No matter if the moral hazard exists or not, a market formed of many individuals who change from the point of view of risk sources, but who cannot be identified systematically in individual way by the insurer, must confront themselves with the same opportunities of the contract and with the same bonuses and must choose the same covering.

### **MONEY SPINS THE SHIPPING AROUND**

Correctly used, information may lead to avoiding cases where physical strength or money power are resorted to, being also persuasive for those holding it, regardless the other's conscious interest. Information is power of the highest quality. Today, computer network allows the access of organizations to a large number of information, and also the access of employees to data about them or their costumers.

This happened as a result of rapid development of computer's technologies, on one hand, and the decrease of its price on the other hand, influencing also its introduction in every tourism activity.

The potential benefits of controlling the freight fluctuation and its return dependency are as follows:

- improved ability to sustain competitive advantage of an organization;
- immediate results in solving organization-wide problems;
- improved organizational productivity in delivering services to clients;
- development and constant improvement of competitive long-range service and technology strategies;
- improvements in the quality of an organization's work force, through capacity building and up training;
- stimulation and motivation of employees;
- formalized knowledge transfer system can be established (best practices, lessons learned);
- improved capture and use of knowledge from sources outside the firm.

Regarding this, the applications used have to contain a number of specific functions, for example: for the evaluation of the employees, for administration of the professional training, etc. Also, specialized applications are used for the recruiting process and it can contribute to a substantial reduction of the costs involved.

The capacity to fulfill an organizational task or an equivalent one, the difference between two stages or forms of uncertainty, before and after a message has been received, the degree to which a system variable depends on or is constrained by another – all this, undoubtedly, represents – information.

In this context, the IT applications in the educational system represent a dynamic, fully extended field, a main point of interest both for schools and the commercial societies that are active on the education market. Although, up to a certain acceptable extend, the hardware and communication infrastructure exists, as far as high-schools are concerned, the usage of the new IT is under expectancy, people's implication to a more superior level being necessary.

# **INTRODUCTORY ACCOUNTING FINANCIAL ANALYSIS RATIOS INFORMATIVENESS UTILIZING THE 2011 FORTUNE 1000 COMPANIES**

Peter Harris, New York Institute of Technology

Liz Washington Arnold, The Citadel

## **ABSTRACT**

*This study will assess the usefulness of information determined from the calculation of fifteen of the financial ratios taught in introductory financial accounting courses. This paper is assessing whether the financial ratios included in various introductory accounting courses to measure liquidity, profitability, solvency, cash flow adequacy, market strength and other ratios provide useful information relative to the company's position in the fortune 1000 and how it compares to a competitor not included in the 2011 Fortune 1000. This study will assist not only in evaluating which ratios are providing useful information, but will also assist in the classroom in determining what ratios should be emphasized. The study will also include 11 years of descriptive analysis of the company.*

# THE 2011 FORTUNE 1000 COMPANIES AND CORPORATE MALFEASANCE

Peter Harris, New York Institute of Technology  
Liz Washington Arnold, The Citadel

## ABSTRACT

*This study will provide an empirical analysis of the activity of the 2011 Fortune 1000 companies to determine the extent, if any, that corporate malfeasance or unethical behavior is associated with each company in the last 11 years. The study is providing data relative to “unethical behavior” and company success. The study will also provide 11 years of descriptive analytical information for these companies. Sources used for this study include the SEC’s Electronic Data Gathering and Retrieval (EDGAR) databases for company submission of financial statements and restatement of financial statements included in each company’s annual report and the SEC’s Auditing and Accounting Enforcement Releases (AAERs). This study also utilized publically accessible news media to retrieve information. This study adds to the contemporary accounting literature by providing information as to the amount of malfeasance, if any, that is associated with our largest company’s.*

# ASSESSING ONLINE VS FACE TO FACE LEARNING

Kalpana Pai, Texas Wesleyan University

## ABSTRACT

The purpose of this research is to assess whether students in an online class are learning as well as students in a face-to-face class setting. *Previous research comparing learning in online vs. face-to-face settings studies suggests that the learning outcomes of students using technology at a distance are similar to those of students who participate in conventional classroom instruction. The "no significant difference" finding has become accepted as fact in the policy community in particular, where at least some public officials have pronounced that the last college campus has been built. Some of these studies find that in an e-learning environment that emphasizes learner-centered activity and system interactivity, remote learners can outperform traditional classroom students.* This study will add to previous studies in this field about online versus face-to-face learning. The students in my classes have access to the same resources and also take the same test. This study has two parts to it. (1) Assessing the student perception of learning through the IDEA survey questions (teaching evaluations) and (2) Using the actual questions on the final exam to examine whether online students do worse or better than face-to-face students. The participants are students from the Principles of Economics classes that I teach – only when I teach both the online and the day-time sections. The findings will help understand students' perceptions about learning in one environment vs. the other as well as actual comparison of student answers across the two environments will reveal any gaps in learning that can be addressed in future instances of teaching the class.

# AN EDUCATION IN LEADING A COLLEGE: GROWING IN TURBULENT TIMES

Gurram Gopal, Elmhurst College

## ABSTRACT

### CASE DESCRIPTION

Elmhurst College is a small liberal arts college located in Illinois that provides undergraduate and graduate programs in liberal arts as well as professional programs in business, nursing and education. The school faced a serious budget crisis in 1971 and then President Dr. Frick implemented stringent financial measures including the termination of some tenured faculty. After a period of steady growth the school faced another financial crisis in 2003. This paper describes the approach taken by Dr. Cureton, the President, to get all stakeholders involved in charting and executing a course that enabled the College to survive and become stronger. The paper highlights the role played by a President of a small college in building bridges with the faculty and developing equity with this key constituency. The paper concludes with a reflection on the current situation facing the College, with a new President who has to manage a serious set of challenges in the current economic downturn.

**KEYWORDS:** managing not-for-profits, higher education, stakeholders, enrollments, college operations

### CASE INFORMATION

Elmhurst College is a small, private liberal arts college located in Elmhurst, Illinois, affiliated with the United Church of Christ. It was founded in 1871 by Carl Frederick Kranz, a minister and teacher who arrived from his native land Germany on December 6<sup>th</sup> and stepped off a passenger train in Elmhurst, accompanied by 14 students. Kranz, who spent his formative years in an orphanage, worked as a tutor for a wealthy family and studied theology at the University of Breslau. He and his students came to Elmhurst from a preparatory seminary in Evansville, Indiana, to establish the German Evangelical Proseminary "to maintain a culture in the wilderness, to provide an educated leadership for the developing communities, and to teach the liberal arts within the context of the Christian faith." The name "Elmhurst College" first appeared on the cover of the school catalog in 1901 (Cutright 1995). The College has grown considerably since then, and currently serves more than four thousand students.

Elmhurst College is registered as a 'not for profit' institution in Illinois and is governed by its Board of Trustees (the Board). The Board is generally composed of thirty to thirty five members. Board members are either alumni of the College, well-known business leaders, or civic leaders. New Board members are elected by other members, with no input or influence from the State of Illinois. Elmhurst College is run by a President who is appointed by the Board. He oversees two distinct constituencies- the faculty who are in charge of the curriculum and the educational component of the College, and the administrative staff (the administration) who are responsible for the administration of the College including recruitment, human resources, finance, facilities management, student affairs, and other activities.

In addition to the large research-driven private and public universities a number of "Liberal Arts" colleges and universities also serve the Chicago-land area. These schools focus more on undergraduate teaching and education than on research and have smaller class sizes than the big universities. Illinois Wesleyan University, Wheaton College, Augustana College, Lake Forest College, Millikin University, North Central College, Dominican University, St. Xavier University, Benedictine University, University of St. Francis, University of Wisconsin-Whitewater, North Park University, Eastern Illinois University, Lewis University, Western Illinois University and Olivet Nazarene University (IL) could be considered in this

category. Of these, Elmhurst College considers Benedictine University, Wheaton College, North Central College, Illinois Wesleyan University, and Augustana College as its peers and direct competitors. In athletics, EC teams, nicknamed the Bluejays, participate in the Division III College Conference of Illinois and Wisconsin, commonly referred to as CCIW.

When Ivan Frick became president of Elmhurst College in 1971, costs were rising faster than income in American higher education and at the College. A sudden splash of red ink at the College produced a major financial crisis for the administration. Dr. Frick moved quickly to cut costs and promote growth. A conservative manager, he focused on expenses and by 1974 eliminated the red ink. When Dr. Frick left office in 1994, the endowment stood at \$35 million, having grown 46-fold during his stewardship. During the Frick years the College saw a number of capital additions and improvements across campus including the Buehler Library, the Computer Science and Technology Center and a nuclear accelerator. The Old Main building was renovated and achieved a spot on the National Register of Historic Places. A new physical education center seated 2,000 Bluejays devotees. During President Frick's tenure the College made significant advances in academic programs, including the establishment of the Center for Business and Economics, a Department of Computer Science and Information Systems, and an accelerated management curriculum for part-time working students- the Elmhurst management Program or EMP. Looking back at the early years of his presidency, Dr. Frick said, "We needed to restore our financial equilibrium to enable us to advance our academic program with some assurance that this was a place with a future." However, in the effort to cut costs Dr. Frick fired some tenured faculty, which created significant friction between the faculty and the administration. Subsequently the faculty had developed a deep mistrust of administration's actions, which has continued to exist to the present time.

Elmhurst College experienced a major change in leadership when Dr. Bryant L. Cureton was appointed as the College's twelfth president on July 1, 1994. Over the next year he worked with faculty, staff, and the Board members in creating a future vision of the College. A five year Action Plan, subsequently called Action Plan I, was developed to create and enhance the following:

- Synergy between liberal learning and professional preparation.
- Vigorous campus intellectual and cultural life.
- A stable, strong, diverse, and successful student community.
- Facilities and resources to support long-term strength.
- Broad external awareness and respect.

Significant progress towards these goals drove the development of a second Action Plan (Action Plan II) to continue the enhancements of the College. Endorsed by the Board of Trustees in March 2001 this plan focused on the following:

- Fulfilling the Potential - Extending and completing the work of Action Plan I
- Creating Memorable Learning Experiences - Bringing the academic and intellectual life of the College to a new level of excellence, enriching the educational experience of students and advancing the College's academic reputation.

After running operating budget surpluses between 1999 and 2001, the College had a deficit of \$344,000 in 2002. Based on preliminary data, the College had run a deficit of \$499,000 in 2003 necessitating a special draw on the endowment that had to be approved by the Board (**Error! Reference source not found.**). Clearly this was a time of crisis. It was apparent that change was imperative and status quo would result in larger deficits and compel the Board to take drastic action. He proposed a radical idea-increasing spending to drive enrollment growth while exercising strict discipline and controlling the discount factor. Dr. Cureton created the blue print for Action Plan III- a successor to the previous two Action Plans, to move the College forward, through the crisis. The key elements, as he sketched them out, were as follows:

- Robust recruiting through the creation of a new position of an Admissions Officer and revising the strategy for recruitment.
- Disciplined financial aid and integration of recruiting and financial aid
- Efficient new program development
- Requiring business plans for all initiatives
- Watchful eye on costs
- Refocused fundraising
- Support for innovation

The College drew significantly less than what was projected from the endowment in 2004 and 2005. The school effectively turned an operating profit in 2006, and allowed it to allocate some money to a special projects fund to execute projects that were not in the original budget.

After President Cureton's retirement in July 2008, Dr. Alan Ray took over as the new President of Elmhurst College. His primary mandate was to increase the endowment and alumni donations, secure funds for major capital projects. However, the global economic downturn that started in 2007 and intensified in 2008 and 2009 had started to affect Elmhurst College. The Endowment had suffered losses of nearly 30% and was near \$90 million.

The new President sent notice to faculty that the decision on salary increases for the upcoming year would be delayed until September, by which time the tuition revenue picture would be clearer. A major revision of the General Education curriculum, spearheaded by the Dean of Faculty and Vice President of Academic Affairs, passed by just one vote in Spring. The College was waiting to see what direction the new President would chart for the College, and how he would sell it to the various constituencies including faculty.

## **BIOGRAPHY**

Dr. Gurram Gopal is the Theophil W. Mueller Endowed Chair, Fulbright Program Adviser and Associate Professor of Business Administration in the Department of Business at Elmhurst College. His recent publications on global sourcing, data synchronization, and customer relationship management in the logistics industry, and case studies have appeared in the Supply Chain Management Review, the International Journal of Supply Chain Management, and Annual Advances in Business Cases. He received the Fulbright Scholar Award in 2011 and spent 2011-2012 at Galway Mayo Institute of Technology in Ireland. During the past five years he has focused on studying sustainable business practices and has taught a First Year Seminar course titled "Local Choices, Global Effects."

# MEETINGS, INCENTIVES, CONFERENCES AND EXHIBITIONS AS A TOURISM DEVELOPMENT STRATEGY IN MAURITIUS

Vanessa Seebaluck, University of Technology Mauritius

Perunjodi Naidoo, University of Technology Mauritius

Prabha Ramseook-Munhurrin, University of Technology Mauritius

## ABSTRACT

*The intent of this study is to assess the potentials of Meetings, Incentives, Conferences and Exhibitions (MICE) market as a tourism development strategy in the small island of Mauritius. It is an area worth investigating as scant research has been carried out on this topic. Most of the research conducted on the MICE sector has revealed its economic contributions, however little academic attention has been given to this industry in small islands. Being a sector that is mostly consumed by the corporate sector, it represents not only benefits but also challenges as corporate MICE clients are very demanding and have specific requirements. The study elaborates on the characteristics of the MICE market highlighting the contributions and challenges of MICE tourism in Mauritius. The study was both primary and secondary in nature. Primary data was collected through semi-structured interviews with key informants involved in the MICE sector.*

**KEYWORDS:** Events, MICE, Incentives, Conferences, Business tourism

## INTRODUCTION

Mauritius is a tropical island in the Indian Ocean, strategically positioned at the intersection of Africa and Asia, at 855 km east of Madagascar (Bramer Asset Management, 2010) with a population of 1,3 million (CSO, 2011). Mauritius has a well established reputation as an international beach resort destination. This reputation is in jeopardy (AHRIM, 2012) since it has not performed at its peak within the past few years. This is caused by the decline in the number of tourists from its traditional European markets. This decline was mostly the result of the Euro zone crisis and the result of direct competitors such as Maldives, Seychelles and Sri Lanka (AHRIM, 2012). While Mauritius recorded a negligible increase in its number of international tourist arrivals in 2011 compared to 2010 (+3.2%), growth was higher in the competitor destination, with +18% for Maldives, +11% for Seychelles and +31% for Sri Lanka. As stated by AHRIM (2012: vi), *these trends will most likely lead both Maldives and Sri Lanka to reach the one million mark in tourist arrivals this year causing Mauritius to lose its leading position in the Indian Ocean region for tourist arrivals by 2012 – a fact that has never been experienced before*. Therefore, to sustain its tourism industry as one of its major economic pillars, efforts need to be carried out to remain competitive.

Strategies such as marketing Mauritius as a comprehensive and diversified destination have to be developed to further satisfy the changing needs of international tourists. As a diversified industry, tourism generates a reliable source of economic development for many developed and developing countries (Mazumder, 2011). On a global basis there is an unprecedented interest in holding conferences in attractive and quality surroundings. Mauritius already possesses these qualities therefore this can significantly add value to its tourism portfolio by further developing its MICE industry. As stated by the World Travel & Tourism Council (1999), to make Mauritius a strong brand, it should promote other tourism products like medical tourism, cultural tourism, ecotourism and event tourism. Diversification of tourism has the potential to add value to a destination's product offering to attract tourists. However, it also represents a challenge for the local stakeholders on various fronts.

This study was initiated to investigate a topic which is yet unexplored in small island destinations. The aims of this study are to examine the characteristics of the MICE sector in Mauritius, its contribution to tourism industry and the challenges involved in MICE tourism.

## LITERATURE REVIEW

### The Mice Industry

The MICE industry has grown over the past decades. It is not only known as a service industry but also as one of the fastest growing sectors of the tourism industry (Dwyer & Forsyth, 1997; Hing *et al.*, 1998). This industry combines different sectors such as trade, transport, travel, leisure, accommodation, food and beverage, venues, information technology and finance. Described as a multifaceted industry (Dwyer & Mistilis, 2000), the MICE acronym consist of the meetings, incentives, conferences and exhibitions (Dwyer & Mistilis, 2000; Campiranon & Arcodia, 2008; Getz, 2008; McCartney, 2008; Rogerson, 2012; Gibson, 2012), which in most destinations fall under the umbrella of the events industry (Getz, 2008).

As defined by the UNWTO, a *meeting* is a structured event which brings people collectively to argue a topic of common interest (UNWTO in CIC, 2011). Meetings can be held for commercial or non-commercial reasons but is mostly generated by the corporate sector as its high yielding, with millions of meetings held all over the world on a daily basis (Campiranon & Arcodia, 2008). What makes a meeting qualify as part of the tourism business is that it engages in some of the services of the tourism industry, and is generally held away from the location of the organization running it (Davidson, 1994). The terminology *meetings* can also be used to cover a wide spectrum of events such as conference and seminars not containing an exhibit component (Seekings & Farrer, 1999; Fenich, 2005).

*Incentive* travel is a universal management instrument that uses an outstanding travel experience to reward participants for improved levels of performance in support of the organizational goals (SITE, 2013). It can be defined as an all expenses paid travel (Rogers, 2003) which is used by organizations as a motivational factor to encourage the productivity and performance of its employees in meeting the desired goal of the organization in terms of sales and that of its business partners in terms of support (Campiranon & Arcodia, 2008). It targets business groups where the host destination promotes potential opportunities it has to offer to businesses in terms of discount prices and the buying power it offers to its corporate buyers. However, with the complex nature of this component of the MICE, it is becoming increasingly difficult for corporate clients to decide which destinations should be chosen for their 'incentive'.

*Conferences* are participatory meetings that are designed mainly for the purpose of discussion, finding and sharing information, solving problems and consultation. Conferences are usually limited in time and have specific objectives. Similar to what meetings are, conferences can be defined as (CIC, 2011) *an event involving 10 or more people for a minimum of four hours during one day or more, frequently held outside the company's own premises*. In most conferences, attendees have two main objectives, especially if they are attending conferences abroad. First that of attending the conference in itself and second that of making the most of the destination or venue in which the conference is being held.

*Exhibitions* bring suppliers of goods and services together with buyers, usually in a particular industry sector (Allen *et al.*, 2002:15). Exhibitions are also known as *expositions*, because they are intended to bring together different suppliers in an environment where they can display and promote their products or services to the attendees on the show floor. The main focus of these events is the business to business relationship (Fenich, 2005) for either promoting new products or gaining new clients (Jurisevic, 2002).

### Economic Issues

The MICE sector brings several contributions to the tourism sector and the destination. The economic impacts of the MICE industry especially that of events have been addressed by many researchers in the field (Gartell, 1991; Dwyer & Mistilis, 1999, 2000; Sherwood, 2005; Getz, 2005, 2008; McCartney, 2008; Campiranon & Arcodia, 2008; Ford, 2011; Li Ting & Zheng Gu, 2011; Gibson, 2012; Rogerson, 2012). MICE is characterized as having the *Three Highs* – *High growth potential, added values and beneficial innovation*. It also offers *Three Larges* – *large output, opportunities for employment and industry associations*; and *Three Advantages* – *advantages over industries in human resources, technological know-how and the efficient utilization of resources* (Janakiraman, 2012). Attendees of MICE activities are known as high spenders that meet the needs of yield driven tourism strategies (Braun, 1992). Business tourists spend more, not only on hotels and restaurants but even on leisure activities such as visits to retail and local attractions such as museums and theaters' (Clark, 2004). In fact they have been found to spend three times more than an average leisure tourist (Campiranon & Arcodia, 2008). This in return generates foreign exchanges and creates job opportunities (Dwyer and Mistilis, 1999; Bowdin *et al.*, 2001; Page, 2003).

### Government Support

Governments support the MICE industry because of its economic benefits (Dwyer, 1999; Dwyer *et al.*, 2000). MICE tourism attracts invaluable business to a region and in return brings high returns to local economies, both directly and indirectly (Davidson, 1992; Lawrence and McCabe, 2001; Bowdin *et al.*, 2001; Campiranon & Arcodia, 2008). The economic multiplying effect makes it a viable and lucrative industry. However, studies have shown that Governments can also bring their support to the MICE sector through other ways such as treasury loans, investment incentives, tax concessions, training programs, promotional and marketing campaigns (Dwyer & Mistilis, 1999). Countries like Singapore, Hong Kong and Indonesia have developed world class facilities due to government support in many ways (Dwyer & Mistilis, 1999). Furthermore governments play important roles also in promoting training and accreditation standards (Dwyer & Mistilis, 2000). However, the challenge for governments is that they are required to invest large sums of money which they would rather spend on their priority agenda item. The MICE sector is not always on the priority list of governments who prefer to inject funds into national services such as health.

### Infrastructure, Transport And Access

The setting up of infrastructure required for MICE need to be well-planned and executed so that positive attributes can benefit the destination (Ranchold, 2004). The planning and implementation of infrastructures such as transport, Information Technology (IT) and purpose built conference and exhibitions venues should be adequate to support the demand for MICE. For example, a total of 1197 exhibition halls worldwide have hosted no less than 30,700 exhibitions in 2010 alone attracting some 2.8 million exhibit companies and over 260 million visitors (UFI, 2011). The available space for holding exhibitions has been on the increase since 2006 with a forecast of an addition of 198 projects for venue building worldwide. The MICE sector is experiencing a rise in demand (Getz, 2008) and in order to supply adequately the industry, infrastructure development is essential.

### Human Capital

Many destinations' economic and human resource progress is linked to opportunities in job creation and human resource development that the MICE industry offers (Hiller, 2000). This can also contribute to satisfy the sustainable development agenda of governments in terms of alleviating poverty while engaging locals in employment. Skills can be trained in three ways through MICE: skills for the service industry;

marketing and in environmental management (Solberg & Preuss, 2005). These skills need to be put to good use so as to become or remain competitive in an industry that increasingly faces competition (McCartney, 2008). To remain competitive, the MICE industry needs to recognize people as a core asset (Weber & Ladkin, 2003). Skills in areas such as management and marketing have been seen to be on the scant side in regions such as Asia Pacific (Dwyer, 1999) but human resource developments in these areas have been well under way. Another concern in the MICE industry is employee retention as organizations fail to recognize employees as *resources and not just part of the production process* (Hillier, 2000: 447). The tourism industry is highly labor intensive and demands a higher percentage of people to work at operations and front line levels. These same jobs are the key ingredient to quality service and improved service standards (Torraco & Swanson, 1995). The dynamism of the MICE industry offers a range of job opportunities that could contribute to the decrease of unemployment rate (Hobson, 1996). However the industry needs to also develop a code of ethics to ensure that the industry conforms to labor laws (Dwyer & Mistilis, 1999).

## METHODOLOGY

The study made use of primary and secondary information. It adopted a qualitative approach to primary data collection to explore the MICE industry in Mauritius. Face-to-face interviews were conducted with 5 Key Informants from the MICE sector including the Destination Marketing Organization, the Mauritius Tourism Promotion Authority (MTPA). The interview was semi-structured in nature and consisted of a list of pre-set questions by the researcher and further questions were asked during the interviews to probe into topics emerging from the responses. Interviews were conducted in the month of March 2013 and lasted for around 30 minutes. Secondary data consisted of analyzing information related to MICE on the website of the MTPA.

## RESULTS AND DISCUSSION

Mauritius is placing special interest in the MICE sector as a component of the tourism industry while promoting itself as a high profile destination. The interviews reveal that the MICE product is targeted at international tourists and the trend for the average length of stay for MICE tourism is 3 nights including 1 Gala dinner and 1 day trip. The most attractive MICE segment for Mauritius is incentive travels as they can bring significant economic revenues as they are high spenders who require up-market products and services. Thus, the destination needs to propose exclusive packages which no one has experienced before and constantly surpass itself to create a *waow* factor or unique experience, mixing business and pleasure (Davidson, 2003). MICE delegates in fact represent a typology of tourist that destinations covet as they represent high quality visitors because of their high spending powers (Campiranon & Arcodia, 2008). This spending power adds onto the economic impact that is derived from those attending events in the MICE sector as they spend on hotels, restaurants, retail, attractions (Clark, 2004) and other services.

It is also acknowledged that business tourists pay more as the leisure tourists for the same facility, because business travel often need better quality services or extra specialist facilities, compared to leisure tourists (Swarbrooke and Horner, 2001). However, respondents note that with the global economic crisis, budgets tend to be more restricted. To be competitive in MICE tourism, destinations need to possess appealing characteristics for hosted buyers who are generally intermediaries or corporate organizations involved in organizing incentive travels, conferences, meetings or events. Mauritius is perceived to be well-positioned in the MICE market and a respondent emphasized that *MICE tourism in Mauritius is not amateur and we are used to the specificities of the industry which requires attention paid to details, long-term planning and several components of industry plan and work together*. A MICE event requires the successful collaboration of various suppliers such as example, IT, audiovisuals, décor, entertainment, attractions, transport, accommodation, food & drink, and the provision of infrastructure and support services. For a country aspiring to become a destination for events and conferences, these elements must

be present (Shone; 1998). Mauritius is promoted as an exclusive destination with a set of key attributes which makes it a competitive MICE destination with a unique selling proposition. The destination possesses a high class image, hospitality of local inhabitants, service quality in hotels, creativity of human capital to provide unique experiences for hosted buyers, luxurious accommodation, fine gastronomy, mix of cultures, high class conference amenities, varied coastal and inland activities, state-of-the-art telecommunications infrastructure, safety and security and value for money which are also promoted on the website of the Destination Marketing Organization, the Mauritius Tourism Promotion Authority (MTPA), [www.mtpa.mu](http://www.mtpa.mu), which is the national organization under the aegis of the Ministry of Tourism and Leisure responsible for promoting Mauritius abroad as a tourism destination. Mauritius is identified as a MICE-friendly destination and the website states that Mauritius:

*possesses all the key ingredients that are required for successful meetings, incentives, conferences and events. The quality and variety of accommodation, the attention to detail in service delivery, state-of-the-art conferencing venues, and the vast number of additional activities on offer all guarantee genuine value for money.*

However, on the MTPA's website, the MICE market is referred to as the Meetings, Incentives, Conferences and *Events*. Events has replaced the traditional terminology *exhibitions* since destination marketers and travel intermediaries perceive that the latter is not considered appropriate as international MICE tourism tends to be characterized by events rather than exhibitions which is perceived by the international travel business market as an obsolete terminology at destination level. The MTPA works in close collaboration with local hotels and Destination Management Companies to promote the MICE tourism product to an attendance of major outbound markets with international hosted buyers in international fairs. The two main MICE international fairs which Mauritius participate in are the Incentive Travel and Meetings Association (ITMA) and the IMEX (the worldwide exhibition for incentive travel, meetings and events). As compared to other exclusive beach-resort, competitors in the region such as the Seychelles and Maldives, Mauritius has well-developed infrastructure as well as ease of access to inland sites which makes it a suitable option for a MICE destination.

As opposed to Mauritius, these small islands are characterized by limited levels of development in terms of infrastructure to host large events such large conference venues, a lack of hotel clusters to accommodate delegates for major events, limited road infrastructure connecting strategic locations and limited logistics for example in terms of large vehicle fleet necessary for transporting tourist groups simultaneously. Mauritius being a bilingual country (French and English speaking) it has no difficulty in providing professional translators which are essential in hosting such events. A respondent also stated that delegates often travel with their spouses and the hotels in Mauritius provide a variety of in-house activities for the former as well as ease of access to sites of interest outside the hotels.

Despite being a small island, Mauritius has adequate capacity to meet the infrastructure and logistics requirements for hosted buyers. Moreover, the country benefits from the only state of the art conference venue in the Indian Ocean, namely the Swami Vivekananda International Convention Centre which can hold 3,500 individuals. It is located around 15 minutes from the capital city, Port-Louis and around 45 minutes from major clusters of hotels in the North and the West coast. For very large events, delegates are accommodated in hotels located mainly on the north and west coasts of the island and are then transported to the conference centre. However, in Mauritius, there is no one stop shop to accommodate the full spectrum of services for large events, hence needing the collaboration of outsourced suppliers which triggers the multiplier effect. On the other hand individual hotels may hold their own meetings and conference as many of them have comprehensive facilities including leisure, several restaurant, conference and banquet facilities for around 300-600 individuals and can thus easily hold meetings and conferences within a single location. For MICE tourism, developing a good supply of air travel to meet the demand of the MICE industry is of crucial importance. Hosted buyers would be looking at a host

destination that not only is found in superb setting, but one that is easily accessible. To facilitate access and increase the number of international tourists arrivals, a state of the art airport is under construction at a costs of Rs 11 billion (385 million USD) and should be operational by April 2013 with the provision for accommodating 4.5 million passenger traffic per year which is doubling the figure of the existing airport. The main markets for MICE in Mauritius are Europe mainly France, UK and Germany, and South Africa. It is important to note that MICE tourism is a global market. For example a pharmaceutical company may have its headquarters in London but different branches all over the world.

Hosting an incentive travel in Mauritius would thus entail that the group will consists of employees from different parts of the world. Despite being a long haul destination for Europe its main MICE market, Mauritius has daily flights from Europe and other destinations, thus access is not perceived as a barrier although South Africa remains an important market due to its proximity to Mauritius. MICE consumers would moreover use local transportation systems to move from one area to the and in such cases conditions of roads need to be improved. MICE tourism is highly valued as a catalyst to develop attractions, image and branding at the destination (Piporas, 2005; Getz, 2008; McCartney, 2008) thus creating opportunities for Mauritius to diversify its tourism product as it has long promoted itself only on its exclusive beach resort attributes. The MICE sector has therefore become an important focus for established markets, building on the need to identify and strengthen the strategies that lead to competitiveness (Weber & Ladkin, 2003).

In order not to lose out on the opportunities, business destinations like Mauritius need to incorporate the development of the MICE sector in its Tourism Master Plan with particular attention on how it should be developed taking into consideration sustainability issues as this type of tourism requires hosting a large number of tourists and the development of mega infrastructures. Moreover, there is a lack of statistics on the MICE market in Mauritius and respondents interviewed stated that MICE may have already contributed to around 100 000 international tourists annually. The government needs to provide support to gather statistical information on the industry so that there is a better analysis of demand in relation to supply for better forecasting. Poor industry information can increase the risk of investors being reluctant to invest into the MICE sector leading to stagnation in its development, investment and competition. Moreover, hosted buyers will also be less interested to purchase the product if ever it is lacking in any aspect. In Mauritius a large section of the private sector, namely three to five star hotels have invested in the provision of conference centers as an added product to their resorts.

They are thus able to host banquets and conferences for groups. In these cases much of the activities occur within the hotel premises, with usually an organized day trip outside the hotel. In some cases, conference attendees hire taxis for visits to places of interest such as the Capital city. However, much of the services associated with the MICE trip are consumed within the hotel. Moreover, MICE tourism contributes greatly to the up-market hotel industry, airline companies, tour operators and other suppliers of products and services related to events. However, attendees are often mostly clustered in large resorts resulting in these powerful organizations receiving much of the benefits as well as airline companies and established destination management companies. Thus, the challenge is to ensure that benefits of tourism reach the segment of small and medium tourism enterprises which may represent 95 per cent of tourism sector (Rogerson, 2008; Rogerson, 2012).

Although respondents mentioned that MICE tourism contributes to SMEs such as the local craft market, it is only to a negligible extent since MICE travel is consumed over an average of three nights leaving little room for outside consumption. It is thus important to broaden economic opportunities for locals through the provision of supply chain linkages to incorporate local suppliers to enhance inclusive development (Scheyvens, 2011). Similarly, Mitchell and Ashley (2010) emphasize that linkages with local suppliers can be a successful way in which mainstream tourism businesses can contribute to local development by incorporating small suppliers into corporate supply chains. Holding of MICE requires a panel of people

to make them happen which could lead to an increase in employment. To cater for the needs of the demanding nature of customers that the MICE industry attracts, there is a need for destination to have people with the right skills and drive to work for this industry. Hosted buyers are experienced consumers of MICE tourism and if unsatisfied will not purchase the Mauritian MICE product. As mentioned earlier, skills in areas such as management and marketing have been well developed in regions such as Asia Pacific (Dwyer & Mistilis, 1999) and in Mauritius, human resource development in these areas have also been well under way. A concerning issue is the retention of employees working in the highly labor intensive tourism sector in Mauritius. The MICE industry demands a higher percentage of people to work at operational and front-line levels and in the case of Mauritius, front line jobs are not well remunerated.

It cannot be stressed enough that these same jobs are the key ingredient to quality service and improved service standards (Torraco & Swanson, 1995) for a memorable experience and the possibility of customer retention. There may be various plans to develop new courses either internally, or at national level through Universities, but if the industry itself shows poor management and reward of its human resources, the industry is directly to suffer. There is a growing concern to revise the wages offered, amongst other motivational sources, for the MICE industry and the tourism industry in general otherwise Mauritius may find itself with serious human resource shortages in the tourism sector. Mauritians are looking beyond the local horizons for better job prospects. This brain drain has considerably impacted upon employee turnover figures in the tourism sector where the cruise industry is enticing the hotel employees with higher pay packages and long breaks thus draining the talents of the Mauritian tourism industry.

MICE bring delegates from different countries to the destination and this can create strong positive word of mouth. Mauritius is also in constant contact with the press. For example, Mauritius organizes familiarization trips and press trips to maintain contact with press and for publicity purposes. The destination also holds in-house training with hosted buyer to market the MICE tourism product. Moreover, to obtain greater visibility for MICE tourism, sometimes co-branding efforts are organized with hosted buyers as well as product launching in the destination which reinforces the marketing efforts. Apart from enhancing the image of the destination, MICE can also have other social benefits such as events can be a trigger for Mauritians to revive their culture and show solidarity. In essence, events can become an opportunity to improve social relationships, for strengthening abilities to understand one another and for community wellbeing (Kurtzman and Zauhar, 1997).

## CONCLUSION

This paper has provided the characteristics of MICE tourism in Mauritius. Economic benefits are generated, however it is uncertain to which extent it is indeed contributing to the well-being of the different strata of the community MICE tourism has several potentials in terms of growth, however caution needs to be exercised with regards to the type of infrastructure to be developed taking into consideration the destination's small and fragile environment while at the same time maintaining its small exotic island cachet which is its core tourism asset. Future research could investigate the extent to which MICE tourism is contributing to the local community through economic opportunities.

## ABSTRACT

*This study investigates the current trends in tourism-based leisure activities in Mauritian, a tourism destination. A self-administered questionnaire was used to assess tourists' attitudes on tourism based leisure activities. 200 questionnaires were distributed to tourists on specific sites where tourism-based leisure activities are usually practiced such as hotels, public beaches, special spots for the practice of leisure activities and shopping malls. The results have shown that tourists prefer most leisure activities that are related to relaxation, physical well-being, fun, health and fitness, discovery and the pleasures of eating, drinking and shopping. Moreover the findings highlight the popularity of visits to nature parks and cultural heritage sites amongst business, leisure tourists and those visiting friends and relatives. Tourism-based leisure activities and related aspects were viewed positively by tourists. The preferences shown by tourists in this study can be drawn towards a better promotion of tourism-related leisure activities for Mauritius.*

**KEYWORDS:** Leisure, Leisure activity, Destination, Mauritius

## INTRODUCTION

The tourism product has its core elements which are accommodation, food and beverages and transportation. However there is a need for unique and memorable experiences for tourists. This calls for additional elements within the tourism product in the form of leisure activities (Torkildsen, 2005). With competition from other tourist destinations such as Seychelles, the Mauritian tourism industry is to improve its offer and go a step further from the traditional sea, sun and sand (3S) tourism product (Juwaheer *et al.*, 2003). Moreover the tourism demand in 3S destinations may be changing towards more non-traditional 3S leisure activities with more adventurous and authentic experiences. Tourists look for more unique experiences in leisure activities provided to them at the destination they visit (Lacher & Harrill, 2010). The most important aspect of leisure provision to tourists is about offering a variety of leisure services, facilities and activities so as to put a vast choice before tourists (Torkildsen, 2005). In order to provide leisure activities effectively and bring a good leisure experience to customers there needs to be proper cohesion among the leisure activities offered, the needs of tourists (Lacher & Harrill, 2010).

Mauritius has now become a major tourist destination in the Indian Ocean (Juwaheer & Ross, 2003). In 2010 the number of tourists' arrivals in Mauritius was 934,827 (CSO, 2010) and the contribution of the Mauritian tourism sector to its GDP was 26.5 % (around 77.8 billion Mauritian rupees). Moreover export earnings from tourism constitute about 34% of the total exports earnings for the year 2010. These export earnings are expected to grow to about 40% of total exports by the year 2020 (WTTC, 2010). In light of these figures and given the core economic role of the tourism industry in Mauritius it is important to consider the development and trends in tourism-based leisure activities as an important component of the tourism product which contributes towards the tourists' experience. As the tourism industry becomes more competitive and professional, the tourism product relies heavily on unique tourists' experiences, with more and more demanding tourists (Williams & Buswell, 2003). The aim of the study is to assess tourists' attitudes on the current trend in tourism-based leisure activities in Mauritius with the view to

better promote the Mauritian destination. The paper will also examine the tourism-based leisure activities that are most favored by tourists in the Mauritian tourism sector and not only related to the 3S concept. The paper is organized as follows. The following section provides the theoretical background of leisure, tourism and leisure, and leisure experience. The research methodology and the empirical analysis are presented next, followed by conclusions and managerial implications.

## LITERATURE REVIEW

### Leisure

Leisure has been defined in relation to time, to an activity, to a state of being, to work (Kelly, 2009), to family and social obligations and to necessary activities (Bull, Hoose & Weed, 2003; Torkildsen, 2005). Leisure may mean different thing to each and every individual and their practice of a leisure activity will depend on particular factors such as time, work, disposable income and family obligations amongst others (Bull *et al.*, 2003; Bull, 2009). This illustrates that it is important to know the context and situation in which the leisure activities are being practiced. Venkatesh (2008) stresses that the absence of work obligation, the absence of family and social obligations and freedom from time barriers are essential to be included in the leisure definition. Brasja-Zganec *et al.* (2011) further explained that leisure activities play an important part in the well-being of individuals as they are occasions to meet such needs as building social relationships, having positive emotions and acquire skills.

### The Key Factors Of Leisure

A number of factors leading to personal satisfaction in leisure activities have been identified and which are, amongst others, entertainment, self-development and escape from routine of daily life (Morgan, 1996; Torkildsen, 2005; Brasja-Zganec *et al.*, 2011). While one may undertake leisure activities to escape the pressures of work (Varley & Crowther, 1998; Watkins, 2007), another person may be doing leisure activities for his/her own self-development or fulfilment (Watkins, 2007). According to Varley *et al.* (1998), individuals seek to differentiate themselves outside their working time and also to overcome a sense of meaninglessness. Morgan (1996) identified four important elements that are worth noting: an absence of necessary activities and obligations, following one's own satisfaction, the playfulness aspect of leisure and the social aspect of leisure. Leisure activities have an element of playfulness leading to enjoyment. Playfulness makes leisure fun and sometimes memorable and unique (Bull *et al.*, 2003; Torkildsen, 2005). Games in leisure have both an escapism and self-development aspect. People involved usually interact with each other giving leisure its social dimension (Torkildsen, 2005). When one chooses a particular leisure activity, this choice can be made under influences relating to social needs, that is, being with friends or the family. This enables the person to obtain more enjoyment practicing the activity rather than being alone (Morgan, 1996; Torkildsen, 2005; Brasja-Zganec *et al.*, 2011).

### Leisure and Tourism

Tourism is viewed in terms of its core components which are accommodation, transportation, food and beverages and the tourism-based leisure activities at a destination (Eccles & Costa, 1996; Williams *et al.*, 2003; Cheung, Law & Lo, 2004). Therefore tourism can be viewed as the consumption of leisure activities together with travel, accommodation and food and beverages. Moreover it is a fact that more and more tourism experiences are based on leisure activities or have leisure activities integrated into them (Veal, 2002; Williams *et al.*, 2003). These days leisure takes the form of travel and tourism (Venkatesh, 2008). Taken from a psychological perspective leisure and tourism come from the need to go away from the daily routine and stress that everyday life brings (Honggen *et al.*, 1996; Varley *et al.*, 1998; Venkatesh, 2008). Venkatesh (2008) and Torkildsen (2005) consider that the leisure facilities available, accessibility to leisure activities, location of leisure facilities and transportation constitute the situational

and opportunity factors that determine leisure participation. In the tourism context, hotels play a major role in providing leisure activities. Nowadays all hotels provide leisure activities in addition to their core products (Torkildsen, 2005). With the competition among hotels in the tourism sector it is important to emphasize on each of the core elements of the tourism product but also on leisure activities so as to have the tourists live a unique experience.

The leisure and tourism product is a mixture of tangible and intangible features (Williams *et al.*, 2003; Torkildsen, 2005). The leisure facilities and equipment, the built environment, the natural environment, the staff behind the leisure activities form the tangible aspect. On the other hand, the intangible aspect of leisure activities is the unique atmosphere, the feeling, fun, excitement generated from participation in the activities. A simple sightseeing activity can provide a tourist with great feeling and amazement. The leisure activities within the tourism product can be supply led or demand led (Williams *et al.*, 2003). Examples of supply led leisure activities include cultural heritage sites and mountain activities. These leisure activities are provided as a result of certain resources and natural features being already present and which are so particular that they are the main focus of the leisure activities. Demand led leisure activities are those which are provided as a result of higher demand from the part of customers. Their provision is therefore based on the response of customers on the leisure activities. Many leisure products and services are modified and adapted to new trends (Williams *et al.*, 2003; Watkins, 2007). Tourism-based leisure activities have to be an outstanding experience to guests. They have to feel the fun, excitement, thrill in the leisure activity.

### Leisure Experience

When taking part in a leisure activity individuals are in search of an experience (Torkildsen, 2005). The enjoyment of a unique experience is more important (Slåtten, Krogh & Connolley, 2011). Leisure organizations must be able to recognize what type of leisure experience the tourists are in need of and act accordingly (Honggen & Huyton, 1996; Williams *et al.*, 2003; Högström *et al.*, 2010). Experiencing fun, excitement, thrill, action are favored by individuals when they choose leisure activities. The leisure experience that results from the practice of particular leisure activities is formed by the imagination of customers together with what they see happening (Honggen & Huyton, 1996; Torkildsen, 2005; Pechlaner, Raich, & Zeni, 2007; Högström *et al.*, 2010). Moreover, Varley *et al.* (1998) have also highlighted the enriching side of leisure experiences within outdoor leisure activities. This is a good point considering that tourists at a destination participate mostly in outdoor leisure.

## **RESEARCH METHODOLOGY**

This study adopted a quantitative research approach to assess tourism-based leisure activities and developed a self-administered questionnaire, which was divided into three sections. The first section was related to the respondent's characteristics such as gender, age group and purpose of travel. The second section prompted the respondents to rate a list of tourism-based leisure activities that are available in Mauritius depending on his/her preference for each of the listed activities. The leisure activities are grouped into four categories: marine activities, sports, nature-related activities and other activities. This list has been compiled through various sources namely several leisure activities organizations' websites (Domaine de Bel Ombre, 2011; Domaine de L'Etoile, 2011; Parc Aventure Chamarel, 2011; Vertical World Ltd, 2011), hotels' websites (Coco Beach Island Resort, 2011; One&Only Le Saint Geran, 2011) and press articles (Elix, 2010). A scale of 5-points was used, where 1 indicated that the respondents did not have any preference for that activity and a 5 indicated that this activity was most preferred by the respondent. The last section prompted the respondent to give his/her views and attitudes on several aspects relating to leisure activities namely the number, variety of leisure activities available and the motives behind the practice of such activities. Using convenience sampling technique, tourists willing to participate in the survey were approached in public beaches such as Grand Bay and Flic-en-Flac. The

survey was carried out over a 5-day period throughout four weeks. A total of 200 questionnaires were distributed to the tourists, requesting them to evaluate their leisure experience by filling in the survey. Of these, 150 questionnaires were returned and in all, 128 questionnaires were found usable for the study, which represented a 64% response rate from the original sample of 200. The collected data has been input and analyzed using spreadsheet software, namely Microsoft Excel. Descriptive analysis such as means, standard deviation and percentages has been used to analyze the data.

## RESULTS AND DISCUSSIONS

In this study these activities have be categorized as sea and marine activities, sports activities, nature related activities and other activities. While many sea and marine activities, sports activities and spa services are offered by hotels or leisure businesses found near or in hotels' premises, nature related activities are provided mainly by leisure businesses found inland. The remaining activities such as pubs/bars/restaurants, casinos, nightclubbing are mainly undertaken in attractive tourist locations found mainly on coastal regions. As for shopping, shopping malls suited to tourists are present throughout the island. Museums and cultural heritage sites and some nature parks are managed by the public sector and visits included in the package of tour operators are organized for tourists. The results demonstrate and analyze the preferences of tourists under each of these categories.

Table 1 is a summary of the demographic data of the tourists and the main observation made is that 74.20% of tourists travelled for leisure and relaxation. Leisure is a discretionary activity that is undertaken during free time for fun, relaxation, playfulness as laid out by previous studies (Torkildsen, 2005; Morgan, 1996, Bull *et al.*, 2003; Kelly, 2009). This is clearly reflected in this study where the majority of tourists traveled for such purpose. Tourism is itself a leisure undertaking at another destination and this finding indicates that most tourists came for leisure activities in Mauritius.

Table 1: the Demographic Profile of the Respondents

RESPONDENTS' PROFILE			
<b>GENDER</b>	<b>%</b>	<b>AGE GROUP</b>	<b>%</b>
Male	58.60%	21-30	26.60%
Female	41.40%	31-40	30.50%
<b>PURPOSE OF TRAVEL</b>	<b>%</b>	51-60	12.50%
Leisure and relaxation	74.20%	Above 60	8.60%
Business/Conference/Convention	13.30%		
Visiting friends and relatives	1.50%		

*Table 1 summarizes the demographic profiles of the respondents*

### Leisure Activities Preferred By Tourists Sea and Marine Activities

Sea and marine activities in Mauritius are closely related to the 3S concept on which the destination relies so much (Juwaheer *et al.*, 2003). These activities are therefore supposed to be the most attractive to tourists. Figure 1 shows that the sea activities that emerged with high mean scores were snorkeling (3.48), whale/dolphin watch (3.37) and sailing (3.05). These activities satisfied the passive (relaxation) and stimulating (escapism) motives mentioned by Venkatesh (2008).

Figure 1: Mean Scores Obtained For Sea And Marine Activities

*This Figure shows the mean scores obtained for sea and Marine activities based on the data*

This is indicative of participation in activities which were accessible and requiring minimum physical efforts. They were also activities that may be undertaken in groups with a social aspect in them. The tourists also considered sightseeing activities especially whale/dolphin watch important. Other sea activities that have obtained low means require either specific skills or sufficient training (surfing, wakeboarding, water skiing, diving and big game fishing). They are not so readily accessible to all tourists and they cannot practice these activities whenever they desire to do so. Therefore they have a lesser appeal compared to other more accessible and readily available activities. Moreover an important point worth noting in this category is the low means obtained by most activities which is against the attractiveness normally attributed to such activities.

### Sports Activities

Swimming pool activities emerge in this category of activities with a mean of 3.38 showing the tourists mostly favor fun and excitement in the sports activities. This is related to the very nature of leisure whereby fun and playfulness (Bull et al., 2003; Torkildsen, 2005; Kelly, 2009) and the lively motives of leisure are sought (Venkatesh, 2008) are sought. It must be noted that such an activity can be practiced mainly in hotels and are within easy reach of tourists staying in such hospitality businesses and this can also partly explain its popularity. The results show that tourists look mainly for activities that are less physically demanding as is the case for tennis, biking and badminton. The relatively favorable mean for fitness and gym show there is interest for health and physical well-being in activities. The overall results however do not show popularity of sports activities among the tourists. Swimming pool activities constitute leisure that can be undertaken in groups adding a social dimension to the activities and the desire for tourists to live leisure experiences with other people. These results confirm that tourists come to Mauritius for leisure and relaxation mainly and are not interested in physically engaging activities. Similar to the sea and marine category, low means have been obtained for the sports activities overall, synonymous of a low appeal for tourists.

Figure 2: Mean scores obtained for sports activities

*This Figure shows the mean scores obtained for sport activities based on data gathered*

### Nature-Related Activities

The only leisure activity that emerges in this category is visiting nature parks with a far higher mean of 3.73 (Figure 3) indicating popularity of such a sightseeing activity among the tourists. The visits to nature parks are part of sightseeing activities which are included in packages of tour operators.

Figure 3: Mean Scores Obtained for Nature-Related Activities

*This figure shows the mean scores obtained for nature-related activities based on data gathered*

The accessibility of tourists to such sites is hence easier and do not require any efforts on their part. This may constitute a valid reason for such a preference by tourists. Visiting nature parks is a rather passive activity which may be related to tranquility, peace of mind, relaxation (passive motives). Again this category of leisure activities has low appeal to tourists which again suggests that tourists prefer passivity. Leisure activities such as mountain climbing canoe/kayak, mountain biking are rather physical in nature and may repel tourists. However, relatively favorable means obtained by trekking (2.91), adventure tracks (2.95) and mountain biking (2.79) suggest a slight preference for adventure, excitement and self development. In this category the low means obtained may indicate that tourists are not likely to undertake such nature-related activities considering that Mauritius is mainly a sea, sun and sand destination. It should be further noted that hunting is the least favored activity which may be explained by the pros and cons related to the very nature of such an activity.

### Other Activities

Figure 4 illustrates that shopping (3.38), pubs/bars/restaurants (3.89) and visiting museums (3.09) and cultural heritage sites (3.60) and spa services (3.30) are the most favored leisure activities in this category and also in all the other three categories. Tourists show interest in the pleasures of eating and drinking (pubs/bars/restaurants), shopping, relaxation (spa) and discovery of historic value of the destination. Again this result highlights rather passive activities that are contrary to novelty in leisure experiences. Such activities are present in many destinations. Shopping and pubs/bars/restaurants are common leisure activities. Museums and cultural heritage sites have an aspect of uniqueness in that they are an evocation of the history and cultural heritage of the destination. Furthermore, the spa service is synonymous of relaxation, peace of mind which is linked with passive motives of tourists as noted by Williams *et al.* (2003) and Venkatesh (2008). New activity such as skydiving is not that favored and certainly involves thrill and excitement. Moreover, a casino gaming has been very unpopular among tourists having the lowest mean.

Figure 4: Mean Scores Obtained for Other Leisure Activities

This figure shows the mean scores obtained for other leisure activities based on data gathered

Tourism-based Leisure Activities Based on the Purpose of Travel Tourists who Travel for Leisure and Relaxation All the leisure activities shown on Figure 5 are related to relaxation in some way.

Figure 5: Leisure Activities of Tourists Coming for Leisure And Relaxation

This figure shows the leisure activities of tourists coming for leisure and relaxation

The activities having highest means, namely, pubs/bars/restaurants, visits to nature parks and cultural heritage sites are mostly relaxing. Apart from helicopter tours all the results shown are in line with what

has been previously found. These results are in line with the nature of leisure activities as being practiced for relaxation and fun mainly and for other needs too (peace of mind, excitement, escapism, physical well-being, health and fitness).

### Business Travelers in Tourism-Related Leisure Activities

It is important to consider the leisure preferences of business travelers at the Mauritian destination. Business/conference/convention travel is a form of tourism and many of these travelers usually take part in some leisure activities during their stay (Morgan, 1996; Veal, 2002; Pechlaner *et al.*, 2007). The following results therefore show the preferences of those respondents who have come to Mauritius for business purposes. Figure 6 shows that the mean results for leisure activities along the four categories for the 13% of respondents who are business/conference/convention travelers. Pubs/bars/restaurants definitely constitute the most preferred activity for such tourists with a mean of 4.12. Sightseeing activities (visits to nature parks and cultural heritage sites) and sports activities (fitness and gym, biking, beach volley) are also amongst the preferred ones. This is in line with what has been noted by Morgan (1996), Veal (2002) and Pechlaner (2007) whereby business tourists usually take part in sightseeing and sports activities during their stay.

Figure 6: Leisure Activities of Business Travelers

This figure shows the leisure activities of business travelers

### Tourists Who Visit Friends and Relatives

Respondents who have travelled to Mauritius to visit friends and relatives constitute the lowest percentage (12.5%). Most of the activities preferred by such types of tourists can be undertaken in groups (diving, snorkeling, submersible, whale/dolphin watch, beach volley, swimming pool activities, trekking, nature parks, shopping, museums, cultural heritage sites, pubs/bars/restaurants). This is synonymous of social motives behind leisure based on the reasoning that tourists who visit friends and relatives mostly favor leisure activities that can be undertaken in groups in order to be with their friends and relatives during their stay. These results confirm this idea by looking at the nature of the different activities and reflect the one key aspect of leisure which is the social dimension as laid out by Morgan (1996) and Brasja *et al.* (2011). This does not at all mean that other motives are not looked for by such tourists.

Figure 7: Leisure Activities of Tourists Coming to Visit Friends and Relatives

*This figure shows the leisure activities undertaken tourists who predominantly come to visit friends and relatives*

#### Attitudes of Tourists on the Leisure Activities Provided in Mauritius

The following analyses stress on the views and attitudes of tourists with regard to related issues on leisure activities such as the number and variety of leisure activities available, the leisure facilities and equipment, the motivations of tourists and the extent to which their needs have been suited and the leisure experience derived. The findings are presented in Table 2. More than 77% of respondents find that the number of leisure activities provided is sufficient in Mauritius (Table 2). This reflects the high number of activities provided by the private sector and other leisure opportunities provided by the public sector (museums, cultural heritage sites, national parks, botanical gardens, etc). Tourists view positively the number of leisure activities which is a good point for the destination. While the highest percentage of respondents view that there is a wide variety of unique leisure activities, there is still 35.90% who view that the activities are more or less the same (Table 2). A small percentage of tourists see a lack of variety in leisure activities in Mauritius. The results therefore reveal a rather positive but improvement is needed on this aspect. As outlined by Veal (2002) facilities is one of the main elements in leisure provision.

They are essential for the leisure activities to take place. Leisure facilities can also be provided by the public sector, that is, beaches, museums, national parks, botanical gardens all have facilities put in place by local authorities. More than 50% of respondents found that the leisure facilities in Mauritius were adequate enough to deliver a high quality experience (Table 2). Ten percent (10%) found that the facilities are outstanding, but there were about twenty-eight percent (28%) who found the facilities adequate if not excellent. Moreover, it should be noted that the quality of leisure facilities will depend on the leisure provider especially in the private sector. While first class hotels will provide outstanding leisure facilities this may not be the case of other low standard hotels. Tourists' views are likely to differ on that aspect. As such this can explain the 3.1% of respondents who found the facilities and equipment not adequate enough to deliver a good leisure experience.

Table 2 further indicates that a high percentage of respondents viewed that leisure plays an important part in the tourism product. Hotels now provide a wide range of leisure activities together with their core products, that is, accommodation and food and beverages. The necessity to combine leisure activities with these two elements has been highlighted by Torkildsen (2005) and Eccles et al. (1996) with regard to the tourism context. With such positive views, the result shows that leisure plays an important role in the Mauritian destination and it is thus crucial to also promote leisure activities. There are various motives

when seeking leisure activities and tourists, as individuals with distinct personalities have each their own motives (Williams *et al.*, 2003; Venkatesh, 2008). The following results indicate the motives of the respondents behind the practice of leisure activities in Mauritius. Table 2 shows the different motives and the percentage of tourists for each of these motives. Most of them sought fun and excitement (25.80%) and escapism (20.30%). All the different motives mentioned are in line with the motives set out by Williams *et al.* (2003) and Venkatesh (2008): stimulating motives (adventure, new experience and escapism), lively motives (excitement and fun), personal development motives (sense of challenge) and social motives (being with family).

The majority of the tourists viewed that the leisure activities have suited their needs to large extent (50%) and have fully suited their needs (35.20%) as illustrated in Table 2. This is another positive point considering that what is most important above all for leisure providers is to fulfil the needs of their customers (Torkildsen, 2005). This result is indicative of tourism-based leisure activities that are aimed towards the different needs of tourists even if a small fraction of the respondents have found the leisure activities practiced have not suited their needs. The leisure experience is a very important aspect of leisure activities (Williams *et al.*, 2003). Torkildsen (2005) highlighted leisure experience as a distinctive feature of leisure activities and stated its importance to customers. The enjoyment of a memorable experience is far more important than every other aspect of leisure activities (Williams *et al.*, 2003; Slåtten, Krogh & Connolly, 2011). Table 2 further indicates that the majority of tourists have had either a memorable or, at least, a satisfying leisure experience. This clearly shows the emphasis laid on leisure experience at the Mauritian destination. These results also demonstrate that provision of tourism-based leisure activities is rightly aimed towards delivering unique, if not, satisfying experiences to tourists.

Table 2: Attitudes of Tourists on the Leisure Activities Provided in Mauritius

Attitudes of Tourists on the Leisure Activities	Percentage (%)
<b><i>Number of leisure activities available</i></b>	
More than enough	21.9
Enough	56.3
Not enough	21.9
<b><i>Variety of leisure activities available</i></b>	
There is a wide variety and each activity is unique	43.0
There is a wide variety but activities are more or less the same	35.9
There is a lack of variety and activities are more or less the same	9.4
There is a lack of variety but each activity is unique	11.7
<b><i>Adequacy of the Facilities and Equipment Offered by Leisure Providers</i></b>	
Outstanding to the point of delivering a unique experience	10.2
Adequate enough to deliver a high quality experience	58.6
Adequate but not enough to deliver a high quality experience	28.1
Not adequate	3.1
<b><i>Role of leisure activities amongst the other elements of the tourism products</i></b>	
To a large extent	48.0
To a small extent	16.0
They are not important	13.0
They are indispensable	23.0
<b><i>Motivation of tourists when seeking leisure activities</i></b>	
Fun and excitement	25.8
Sense of challenge	6.3
Being with family	17.2
Adventure and thrill	10.9
New experience	19.5
Escape routine of daily life	20.3
<b><i>Extent to which the leisure activities have suited the needs of tourists</i></b>	
To a large extent	50.0
To a small extent	8.6
They have fully suited my needs	35.2
They have not suited my needs	6.2
<b><i>Leisure experience derived by tourists</i></b>	
Memorable	43.0
Satisfying	54.7
Disappointing	2.3

Table 2 presents tourists attitudes on the leisure activities provided in Mauritius

## CONCLUSION

This study on tourism-based leisure activities has provided positive indications on the views and attitudes of tourists with regard to the different aspects of leisure activities in Mauritius. These aspects are the variety, adequacy of leisure facilities, satisfaction of leisure needs, leisure experience derived, the place of leisure in the tourism product. The views reflect very good leisure provision with a view at satisfying the tourists' needs and delivering a memorable experience. The preferences of tourists show that they look for relaxation, fun, health and fitness, physical well-being and also the pleasure of eating, drinking and shopping in the practice of leisure activities in Mauritius.

Tourism-related leisure activities such as snorkeling, whale and dolphin watch, swimming pool activities, fitness and gym, visits to nature parks, museums and cultural heritage sites, spa, shopping and going to pubs, bars and restaurants have emerged as the most favored by tourists in this study. It is important to point out that visits to nature parks and cultural heritage sites have had undisputable popularity amongst tourists. This indicates the possibility of relying on activities not related to the sea, sun and sand concept to promote the destination. Moreover the preferences of tourists for shopping and pubs/bars/restaurants show that these are main leisure activities on which promotional efforts of the relevant destination promotion authority can be concentrated. Mauritius is still mostly known as a sea, sun and sand destination and in light of what has been found the leisure activities that are not based on this concept can be used in the promotion of the destination. There can be less reliance on sea and marine activities, as these will be continually provided by hotels, and more on other activities such as sightseeing which have been mostly favored by tourists.

# ANALYZING OF ENTREPRENEURIAL DIMENSIONS IN ALBANIAN BANKING SYSTEMS – SOME IMPROVEMENT FROM INFORMATION TECHNOLOGY

Kozeta Sevrani, University of Tirana, Albania  
Klodiana Gorica, University of Tirana, Albania  
Ermelinda Kordha, University of Vlora

## ABSTRACT

*Marketing and IT are the most reasons for having success and being welcomed in entrepreneurial economy or for failure. Effective marketing is critical to the success of any entrepreneurial venture: banks. Recently, for the banks in order to gain market share, there is an emergency for being entrepreneurial: in the turbulence world where competitive advantage is quite impossible to be achieved, where innovation or risk taking and resource leveraging, or having the possibility to achieve an opportunity are the common questions. IT can help in improve the efficiency and further more can sustain adding value through innovation, risk taking or some others entrepreneurial features for those banks who really “cut edge” within the industry. This paper presents the results of a questionnaire with bank staff. What is clear is that the banks are mainly after the game how they manage the process of innovation. Sustainable competitive advantage depends on a number of factors. But one of the clear conclusions is they keep growing and the highest price are those with the greatest innovation. A vicious cycle of innovation and success generates success reel innovation. In the banking sector as well as in other sectors facing the challenges of the future will depend on the intensive and constant innovation in products, services and processes. Many banks are actually trying to achieve operational excellence and improve efficiency. So to achieve competitive positioning will be done by those banks that will ensure long-term customer loyalty by delivering compelling and attractive products and services designed for the needs of clients.*

**KEYWORDS:** Entrepreneurial, IT, Marketing, Innovation, Risk Taking, Opportunity.

## INTRODUCTION

Banking system as a very important services sector within the word need to be more involved in a new era of marketing: entrepreneurial marketing: which means that even you are working in a small local banking system or an international banking system, every marketing manager or even a simply manager, need to much more knowledge based on some new and tendencies dimensions which makes the marketing quite different from traditional marketing. Related to those dimensions can be mention those features which are related to the necessity to go award through innovation, based on opportunity drive, going ahead based on risk taking, etc.

For the services ventures, include banking systems is very difficult to achieved competitive advantages, to add sustainable values and to have an intensity consumer. Banking systems today must operate in an environment which consist in increased risk, rarely of resources, decreased ability to forecast everything, sot the traditional mindset is incapable to be adapt to the new structural forms which in fact allows possibility for changes in order to drive further in the new era: entrepreneurial economy: entrepreneurial ventures: entrepreneurial banks, and all this can be sustained by especially technology and communication with the last aims: achieving innovation and risk taking.

Although many criticism of traditional marketing are done by academics around the world, is having an positive impact especially if those case which are more concern to the services sector, especially in banking sector, where recent developments are encouraging.

## NEW ERA: INFORMATION-BASED SOCIETY AND ENTREPRENEURIAL ECONOMY

*“When we talk about the new information based economy, we're talking about a world in which people work with their brains instead of their hands. A world in which communications technology creates global competition - not just for running shoes and laptop computers, but also for bank loans and other services that can't be packed into a crate and shipped. A world in which innovation is more important than mass production. A world in which investment buys new concepts or the means to create them, rather than new machines. A world in which rapid change is a constant. A world at least as different from what came before it as the industrial age was from its agricultural predecessor. A world so different its emergence can only be described as a revolution” (Wired magazine's, Encyclopedia of the New Economy <http://hotwired.wired.com/special/ene/>).*

The realization of new era information based economy underscores the fact that ITs have become a very important part of and drives the direction of the contemporary economy of the world. In using IT and especially the Internet, many organizations have looked to add more value to the tangible products they sell, by providing additional information-based' services.

## LITERATURE REVIEW

Competition in the banking sector is becoming tough. Banks that grow and have prosperity are those that develop new products, services and channels in the market by being profitable. Innovation will be increasing the key to success.

It is often said that banks are poor in innovation. But this is not completely right. More innovation needs to be involved in this sector. But much of it is not classified correctly, and much of it focuses on new processes and way of doing business rather than in the development of new technology and products.

Marketing and IT are the most reasons for having success and being welcomed in entrepreneurial economy or for failure. Effective marketing is critical to the success of any entrepreneurial venture: banks. Recently, for the banks in order to gain market share, there is an emergency for being entrepreneurial: in the turbulence world where competitive advantage is quite impossible to be achieved, where innovation or risk taking and resource leveraging, or having the possibility to achieve an opportunity are the common questions. IT can help in improve the efficiency and further more can sustain adding value through innovation, risk taking or some others entrepreneurial features for those banks who really “cut edge” within the industry.

Recently there has been a growing interest in the use of 'intrapreneurship' as a means for corporations to enhance the innovative abilities of their employees and, at the same time, increase corporate success through the creation of new banking corporate ventures. While the literature illustrates a wide variety of entrepreneurial factors, there are a few elements that are consistent throughout the writings in this field. "Great difficulty in the world for people is not to accept new ideas, but to forget old ideas". Starting from the saying of the above, note that the developments in the field of entrepreneurship has increased in recent years in the areas of business development, as well as in decision-making and economic growth of different countries of the world. Challenges faced by large banking corporations nowadays, is the exploitation of energy that motivated employees who are eager to create products, services and new processes. Corporations are faced with the dilemma of having rules and control while allowing you creative Employees think and act "outside the box" control structure.

With regard to banking institutions, three are the dimensions of entrepreneurship which are applicable to them;  
 innovation,  
 risk taking  
 Proactive rather than reactive

Let's go through the innovation as an entrepreneurial mindset in the banking system:

#### 1. Three boards of *innovations*

Services - New and Improved

Products - unique and improved

processes - new or better ways to carry out a task or function

*Innovation* - to what extent the company is doing new things, unique or different? Do this concept addressed to a need which is not addressed earlier? Changing the way addressing the needs is radical change compared to traditional solutions represents a small change or improvement to an existing product. In fact risk taking in organization level in as follows:

Financial

Technique

market

Personal

Social

Figure 1: Relating Types of Innovation to Risk

*Proactivity in the banks:* “entrepreneurship operating on, instead of react to their environment ”

3 ways of measuring proactivity

To Follow Vs. to lead the competition in innovation

To favor the proved and the truth Vs. emphasis on growth, innovation and development

To try to collaborate with competition vs. trying to circumvent them

*What means this for the new banks?* Seeking new opportunities that may not be related to current business flow;

Introduction of new products and brands before competition; By the strategic eliminating operations that are in the stage of maturity or decline lifecycle. Entrepreneurship rate in the bank is based in the three elements (from seven that entrepreneurial marketing accounts)

(*Innovative, risk-making, proactive*). Coordinate the enterprise network is necessary for managers who try to determine the role of entrepreneurship in their organizations. Entrepreneurship strategy that a company is determined precisely based on its location in the network.

## QUESTIONNAIRES ON INNOVATION AND ENTREPRENEURSHIP ASSESSMENT IN BANK

The Bank is making a questionnaire of its employees with regard to innovation and entrepreneurial level or dimensions. It needs to assess the developments that have occurred in innovation and entrepreneurship concept intervention.

What is the assessment of innovation and entrepreneur in bank? Is a research to get the opinion and sentiments of employers about innovation and entrepreneurship.

Who will answer? Bank personnel belonging to different levels of the hierarchy, starting from different branches, specialist of different units, senior, supervisor, project coordinator and members of senior management. Employees have different job years of work, ranging from a minimum of two years and more, as well as belonging to the age group over 25 years old. Generally are women and few men.

Why is taken the questionnaire? It is important that the Bank should be aware of how they perceived the work place with regard to innovation and entrepreneurship.

Are those answers confidential? The answers are confidential and also the dates of employers.

Are there wrong answers? There are not wrong or exact answers. Answers must be sincerely about employer's perception, based on their personal experience.

### Questionnaire

1 = Totally not agree 2 = not agree 3 = I am not sure 4 = agree 5 = totally agree

Supporting Institution Management for Corporate Entrepreneurship

Bank reacts quickly in the application of improved working methods to which are developed by employees

2. Bank support the development of new ideas and the improve of its performance

3. High management is aware and respects my ideas and suggestion.

4. High management of bank has experience in innovative process

5. Bank support personal initiative considering the fact that some of them will fail

6. Bank support equally her managerial and that professional staff for carrier opportunity Development

## ORGANIZATIVE BARRIERS AND BUREAUCRACY

7. There are not many written rules and procedures to full fit my obligations

8. Very rarely I have to follow the same work methods to meet their daily tasks

**INNOVATION - SUCCESSFUL POSSIBILITY OF TECHNOLOGY**

9. Actually the Bank assesses and measures the progress of innovation using successfully the technology
10. Bank is doing new things, unique or different from competition
11. Demonstration of a small change or improvement of an existing product
12. Innovation through the using of Intranet or Internet

**PROCESS**

13. Banka has a system that ensures that innovation/entrepreneurships activities to be integrated with daily tasks ka
14. Banka use examination and diffusion process of recourses to ensure that new ideas and new initiatives will be considered
15. Actually has a process for the collection of the ideas on staff.

**INOVATION PORTFOLIO /PROACTIVITY**

16. The Bank is a follower vs. Directions to the competition in innovation
17. Elimination of the operations that are in mature or declining phase of lifecycle
18. Bank compares innovations with other banks to provide information on risk, return potential and resource requirements

**QUESTIONNAIRE RESULTS:**

		average of points
INSTITUTIONAL MANAGEMENT SUPPORT CORPORATION ENTREPRENEURSHIP FOR	Bank reacts quickly in the application of improved working methods to which are developed by employees	3.29
	2. Bank support the development of new ideas and the improve of its performance	3.72
	3. High management is aware and respects my ideas and suggestion	2.9
	4. High management of bank has experience in innovative process	3.7
	5. Bank support personal initiative considering the fact that some of them will fail	2.8
	6. Bank support equally her managerial and that professional staff for carrier opportunity development	2.8
ORGANIZATIVE BARRIERS AND BUREAUCRACY	7. There are not many written rules and procedures to fullfit my tasks	2.6
	8. Very rarely I have to follow the same work methods to meet their daily tasks	2.55
INNOVATION - SUCCESSFUL POSSIBILITY OF TECHNOLOGY	9. Actually the Bank assesses and measures the progress of innovation using successfully the technology	4.57
	10. Bank is doing new things, unique or different from competition	3.19
	11. Demonstration of a small change or improvement of an existing product	3.7
	12 Innovation through the using of Intranet or Internet	3.7
PROCESS	13. Banka has a system that ensures that innovation/entrepreneurships activities to be integrated with daily tasks	3.5
	14. Banka use examination and diffusion process of recourses to ensure that new ideas and new initiatives will be considered	3
	15. Actually has a process for the collection of the ideas on staff	2.5

INNOVATION PORTFOLIO /PROACTIVITY	16 The Bank is a follower vs. Directions to the competition in innovation	3.4
	17. Elimination of the operations that are in mature or declining phase of lifecycle	3.3
	18. Bank compares innovations with other banks to provide information on risk, return potential and resource requirements	3.75

Figure 1: Institutional Management Support

Figure 2: Organizational Barriers, And Bureaucracy

Figure 3: Innovation- Successful Possibility of Technology

Figure 4: Innovation Portfolio /Proactivity

The lowest

Actuality has a structured process for the collection of the ideas from the staff  
 Very rarely I have to follow the same work methods to meet their daily tasks  
 There are very few written rules and procedures to fulfill my duties

The highest

The Bank currently assesses and measures the progress of innovation using technology successfully  
The Bank supports the development of new ideas to improve its performance  
High management of Bank has experience in innovative process

**RESEARCH FINDINGS**

The development of IT and marketing has been very significant in Albania. These are two fields which represent many challenges for the future and especially for the services sector: banking systems should improve their efficiency based on entrepreneurial dimensions and IT. The country has seen the coming of Internet, the advent of closed networks and applications, the growing imports of computers and systems and the significant use of computers and Internet in offices. These developments are positive and are contributing towards the overall development of Albania even though some difficulties remain. Based on the results of the questionnaire resulted that:

Bank is perceived from the its employers as follower and not leader in innovation  
Not innovator in new products but simply re-design of existed

Does not assume any risk for the promotion of creative and innovative ideas but wants them to competitors

Promote the use of technology

Information systems and Information technology have become an important element of those ventures who intent to become more entrepreneurial in a global settings. The aim of using technology has changed a lot over the years. Now it is important not only to improve efficiency but also to improve business effectiveness and to manage organizations more strategically, through IT use.

Building an IT system in order to improve effectiveness' of Albanian entrepreneurship includes the ability they give to companies to:

Link to Customers and Suppliers  
Improve Integration of Internal Processes  
Market Information-based Products and Services  
Improve profitability

Albanian businesses are in fact in the growth period of adapting ICT in their management, processes and marketing.

Albanian business is that their investment is more concentrated in computer capital and less in labor, because they link less with the revenue generation.

Companies in Albania are not exactly in the same situation about technology use. They are eager to invest in technology, and have a relatively high dispersion of technology, but problems arise with employees and their skills to use technology.

# BEST PRACTICES IN RESEARCH

Terrance Jalbert, The University of Hawaii-Hilo

## ABSTRACT

### GETTING AN IDEA

1. Maintain a running list of your ideas.
2. Every time you have a few minutes, go to your list and ask yourself, in the next 30 minutes how can I advance one of these ideas.

### RESEARCH PARTNERS

#### Selecting a Partner

1. There are advantages to working on your own.
2. Select someone with the right characteristics
  - a. Hard Worker
  - b. Willing to do their share of the work
  - c. Someone with time to conduct research
  - d. Intelligent
  - e. Mutual Interests
  - f. Cooperative
  - g. Likely to reciprocate
3. Good research partners are hard to find. Don't abuse a good research partner.

#### Working with a Partner

1. Start only one paper at a time with a new research partner.
2. Be patient with your research partner. They have a life and due to births, illnesses and other life events, they may not be on your schedule.
3. Recognize on some projects you will do most of the work. On others, your partner may do most of the work.
4. Use caution when selecting one of the professors from your Ph.D. program as a research partner.

#### How Many Authors on a Paper?

1. Two or three authors are good.
2. Four authors is not good but can be ok.
3. More than four authors looks bad.

### WRITING YOUR MANUSCRIPT

#### Writing your Manuscript

1. Use only Microsoft Word to type your document.
2. Using free Word clones causes significant problems in the publication process.
3. Files created in another program and copied or saved as a Microsoft Word file cause significant problems in the publication process.
4. Unless the journal specifically requests otherwise, use the standard Microsoft Word equation editor.

5. Use only Microsoft spreadsheets and Microsoft
6. drawing programs.
7. Back up your files on a daily basis.

### Organizing your paper

1. Organization
2. Abstract
3. Introduction
4. Literature Review
5. Data and Methodology
6. Results
7. Concluding Comments

### Title

1. Descriptive and no more than 15 words.
2. Write a strong title
  - a. Strong Words:
    - i. Empirical, Evidence
  - b. Weak Words:
    - i. Analysis, Case
    - ii. Use Key Words from your Discipline
3. Think about what will look good on your vita.

### Abstract

1. General Introduction to your paper
2. The goal is to precisely communicate to the reader what the paper is about.
3. Not more than 200 words
4. Do not use acronyms
5. Generally do not cite other papers in the abstract

### Introduction

1. A brief introduction to the problem being addressed.
2. Include some summary statistics of the magnitude of the problem.
3. One paragraph discussion of the general state of the literature.
4. What you are going to do in the paper to advance the literature.
5. A few lines indicating how the remainder of the document is organized.

### Literature Review

1. As a general rule do not cite magazines.
2. Use scholar.google.com
3. Narrow your literature review down to those articles that directly relate to the issue you are addressing in your paper.
4. Make sure that everything that you cite in the text is included in your reference section.
5. Make sure that everything you reference is cited in the body of the text.

Data and Methodology

1. Where the data was obtained from?
2. Time period covered in the analysis?
3. Frequency of the data observations?
4. Variables that the data were collected for?
5. Summary statistics.
6. Hypotheses that are being tested.
7. For regressions, specify the equation being estimated in the text of the document.
8. For Surveys indicate
  - a. Questions included in your survey? (Consider including the survey instrument as an appendix to the paper)
  - b. When was the survey conducted?
  - c. Where was the survey conducted?
  - d. What was the response rate?
  - e. What are the total number of usable observations?
  - f. Did you receive human subject research permission from your University?

Results

1. Make sure to introduce each table and figure you present in the text of your document.
2. Walk the reader through the results.
3. Select an observation in your table and explain that observation to the reader.
4. Incorporate data into MS Word tables.
5. Segregate your data when possible to get additional results,
  - a. by gender, age, country, region, year, industry, before and after a crises.

Tables

1. Don't create small one or two line tables.
2. Include information directly in the document text.
3. Combine several small tables into a single table with multiple panels.
4. Do not use exponential notation (3.2E-5).
5. Display appropriate precision
  - a. 0.0021, 1.134, 10.22, 100.6, 1,049.1, 10,432

Table Description

1. Make sure to include a 3-6 line description below your tables. The reader should be able to understand what is contained in the table without referring back to the text of the document.
2. This description is not to replace the discussion in the text, but to supplement the discussion in the text.
3. Redundancy is ok in this case.
4. Example of Table Description

*This table shows the results of the regressions on CEO compensation using data from 2004. The estimated equation is: CEO Compensation =  $a + b_1(\text{CEO age}) + b_2(\text{years with company})$ . The first figure in each cell is the regression coefficient. The second figure in each cell is the t-statistic. \*\*\*, \*\* and \* indicate significance at the 1, 5, and 10 percent levels respectively.*

### Concluding Comments

1. Reiterate the goal of your paper.
2. Briefly describe the test methodology and data.
3. Briefly summarize your major findings.
4. Discuss how managers might benefit from the results.
5. Discuss any limitations of your work.
6. Provide suggestions for future research.

### Acknowledgements

1. Do acknowledge anyone that has helped you with the paper.  
Colleagues, Administrators, Funding Agencies, Assistants, Reviewers, Editors.  
It is a nice courtesy to the reviewers and editor.
2. It subtly communicates to colleagues the journal is peer reviewed.
3. Few people will be insulted if you acknowledge them but should not have.
4. Many will be insulted if you do not acknowledge them but should have.
5. Acknowledgments-Make sure to indicate that any remaining errors are the authors responsibility.
6. If someone has contributed substantially to your paper consider making them a co-author on the paper rather than just acknowledging them.

### Biography

1. Your biography should indicate your employer, your publication history, contact information and any other important information.  
Tom Tetertall, Ph.D. is Professor of Management at the University of East Hawaii. He is also an arbitrator for the Human Ethics Commission. His research appears in journals that include: Diversity Review, Management Styles, and Latino Business Review. He can be contacted at: University of East Hawaii, COB, 400 W. 2nd St., Kauai Hawaii, 96333, USA, email: tomt@NHI.edu.
2. Do not make your biography excessively detailed.

### **FORMATTING**

1. Editors are looking for papers that are high quality. But they also look for papers that will not add an excessive burden to their work load.
2. They look for authors that will be pleasant to work with on revisions and in the publication process.
3. A properly formatted and written paper communicates to the editor that you will be pleasant to work with, thereby increasing your chance of publication.
4. Check the journal style guidelines to make sure you have the paper formatted properly.
5. Be sure figures and tables are editable in Word
6. Anything created or imported as an image is problematic.
7. Anything that is scanned needs to be recreated.
8. Make sure that figures and tables are legible.
9. If you are unable to edit it in MS Word it should be recreated.
10. When copying from Excel into word make sure to use the "Paste Special", "Paste as Chart" Command so it can be edited in MS Word.
11. Avoid one-sentence paragraphs.
12. Avoid one-paragraph sections.

13. If you have subsections underneath a main section, start the main section by indicating how the subsections are laid out.
14. Bullet lists do not appear well in journals.
  - a. Longer lists should be placed in a table. Then reference the table in the text of the document.
  - b. Shorter lists should be incorporated directly into the text.
15. Make sure your references are formatted according to journal guidelines.
16. Do not use text boxes
17. Do not use section breaks.
18. Do not use text levels

## WRITING QUALITY

1. Use the grammar checker in MS Word.
2. Use an advanced writing editor:
  - a. Stylewriter \*\*
  - b. Whitesmoke.
3. Write in third person active voice when possible.
4. Give it to a friend to read.

## WORKING WITH THE EDITOR

### Submissions

1. Leave your document set for 1-2 weeks between completion and submission. Give the document a final read before submission.
2. Indicate in your submission correspondence that the paper is not under review elsewhere and has not been published elsewhere.
3. Never EVER submit a document to two journals simultaneously.

### Correspondence

1. Don't ask the editor every week for a status update. (every 2-3 months is sufficient)
2. If you are close to a tenure or promotion decision, do let the editor know. Editors are human and will commonly try to get the review completed prior to the promotion decision date.
3. Use submission numbers in all correspondences.
4. Be courteous when corresponding with the editor.
5. Publishing is to a certain degree political. Be willing to review papers for the journal.

### Reputation

1. Our industry is small. Editors remember if you were especially easy or especially hard to work with.
2. Your reputation is very important, so make sure you leave the best possible impression, even if your paper is rejected.

### Nonresponsive Editors

1. After 3 months, ask if there is any additional information you can provide.
2. After 6 and 9 months request that the editor send a reminder to the reviewers.
3. After 1 year send the editor a status check email.

4. After one year and two weeks, if the editor has not responded, send them a letter withdrawing your paper from publication consideration and try elsewhere.

## REVIEWER AND EDITOR COMMENTS

1. Respond to revise and resubmit requests as quickly as possible, but take sufficient time to complete the requested changes.
2. Set the revised manuscript down for a week and reread the paper before submitting it.
3. Do not send the exact same version back to the editor without having addressed the concerns of the reviewers.
4. Do not respond rudely.
5. Prepare a document that indicates how you have addressed each of the reviewers concerns.
6. Your document should review each change that the reviewer has requested and your response to each request individually.

Reviewer Comment: In your data section please indicate the number of observations.

Author Response: Thank you for your suggestion. We have incorporated a sentence indicating the number of observations on page 22 as follows. "The data included 2,436 usable observations."

7. In the event that you are not able to address a reviewers concern. Explain carefully why you are not making the changes, and request the reviewers understanding. Acknowledge the issue in the paper and note it as a limitation, or area for future research.

## ACCEPTANCES

1. Make sure to read the page proofs carefully.
2. Pay any fees due. Publishing is expensive, but it is a necessary evil. You have invested a great deal of your time in the research, the publication fee is a small part of your total investment in the project.
3. Expect some time between acceptance and publication.

## REJECTIONS

1. Rejections happen.
2. Don't be discouraged by a rejection. Rejections are part of the process.
3. Make any changes that the editor and reviewers suggest and submit the paper to a different journal.

# OPERATIONAL RISK ANALYSIS OF INDUSTRIAL SMALL AND MEDIAN ENTERPRISES - SMES

Jorge A. Restrepo, Tecnológico De Antioquia  
Jairo Angel Díaz, Universidad Autonoma Latinoamericana  
Juan Esteban Ocampo, Autonoma De Las Américas

## ABSTRACT

*This paper develops a quantitative analysis of operative risk. We model the volatilities of major financial indices Chemicals Industry for the period 2000-2009. The model uses at Analytical Hierarchy Process (AHP) a multicriterio technique to finding out weight of the major financial indices: profitability, indebtedness, liquidity, efficiency and viability. Next, set up an operative risk measure capturing the whole Industry indices. It becomes the risk measurement benchmark to settle level business risk by a membership function which a qualitatively sorts as severe, moderate or low. Also, the model uses the technique of time series analysis to predict Industry ratios. We use a linear programming model deciding the features and choose the method to represent minimum forecast error. Last, projecting ratios and their volatility and settling the level expected risk.*

**JEL:** C61, C32, D81

**KEYWORDS:** Operational Risk, Modeling, AHP, Time Series

## INTRODUCTION

According to opinion survey joint industrial - OSJI - Antioquia industries make up 20% of total Colombian industries manufacturing and 32% of nontraditional exports. Concentrated Antioquia 141,424 total 641,446 employees, representing 22% of people employed in domestic industry, even though the Antioquia's population represents 13% of the country's. On the other hand, Antioquia's imports displayed a large growth of U.S. \$ 4,844 million and contribution 11.9%, the most relevant data comes in nontraditional export increased by U.S. \$ 4,501 million, up 31.1%. A study of competitiveness in the SMEs in the region, recorded as weakness the lack of a continuous record of signals and accounting and financial reporting Restrepo M J. (2009). Many of the studies towards the firms' analysis and industry based on financial diagnosis, but there are few studies on the identification and risk measurement associated with the company's business. F. Celaya P. & Lopez (2004). The paper takes on measuring risk in Colombian SMEs Chemicals Industry in the period 2000-2009. In the first part, we discuss the conceptual framework within which limits the risk of nonfinancial companies. In the second part, it develops method for analyzing volatility and it use the AHP multicriterio techniques to weighted indices. Last, thought time series forecasting we predict indices and assessment risk level undertaken by such companies and finally we display main results in Chemicals industry companies.

## LITERATURE REVIEW

### Risk definition

The Basel Committee on Banking Supervision (2003) states that risk analysis can be define as systematic use of available information to discover the frequency with which some events may occur and the size from its effects. Castillo M, (2008) defines operational risk as the possibility of financial losses that arise in firms because of events associated with failures or shortages. These financial losses can emerge from decision making or tactical or strategic business, direct reports or related technologies carried out or result

of external events, including legal risk. The cited author considers no losses resulting from unintended changes by the political, economic and social. Meanwhile, Jorion (2000) raises as risk associated with expected results volatility, on assets position or liabilities effected of interest measures. Usually large corporations define four pillars or risk categories: credit risk, market risk, strategic or business risk and operational risk. Much business risk associated with occurring adverse events-the case of no coverage of fixed costs in a period -. Sometimes analysis may be find opportunities for improvement, because induces scanning for all possible results for an adverse specific event.

We delimit four basic types of risk, as described below, and leave aside the so-called business risk, arising from an external incident or event which limits the company achieve its business goals. This work focuses on quantifying the risk to higher detail. Different authors M. Castillo (2008), Jorion (2000), JP Morgan. (2011), Medina (2006), Sturm P. (2013) (Sturm, 2013) presents the following classification: a financial risk for purposes of this article is related with cash flows and the company's inability to fulfill its liabilities. Operational risks in this group are all those confined to mistakes or shortages in production, trading, accounting and internal labor needed to fulfill business ordinary course. Risks to high severity, fits possible loss to outside events issued low frequency high severity, as may be case strikes, riots, political events, public events, weather, among other and Reputational risks grouping risks from breaking laws, policies and rules from national or international organizations. In short, the main concerns of a business are to identify and classify a subjective risk pool. For example in tourism businesses, weather represents a critical success, and therefore it would be an operational risk rather a high severity risk.

This study follows the approach of Celaya F. Lopez & P. (2004), which considers these risks arise from company's tactical and strategic business and its relations with business environment. The operative risk represents the firm's lack resources to fill overheads costs and performing, and financial risks mark the probability of not facing the overhead associated with debt. This paper defines operational risk from accounting and financial vision, where performing expenses divide into fixed and variables. The fixed part does not depend on performing volume business. The key driver includes goods manufacturing and sales, but its causation and payment or pay-out are independent events from incomes and production. Accounting profit reduced with expenses. We define the operational risk as a leverage weighted linear from profitability, efficiency and sustainability indices.

## DATA AND METHODOLOGY

The proposed model finds out total risk as convolution of operational and financial risk. We assessment a leverage weighted from profitability, efficiency, viability, liquidity and debt indices. While "the traditional financial indices techniques presenting major restrictions in decision making, they have a widely used because using indices allow comparisons and analysis from trends in business performance. Adding they allow compare with results standard measuring which may be target by the firm or industry averages." Restrepo M J. (2009). In this vein, the proposed method allows fixing the consistency overtime, the industry's ability to create high returns and mitigate overall risk, and Industry risk measure becomes a benchmark for settling risk that one particular business expects to face. The risk faced by an SME depends on randomness behavior their financial indicators, which is the purpose this work: to measure volatility Industry ratios for it uses historical data period 2000-2009. Data obtained become the standard measure or benchmark for determining and quantifying risk in a particular firm. We use the definition financial structure, raised by Gitman (2003), and set the explanatory power of every indicator by using Analytic Hierarchy Process, method known as by its acronym: AHP, which is a multicriterio analysis method for discrete problems, where it divides or ranks the decision problem into criteria and sub criteria. The indicators that have greater explanatory operational risk are summarized by Table 3

Table 3: Financial Indices That Explain the Operational Risk

Indices	
PROFITABILITY	DEBT
Gross Margin (%)	Debt to equity ratio (%)
Operating margin (%)	Financial obligations / liabilities (%)
Net margin (%)	Total Liabilities / Sales (%)
Return / Equity (ROI) (%)	Current Liabilities / Total Liabilities (%)
LIQUIDITY	VIABILITY
Current ratio (times)	Ebitda (MLL)
Acid test (times)	EBITDA / Sales (%)
Working capital (MLL)	Sales / Financial obligations (sometimes)
EFFICIENCY	
Asset Turnover (times)	
Portfolio turnover (days)	
Rotation suppliers (days)	
Inventory turnover (days)	
Operating cycle (days)	

*This table shows the financial indices used to explain Operational Risk in small and median enterprises*

To quantify operational risk -RO - contains the financial ratios presented in Table 3 using Equation 1.

$$Ro = \sum_{j=1}^m \sum_{i=1}^n W_j X_i \quad \text{Equation 1.}$$

Where:

J = 1-5 represents the major indices: profitability, leverage, efficiency, viability and liquidity

I = 1 to 20, represents the two level indices summarized in Table 1 Database It takes as financial metrics the Industry in period 2000-2009, and it is estimate average and growth rate year by year, and as a measure risk used volatility of each indicator type i, with i = 1 to 5 principal units j. = 1-20 secondary units.

#### Hierarchical Process Analysis

The analytical hierarchy process (AHP) is a structured technique which widely used for analyzing multifaceted decisions. Saaty, T.L. developed AHP technique in the 1970 and since it is broadly studied and sophisticated. (Vaidya & Kumar, 2006), built a paper where they related 150 AHP application papers, 27 of them are analyzing critically. This article affords a ready reference on AHP, and become as an informative summary set for AHP researchers and consultants. In the particular case of the risk estimate, (Saaty, 1987) drawings of how we can deal with risk and uncertainty using the Analytic Hierarchy Process, a new approach to measurement by ratio scales. In summary, the AHP method is a technique to quantify expert opinions or judgments about the relative importance each and every a criterion, usually conflicting, utilized in complex decision-making process.

The forecasting process by indicators one by one, involved analysis of time series of all financial ratios and applying a linear programming model using solver in Excel to determining the value which minimizes the predicting error. Identified how to predict we proceeded to analyze statistically better adjust to the time series by different functions for every indicator. Once identified the best adjust was calculated every financial ratio and the results are summarized in

Table 4.

Table 4: Profitability Indicators Percentage Growth Period 2000-2009

<i>Periods</i>	<i>2000- 2001</i>	<i>2001- 2002</i>	<i>2002- 2003</i>	<i>2003- 2004</i>	<i>2004- 2005</i>	<i>2005- 2006</i>	<i>2006- 2007</i>	<i>2007- 2008</i>	<i>2008- 2009</i>

## RESULTS AND DISCUSSIONS

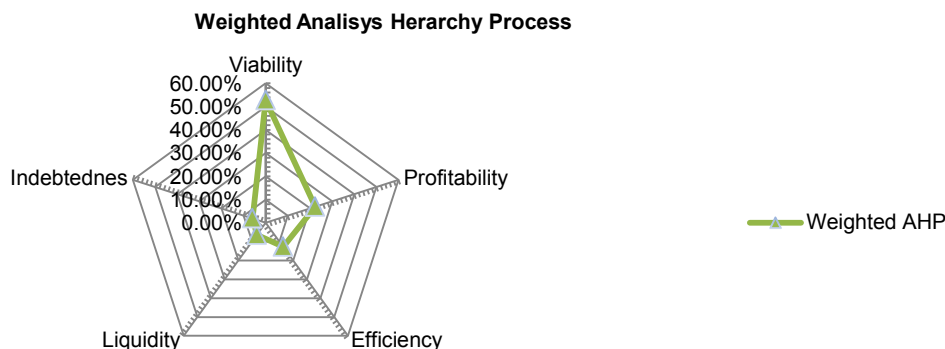

The data from table 3, allow inferring as the company takes an operational risk (OR) of 140.8%, representing -3.0% of the risk undertaken by industry, placing company in a minor level of risk. Similarly, shows the risk levels for main indicator and is highlighted as viability indicators, representing a 52.7% weighting in determining operational risk, followed by profitability ratios with a weight of 22.3%, in scale efficiency indicators represent a weight of 12.7%, the liquidity of 6.4% and debt closed at 6%.

Table 7: Major Financial Ratios and Their Weighted Using AHP

Name	Industry Risk	Company Risk	Company vs Industry	Weighted AHP
Profitability	97,4%	95,5%	-1,94%	22,3%
Efficiency	178,0%	168,2%	-5,70%	12,7%
Indebtedness	189,1%	191,1%	1,05%	6,0%
Viability	147,8%	143,5%	-2,99%	52,7%
Liquidity	181,5%	174,5%	-3,93%	6,4%

This table shows the risk levels for main indicator and is highlighted as viability indicators, representing a 52.7% weighting in determining operational risk.

This Table shows the quantification and classification the Operative Risk per level 2 indicator for industry and company, are classified according to the weight measured by the AHP technique.

Figure 4, graphically displaying the operating risk of the company compared to industry, where is possible to visualize every financial metric of second level and the degree of risk which demonstrates the company compared with the industry it belongs to. We illustrated by showing gross margin industry risk of 8.7% while the company has a value of 4.7% below industry.

Figure 4: Graphic representation financial ratios level 2. Industry vs Company.

This figure shows a graphic representation financial ratios level 2 to illustrate a Operative Risk Industry vs Company.

## CONCLUSIONS

integrating analyzed indicators: profitability, leverage, efficiency, viability, liquidity and country risk, may develop a company's risk analysis and establish performance level to offset the risk. It is possible, through applying different tools and strategies to mitigate operational risk, financial risk and structural return on investment, through strategies designed to reducing costs and expenses and the stabilization of yields. Risk is inherent to all human activity; the business activity is not immune to this reality and requires leaders and strategists to play a proactive role in designing strategies to business performance.

We present a method of easily understood and applied to determine the operational risk in SME companies, these risks are inherent in the dynamics of company and its constant interaction with the environment, this book fulfills the operational risk related to financial indexes which may indicate the company's inability to generate cash flows and cover its fixed costs and operating expenses, also financial risks associated with the probability of not cover fixed costs associated with indebtedness structure or the inefficiency of the firm on the use of limited resources and operating lower than industry averages.

The model presented combines using multicriteria analysis technique, the first-level financial ratios: Profitability, Indebtedness, Efficiency, Viability and Liquidity; generating the weight of each indicator and taking a company's share in comparison with the industry and establishing a risk degree expected by a company in the sector, as illustrated through the case study of the chemical sector.

This case study is designed as a useful tool for SME entrepreneurs in measuring of the potential risks associated with its business, is reflected as the chemical industry, with the structure developed in the last decade has a volatility in its indices financial, namely: profitability, liquidity, efficiency, viability and indebtedness which translates into average total risk index of 28.7%. Meanwhile the analyzed company has a total risk index of 19.3%, which means a lower risk, which represents 60.1% of sector risk. In the same address, using the AHP technique was found the second-level indicators weight and EBITDA is shown as having a weight of 78.2% in the group of viability indicators, while the acid test weighs 70.5% in liquidity indicators, the debt ratio by 64.5% in indebtedness indicators and ROA of 52.5% weight in the group profitability indicators finally stands out as the assets turnover exhibits a weight of 31.6% in the efficiency. It also proposes a simple measure to evaluate the profitability's consistency risk, once period firms may submit a high performance and low in others. Now, as the risk associated with the randomness the ROI sector behavior, their quantification is possible by determining the returns' standard deviation in the analyzed period and divided by the average performance, obtaining a value of 29% for ROI and 30% for ROA. It can be inferred which the chemical industry has a 30% risk behavior profitability. From the standpoint of the modeling, this study has limitations due to the lack of industry historical information, only with a 10 years period, but if were possible to have a higher data time series, would be feasible to measure operating levels leverage and total financial and determining of these indices' volatility and quantify enabling business and financial risk associating them to the volatility's calculation, however this analysis contributes significantly to the construction, understanding and approach to quantifying the business and financial risk of SME entrepreneurs.

## RELATIONSHIP MARKETING AND THE NET GENERATION OF COUPONERS

Brianna Ballard, Indiana State University  
Lakisha L. Simmons, Belmont University  
Jennifer Garrison, Indiana State University  
Jacob Braunecker, Indiana State University

### ABSTRACT

*In recent years, the economy has been declining and the use of coupons by a younger generation seems to be on the rise. Coupons can be used to save the consumer money on a certain item or brand. The net generation, consumers ages 18-24, is using coupons and discounts more than we realize. The main goal of this study is to determine why the net generation is now using coupons and how frequently they use coupons. We gathered quantitative and qualitative data which resulted in more detailed reasons why the net generation uses coupons and their perception of relationships formed with manufacturers. Our research helps inform marketing professionals that a new generation is using coupons and why and by what methods the net generation accesses coupons. This research informs marketers in their relationship marketing promotion efforts.*

**JEL:** M31

**KEYWORDS:** relationship marketing, social media, digital coupons

### INTRODUCTION

A recent extreme coupon phenomenon has occurred (Bero, 2011). Through this new outlet, the net generation, consumers ages 18-24, has been initiated into the culture of couponing. The research conducted by Bawa and Shoemaker (2011) showed that those who use coupons often are likely to continue to use them over time. Thus, younger coupon users are more likely to continue their use and potential for long standing relationships with manufacturers.

Coupons are used to save the consumer money on a certain item or brand (Pisani, 2012). They are most commonly distributed through media such as newspapers, flyers, or the web. College aged students are increasingly attracted to coupons. In an interview, a college student states couponing is important to her because it helps her to be financially independent and stretch her small paycheck a long ways (Bero, 2011). Also, with the onset of online coupons, college-aged students are able to find and use coupon through a media they are highly familiar with: their phones (Thibodeaux, 2011).

Relationship marketing is defined as “marketing activities directed toward establishing, developing, and maintaining successful relational exchanges” (Morgan and Hunt, 1994, p. 22). According to Vargo and Lusch (2004), a paradigmatic shift took place in marketing such that the focus is not on selling tangible items and but more on creating ongoing relationships with consumers. This study researches the prevalence of couponing in the net generation, digital coupon opportunity, and the reasons why the net generation use coupons. Qualitative and quantitative data were gathered.

Our research contributes to practice by informing marketing professionals why and by what methods the net generation accesses coupons. Recently, Internet coupons have become popular and have been shown to lead to brand loyalty and brand repositioning in a consumers mind (Simmons, et al 2013).

## LITERATURE REVIEW

In a Nielsen survey from 1965, two-thirds of coupon users said they do consider the face value when deciding whether or not to use the coupon. On average, higher face values have higher standard levels of redemption. When coupons are issued for a particular brand, some coupon users will buy that brand as an alternate. This increases sales for the company because of the coupon being used (Shoemaker, 1985).

Consumers aged 18-24 have the highest redemption rates for digital coupons (Miller & Associates, 2010). On the other hand, consumers aged 65 and older are the most likely to redeem coupons that were distributed in the newspaper (Miller & Associates, 2010). Among these two most popular age groups for coupon redemption, there are further distinguishing characteristics that marketers can use to direct their campaigns. Research showed the long held stereotype that females are more likely to use coupons. In their sample of 535 consumers, they found that this might be because as a whole, females are more price sensitive than males, which means that females are more likely to notice and care about incremental changes in prices of their products and brands (Hill & Harmon, 2009). Another influencing factor in the increased likelihood of females to use coupons is that females were found to be more flexible than males in their shopping patterns, or in other words more open to changing brands if a difference was found (Hill & Harmon, 2009).

## DATA ANALYSIS AND RESULTS

After a four-week online survey period, a total of 240 surveys were received. Students studying business at a mid-west university were invited to participate in an online survey. Authors posted the links on their Facebook pages soliciting those 18-24 to complete the survey. After data cleaning and deleting responses outside of our target 18-24 range and those who do not use coupons, 171 responses were left for data analysis. The average respondent age was 21.9. Out of the 171 valid responses, 153 (89%) of the respondents were currently enrolled in a college program and almost two thirds of our sample was female (28.7% male, 71.3% female).

### Research Question 1: “How Often Do You Use Coupons?”

Our first research question is aimed at determining frequency of coupon use. We asked how often respondents used coupons from all possible sources and then more specifically how often they used coupons from social media Web sites. Research shows that the redemption rate of online coupons is drastically higher than ones offline (Lewis, 2006). Our study reports data that the net generation uses coupons from social media Web sites frequently versus from all sources including the Sunday newspaper only occasionally (Table 1).

Table 1: Coupon Use Frequency Results

H1	How often do you use coupons from sources like the Sunday newspaper and social media Web sites?	3.48	1.488
H2	How often do you use coupons from social media Web sites?	2.38	1.332

*Very Frequently (1) Occasionally (3) Never (5)*

Research Question 2: How many hours in a day do you spend on social media websites? Pasini (2012) reports an increase in manufacturer's posting coupons on their Facebook pages. Through this new outlet, the net generation has been newly initiated into the culture of couponing. Therefore, we wanted to know more about the time opportunity for manufactures to capture the attention of the net generation with their

coupons. Thus, we asked the net generation how many hours they spend per day on social media Web sites and the average was two hours per day.

Research Question 3 - Why do you use coupons? Students used to view coupons as a negative thing for “cheap” people; however, one student put it succinctly: “But when the economy is a factor like it is today we care less about the stigma and more about having enough money to put gas in the car,” (Sudar, 2011). In effort to explore more reasons why the net generation uses coupons we asked three quantitative survey questions and one open ended question. In a nutshell, the net generation uses coupons to save money (Table 2) and our qualitative analyses further tells us that they use coupons to save money through the rough economy, they use them because their moms used them, and to save even more when combining coupons with store sales.

Table 2: Coupon use motives

	Items	Mean	StdDev	Source	Qualitative results
W1	I use coupons to save money.	4.07	1.153	Bİr, A., et. al, 2011	<p><i>“Mainly to save money in the rough economy.”</i></p> <p><i>“I am a college student, so I try to save money anywhere I can.”</i></p> <p><i>“With being a college student, I don't always have much money after expenses. By using coupons I can save my money in a more efficient way.”</i></p> <p><i>“Coupons are like free money. If you have access to them, you might as well save some money within your purchases. I feel like a lot of people don't want to seem cheap or just don't take the time, but it pays off.”</i></p>
W2	I use coupons because a friend/family member does.	3.31	1.278	Bİr, A., et. al, 2011	<i>“My mother has always used coupons and I followed in her footsteps.”</i>
W3	I use coupons because the popular media has made it attractive to me (e.g. Extreme Couponing TV show, etc.) Other	2.70	1.174	Bİr, A., et. al, 2011	<p><i>“To save money, especially when catching items already on sale, I can save more money when combined with a coupon.”</i></p> <p><i>“Because I am a poor college student. It's also kind of thrilling to see how much I can save with coupons.”</i></p>

*Strongly disagree (1) to strongly agree (5)*

Research Question 4 – Does the net generation perceive that using coupons helps them enter into relationships with manufacturers? Relationship marketing encourages the relational exchange between consumers and manufacturer so that goods and services are tailored to the consumers’ needs and the maintenance of successful relational exchanges (Morgan and Hunt, 1994). In our research, the manufacturer is providing online coupons in hopes that the consumer will use the coupon and begin or maintain a relationship with that manufacturer. Our study finds that overall respondents neither disagree nor agree that using coupons presented online improves their connection to a business, helps them to discover new businesses, affects the way they see a brand or business compared to similar brands or business, or have a positive view towards brands that offer coupons for their products. In summary, the net generation’s goal is not to make connections or stay loyal to anyone brand. One respondent provided the following comment *“To save money, not to make a connection with businesses. For example, I could get a coupon for 40% off Kohl's clothing and I'll finally be able to buy a new pair of jeans.”*

Table 3: Coupons and Relationship Building

R1	Using coupons presented through social media would improve my connection to the business.	2.77	1.09	<i>"To save money, not to make a connection with businesses. For example, I could get a coupon for 40% off Kohl's clothing and I'll finally be able to buy a new pair of jeans."</i>
R2	I find that coupons offered through social media to be valuable.	2.61	1.09	
R3	Coupons presented through social media allow me to discover new product/business interests.	2.61	1.04	
R4	Social media coupons affect the way that I see a brand/business compared to other brands/businesses in its related market.	2.82	1.08	
R5	I have a positive view towards brands/businesses that offer coupons for their products.	2.34	1.09	

*Strongly disagree (1) to strongly agree (5)*

## DISCUSSION AND CONCLUSION

In this research we focused on the link between the popularity of couponing and online interaction with companies offering coupons online. Almost all respondents in the 18-24 year old range used coupons because they save them money while they are in college and living in a tough economy. They also use them because a friend or family member does, but not so much because of popular couponing shows. We also learned that our respondents in the net generation don't care about relationship building they just want the coupon and will not be brand loyal unless other factors are introduced. Or maybe they will become loyal without knowing it, since they spend two hours a day on social media sites. We conclude that although social media is relatively new, companies need to take notice now. Our research listened to some net generation individuals and we surmise that just a manufacture coupon online is not enough to build a relationship. Through the use of coupons in social media businesses can attract the net generation and through continued posting of coupons they can build brand loyalty for the many years to come.

# LEADERSHIP AND NATIONAL CULTURE IN THE UAE

Abubakr Suliman, The British University in Dubai

Ealbra Moradkhan, The British University in Dubai

## ABSTRACT

*With the trend towards globalisation, multinational corporations continue to seek global diversity. As such it is imperative to better understand the importance and impact of organisational variables such as leadership and culture on organisational performance and productivity. Globalisation and transferability of humane capital across the globe has stimulated an increasing need to develop global managers who understand the implications of cross-cultural work environments and are able to effectively manage people from different cultural backgrounds with diverse cultural values and practices to achieve business success.*

*National culture (NC) has an overwhelming power to influence people's behaviour both at society and organisational levels. This study examined how NC and its dimensions influenced the leadership behaviours of the managers in the United Arab Emirates (UAE).*

*The NC and leadership dimensions used in this study were the ones developed by Project GLOBE. The survey covered a sample of managers in the Marine and Oil & Gas sectors from a variety of countries and the data obtained from the sample was subjected to a series of statistical tests. The results of this study confirmed that NC is positively correlated to the leadership behaviours of managers in the UAE. However more specifically the study revealed that Charismatic, team oriented, humane oriented and autonomous leadership behaviours are culturally endorsed whereas self protective and participative leadership behaviours are significantly correlated to NC. Leadership is a competitive advantage that influences organisations' sustainable performance results. In order to enhance leadership abilities of the managers in a diverse cultural environment such as the UAE, this study has made recommendations in relation to 'organisational culture', 'recruitment & selection' and 'leadership development'. Organisational culture can be referred to as a micro model of national culture, hence a strong culture will outline the expected behaviours of the leaders and other members that are perceived to contribute towards organisational performance and success. In addition to that, this study also recommends to evaluate underlying intellect and interpersonal skills of the candidates for leadership roles along with their technical skills and experience in order to have a comprehensive assessment of one's leadership potential. And finally organisations should hold all the senior executives and line managers accountable for the development of individual managers by owning and executing succession plans.*

**KEY WORDS:** Leadership, National Culture (NC), United Arab Emirates (UAE), Project GLOBE.

## INTRODUCTION

Despite numerous studies over the past several decades, there is still no unique definition for Leadership. Robins and Jude (2009, p. 419) define leadership as "the ability to influence a group toward [sic] the achievement of a vision or set of goals". Naylor (2004, p. 354) suggests that "leadership is the process of influencing people towards achievement of organisational goals". Similarly, Tannenbaum and Massarik (1957) pointed out that the essence of leadership is influencing the behaviour of people through communication. As it can be observed in these three examples, the core concept of almost all leadership definitions is about leaders influencing a group of people to accomplish some shared goals. There has been much research carried out on leadership and leaders' characteristics and the subject has evolved to a large extent since 1900. The history of leadership as a distinct subject goes back to 1927 when the 'trait theory' was introduced; however some researchers such as Bowden (1927), Carlyle (1841) and Galton

(1869) argue that the leadership concept existed even prior to the 19<sup>th</sup> century, which they refer to as 'personality era - great man period' (Van Seters and Field, 1993). The last era of leadership research is referred to as the 'transformational era' which started in 1977 with House's work on 'Charismatic theory' followed with works by Burns (1978) and Bass (1985) on 'Transformational theory'.

Researchers have done a great deal of work over the past few decades in order to determine how leadership attributes contribute to organisational success and as Burns (1978, p. 2) put it "leadership is one of the most observed and least understood phenomena on earth." As a result different leadership theories and traits have evolved over the past few decades.

The focus of this dissertation is to assess through a research-based study if national culture (NC), which is embedded in each individual as practices and values, has an impact on the leadership behaviour of the managers in the United Arab Emirates (UAE) organisations from different ethnic backgrounds.

Culture has been a phenomenon of interest for social scientists for many years. The word 'culture' has a variety of meanings. Different researchers have defined it in various ways according to their beliefs. Tylor (1871, p. 1) provides one of the earliest definitions of culture and defines it as "... that complex whole which includes knowledge, belief, art, morals, custom and any other capabilities and habits acquired by man as a member of society".

Hofstede argues that culture is not a characteristic of individuals and it encompasses a number of people who were subjected to the same education and life experience, he defines culture as "the collective mental programming of the people in an environment" (1980, p. 43).

NC refers to a set of motives, beliefs, values, norms and behavioural practices shared by people of a nation. People of a particular country normally share certain behavioural traits that are apparent to outsiders.

As mentioned above, different leadership styles and behavioural patterns have evolved in the past century but there had been limited studies on cross-cultural applicability of them until House et al. started the 'Global Leadership and Organisational Behaviour Effectiveness' (GLOBE) project in the early 1990's. GLOBE was a 10 year research programme which started in 1994. The project focused on the relationship of national and organisational cultural values and practices and leaders' attributes and behaviour in 62 societies including some Arab countries but not the UAE.

The UAE with a land mass of 83,600 sq km is located on the Arabian Peninsula on the south side of the Persian Gulf. It has land borders with the Sultanate of Oman and the Kingdom of Saudi Arabia and sea borders with Iran and Qatar. It comprises of seven emirates: Abu Dhabi (capital city), Dubai, Sharjah, Ajman, Umm Al Quwain, Ras al-Khaimah and Fujairah each governed by a hereditary Emir. The Federation which was previously known as the "Trucial States" was established on the 2<sup>nd</sup> December 1971 (Gaad et al., 2006). The UAE happens to be a country that is ethnically very diverse and much research have been conducted on this kind of diversity within the UAE's labour market. As an emerging and developing country, one can attribute this diversity to the need for skills and expertise that are not available within the local market. It is well known that the Gulf Cooperation Council (GCC) labour markets, the UAE being one of them, are dominated by expatriates. This influx of expatriates started in the late 60's and early 70's, as a result of the discovery of oil and its commercial production. Many of these countries did not have the knowledge to successfully develop this industry and as such started relying mainly on expatriates for the development of their countries. As reported by Randeree (2009) the UAE is inhabited by a variety of cultural groups such as Emirati, Iranians, Filipinos, Indians, Europeans, and Americans. This kind of diversity can also be seen at the management level of the UAE organisations where management teams consist of Emiratis, Western and Eastern Europeans, Asians, Middle Eastern,

etc. Not only does such diversity not help to make the cultural differences amongst different nationalities disappear or diminish but it also brings its own challenges, as by default people do not normally appreciate and accept cultural values and practices in other parts of the world which differ from their own countries.

This study aims to focus on the role of NC on leaders' traits and behaviour in UAE organisations. It will focus on studying the impact of NC on leadership behaviour of managers within culturally diverse organisations within the UAE based on the GLOBE project classification of NC and leadership behaviour. The next section will provide an overview of the aims, objectives and research question.

With the trend towards globalisation, organisations need to better understand the importance and impact of organisational variables such as leadership and culture on organisational performance and productivity. Multinational corporations continue to seek global diversity; however training and development of competent global leaders is a real challenge for multinational companies. The question that needs to be answered is "what leadership behaviour should leaders apply and to which colleagues and subordinates group?" This trend puts a demand on research to understand if the diversity of cultural values and practices constitute a management problem.

House et al. (2002) stated that the study of cross-cultural literature has indicated a strong correlation between culture and leadership styles. Furthermore House et al. (1997) pointed out that cultural forces influence many aspects of the leadership phenomenon and they provide substantial evidence that leaders' behaviour and traits vary considerably based on the cultural beliefs and values of the regions and countries they come from.

Globalisation and transferability of human capital across the globe has stimulated an increase in sociologists and management scholars' interest to understand the cultural similarities and differences of human communities and their impact on their interaction. The GLOBE Project is one of the most recent endeavours, which has explored the cultural values and practices in a wide variety of countries and their impact on leadership behaviour and organisational practices (House et al., 2002). As mentioned in the previous section the GLOBE research is an in-depth study of 62 societies including a few GCC countries such as Qatar and Kuwait but not the UAE.

In countries with a limited talent pool such as those in the GCC, the UAE being one of them, there is a very heavy reliance on expatriates which leads to having a diversified workforce in organisations. The demographic statistics of the UAE based on a 2008 census published by a local newspaper shows that Emiratis consist 13.5% of the UAE population (Randeree, 2009). However Kaposzewski (2006) points out that the dominance of foreigners is more prominent in the workforce than in the total population. This workforce comes from different parts of the world.

The UAE has gone through a period of rapid expansion over the last few years and despite the economic downturn, the UAE's strategic position and oil and trade revenues have allowed it to plan for further levels of expansion. Hence understanding the impacts of cultural diversity on leadership behaviour in UAE organisations is timely and important in order to overcome any potential barriers in the way of organisations and as a result the country's success.

This study focuses on marine and oil & gas sectors in the UAE. Although the 2008-2009 economic downturn has had a negative impact to different extents on these sectors, they still continue to grow because of a high energy demand worldwide. In the UAE employees working in marine and oil and gas sectors have been recruited from different cultural backgrounds at all levels of organisations including the leadership teams. Whilst such diversity at the senior level has brought a wealth of diversified management and leadership experience, it has also brought challenges in integrating culturally different leadership styles.

This research is going to reveal if NC has any impact on leader's behaviour and if so how such differences can be better understood in order to build a cohesive leadership team. Also this study is meant to augment GLOBE's project by studying the role of NC on leadership behaviour in the UAE which was not amongst the 62 societies studied by GLOBE.

## LITERATURE REVIEW

Chapter two aims to present a brief overview of the emergence of leadership as a field of study and the different leadership theories developed over the past few decades. Also it provides a theoretical overview of NC and its emergence. Finally this chapter explains the development of the UAE and its culture and also begins to establish a link between NC and leadership behaviour, in order to support the hypotheses that will be presented at the end of this chapter.

Leadership has been one of the major research topics in social and organisational psychology. The term 'leadership' has been in existence since 1700s (Stogdill, 1974), however Bass (1990) argues that scientific research on the subject started only since the twentieth century although the principles of leadership go back as far as the emergence of civilisation. Such principles can be found in Egyptians' Hieroglyphs for leadership, leader and follower in 2300 B.C., followed by Chinese classics written in the sixth century B.C. and more recently in the Greeks and Renaissance works (Bass and Bass, 2008).

There are numerous definitions and theories of leadership which has evolved greatly since the nineteenth century. Table 1 shows a summary of the evolutionary stages of the leadership theory. The next few sections are going to briefly discuss the major leadership theories developed throughout the past and present centuries.

On the other hand, the study National Culture (NC) of has been receiving worldwide interest by both researchers and academics. This is the result of the impact NC is perceived to have on leaders' and employees' behaviour, change management, workplace diversity and many more areas which all ultimately impact organisational performance. Globalisation has broken some of the economical barriers but cultural barriers still tend to pose a threat on both organisational and employees' performance.

NC has always been one of the dominant areas of Human Resource Management discipline. Having people from different cultural backgrounds could be considered as an advantage in many ways since they bring with them different values and skills that could be advantageous if used in the right direction. However one should be aware of the challenges that such diversity may bring due to the differences in values and practices which are embedded in people's behaviour, and hence very difficult to change. NC has been studied by a number of researchers in relation to management practices and organisational behaviour. One of the leading studies of NC is the one conducted by Geert Hofstede (1982, p. 21) who defined NC as "the collective programming of the mind which distinguishes the members of one human group from another". He also suggests three levels of uniqueness in mental programming, as shown in Figure (1), which he believes can be inherited, transferred in our genes or learned after our birth:

Table 1: Major leadership Eras (Seters and Field, 1993, p. 31)

<i>Major leadership Era</i>	<i>Period</i>	<i>Theories/approaches</i>
Personality Era	Great man period	• Great man theory (Bowden, 1927; Carlyle, 1841; Galton, 1869)
	Trait period	• Trait theory ( Bingham, 1927)
Influence Era	Power relations period	• Five bases of power approach (French, 1956; French and Raven, 1959)
	Persuasion period	• Leader dominance approach (Schenk, 1928)
Behaviour Era	Early behaviour period	• Reinforced change theory (Bass, 1960) • Ohio State Studies (Fleishman, Harries and Burt, 1955) • Michigan State Studies (Likert, 1961)
	Late behaviour period	• Managerial Grid Model (Blake and Mouton, 1964) • Four-Factor Theory (Bowers and Seashore, 1966) • Action Theory of Leadership (Argyris, 1976) • Theory X and Y (McGregor, 1960; McGregor, 1966)
Situation Era	Environment period	• Environment Approach (Hook, 1943) • Open-Systems Model (Katz and Kahn, 1978)
	Social status period	• Role Attainment Theory (Stogdill, 1959) • Leader Role Theory (Homans, 1956)
	Socio-technical period	• Socio-technical systems (Tris and Bamforth, 1951)
	-	• Contingency Theory (Fiedler, 1964) • Path-Goal Theory (Evans, 1970; House, 1971) • Situational Theory (Hersey and Blanchard, 1969; 1977) • Multiple Linkage Model (Yuki, 1971; 1989) • Normative Theory (Vroom and Yetton, 1973; Vroom and Jago, 1988)
Transactional Era	Exchange period	• Leader Member Exchange Theory (Dansereau, Graen and Haga, 1975) • Reciprocal Influence Approach (Greene, 1975) • Emergent Leadership (Hollander, 1958)
	Role development period	• Social Exchange Theory (Hollander, 1979; Jacob, 1970)
	Ambiguity period	• Attribution Approach (Pfeffer, 1977)
Anti-leadership Era	Substitute period	• Leadership Substitute Theory (Kerr and Jermier, 1978)
	-	• McKinsey 7-S Framework (Pascale and Athos, 1981) • Theory Z (Ouchi and Jaeger, 1978) • In Search of Excellence Approach (Peters and Waterman, 1982) • Self-Leadership (Manz and Sims, 1987)
Transformational Era	Charisma period	• Charismatic Theory (House, 1977) • Transforming Leadership Theory (Burns, 1978)
	Self-fulfilling prophecy period	• SFP Leader Theory (Field, 1989; Eden, 1984) • Performance beyond Expectations Approach (Bass, 1985)

**Universal level:** Hofstede refers to this level as “biological operating system of the human body”, which is shared by almost all mankind.

**Collective level:** This is common language and behaviour of the people belonging to a certain group and category. It is at this level that most of the human being’s mental programming is learned during his entire life.

**Individual level:** This is the level of individual personality which is truly unique. No two people are programmed exactly alike.

Hofstede's work on NC has been instrumental in the study of cross-cultural differences explaining that what might be an acceptable norm to the members of one society may not be necessarily acceptable to the members of another society. Hofstede's work on multidimensional cultural model originated from his study of the employees of IBM corporation across 72 countries. According to Hofstede "many national differences in work-related values, beliefs, norms, and self-descriptions, as well as many societal variables, could be largely explained in terms of their statistical and conceptual associations with four major dimensions of national culture" (Minkov and Hofstede, 2011, p. 11). The four dimensions are named as power distance, uncertainty avoidance, individualism versus collectivism, and masculinity versus femininity. Later in 1991 and after his IBM study, Hofstede introduced a fifth dimension which he labelled as 'long-term versus short-term orientation'. In 2010 and based on Michael Minkov's world values survey data analysis for 93 countries, the sixth dimension labelled as 'indulgence versus restraint' was added to the Hofstede's dimensions of NC. The next few paragraphs provide a brief description of Hofstede's NC dimensions.

*Large versus small power distance:* refers to the degree of unequal distribution of power amongst people in a society which is normally expected and accepted by the general public. In many countries, people are different as far as their wealth, power and social status are concerned; however some countries aim to minimise the differences as much as possible while some others foster or maintain them. High power distance at the organisational level can be observed through centralisation of authority, strong hierarchies and large gaps in status and compensations and benefits.

*Strong versus weak uncertainty avoidance:* Hofstede and Hofstede (2005, p. 167) defined uncertainty avoidance as "the extent to which the members of a culture feel threatened by ambiguous or unknown situations". In high uncertainty avoidance cultures, there are more rules and regulations, safety and security measures and people from these cultures are normally more emotional and have deep religious beliefs. On the contrary people from low uncertainty avoidance cultures are more open to opinions of others than just their own, contemplative and less emotional. In the organisations with high uncertainty avoidance, there is very formal business conduct with lots of rules and policies, need for clear structure and avoidance of differences. On the other hand in organisations with low uncertainty avoidance one can observe more trust, an informal business attitude, concern with long term strategy and more acceptance of change and risk.

*Individualism-collectivism:* As Hofstede and Hofstede (2005, p. 76) stated:

[i]ndividualism pertains to societies in which the ties between individuals are loose: everyone is expected to look after himself or herself and his or her immediate family. Collectivism, as it's opposite, pertains to societies in which people from birth onward are integrated into strong, cohesive in-groups, which throughout people's lifetime continue to protect them in exchange for unquestioning loyalty.

Individualistic cultures encourage their members to look after their own interests whereas members of collectivist cultures are expected to look after each other's interests as well as their own.

*Masculinity-femininity:* Hofstede and Hofstede (2005, p. 120) defined this dimension as:

[a] society is called masculine when emotional gender roles are clearly distinct: men are supposed to be assertive, tough, and focused on material success, whereas women are supposed to be more modest, tender, and concerned with the quality of life. A society is called feminine when emotional gender roles overlap: both men and women are supposed to be modest, tender, and concerned with quality of life.

In other words masculine cultures are those that value assertiveness, success and money more as opposed to feminine cultures which emphasise on good working relationships and quality of life.

*Time orientation (long term and short term):* In 1991 and after his IBM study, Hofstede introduced this dimension which represents the extent to which members of a culture accept delayed fulfilment of material, societal, and emotional needs (Hofstede and Hofstede, 2005). In short-term oriented societies

one could observe promotion of virtues related to the past and present such as, national pride, personal stability, respect for tradition, and fulfilment of social obligations. In long-term oriented societies people value qualities related to the future such as persistence, frugality, adapting to changing circumstances and having a sense of shame.

*Indulgence versus restraint:* ‘indulgence’ describes a society that allows people to freely satisfy their basic needs and desires whereas ‘restraint’ refers to societies with stringent social norms, which suppresses gratification of basic needs of their people.

In recent years, the GLOBE study has attracted the attention of many scholars in the field of NC. As mentioned in section 2.1.7, the main objective of GLOBE was to develop a theory to understand and predict the impact of cultural variables on leadership and organisational effectiveness, economic competitiveness of societies and the human conditions of members of the 62 societies which were part of the study (House et al., 2004). Table 4 lists the societies that participated in the GLOBE study.

For the GLOBE research programme, the researchers defined culture as “shared motives, values, beliefs, identities, and interpretations or meanings of significant events that result from common experiences of members of collectives and are transmitted across age generations” (House et al., 2002, p. 5). In this project ‘culture’ is examined in terms of both values and practices. Values are expressed in response to the questions in the form of judgments of ‘what should be done’, whereas practices refer to the ways things ‘are done’ (House et al., 2002).

As a result of this project, the researchers introduced nine dimensions for measuring NC, which made up the independent variable of the study. House et al. (2004) clarify that the first 6 dimensions (power distance, uncertainty avoidance, institutional collectivism, in-group collectivism, gender egalitarianism and assertiveness) had their origins in the four dimensions of NC introduced by Geert Hofstede (1980). ‘Future orientation’ dimension was derived from the works of Kluckhohn and Strodtbeck (1961) as well as Hofstede and Bond (1988) and Hofstede (2001); ‘performance Orientation’ has its roots in McClelland’s (1961) work and ‘Human Orientation’ dimension has its origins in the studies carried out by Kluckhohn and Strodtbeck (1961), Putman (1993) and McClelland (1985) (House et al., 2004).

Many researchers argue that management theory is influenced by specific societal values, beliefs, norms, and work and social experiences (Ali, 1996, p. 4). Management or leadership theories that may work in one country may not be a solution for another. For example; Hofstede (1993) argues that American theories of leadership are not suitable for countries such as Germany, Japan, France and Holland. In the same article he also argues that Western, mainly American leadership theories, have not contributed to the development of the poorer countries either. A number of studies suggest that NC influences the leadership style of managers. Al-Faleh (1987) suggests that Arab culture, the UAE being one of them, has certain distinctive characteristics which govern managerial practices and behaviour such as paternal role of managers, consultative management, importance of social formalities and the value of loyalty over efficiency. Such characteristics are very different from the ones practiced in western culture.

Hypothesis H1: Leadership behaviour of managers in the UAE is influenced by their national culture.

House et al. (2004) identifies CL as one of the culturally endorsed leadership behaviour and defined it as the ability to inspire, motivate, and expect high performance outcomes from others while maintaining integrity and respecting core values. Charismatic leaders possess visionary and inspirational behaviours followed by values such as dignity and freedom which have universal appeal.

Hypothesis H2: Charismatic leadership is not influenced by the national culture of the managers.

Team-oriented leaders emphasise team building and create a common purpose amongst team members. Such leaders are known to be collaborative, communicative, group-oriented and non-malevolent.

A work team generates positive synergy through coordinated efforts to achieve a level of performance that is greater than the sum of individual inputs (Robins and Judge, 2009). As such one can argue that cultural beliefs of the leaders can influence the development of this leadership style in an organisation; for example leaders from high PD societies where the power and decision making are centralised at the top, the UAE being one of them, are less likely to develop TOL style.

Hypothesis H3: Team-oriented Leadership is influenced by the national culture of the managers.

House et al. (2004) suggests that SPL style focuses on ensuring the safety and security of the individual or group member. They identify five main dimensions associated with this leadership style; conflict inducer, face saver, procedural and status consciousness. In societies exhibiting a large degree of PD, one can observe a hierarchical order which is accepted by people in those societies, as such individuals' level and place in the chain of command does not need any justification. As shown in figure 3, the UAE scores high on this dimension (score of 90) which means that people accept a hierarchical order. This suggests that NC is likely to play a role in the development of this leadership style.

Hypothesis H4: Self-protective Leadership is influenced by the national culture of the managers.

This leadership behaviour promotes values such as modesty, generosity and compassionateness which have universal appeal. It also encourage people to be friendly, caring and considerate towards other people's interests.

Hypothesis H5: Humane-oriented Leadership is not influenced by the national culture of the managers.

Autonomous leaders have the tendency to be independent and act independently with minimal interest in interdependent relations (House et al., 2004). Nohria and Khurana (2010) suggest that autonomous leaders prefer to be self-reliant and work alone rather than working with others therefore they tend to build their independence. Societies that promote collectivism such as the UAE are expected to discourage such leadership behaviour as the group cohesiveness can be jeopardised by the behaviour of such leaders. Hence it can be perceived that AL style depends on the cultural values and practices.

Hypothesis H6: Autonomous Leadership is influenced by the national culture of the managers.

Participative leaders involve their team in decision making and implementation of the decisions. The degree of involving others may vary depending on one's cultural values and practices. For example in high PD societies and organisations, decision making is likely to be centralised at the top and there is less likelihood to observe PL. Similarly in low GE organisations, there is a lesser degree of women's involvement in decision making positions. Hypothesis H7: Participative Leadership is influenced by the national culture of the managers.

## METHODOLOGY

### Research design

In order to uncover and understand 'the role of NC on leadership behaviour', taking a structured survey approach was deemed to be most suitable. The survey strategy is usually associated with a deductive approach as suggested by Saunders, et. al. (2000) and it is a widespread strategy in management and business research. O'Leary (2007) suggests that in social science research, methods that rely on deductive reasoning start with a theory, which is narrowed down to a testable hypothesis, data is then collected and analysed to see if the hypothesis can be confirmed and the theory verified.

Out of the three possible mechanisms of data collection used in survey approach (questionnaires, structured interviews and structured observations), questionnaires were used in this research to collect data and test the hypotheses since they would allow to gather information from a larger population compared to the other mechanisms (Saunders, et. al., 2000).

### Questionnaire design

All participants in this study were provided with a questionnaire along with an introduction letter outlining the objective of the study and assuring respondents' anonymity of their identity. The questionnaire included three sections; 1) demographic variables 2) leadership items and 3) NC items (appendix 2).

### Demographic variables

This part of the questionnaire included questions such as gender, age, nationality, educational level and position in the organisation. The answers were measured on a 2 to 7-point scales depending on the nature of each question; for example gender was measured on a 2-point scale (Female/Male) whereas education was measured on a 6-point scale (Less than high school diploma up to masters degree and above). Nationality was measured on an 8-point scale including Eastern and Western Europeans, Asian, Arab and other Middle Eastern, South and North Americans, Africans.

### Leadership, dependent variable

The major question that needs to be addressed in the study of the leadership behaviour of the managers in the UAE, is the extent to which cultural values and practices are linked to leaders' behaviours and leadership styles. As described in section 2.1.7, GLOBE introduced six culturally endorsed leadership behaviour named 'charismatic leadership', 'team oriented leadership', 'participative leadership', 'humane orientation leadership', 'autonomous leadership', and 'self protective leadership'.

In order to measure the six global leadership patterns of behaviour in the UAE, 30 items were selected from the GLOBE study (House et al., 2004); 9 items for CL, 7 for TOL, 3 for PL, 3 for HOL, 2 for AL and 6 for SPL dimension. All items were measured against a 7-point scale designed by GLOBE project that ranged from 'this behaviour greatly inhibits a person being an outstanding leader' to the highest scale of 'this behaviour contributes greatly to a person being an outstanding leader'.

### National Culture, independent variable

To measure the four dimensions of NC 10 items were selected from GLOBE project (House et al., 2004); 3 for gender egalitarianism (GE), 3 for power distance (PD), 2 for future orientation (FO) and 2 for in-group collectivism (IGC). All items were measured against a 7-point scale designed by GLOBE project that ranged from 'strongly agree' to 'strongly disagree'.

### Pilot study

Prior to the distribution of the questionnaire to the study sample, it was piloted on 5 people out of which one was Indian, two British, one Norwegian, and one Iranian. A Pilot study was carried out in order to check the feasibility of the questionnaire and improve the design of it before it was distributed amongst a larger population. The pilot study samples did not form a part of the main survey results. The purpose of the study and the need for the pilot study were explained to every participant in a one-on-one session and they were asked to provide their feedback on the questionnaire design in general and also highlight any ambiguous words or phrases. One comment was made on part A of the questionnaire and 3 of the participants suggested that a few attributes of leadership in part B were ambiguous. No comments were made by any of the participants on Part C of the questionnaire, which was in reference to NC questions. The questionnaire was later revised based on the participants' feedback.

### Study sample and Data collection

A total of 320 senior employees were invited to participate in this study. The participants were selected from leading oilfield services and marine companies in the UAE providing marine and engineering solutions to the global energy industry. The participants selected in the study are all senior employees based in the UAE who come from different cultural backgrounds.

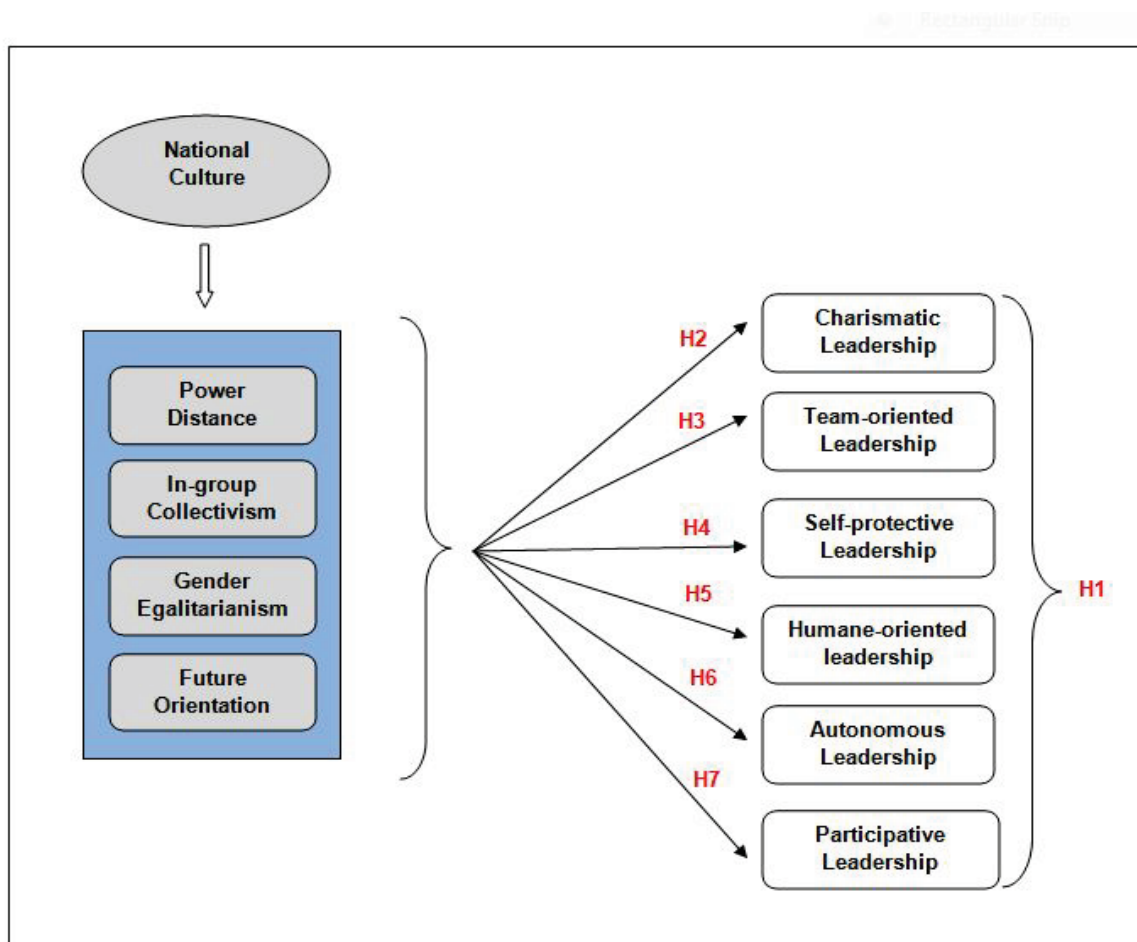

220 of the participants selected to participate in this survey were invited through an email, which briefly described the purpose of the study. After the invitation email, 220 questionnaires were sent out through mail and all participants were requested to return the completed questionnaire by internal mail or any other way convenient for them. A few of the participants requested a soft copy of the questionnaire, which they sent back via the internal email system. The remaining 100 participants were approached during an exhibition and invited to participate in the study. As the survey started in the middle of summer, it was left open for approximately three months to allow all the participants to come back from their summer holiday and complete the questionnaires. Out of 320 questionnaires only 113 were returned out of which 103 were complete and acceptable to be used in the quantitative analysis.

#### Model of the study

Figure 2 has been developed based on the hypotheses that were proposed in section 2.4 for further clarification. The figure demonstrates whether the NC has an impact on the development of the six leadership behaviour of the managers in the UAE organisations or not. As such, this study will explore the link between the six culturally endorsed leadership behaviour (CL, TOL, SPL, PL, AL and HOL) and the four dimensions of NC (PD, IGC, GE and FO) based on the GLOBE project classification of these dimensions.

Figure 2 - A research model of NC and leadership behaviour

#### Research limitations

This research has a few limitations as follows:

- 1) The questionnaire for collecting the data was in English only and not translated into any other language, and this may have caused some degree of confusion in understanding the meaning of some words and phrases for the non English speaking participants. As a result, the English speaking participants might have had the advantage of comprehending the questions more easily.
- 2) Participants were asked to fill the questionnaires at their convenience prior to the deadline and the conditions under which the test was completed were not controlled. Hence it cannot be assured that the conditions for responding to the questions were always the same and also optimal with no interruption or influence of external factors.
- 3) The number of participants or the study sample can also be considered a limitation of this study and might have been the cause of the non-normality of the variables.

## RESULTS

Data for this research was collected from 113 respondents, however only 103 of the responses were deemed suitable for processing. Table (2) exhibits the demographic characteristics of the sample (N=103). As is evident from Table 7, the majority of the respondents were male (96%). The age range of most of the respondents was from 36 to 57 years old with 40% between 36-46 and 32% between 47-57 years old. The majority of the respondents (62%) were Asian and Western European constituted 26% of the sample. The remaining 12% were Eastern Europeans, Middle Eastern, African and North American. In terms of educational qualifications, 65% of the respondents held a Bachelors degree and above and 23% held a college or vocational degree. Only one of the respondents fell under the High School Diploma grouping. Respondents who occupied supervisory roles constituted 43% of the respondents, Managers' position constituted 41% of the sample, 14% were Senior Manager and finally 3% of the respondents were Senior Executives.

Table 2: Demographic Characteristics of the Study Sample

	Sex	Age	Nationality	Educational Level	Job Title
Male	99				
Female	4				
Less than 25 years old		1			
25-35 years old		19			
36-46 years old		41			
47-57 years old		33			
58 or above years old		9			
Western European			27		
Eastern European			4		
Asian			64		
Arab/Middle Eastern			3		
North American			4		
African			1		
Less than high school				1	
High School Diploma				3	
Higher National Diploma				8	
College degree /vocational qualifications				24	
Graduate degree				28	
Master degree or above				39	
Supervisor					31
Assistant Manager					13
Manager					42
Senior Manager/Director/VP					14
Senior Executive					3

The reliability of a measure is established by testing both consistency and stability Sekaran (1992); the former indicates how the items measuring a variable sit well together as a group whereas the latter shows

the ability of a measure to produce consistent results under different conditions. Table (3) illustrates the study variables and their corresponding reliability coefficients or Cronbach's alpha values. As it can be seen in table 8, the Cronbach's alpha is above 0.7 for all the factors hence we can conclude that the data is reliable.

## DISCUSSIONS

The results of the linear regression in the previous section showed that NC can account for 16% of the variation in Leadership behaviour of the managers. Therefore when we underline the differences in managers' leadership styles, we should take into consideration the cultural differences. NC is a significant predictor of leadership behaviour ( $F= 19.18, p < .001$  and  $t\text{-value}= 4.38, p < .001$ ). This result confirms hypothesis H1 and the argument that the differences in societal values influence the perception of realities amongst people and as House et al. (2004) suggest, people within the same cultural group have similar beliefs about leadership but there are significant differences about leadership viewpoints amongst different cultural groups.

The results of the Spearman correlation in the previous section showed that NC does not have any impact on CL behaviour ( $F\text{-ratio} = .04, p > .05$  and  $t\text{-value} = .19, p > .05$ ) confirming hypothesis H2. There is a lot of evidence to support the supposition that the effect of charismatic leader behaviour is not limited to certain cultures, but is pan-cultural. For example Bass' (1997) study suggests similar result in China and Japan. Furthermore House et al. (2004) cross-cultural study suggests that the behaviour of a charismatic leader is universally accepted as behaviour of a highly effective organisational leader.

## CONCLUSIONS AND RECOMMENDATIONS

A number of studies have shown that leadership is one of the principle factors for improving an organisation's performance. Thomas (1988) suggests that leader differences has a significant impact on the performance variations within a firm. Effective leadership is a competitive advantage that leads to sustainable organisational performance. As such 'leadership' becomes of particular importance in positions that involve managing people.

Although literature suggests many definitions for 'organisational culture', a lot of them refer to it as shared assumptions held by the employees which is very similar to how 'NC' has been defined by many researchers. NC is a pervasive phenomenon and as Fombrun (1983) puts it, organisational culture takes on part of the characteristics of the NCs. Smith and Kleiner (1993) suggest three mechanisms by which culture can contribute to organisational effectiveness; 1) helps members understand the expected behaviour 2) generates commitment to work and 3) acts as a control system. Since strong organisational culture greatly influences the behaviour of the employees, understanding and modifying the organisational culture plays a key role in shaping the behaviour of the leaders.

As this study indicated, GE and IGC have an impact on the leadership behaviour of the managers. Furthermore FO is also correlated with PL behaviour. Organisations should endeavour to achieve higher levels of GE, IGC and FO. To create high GE, organisations must enforce equal employment opportunities. In such environments the employment and promotion opportunities and rewards are dependent on competencies rather than gender.

# THE ENVIRONMENTAL IMPACT OF CULTURAL EVENTS: A CASE STUDY OF GANESH FESTIVAL IN INDIA

Shivaji Borhade, Bharati Vidyapeeth University, Pune (India)

## ABSTRACT

*Ganesh festival is one of the most popular of Hindu festivals and it is observed throughout India as well as by the devoted Hindus in all parts of the world. The spectacular festival honours the birth of the beloved Hindu elephant headed god, Lord Ganesh, popularly worshiped for his ability to remove obstacles and bring good fortunes. The most serious impact of the Ganesh festival on the natural environment is due to the immersion of idols made of Plaster of Paris into lakes, rivers and the sea. The noise levels in all the cities of Maharashtra were exceeding the permissible limit during the Ganesh festival. In spite of legal standards in place and efforts of the regulatory agencies, the noise levels could not be controlled under the permissible limit. The environmental problems in India are growing rapidly. It is one of the most serious problems facing humanity and other life forms on our planet today. As the country's population and economy continue to grow, the need to find solutions becomes more urgent.*

**KEYWORDS:** Cultural Events, Ganesh Festival, Ganesh Mandals, Environmental Impact, Pollution.

## INTRODUCTION

Festivals are celebrated throughout the world in different manners and for different reasons. Some are ancient and some are modern. Since the origin of festivals lie in our ancient culture and tradition, they are highlighted with full fanfare. Festivals offer us a picture of how the society functioned and celebrated. Festivals attract all types of cultures. Each culture has its own customs and practices. Festivals have a lot of spiritual and religious significance. India has a great cultural heritage. Indian people celebrate a number of festivals every year. Ganesh festival is one of them.

Now, Ganesh festival is celebrated not only in India but also different corners of the world such as USA, France, New York, San Francisco, Chicago, Sydney, Nairobi, Tokyo, Muscat, Bali, etc. Ganesh *Chaturthi* (Fourth day of *Bhadrapad* month) is celebrated in the UK by the migrant Hindu population as well as the large number of Indians residing there. Government of Mauritius has declared public holiday on Ganesh *Chaturthi* due to the popularity of this festival. While the Marathi community plays a big role in organising the festival around the world, participation from all communities such as Gujarati, Tamil, Telugu, North Indian, Bengali etc. is seen as the reason for its success and uniqueness. Ganesh *Chaturthi* is one of the most popular of Hindu festivals and it is observed throughout India as well as by the devoted Hindus in all parts of the world.

Indian calendar is filled with lots of festivals considering different religions. The Ganesh festival is a cultural event celebrated by Hindus globally as a birthday of Lord Ganesh. It is celebrated all over India and also abroad in some parts where majority of Indians are living. Initially, it was celebrated only in the Maharashtra state of India but slowly it has spread all over the India. During the British rule, to encourage the fight for freedom among the people, one of the great Indian freedom fighter-Lokmanya Tilak used Ganesh festival as a hidden way to gather people and to encourage them for fight for freedom. After that, this festival became a big public event. This festival is locally known as 'Ganesh Chaturthi'. It is celebrated by establishing idols of Lord Ganesh in homes as well as pendals and by offering prayers daily

with family, friends and community for ten days. This festival ends with immersion of idols in the sea, rivers or lakes on the eleventh day. It's an occasion of great joy and fun.

Apart from all the fun and cultural integrity, the Ganesh festival also has some bad impact on environment. According to tradition, on the last day of festival, all idols are immersed in the nearby lakes or rivers. It causes a pollution of these important water resources. Most of the idols are made of plaster of Paris and painted with harmful chemical colours which are polluting the water bodies. Also, along with idols, there are other non-biodegradable accessories used during the worship which are also immersed in the water bodies. The scenario of all garbage in the lakes and rivers on the next day after immersion ceremony is really bad. While celebrating Ganesh festival, there are various ways which contribute to the serious environmental pollution and degradation.

The celebration of Ganesh festival has changed in terms of its scale as well as involvement of the people. About 80 per cent of India's populations are Hindus. In recent years, their religious festivals and customs have come under increasing scrutiny as public awareness of environmental issues grows. The activities of the Ganesh festival cause the concerns in terms of water pollution, air pollution and noise pollution. In the light of the above discussion, the present chapter has been planned to study the impact of Ganesh festival on environment.

## LITERATURE REVIEW

Assessment of eco friendly Ganesh idols (2010) conducted by National Environmental Engineering Research Institute observed on the basis of inputs that there would be no discharge of conventional pollutants in the aquatic environment, so marine flora and fauna would not be affected. The thermal discharges of condenser cooling water would not exceed the stipulated standards and would not put aquatic creatures in danger.

A study titled 'Ganesh Idol Immersion & Water Pollution in the State of Maharashtra: an Action Plan' (2012) found that majority of the Ganesh idols are made of PoP. These idols take several months to dissolve in water. Careless immersion of Ganesh idols in water bodies blocks the natural flow of water. In many areas the same polluted water gets pumped into homes. The article analysed legislation relating to prevention and control of water pollution in India. The observation of the study is that Ganesh mandals are responsible for water pollution.

Madhav Srinivasan (2012) observed that environmental concerns over immersing the idols of Lord Ganesh in the sea have been growing over the years, mainly because of the impact that the chemical paints used in these idols have on natural water bodies. This impact on the environment can be significantly reduced by using clay idols or by depositing the idols in common water tanks that are constructed by the government for this purpose.

Maharashtra Pollution Control Board in its report (2011) observed that noise levels in some of the cities decrease this year significantly, but these are still higher than the permissible limits. Although the noise level get decreased but these are still higher than the permissible limits, which is the matter of concern. The noise levels were found to be having a decreasing trend in cities like Kolhapur, Satara, Mumbai, Navi Mumbai, Thane, Aurangabad and Amravati over the last few years. However, some cities like Nagpur, Jalgaon have shown increasing trend in the noise levels. The other cities like Pune and Nashik have shown a comparatively constant trend in the noise levels. The ambient noise levels were exceeding the standards specified under the Noise Rules, 2000.

## METHODOLOGY

A suitable sample design was framed for the study where universe selected were Ganesh Mandals in the state of Maharashtra. The study is based on the primary data collected with the help of structured questionnaire from 250 respondents selected from different districts of the state of Maharashtra. The questionnaire contained both open and close ended questions related to impact on environment. The primary data was collected by adopting interview method and observation method. The secondary data was collected from published and unpublished reports, journals, books and also websites. The simple statistical tools and techniques were used for the analysis.

### Objectives

The purpose of this study is to determine the direct, indirect and induced environmental impact of cultural events in India. For this, a case study of Ganesh festival which is celebrated in India and abroad on a grand scale has been undertaken. In addition, the study addresses the following aspects.

1. To foster professionalism in Ganesh festival.
2. To provide systematic study of Ganesh festival as environmental phenomena.
3. To assess the celebration of Ganesh festival with water, sound and air pollution.

### Hypotheses

The following hypotheses were formulated in order to achieve the above objectives:

1. Ganesh festival has made a great and adverse impact on environment through water, sound and air pollution.
2. There is no significant relationship between the general environmental concerns of Ganesh mandals and their attitude towards Ganesh festival.

## RESULTS AND DISCUSSIONS

Table 1 shows that out of 250 respondents 102 (40.8%) expressed agreed towards opinion that there is water pollution due to Ganesh festival. Out of the agreed respondents, 64 (25.6%) were strongly agreed while 38 (15.2%) respondents were agreed towards water pollution. It is clear from the table that 118 (47.2%) respondents agreed that there is sound pollution due to celebration of Ganesh festival. It indicates that nearly half of the respondents were agreed regarding sound pollution. So far as the air pollution is concerned, only 39.6 percent of respondents accepted that there is air pollution from celebration of Ganesh festival.

It was found that 130 (52%) respondents expressed that vulgar songs are played in the pandal where the Ganesh idol is consecrated. People who do not worship an idol at home participate in such public celebrations with true devotion and spiritual emotion but are unable to derive any happiness from it due to overcrowding and unnecessary chaos and noise in the pandal, which is not conducive to such functions. It seems like the Ganesh mandals of today are more interested in changing religious concepts before actually comprehending them. Rituals like moving lit lamps (arti), ritualistic worship (puja), making offerings to the deity (tirtha prasad); paying obeisance to the Lord, listening to songs in praise of God (kirtan) and discourses should acquire a significant position in the celebrations.

Table 1: Perception Towards Environmental Impact of Ganesh Festival

Sr.	Question	Strongly Agree	Agree	Neither Agree nor Disagree	Disagree	Strongly Disagree	Total
1	Water Pollution	64	38	6	114	28	250
2	Sound Pollution	69	49	15	83	34	250
3	Air Pollution	47	52	18	80	53	250
4	Vulgar songs are played in the pandal	98	32	12	58	50	250
5	Only bigger Ganesh mandals violate the decibel limits to use loudspeakers	139	59	3	32	17	250
6	Only bigger Ganesh mandals violate the time limit to use loudspeakers	159	46	9	23	13	250
7	Ganesh idols made from PoP are not harmful to the environment	79	65	10	64	32	250

13	Ganesh mandals use <i>Gulal</i> during festival	151	57	4	30	8	250

Source: Primary data from field survey

In 1893, Indian freedom fighter and social reformer Lokmanya Tilak transformed the annual festival into a large, well-organized public event. Unfortunately, the growth of the Ganesh festival has not necessarily been sustainable. Over time, public celebrations have become more lavish, grander and louder. As a result, ambient noise levels increases considerably. In order to assess the problem of rising noise levels in all over the Maharashtra state during Ganesh festival period, Maharashtra Pollution Control Board (MPCB) has taken initiative to carry out the survey during Ganesh festival. The above table shows that in opinion of 198 (79.2%) respondents, bigger Ganesh mandals violate the decibel limits to use loudspeakers while 57.6 percent respondents agreed that these Ganesh mandals violate the time limit to use the loudspeakers. There were some Ganesh mandals who do not put up loudspeakers. But statistically that does not prove that overall noise levels have reduced. The prescribed noise level for commercial areas is 65 dB, residential areas 55 dB, silent zone 50 dB, and industrial zone 75 dB. The dB level should go down by 10 units after 10 p.m. In fact, anti-noise activists have recorded noise levels that are often more than twice the limit set by the authorities. It is not uncommon to come across Ganesh mandals blasting film music at night, where the noise levels reach 110 dB or even 120 dB, which are positively harmful for humans.

The above table reveals that 90 (36%) respondents were agreed regarding poisoning of the waters of lakes, rivers and the sea due to immersion of PoP Ganesh idols. PoP is not a naturally occurring material and contains gypsum, sulphur, phosphorus and magnesium. The idols take several months to dissolve in

water and in the process poison the waters of lake, ponds, rivers and seas. The chemical paints used to decorate the Ganesh idol contain mercury, lead, cadmium and carbon and this increases the acidity and heavy metal content water. Nearly 90% of the Ganesh idols of large and small size are made of Plaster of Paris (PoP). It is to be highly noted that PoP dissolves very slowly in water and gradually and steadily releases its dangerous and harmful components in the surroundings and water bodies. On the other hand the toxic waste immediately kills the animal and plant life in the water. The PoP used to make the Ganesh idol doesn't dissolve in water, so after the immersion, many of the remaining pieces of the idol sink in the bottom of the lakes and oceans and can take several years to disintegrate. This disturbs the water's ecosystem by reducing water levels. 140 (56%) respondents accepted that pollution from Ganesh idols damages eco-system while 42.4 percent respondents agreed that pollution damages health by polluting drinking water sources.

### Testing of Hypothesis

Ganesh festival has made a great and adverse impact on environment: Accepted to some extent

H<sub>1</sub>: Ganesh festival has made a great and adverse impact on environment through using Gulal during Ganesh Festival: Accepted to a great extent

H<sub>2</sub>: Ganesh festival has made a great and adverse impact on environment regarding Water Pollution: Rejected to some extent

H<sub>3</sub>: Ganesh festival has made a great and adverse impact on environment regarding Sound Pollution: Rejected to some extent

H<sub>4</sub>: Ganesh festival has made a great and adverse impact on environment regarding Air Pollution: Rejected to some extent

Table 2: One-Sample Statistics for Hypothesis

Particulars	N	Mean	Std. Deviation	Std. Error Mean
X1 A: Use of <i>Gulal</i> during Ganesh Festival	250	83.37	37.087	2.346
X1 B: Opinion of Ganesh Mandals Regarding Water Pollution	250	40.99	48.680	3.079
X1 C: Opinion of Ganesh Mandals Regarding Sound Pollution	250	47.33	49.501	3.131
X1 D: Opinion of Ganesh Mandals Regarding Air Pollution	250	40.20	48.515	3.068
<b>X: Ganesh festival has made a great and adverse impact on environment</b>	<b>250</b>	<b>52.97</b>	<b>39.38</b>	<b>2.49</b>

Table 3: One-Sample Test for Hypothesis

Particulars	t	Df	Test Value = 50			
			Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
X4 A: Use of <i>Gulal</i> during Ganesh Festival	14.226	249	.000	33.368	28.75	37.99
X4 B: Opinion of Ganesh Mandals Regarding Water Pollution	-2.926	249	.004	-9.008	-15.07	-2.94
X4 C: Opinion of Ganesh Mandals Regarding Sound Pollution	-.853	249	.394	-2.672	-8.84	3.49
X4 D: Opinion of Ganesh Mandals Regarding Air Pollution	-3.193	249	.002	-9.796	-15.84	-3.75
<b>X4: Ganesh festival has made a great and adverse impact on environment</b>	<b>1.814</b>	<b>249</b>	<b>.234</b>	<b>2.973</b>	<b>-1.93</b>	<b>7.87</b>

From Table 2 it is observed that, the actual mean is 52.97. It is greater than 50 (elementary mean) where the value of t was 1.814 greater than  $t_{\alpha}$ . Hence, the value of t is significant. Therefore, explores lies within

acceptable level so this hypothesis is accepted to some extent which states that; Ganesh festival has made a great and adverse impact on environment.

### Suggestions

Based on the present study the following recommendations were emerged from the celebration of Ganesh festival:

1. PoP idols or idols made of hazardous chemical should be banned.
2. Immersion of Ganesh idols directly into public and natural water bodies should be avoided. The idols should be immersed in artificial water tanks. People should be encouraged to immerse Ganesh idols in tanks rather than natural water bodies.
3. Ganesh Mandals should participate in eco-friendly awareness campaign.
4. Use of Gulal during festival should be either avoided or minimized during Ganesh processions.
5. Use of non biodegradable materials such as thermocol, plastic, garlands and other decorations should be avoided.
6. Playing of Loud music which might create disturbance to others during processions and prayers should be avoided.
7. Incentives and prizes for Ganesh mandals as well as residents for celebrating eco-friendly Ganesh festival should be offered.

### **CONCLUSION**

Festivals make us feel great about the time we spend together on its pretext but thinking locally would definitely make one realise the disadvantages of festivals. India is not devoid of pollution. It's one of the major challenges that India faces today. To create public awareness and change the attitude of people is the most important action which is required to be taken to prevent water pollution, sound pollution and air pollution. Involvement of the public and its active participation in the implementation of environmental programme is a must for success of pollution control.

# AUDITOR INDEPENDENCE, AUDIT FEES LOW-BALLING, AND NON-AUDIT SERVICES: EVIDENCE FROM A DEVELOPING MARKET

Arvind Patel, The University of the South Pacific  
Pranil Prasad, The University of the South Pacific

## ABSTRACT

*This study empirically examines the supply side of the market for non-audit services. In particular, a model for the supply side of the market for non-audit services is developed. This model is then tested using audit and non-audit fee data from Fijian listed companies from the year 1980 to 2010. We find that audit fee low-balling leads to increased supply of non-audit services. This result is statistically significant. We also find that Big 4 auditors supply less non-audit services compared to non-Big 4 auditors. Finally, we find that the longer the auditor tenure the lower the supply of non-audit services. However, both these results are statistically insignificant. This leads to a conclusion that non-audit services are being supplied for opportunistic reasons as opposed to efficiency reasons. Our results are robust to a number of sensitivity checks.*

**KEYWORDS:** Auditor independence; audit fees; non-audit fees.

# ACCOUNTING AND AUDITING PRACTICES IN NON-GOVERNMENTAL ORGANIZATIONS

Arvind Patel, The University of the South Pacific

Pranil Prasad, The University of the South Pacific

## ABSTRACT

*This paper examines the accounting and auditing practices in non-governmental organizations (NGOs). It seeks to understand accounting processes and reporting practices in NGOs. NGOs have become important institutions in world affairs but accounting research has not developed significant interest in their operations and accounting practices. We use content analysis on the annual reports of 20 NGOs operating in Fiji. The results show variations in the accounting and auditing practices of the NGOs. Further analysis indicates that a number of factors influence the accounting and auditing practices of NGOs. Our analysis shows that financial reporting practices are in part shaped by the requirements of donor agencies and influence of specific stakeholder groups. We also find that the need to legitimize their operations also influences the accounting and auditing practices of NGOs. This paper contributes to the limited empirical research on the accounting and auditing practices of NGOs in developing markets.*

# ISSUES AND CHALLENGES IN THE ADOPTION OF PUBLIC SECTOR ACCOUNTING STANDARDS: A DEVELOPING COUNTRY PERSPECTIVE

Arvind Patel, The University of the South Pacific  
Pranil Prasad, The University of the South Pacific

## ABSTRACT

*This paper examines the issues and challenges surrounding the adoption of International Public Sector Accounting Standards (IPSAS) in Fiji. In particular, the focus is on the benefits and challenges of the current cash basis IPSAS used in Fiji compared to the benefits and challenges of the accrual basis IPSAS. We conduct interviews and surveys on government accountants and government ministries to investigate the issues and challenges that they face in the application of cash basis IPSAS and the challenges that they will face with full accrual based IPSAS (if and when they are adopted). Our findings suggest that Fiji's public sector would benefit from the adoption of full accrual based IPSAS; however, there are a number of challenges that must be addressed before the move to the accrual based IPSAS.*

# MANAGEMENT OF ROADS MAINTENANCE LEVY FUND AT AGENCY LEVEL IN KENYA: A FOCUS ON CHALLENGES, PROSPECTS AND POLICY

Daniel Odongo Oronje, Lake Victoria South Water Services Board, Kenya

Charles M. Rambo, University of Nairobi, Kenya

Paul A. Odundo, University of Nairobi, Kenya

## ABSTRACT

*The Road Maintenance Levy Fund came into existence in 1993 through an Act of Parliament, to facilitate the maintenance of public roads. The Kenya Roads Board administers the Fund and works in collaboration with various implementing agencies. However, anecdotal information suggests that the management of the fund at the agency level is constrained by various challenges. This study sought to identify key challenges experienced by road agencies to justify reforms towards better management and utilization of the Fund. We applied the cross-sectional survey design to source information from 146 key informants. The study found that political interference (71.9%), procurement malpractices (67.1%), funding inconsistency (64.4%), understaffing (54.1%), inconsistent communication (28.8%) and delay in auditing (40.4%) were the key challenges affecting operations of road agencies. Initiating appropriate institutional and procedural reforms targeting the Board and road agencies is likely to address the issues. The study recommends the need for new clearer rules, regulations and procedures to curb political interference, linkage between road agencies and enforcement agencies for the procurement law, electronic transfer of funds directly to agency accounts, human resource needs assessment to justify recruitment and rationalization.*

**JEL: O16**

**KEYWORDS:** Road Maintenance Levy Fund, Kenya Roads Board, Road Agency, Political Interference, Procurement Malpractices, Funding Inconsistency

## INTRODUCTION

Road transport is the most widely used means of transportation for people and freight in the Sub-Saharan Africa (SSA). In Kenya, road transport accounts for over 80% of land freight and passenger traffic (Kenya Institute of Public Policy Research and Analysis [KIPPRA], 2001; World Bank, 2011; GoK, 2012). Road construction is a capital-intensive investment; therefore, initiating a proper maintenance back-up plan is not only logical but also important in the economic sense. Regular road maintenance is vital for users' comfort, safety and national economic growth. Un-maintained roads increase vehicle operating costs and overall transportation costs, which in turn, affect all sectors of the economy, much to the disadvantage of low income-earners (Heggie, 1994; KIPPRA, 2001).

In Africa, the notion of a "road fund" was pilot-tested in countries such as Burundi, Senegal and Gabon (Brushett, 2005). However, the "first generation" road fund initiatives were largely unsuccessful, culminating to reforms process in the early 1990s, which paved the way for "second generation" road fund initiatives (Benmaamar, 2006), which sprouted in many developing countries between 1990 and 1999 (Heggie, 1995; Zietlow & Bull, 2002; Kumar, 2002; Brushett, 2005). In Kenya, the Road Maintenance Levy Fund (RMLF) came into existence in 1993 through an Act of Parliament. The Kenya Roads Board (KRB) administers the Fund. The Act designates specific road agencies, including Roads Department at the Ministry of Roads and Public Works (MoRPW), District Roads Committees (DRCs),

Kenya Wildlife Service (KWS) and local government authorities across the country including (Nyangaga, 2007; KACC, 2007; GoK, 2012).

However, previous studies show that the effectiveness of road agencies is constrained by issues such as political interference, lack of proper financial management systems, delay in funding, financial indiscipline, lack of sound procurement systems and procedures, as well as collusion between agency staff and contractors to approve poor workmanship, among others (Heggie, 1995; Kumar, 2002; Benmaamar, 2006). In Kenya, there is a dearth of systematic and comprehensive literature regarding the challenges experienced by road agencies in managing and accounting for road funds.

## LITERATURE REVIEW

Road transport is essential for socio-economic development world over, as it provides necessary links between production and market centres (Heggie, 1995; Brushett, 2005). The quality of the road network determines the affordability of transportation costs, prices of basic commodities and the quality of life, especially for low income-earners. The development and maintenance of appropriate road network remains a fundamental recipe for economic growth and poverty reduction in the SSA (Heggie, 1994; 1995; Brushett, 2005). In the SSA, the “first generation” road funds were pilot-tested in Burundi, Senegal and Gabon; however, most countries involved in the pilot test performed below expectation. To address the weaknesses of the first generation road fund initiative, the Sub-Saharan Africa Transport Policy Program (SSATP), a World Bank supported program, spearheaded reforms towards the end of 1980s, to enhance management efficiency of the road fund (Brushett, 2005).

The initiative culminated to the birth of “second generation” road fund, particularly in the 1990s. For instance, the Ghana Road Fund came into existence in 1996. In Honduras, the Road Maintenance Fund came into existence in 1993, while Costa Rica did so in 1998. In Tanzania, the Road Fund was initiated in 1992; while in Kenya, the RMLF was established in 1993 (Zietlow & Bull, 2002; Kumar, 2002; Heggie, 1995). To facilitate operations of the management boards, founding legislative frameworks designate separate road agencies to deal directly with contractors and suppliers as well as manage the utilization of road funds at the community level (Benmaamar, 2006).

Various studies such as those done by Heggie (1995), Kumar (2002) and Benmaamar (2006) have indicated that various factors constrain the effectiveness of road agencies within a decentralized system of road management. Benmaamar (2006) singles out political interests as the key factor derailing procurement procedures, leading to poor workmanship and loss of public resources. The political interference at the agency level has also constrained the participation of community members (Kumar, 2002). Lack of sound financial management systems affects the accuracy of agency returns, in some cases leading to time and budgetary overruns. Lack of proper analytical systems for prioritization creates room for political interests to guide the choice of roads to maintain, which in most cases may be of low economic value to communities.

## DATA AND METHODOLOGY

We applied the cross-sectional survey design, with both quantitative and qualitative approaches to source, process and analyze the requisite information. The study targeted key informants, which included staff at MoRPW, DRC members, contractors, suppliers, consultants and local authority staff. We successfully interviewed all the 146 key informants, which we contacted. We applied purposive sampling to select participants based on their incumbency at the time of the study. We also applied a key informant interview guide with structured and semi-structured questions to source the data, where we gauged the seriousness of the challenges experienced by road agencies by requesting participants to rate their perceptions on a three-point scale of ‘not serious’, ‘serious’ or ‘very serious’. Quantitative analysis that

we obtained frequency distributions with percentages and cross-tabulation with Chi-square tests, we also transcribed, clustered into nodes and explored qualitative data for patterns and meaning to the flow of the funds. Detailed description of the design and approaches that we used in this study are available in following publications (Nachmias & Nachmias, 1996; Bryman & Cramer 1997).

## RESULTS AND DISCUSSIONS

The study covered 146 key informants, including 29 (19.9%) staff of the Ministry of Roads and Public Works (MoRPW), 6 (4.1%) engineer consultants, 22 (15.1%) members of District Roads Committees (DRCs), 10 (6.8%) contractors, 16 (11.0%) suppliers and 63 (43.2%) staff of local authorities. Political interference, procurement malpractices, funding inconsistency, understaffing, inconsistent communication and delay in auditing were the challenges affecting operations of road agencies. We have presented and discussed details in the subsequent paragraphs.

Figure 1 shows that 105 (71.9%) out of 146 participants said political interference was a key challenge affecting road agencies. The challenge manifested itself through diversion of funds to non-prioritized roads with the aim of rewarding specific communities perceived to be politically loyal; as well as influence of the procurement process to favour political loyalists, business associates or family members. In some cases, political leaders harassed, intimidated, assaulted and even manipulated the system to have Government officers standing on their way transferred to other stations. Based on this, out of the 105 participants, 24 (22.9%) described political interference as a serious challenge, while 79 (75.2%) felt it was very serious.

Figure 1: Political Interference and Procurement Malpractices

*This figure presents information on the proportions of participants who identified political interference and procurement malpractices as the key issues affecting the operations of road agencies. The figure shows that more than two-thirds of the participants, 71.9% for political interference and 67.1% for procurement malpractices, identified the issues. The figure also shows participants' perception regarding the seriousness of each challenge, based on their experiences with the system.*

Under such circumstances, agency staff found it extremely difficult to fulfil the interests and expectations of political leaders without breaching formal operational procedures or overrunning their budgets, resulting to low motivation and lack of enthusiasm. Again, the transfer of key staff such as engineers affected project continuity, as new comers took some time to grasp institutional dynamics. Figure 1 also shows that 98 (67.1%) participants mentioned procurement malpractices, which included issues such as conflict of interest, where some tender committee members acted in favor of particular candidates, tendering documents designed in favor of particular bidders, emergency procurement, single-sourcing of providers, as well as some politically-connected bidders colluding with tender committee officials to overprice materials and works. In this regard, up to 60 (61.2%) participants felt that procurement malpractices was a serious challenge, while 31 (31.6%) were of the view that the challenge was very

serious. In figure 2, up to 94 (64.4%) participants identified funding inconsistency as one of the challenges constraining the operations of road agencies. Participants attributed the inconsistent flow of funds to various factors, among them being a lengthy disbursement channel and lack of a proper tracking system. In this regard, participants pointed out that KRB disburses funds to the districts through cheques upon receiving revenue collections from Kenya Revenue Authority (KRA). The district treasury, which coordinates all public funds at the district level, receives disbursements and issues new cheques to various agencies as per the Authority to Incur Expenditure (AIE) from the chief finance officer, MoRPW headquarters. Sometimes disbursements stagnated at the district treasury, while awaiting AIEs from the Ministry headquarters. In view of this, 29 (30.9%) described the challenge as serious, while the majority, 59 (62.8%) rated it as very serious.

Figure 2: Funding Inconsistency and Understaffing

*This figure indicates the proportion of participants citing funding inconsistency and understaffing as key challenges affecting the operations of road agencies. The figure shows that more than one-half of the participants identified the issues (64.4% for funding inconsistency and 54.1% for understaffing). The figure also indicates participants' perception regarding the seriousness of funding inconsistent and understaffing, based on their experiences with the system.*

Furthermore, some agencies did not receive their disbursements in time due to lack of follow-up communication from KRB headquarters. Quite often, agencies were not aware of disbursement schedule at KRB headquarters. Without follow-up communication, funds stagnated at the district treasury for longer than necessary, even when AIEs came in time. Other factors causing inconsistent flow of funds included delay in auditing, weak financial management system and delay in the requisition and remittance of AIEs. Again, Figure 2 indicates that 79 (54.1%) participants identified understaffing as one of the challenges resulting from delayed replacement of officers leaving the station through transfers to other stations, as well as those absent due to prolonged illness or natural attrition. Particularly missing were special skills such road construction engineers and technicians, accountants, auditors and administrative staff. For this reason, available staff coped with the resultant heavy workload through multi-tasking, sometimes performing tasks for which they had no training at all. In some districts, the public works officers doubled as roads officers, in addition to administrative, bookkeeping and procurement activities. In one agency, an office cleaner was also performing the roles of an accounts clerk, albeit without any formal training. Consequently, 43 (54.4%) participants felt that understaffing was a serious challenge, while 26 (32.9%) described the challenge as very serious.

The findings presented in figure 3 show that 42 (28.8%) participants identified inconsistent communication between KRB and road agencies as one of the challenges affecting activities of the latter. Participants indicated that most agencies were often not aware of disbursement schedules at KRB headquarters, leading to funds overstaying at the district treasury. In this regard, they cited cases where some agency staff colluded with treasury officials to siphon out stagnating funds. Due to communication

inconsistency, some agencies received their disbursements towards the end of fiscal periods or towards wet seasons, when they could do very little work. Based on this, 23 (54.8%) participants opined that the challenge was serious, while 11 (26.2%) described it as very serious.

Figure 3: Frequency Of Communication And External Auditing

*This figure indicates the proportion of participants mentioning inconsistency in communication from the Kenya Roads Board (KRB) and delay in external auditing as among the challenges affecting the operations of road agencies. The Figure also shows participants' perception regarding the seriousness of the issues mentioned, again based on their experiences.*

The results in figure 3 further show that 59 (40.4%) participants identified delay in external auditing as among the challenges constraining operational efficiency and consistency among road agencies. Participants hinted that some districts did not have resident auditors and each year, the government mobilized auditors from other stations to evaluate the financial accounts of road agencies. In some instances, the agencies could wait for up to four months for auditing services in order to qualify for subsequent funding. The timeliness of external auditing remains crucial for the redress of issues arising, continuation of funding and staff motivation. Consequently, 33 (55.9%) participants indicated that delay in external auditing was a serious challenge, while 21 (35.6%) described it as a very serious challenge.

## CONCLUSIONS

In Kenya, up to 16% of the RMLF goes to constituencies through DRCs; consequently, the involvement of political leaders in decisions on the utilization of road funds is inevitable. Hence, the decisions and activities of such committees are prone to political influence. This poses a lot of challenge to public officers managing road funds. Without proper checks on political interference, road agencies may not live up to the expected standards of prudent resource use, quality workmanship and accountability. In view of this, KRB in collaboration with the Government should formulate clear rules, regulations and procedures for all road agencies in the country. The document should be clear on the separation of roles between committees such as DRCs and Government officials, a definition of political interference, reporting channel, dispute resolution office, among other provisions.

Transparency and accountability are the pillars of public procurement process and effective governance of public institutions. Whereas transparency deals with issues of clarity, accountability deals with answerability to all contenders. In managing public procurement, the application of either concept in isolation creates opportunity for procurement malpractices, which weaken financial management discipline and compromise cost control measures as well as quality workmanship. The efficiency of the procurement process depends on the extent of adherence to procurement regulations and procedures, institutional culture, political will, as well as the competence and integrity of the staff in-charge.

Kenya enacted the law governing public procurement in 2005; however, enforcement remains a key challenge, particularly due to inadequate political will. This suggests that instituting appropriate legislation and establishing the institutional frameworks are not enough to entrench transparency and

accountability into the procurement process. There is need for political will right from top leadership to effectively curb procurement malpractices. However, as a short-term measure, linking road agencies and sensitization about the roles of enforcement agencies, viz. the Public Procurement Oversight Authority and Kenya Anti-Corruption Commission, is likely to discourage the incidence of malpractices at the agency level. Regular communication between KRB and road agencies facilitates reporting, enhances managerial accountability, motivates staff, improves financial management and most importantly, expedites the flow of disbursements. Without follow-up communication from KRB, funds stagnating at the district treasury for longer than necessary may be at risks of diversion or siphoning by public officials. Developing and implementing an appropriate communication strategy is an option that KRB should consider to improve the management of road funds. The introduction of electronic transfer of funds directly to agency accounts is a viable option that KRB should explore, safeguard against possible abuse and adopt to avoid the bureaucratic bottlenecks inherent in the current system.

The loss of staff through natural attrition, prolonged illness or transfers creates gaps, increases workloads and undermines performance. There is no doubt that coping measures such as multiple tasking affected the accuracy of financial accounts and reporting. In view of this, KRB in collaboration with the Government should consider undertaking a human resource needs assessment to establish staffing gaps and overlaps to justify recruitment and rationalization. External auditing of the agency financial accounts adds credibility to the annual financial reports. The timeliness of external auditing remains crucial for the redress of issues arising, continuation of funding and staff motivation. Given the national scope, external auditing of agency accounts is a demanding exercise, requiring the Government to recruit more auditors for expeditious results.

## **ACKNOWLEDGEMENT**

We thank all the individuals and institutions who supported this study through ideas, information and logistics. First we are grateful to the University of Nairobi for granting the opportunity for Daniel Odongo Oronje to pursue the Master of Arts degree in Project Planning and Management. Secondly, we acknowledge the support of Dr. Francis N. Nyangaga and the entire Board of Directors of the Kenya Roads Board for logistical support to the study team. Thirdly, we are indebted to Mr. Tom Odhiambo, a social science research specialist and writer for critiquing and shaping the manuscript. Finally, we remain indebted to all the key informants who spared their time to provide the requisite information.

## **BIOGRAPHY**

Daniel Odongo Oronje is a Manager, Rural Water and Sanitation, Lake Victoria Water Services Board. He holds a master's degree in Project Planning and Management and a bachelor's degree in Civil Engineering with close to 13 years experience in the planning, management, construction and supervision of roads. He is a registered civil engineer with the Engineers Registration Board of Kenya. His experience in the roads sector spans over 9 years. He is reachable through: telephone number: + 254 722 387 186 or + 254 729 330 089; email address: oronjed@yahoo.com

Dr. Charles M. Rambo is a Senior Lecturer and coordinator of Postgraduate programs at the Department of Extra Mural Studies, University of Nairobi, Kenya. His academic interests include financial management, small and medium enterprises and education financing. His previous work appears in journals such as Journal of Continuing, Open and Distance Education, International Journal of Disaster Management and Risk Reduction, African Journal of Business and Management, African Journal of Business and Economics, as well as International Journal of Business and Finance Research. He is reachable at the University of Nairobi through telephone number, +254 020 318 262; Mobile numbers +254 0721 276 663 or + 254 0733 711 255; email addresses: rambocharles@yahoo.com or crambo@uonbi.ac.ke

Dr. Paul A. Odundo is a Senior Lecturer at the Department of Educational Communication Technology, University of Nairobi, Kenya. He became a Research Associate at Institute of Policy Analysis and Research (IPAR) in 2001. His academic and research interests include institutional capacity building, decentralized development, instructional planning and management, educational administration. His previous work appears in IPAR Discussion Paper Series, the Fountain: Journal of Education Research and African Journal of Business and Management. He is reachable at the University of Nairobi through telephone number, +254 020 318 262; Mobile numbers +254 0722 761 414; email address: odundopaul@yahoo.com

# THE FLOW OF FUNDING FOR SUSTAINABLE ROAD MAINTENANCE IN KENYA: ADDRESSING DISBURSEMENT OF FUNDS, PROCUREMENT GAPS AND ACCOUNTABILITY

Daniel Odongo Oronje, Lake Victoria South Water Services Board, Kenya

Charles M. Rambo, University of Nairobi, Kenya

Paul A. Odundo, University of Nairobi, Kenya

## ABSTRACT

*Kenya established the Road Maintenance Levy Fund in 1993 to finance road maintenance. The Kenya Roads Board is at the centre of the Fund's administration and accomplishes this by working in collaboration with various implementing agencies. However, through professional experience, we have learnt that the flow of funds to road agencies is inconsistent due to various factors. We applied the cross-sectional survey design to source information from 146 key informants. The study found that delay in allocation committee meetings (33.0%) and requisition of the Authority to Incur Expenditure (71.3%); lengthy disbursement channel (84.0%), lack of a proper tracking system (47.9%) delay in external auditing (56.4%) and weak financial management system (24.5%) were the key factors constraining the flow of funds. The constraints affected the implementation of work plans (73.4%), maintenance backlog (60.6%) and encouraged procurement malpractices (57.4%), among other issues. The study recommends the need for electronic fund transfer to agency accounts, follow-up communication to track disbursements; enforcement of adherence to provisions of the Public Officer Ethics Act and the Public Procurement and Disposal Act, commercial accounting practices at the agency level and additional audit staff.*

**KEYWORDS:** Road Maintenance Levy Fund, Kenya Roads Board, Road Maintenance Agency, Sustainable Road Maintenance, Disbursement of Funds, Procurement Gaps and Accountability

## INTRODUCTION

Road transport plays an important role in the development of the Kenyan economy. It accounts for over 80% of land freight and passenger traffic in Kenya (Kenya Institute of Public Policy Research and Analysis [KIPPRA], 2001; World Bank, 2011; Government of Kenya [GoK], 2012). An efficient road infrastructure is a prerequisite for socio-economic development (Heggie, 1995; Nyangaga, 2007). The development of a road network cannot be complete without a sound and sustainable program for its maintenance. In Kenya, the Road Maintenance Levy Fund (RMLF) came into existence in 1993. The Kenya Roads Board (KRB), which was established through the Kenya Roads Board Act No. 7 of 1999, administers and manages RMLF resources (GoK, 2006; Kenya Anti-Corruption Commission [KACC], 2007).

To achieve this, KRB works in collaboration with various agencies, including the Roads Department at the Ministry of Roads and Public Works (MoRPW), District Roads Committees (DRCs), Kenya Wildlife Service (KWS) and local government authorities across the country (GoK, 2006; KACC, 2007). KRB disburses road funds in accordance with a formula that in the Kenya Roads Board Act, in which case, 57% goes to the Department of Roads; 24% goes to DRCs, local authorities and KWS; 16% goes to constituencies through DRCs and 3% goes towards overhead costs at KRB headquarters (KACC, 2007;

GoK, 2012). However, the most outstanding challenge with the disbursement system is the inconsistent flow of funds to road agencies.

The disbursement of road funds is done following three main methods. The first method is where funds are disbursed directly to agencies; the second method involves direct payment of contractors and suppliers upon certification of the work; while the third method is the disbursement of funds to road agencies on the condition of accountability (Heggie, 1995; 1999; Kumar, 2002). Studies conducted in other countries have revealed weaknesses of the disbursement methods. For instance, in Mozambique, de Richecour (1994) found that direct disbursement of funds was too demanding in terms of qualified supervisors (Heggie, 1995). In Ghana, Heggie (1995) indicated that the second method associated with lack of stringent financial control measures and abuse by internal cartels. The third method, associates with bureaucratic inefficiencies (Heggie, 1995; Kumar, 2002). In Kenya, the review revealed a paucity of systematic academic investigations on issues arising from the method, which KRB adopted to disburse funds to road agencies. The purpose of this study was to identify key lessons that may justify necessary reforms to improve the flow of funds to the agencies for sustainable road maintenance.

## LITERATURE REVIEW

There is no doubt that road transport plays an important role in the development of the global economy. Consequently, all countries are increasingly investing substantial resources in the roads sub-sector to improve road network, thereby, enhance user comfort and safety; as well as reduce production costs and commodity prices (Heggie, 1995). Being a capital-intensive initiative, the growth in human population and expansion of budgetary allocation to the social sector have seen the funds available for road maintenance dwindle over the years. The search for a more sustainable funding solution prompted the establishment of road funds, mainly financed through fuel levy, weighbridge toll collections as well as bridge and canal toll collections (Heggie, 1995).

Many developing countries established their road funds in the 1990s. For instance, the Ghana Road Fund came into existence in 1996. In Honduras, the Road Maintenance Fund came into existence in 1993, while Costa Rica did so in 1998. In Tanzania, the Road Fund was initiated in 1992; while in Kenya, the RMLF was established in 1993 (Zietlow & Bull, 2002; Kumar, 2002; Heggie, 1995). The literature reveals that road funds are managed by central boards, which disburse funds periodically to the agencies to enable them carry out their maintenance work. The literature review reveals three distinctive procedures through which funds are channelled to road agencies. In this regard, the central board can either: disburse funds directly to road agencies, settle bills periodically after certification a contractor/supplier has completed the satisfactorily, or disburse funds on a conditional basis and undertake technical and financial audits *ex post* (Heggie, 1995; Kumar, 2002).

## DATA AND METHODOLOGY

We applied the cross-sectional survey design to guide the research process. The study targeted key informants, which included staff at MoRPW, DRC members, contractors, suppliers, consultants and local authority staff. We successfully interviewed all the 146 key informants and we applied purposive sampling to select participants based on their incumbency. We also applied a key informant interview guide to source the data, where we gauged the seriousness of the challenges experienced by road agencies by requesting participants to rate their perceptions on a three-point scale of 'not serious', 'serious' or 'very serious'. Quantitative analysis that we obtained frequency distributions with percentages and cross-tabulation with Chi-square tests, we also transcribed, clustered into nodes and explored qualitative data for patterns and meaning to the flow of the funds. Detailed description of the design and approaches that we used in this study are available in following publications (Nachmias & Nachmias, 1996; Bryman & Cramer 1997).

## RESULTS AND DISCUSSIONS

The study covered 146 key informants, which included 29 (19.9%) staff of the Ministry of Roads and Public Works (MoRPW), 6 (4.1%) engineer consultants, 22 (15.1%) members of District Roads Committees (DRCs), 10 (6.8%) contractors, 16 (11.0%) suppliers and 63 (43.2%) staff of local authorities. Among other findings, the results indicated that delay in allocation committee meetings, delay in requisition of the Authority to Incur Expenditure, lengthy disbursement channel and lack of a proper tracking system for disbursements were the key factors affecting the flow of funds to road agencies. Other factors included delay in external auditing of the financial accounts and weak financial management systems.

The results show that even though 52 (35.6%) out of 146 participants affirmed that disbursements had been consistent, more than two-thirds [94 (64.4%)] hinted a contrary opinion. This finding suggests that funding inconsistency was a critical challenge among road agencies. The results presented in Figure 1 show that 79 (84.0%) out of 94 participants cited the lengthy disbursement system as a key factor constraining the consistency of disbursements. Regarding the extent of seriousness, 47 (59.5%) out of 79 participants indicated that lengthy disbursement system was a serious constraint, while 29 (36.7%) participants described the challenge as very serious. District treasury receive disbursements from KRB and issues new cheques to various agencies as per the Authority to Incur Expenditure (AIE).

Figure 1: Disbursements Channel and Tracking System for Disbursements

*This figure indicates the proportion of participants who cited lengthy disbursement system and lack of a proper tracking system for disbursements to the districts. Notably, a higher proportion (84.0%) identified the stages involved in the disbursement channel as a key factor affecting the consistency flow of funds, while 47.9% mentioned lack of a proper tracking system for disbursements. The Figure also shows participants' opinion regarding the seriousness of the issues mentioned, again based on their experiences.*

The results show that lack of a proper tracking system for disbursements was another factor affecting the consistency of funding flow, as indicated by 45 (47.9%). Besides, Figure 1 shows that out of 45 participants, 23 (51.1%) described lack of a proper tracking system for disbursements as a serious constraint, while 14 (31.1%) rated it as 'very serious'. Based on this, participants said that some agencies did not receive their disbursements in time due to lack of follow-up communication from KRB

headquarters. Without follow-up or alerting communication agencies, funds could lodge at the district treasury for longer than necessary, even when the MoRPW issued AIEs in good time.

As indicated in Figure 2, up to 53 (56.4%) participants mentioned delay in external auditing of the agency financial accounts as an impediment to consistent flow of funds. Besides, 36 (67.9%) out of 53 participants rated the challenge as serious, while 7 (13.2%) believed that the challenge was very serious. Participants indicated that the Auditor General's office was responsible for evaluating road funds. External auditors submitted their reports to KRB to support decisions regarding subsequent disbursements. Consequently, delay in external auditing affected the timeliness of subsequent disbursements. Participants attributed delay in external auditing to understaffing at the Auditor General's office. Furthermore, Figure 2 indicates weak financial management system at the agency level was among the challenges. This was stated by 23 (24.5%) out of 94 participants. Besides, up to 13 (56.5%) were of the view that the challenge was serious, while 9 (39.1%) said the challenge was very serious.

Figure 2: The Timeliness of Auditing and Financial Management System

*Presented in this figure are the challenges related accountability and financial management system at the agency level. Up to 56.4% of the participants indicated that delay in external auditing was a key factor affecting the consistency of disbursements for road maintenance, while 24.5% cited weak financial management system as one of the constraints. This Figure also shows how the participants rated the seriousness each constraints mentioned.*

The seriousness of this challenge manifested itself through inconsistencies between agency annual reports and findings of audit reports. The law requires all agencies to file their financial reports at the end of each financial year, indicating receipts and expenditures. In situations where agency reports differed significantly from audit reports, resolving such inconsistencies took as long as six months, before the resumption of funding. Participants hinted that when funds are received from KRA, an allocation committee at KRB convene to discuss and allocate funds as per agency work plans. However, the meetings were not consistent as pointed out by 31 (33.0%) participants. When asked to share opinion regarding the seriousness of the matter, Figure 3 shows that 13 (41.9%) said it was 'serious', while 8 (25.8%) felt that it was 'very serious'.

Delays in the allocation committee meetings directly affected the consistency of findings, as no disbursement could be effected before approval by the allocation committee. Participants indicated that the composition of the committee included the public and private sectors, which contributed towards the difficulty of raising quorums for meetings. Even the committee had a fixed schedule of meetings, the delay was noted particularly when members are required for special sessions to discuss and allocate funds for agencies whose accounts are reconciled and reinstated. Figure 3 indicates that 67 (71.3%) participants identified delays in the requisition of AIE as one of the constraints to consistent funding. Regarding the seriousness of the challenge, up to 33 (49.3%) participants described the constraint as

‘serious’, while 22 (32.8%) felt that it was ‘very serious’. The study also found that inconsistent disbursement of funds affected the activities of road agencies in various ways. In this regard, out of 94 participants who indicated that disbursements were inconsistent, 69 (73.4%) mentioned delay in work plan implementation as the main challenge resulting from inconsistent flow of funding, 57 (60.6%) cited procurement malpractices, 30 (31.9%) stated poor workmanship, 54 (57.4%) participants indicated backlog of maintenance works, 27 (28.7%) mentioned higher cost of repair.

Figure 3: Committee Meetings and Authority to Incur Expenditure Requisitions

*This figure presents issues arising at the Kenya Roads Board level, including delays in allocation committee meetings and delays in the requisition of the Authority to Incur Expenditure. The results show that up to 33.0% of the key informants stated delays in the allocation committee meetings, while 71.3% felt that delays in requisition of AIE was a key constraint to the flow of funds. Figure 4 also shows participants' opinion regarding the seriousness each constraint mentioned.*

## CONCLUSIONS

The study found that disbursements were inconsistent for most road agencies (64.4%), which posed a challenge regarding road maintenance. There is no doubt that the road fund was a noble idea, aimed at providing a sustainable mechanism for road maintenance in developing countries. In Kenya, the disbursement of consistent flow of road fund is constrained by various factors, including delay in allocation committee meetings (33.0%), delay in requisition of the Authority to Incur Expenditure (71.3%), a lengthy disbursement channel (84.0%), lack of a proper tracking system for disbursements (47.9%), delay in external auditing (56.4%) and weak financial management system (24.5%).

The constraints affected routine maintenance of roads, for instance, by delaying the implementation of work plans (73.4%), increasing maintenance backlog (60.6%) and encouraging procurement malpractices (57.4%), among other issues. Being a system that involves many stakeholders, the approach to addressing the issues should be multisectoral, including the fund oversight authority, line ministries and departments, anticorruption authority, procurement oversight authority, road agencies and the civil society. The forum should identify appropriate measures and implementation modalities. In this era of technology, disbursing funds to road agencies should not take more than four workdays. KRB should consider changing the mode of disbursements from cheques to Electronic Funds Transfer directly to agency. Again, depending on the magnitude of projects, KRB should adopt a mixed model of disbursing funds. KRB should also initiate a strong system to track the flow of disbursements.

Equally important is the need to expedite requisition for AIEs by taking appropriate supervisory measures. The Public Service Commission and the Kenya Anti-Corruption Commission should ensure that all public officials conduct themselves within the provisions of the Public Officer Ethics Act Cap 183

of 2003 to enhance discipline in handling public funds. The procurement of works and materials for road maintenance is a critical area that requires illumination to award tenders to qualified contractors with adequate capacity. Although the law already exists, enforcement remains a key gap. The Public Procurement Oversight Authority and the Kenya Anti-Corruption Commission should step up their roles by conducting procurement activities in accordance with the procedures.

A strong system of financial management is indispensable for budget control and informed management decisions. Road agencies should move towards regular commercial accounting practices, including standard income and expenditure statements as well as balance sheets. Effective financial management should enhance accountability, minimize chances of financial misappropriation and improve accuracy. In this regard, proper accounting systems are likely to improve the consistency of funding flow. External auditing is also an important tool for strengthening managerial accountability. The timeliness of the exercise remains paramount to ensure that road agencies receive their allocations in time. Improving the staffing level at the Government's audit office is a key step towards ensuring timely auditing of agency accounts.

### **ACKNOWLEDGEMENT**

We thank all the individuals and institutions who supported this study through ideas, information and logistics. First we are grateful to the University of Nairobi for granting the opportunity for Daniel Odongo Oronje to pursue the Master of Arts degree in Project Planning and Management. Secondly, we acknowledge the support of Dr. Francis N. Nyangaga and the entire Board of Directors of the Kenya Roads Board for logistical support to the study team. Thirdly, we are indebted to Mr. Tom Odhiambo, a social science research specialist and writer for critiquing and shaping the manuscript. Finally, we remain indebted to all the key informants who spared their time to provide the requisite information.

### **BIOGRAPHY**

Daniel Odongo Oronje is a Manager, Rural Water and Sanitation, Lake Victoria Water Services Board. He holds a master's degree in Project Planning and Management and a bachelor's degree in Civil Engineering with close to 13 years experience in the planning, management, construction and supervision of roads. He is a registered civil engineer with the Engineers Registration Board of Kenya. His experience in the roads sector spans over 9 years. He is reachable through: telephone number: + 254 722 387 186 or + 254 729 330 089; email address: oronjed@yahoo.com

Dr. Charles M. Rambo is a Senior Lecturer and coordinator of Postgraduate programs at the Department of Extra Mural Studies, University of Nairobi, Kenya. His academic interests include financial management, small and medium enterprises and education financing. # COMMUNITY AWARENESS, PARTICIPATION AND PERCEPTIONS ABOUT COMPLETION RATE OF THE ROAD MAINTENANCE LEVY FUND PROJECTS IN KENYA

Daniel Odongo Oronje, Lake Victoria South Water Services Board, Kenya

Charles M. Rambo, University of Nairobi, Kenya

Paul A. Odundo, University of Nairobi, Kenya

## ABSTRACT

*The Government has decentralized about 16% of the Road Maintenance Levy Fund to constituencies to maintain feeder roads. Decentralization of the fund creates opportunity for communities to participate in road maintenance, thus, improve transparency, accountability, ownership and sustainability. Although the Fund had operated for nearly two decades, no study had ever assessed the level of community awareness, participation and perceptions regarding project completion rates. We applied the cross-sectional survey design to source information from 298 community leaders and motorists. Out of 298 respondents, 102 (34.2%) were aware of the Fund, of which only 43 (42.2%) had participated in maintenance projects. Besides, only 34 (33.3%) respondents were positive about project completion rate, the majority, 68 (66.7%) indicated negative opinions. Inconsistent flow of funds (82.4%), political interference (71.6%) and delay in auditing (39.2%) were among the factors affecting project completion rates. Among other aspects, the study recommends the need to sensitize the public about RMLF to improve awareness and participation, secure a hotline number to improve reporting, publicize annual work plans, budgets and expenditure reports for validation by the public, introduce electronic transfer of funds to agency accounts, develop rules, regulations and procedures to safeguard agencies from political interference.*

**JEL:** 016

**KEYWORDS:** Community Awareness, Community Participation, Road Maintenance Levy Fund, Road Completion Rate, Kenya Roads Board

## INTRODUCTION

Participatory development is an important approach towards enabling communities to play an active role in projects initiated to address issues affecting their life and livelihoods (World Bank, 2004). The Road Maintenance Levy Fund (RMLF) was established through the Road Maintenance Levy Fund Act number 9 of 1993 to facilitate the maintenance of public roads. Kenya Roads Board (KRB) manages the Fund and allocates about 57% of the fund to the Department of Roads; 24% goes to District Roads Committees (DRCs), local authorities and the Kenya Wildlife Service (KWS); 16% is decentralized to constituencies for the maintenance of rural access and feeder roads through DRCs and 3% goes towards overhead costs at KRB headquarters (Kenya Anti-Corruption Commission [KACC], 2007; Nyangaga, 2007; GoK, 2006; 2012). Decentralization of the fund gives communities the opportunity to participate at every stage of road maintenance activities, including prioritization, planning and implementation, as well as monitoring and reporting. Community awareness and participation in RMLF projects is also crucial for transparency and accountability, with a view to eliminating misappropriation or poor workmanship issues (KACC, 2007; Aukot *et al.*, 2010). Various empirical studies, including World Bank (2001), Khwaja (2004), World Bank (2004) and Thwala (2009) have shown that community awareness and participation significantly associate with project success. In Kenya, the literature review revealed a paucity of

information on the level of community awareness and participation in RMLF projects. We conducted this study in Kisumu, Siaya, Nyando, Kisii and Migori Districts of Nyanza Province.

## LITERATURE REVIEW

Community awareness and participation are processes through which stakeholders' gain influence and control over development initiatives, decisions and resources affecting their lives and livelihoods (World Bank, 2004). Community participation brings forth several advantages to communities in terms of empowerment, capacity building, improving project effectiveness and efficiency; project cost-sharing and enhancing ownership (Thwala, 2010). The success of community awareness and participation depend on the extent to which community members are involved to support various phases of project life, including design, implementation, supervision and evaluation (World Bank, 2004). However, this model of community has elicited criticisms for being too project-based, because it adopts a means-oriented approach; through which community participation is emerges as a means towards the realization of project goals (Abbot, 1991; Thwala, 2010).

The alternative approach, which is ends-oriented, perceives community awareness and participation as processes through which communities are empowered to play a more active role in mobilization, planning, setting objectives, goals and targets; management, implementation as well as monitoring and evaluation (Abbot, 1991; Adams, 1999; Thwala, 2010). Despite an important role played by community participation, Connor (1997) found that it associates with some issues, for instance, coordination and integration of diverse interests into the project plan and implementation. When community participation involves many diverse groups, bringing together their different needs in the design and implementation of the project can prove to be very challenging. Moreover, diverse interests may result to collective action as well as conflict among participants (Nelson & Wright, 1995).

## DATA AND METHODOLOGY

We applied the cross-sectional survey design to guide the research process. The study targeted community leaders, motorists and officials of public transport associations. Out of 319 people contacted, we successfully interviewed 298 (93.4%) respondents. We applied purposive and random sampling to select respondents. We applied a survey questionnaire with structured and semi-structured questions to source the data. We requested respondents to rate their opinions on the subject on a four-point rating scale of 'very low', 'low', 'high' and 'very high'. Furthermore, quantitative analysis that we obtained frequency distributions with percentages and cross-tabulation with Chi-square tests, we also transcribed, clustered into nodes and explored qualitative data for patterns and meaning to the flow of the funds. Detailed description of the design and approaches that we used in this study are available in following publications (Nachmias & Nachmias, 1996; Bryman & Cramer 1997; Rindfleisch, Malter, Ganesan & Moorman, 2008).

## RESULTS AND DISCUSSIONS

The study covered 298 respondents, which included 116 (38.9%) community leaders, 142 (47.7%) motorists and 40 (13.4%) officials of public transport associations. Most respondents, 242 (81.2%) were men, while women were 56 (18.8%). Besides, the respondents were aged between 18 and 66 years, with up to 108 (36.2%) falling in the 30 to 39 years age bracket. One-half, 149 (50.0%) respondents had attained some secondary school education, 84 (28.2%) reported having some college education, while those with university education were 12 (4.0%). In addition, respondents were diverse in terms of professional background, with up to 118 (39.6%) being drivers, 59 (19.8%) respondents were in business, 45 (15.1%) were farmers, 27 (9.1%) said they were teachers, while 22 (7.4%) were administrators.

Out of 298 respondents, only 102 (34.2%) were aware of the Fund, with more than two-thirds, 196 (65.8%) indicating that they had never heard of the Fund. This finding suggests that the Fund was not a popular initiative at the community level. A low level of awareness may have far-reaching implications on the participation of community members in road maintenance projects. Across the districts, Figure 1 shows that the proportion of respondents aware of the road maintenance Fund was highest in Kisumu and Kisii Districts, as reported by 35 (47.3%) and 30 (45.5%), respectively. Contrastingly, the proportion of respondents reporting lack of awareness was highest in Migori and Nyando Districts, according to 43 (82.7%) and 46 (75.4%), respectively.

Figure 1: Awareness of the Road Maintenance Levy Fund Across the Districts

*This figure presents information on the level of community awareness about the Road Maintenance Levy Fund across the five districts. Notably, awareness level was highest in Kisumu at 47.3% and Kisii and 45.5%. However, the proportion indicating lack of awareness about the Fund was highest in Nyando (82.7%) and Migori (75.4%).*

Based this, the cross tabulation analysis obtained a computed  $\chi^2$  value of 23.447, with 4 degrees of freedom and a p-value of 0.001, which was significant at 0.01 error margin. This suggests up to 99% chance that awareness about the Fund was significantly different across the districts, with some districts reporting higher levels of awareness than others. Nonetheless, the overall picture shows that awareness level about the Fund remains poor even in those districts that were relatively better-off. Information about the Fund was received for the first time through various media, including radio, 29 (28.4%), friends/colleagues, 41 (40.2%), community leaders, 12 (11.8%), newspapers, 9 (8.8%); community forums, 6 (5.9%); internet, 3 (2.9%) and television, 2 (2.0%).

The results show that out of 102 people awareness of the Fund, only 43 (42.2%) had participated in road maintenance projects funded through RMLF. Across the districts, Figure 2 shows that participation was highest in Kisumu, with 19 (54.3%), followed by Migori, where 6 (40.0%) respondents had participated. Contrastingly, the proportion of those who had not participated in such projects was highest in Nyando, 7 (77.8%) and Kisii, 19 (63.3%). The analysis obtained a computed  $\chi^2$  value of 14.081, with 4 degrees of freedom and a p-value of 0.024, which was significant at 0.05 error margin, thereby suggesting up to 95% chance that participation in projects funded through RMLF varied significantly across the districts.

Figure 2: Ever Participation in Projects Funded Through the Road Fund

*This figure presents information on the level of participation in road maintenance projects through the Road Maintenance Levy Fund across the five districts. The results show that participation was highest in Kisumu (54.3%), Migori (40.0%) and Siaya (38.0%). However, the proportion of those who had not participated in such projects was highest in Nyando (77.8%), Kisii (63.3%) and Siaya (61.5%).*

The study found that respondents participated at various levels of the project cycle, including prioritization, 16 (37.2%) casual labour, 10 (23.3%), tendering process, 6 (14.0%) planning and budgeting, 4 (9.3%) and monitoring, 3 (7.0%) monitored, among others activities. Those who had participated in road maintenance projects were asked to indicate their opinion regarding the completion rate of such projects. The results in figure 5 show that 53 (52.0%) out of 102 respondents were of the view that project completion rate was low, while 15 (14.7%) described the matter as very low. However, 28 (27.5%) respondents said the project completion rate was high, while 6 (5.9%) felt that it was very high.

Figure 3: Perception About the Project Completion Rate

*This figure shows respondents' perceptions regarding the rate of road maintenance project completion. The results show that 52.0% of the respondents described project completion rate as low, 14.7% described the matter as very low, 27.5% said project completion rate was high, while 5.9% rated the matter as very high. Cumulatively, 34 (33.3%) respondents were positive, while 68 (66.7%) expressed reservations about project completion rate, basing their opinions on projects with which they were familiar.*

Cumulatively, up to 34 (33.3%) respondents were affirmative about project completion rate, while the majority, 68 (66.7%) expressed the reservations about the matter. The results suggest that completion rate of road maintenance projects in the study area was generally poor. In this regard, respondents indicated that most projects either took too long to complete or were never completed at all. This confirms that RMLF was not successful, at least at the time of this study. Factors constraining the project

completion rate included inconsistent flow of funds, 84 (82.4%), political interference, 73 (71.6%), delay in external auditing, 40 (39.2%) and financial misappropriation, 21 (20.6%).

## CONCLUSIONS

The purpose of this study was to assess the level of community awareness, participation and perceptions regarding the completion rate of RMLF projects. On aggregate, awareness level about RMLF remains low; thus, necessitating appropriate interventions to enhance its popularity. Such low level of awareness limits the extent to which community members can make their contribution to enhance transparency and accountability in the management of the road funds.

Due to the low level of awareness, the level of participation in RMLF projects was even lower. Among those who were aware of the Fund, only 43 (42.2%) had participated in the projects. Participation was relatively higher in Kisumu (54.3%) and Migori (40.0%) than in Nyando (22.2%) and Kisii (36.7%). Community participation plays a key role in enhancing accountability by ensuring that road agencies become accountable and responsible in their role as stewards of the fund. When community members are involved, they nurture a sense of ownership and responsibility. This is likely to spur factual reporting of cases of poor workmanship or embezzlement of road funds.

Empowering community members with information about RMLF is likely to encourage their participation, which in turn, will strengthen proper utilization of funds. For this matter, KRB and the Government should initiate a sensitization campaign targeting the general public to improve awareness about the Fund and to spur participation in road maintenance projects. KRB should create a register to capture reported issues, securing a hotline number to encourage reporting, facilitating the investigative department to establish the credibility of reported issues. The role of community members can be enhanced further by publicizing annual work plans, budgets and expenditure reports to enable citizens connect with a road with which they are familiar. In case financial reports are not correct, then community members can link up with KRB to provide their facts to necessitate investigations and appropriate disciplinary actions to agencies found culpable.

Furthermore, 33.3% of those who were aware of the RMLF were positive about project completion rate, while up to 66.7% indicated negative opinions. Factors constraining the project completion rate included inconsistent flow of funds (82.4%), political interference (71.6%), delay in external auditing (39.2%) and financial misappropriation by some road agencies (20.6%). In view of this, KRB should open up communication with road agencies to avoid stagnation of funds along the disbursement channel, introduce electronic transfer of funds; formulate clear rules, regulations and procedures for all road agencies in the country. KRB should sensitize all agencies on the new rules, regulations and procedures and empowered to seek administrative opinion from a definite higher office to curb political interference. Given the national scope, external auditing of agency accounts is a demanding exercise, requiring the Government to recruit more auditors for expeditious results.

## ACKNOWLEDGEMENT

We thank all the individuals and institutions who supported this study through ideas, information and logistics. First, we are grateful to the University of Nairobi for granting the opportunity for Daniel Odongo Oronje to pursue the Master of Arts degree in Project Planning and Management. Secondly, we acknowledge the support of Dr. Francis N. Nyangaga and the entire Board of Directors of the Kenya Roads Board for logistical support to the study team. Thirdly, we are indebted to Mr. Tom Odhiambo, a social science research specialist and writer for analyzing and shaping the manuscript. Finally, we remain indebted to all the community members provided the requisite information.

## BIOGRAPHY

Daniel Odongo Oronje is a Manager, Rural Water and Sanitation, Lake Victoria Water Services Board. He holds a master's degree in Project Planning and Management and a bachelor's degree in Civil Engineering with close to 13 years experience in the planning, management, construction and supervision of roads. He is a registered civil engineer with the Engineers Registration Board of Kenya. His experience in the roads sector spans over 9 years. He is reachable through telephone number: +254 722 387 186 or +254 729 330 089; email address: oronjed@yahoo.com

Dr. Charles M. Rambo is a Senior Lecturer and coordinator of Postgraduate programs at the Department of Extra Mural Studies, University of Nairobi, Kenya. His academic interests include financial management, small and medium enterprises, small-scale farming and education financing. His previous work appears in journals such as Journal of Continuing, Open and Distance Education, International Journal of Disaster Management and Risk Reduction African Journal of Business and Management, African Journal of Business and Economics, as well as International Journal of Business and Finance Research. He is reachable at the University of Nairobi through telephone number, +254 020 318 262; Mobile numbers +254 0721 276 663 or +254 0733 711 255; email addresses: rambocharles@yahoo.com or crambo@uonbi.ac.ke

Dr. Paul A. Odundo is a Senior Lecturer at the Department of Educational Communication Technology, University of Nairobi, Kenya. He became a Research Associate at Institute of Policy Analysis and Research (IPAR) in 2001. His academic and research interests include institutional capacity building, decentralized development, instructional planning and management, educational administration. His previous work appears in IPAR Discussion Paper Series, the Fountain: Journal of Education Research and African Journal of Business and Management. He is reachable at the University of Nairobi through telephone number, +254 020 318 262; Mobile numbers +254 0722 761 414; email address: odundopaul@yahoo.com

# THE ECONOMIC ANALYSIS OF OBESITY

Tahereh Alavi Hojjat, DeSales University

## ABSTRACT

*Over the past several decades, obesity has grown into a major global epidemic. Obesity in the United States is widely acknowledged to be a severe and growing problem. In the United States (US), more than two-thirds of adults are now overweight and one-third of the overweight population is obese. There is growing evidence that obesity in America is largely an economic issue. In this paper, we will provide an overview and an economic analysis of obesity based on behavioral economics as a non-rational behavior. Economic costs of obesity are discussed with an emphasis on healthcare costs, as obesity is perhaps the largest medical problem in America. Research to date has identified at least four major categories of economic impacts linked with the obesity epidemic: direct medical costs, productivity costs, transportation costs, and human capital costs. Stemming the obesity epidemic cannot be separated from stemming the tide of poverty and income inequality gap. The obesity issue could be related to rising fast-food outlets and availability of vending machines, too much advertising for unhealthy food, falling minimum wage, government subsidies, income inequality gap and lack of health and family benefits. These issues need to be addressed through a concerted program of environmental and policy interventions.*

**KEYWORDS:** obesity, medical costs, economic cost, inequality gap, poverty

## INTRODUCTION

Over the past several decades, obesity has grown into a major global epidemic. According to Journal of the Medical Association (2010) in the United States (US), rates of obesity have doubled since 1970 to over 30 percent, with more than two-thirds of Americans being overweight today. In 2010, no state had a prevalence of obesity less than 20%. Thirty-six states had a prevalence of 25 percent or more; 12 of these states, (Alabama, Arkansas, Kentucky, Louisiana, Michigan, Mississippi, Missouri, Oklahoma, South Carolina, Tennessee, Texas, and West Virginia), had a prevalence of 30 percent or more.

Obesity is not limited to the United States, most of the world has grown fatter since the 1970s, and economists naturally turn to economists to explain why. As the median person become fatter, it becomes socially acceptable to be fat (Jenkins, 2013).

Causes and consequences of this are beyond the scope of this paper, as it can be very complex regarding heterogeneous population at the individual level. Therefore, we will consider major factors contributing to obesity, in general. At the end, we will propose food policy recommendation to fight against obesity.

Overweight and Obesity are terms used to express weight ranges that are greater than what is considered healthy for a given height. In the case of adults, weight and height are being used to calculate “Body Mass Index” (BMI) to define what qualifies as overweight and obese. Obesity in adults is generally defined as a BMI of 30 or greater, with a BMI of 25-29 categorized as being overweight (Dalrymple, 2010), for more details, see Table 1 on weight range. According to the National Health and Nutrition Examination Survey (NHANES), obesity prevalence in 2007-2008 was 32.2 percent and 35.5 percent among adult males and females, representing more than a 100% increase from 1976-1980 and a 50 percent increase from 1988-1994 (Flegal et al. 2010).

Table 1: Weight Range

Height	Weight Range	BMI	Considered
5' 9"	124 lbs or less	Below 18.5	Underweight
	125 lbs to 168 lbs	18.5 to 24.9	Healthy weight
	169 lbs to 202 lbs	25.0 to 29.9	Overweight
	203 lbs or more	30 or higher	Obese

*Source: National Center for Health Statistics, 2011*

The nation is spending \$75 billion a year on weigh-related disease such as; type II diabetes, heart disease, hypertension, high cholesterol, gallbladder disease and osteoarthritis being merely on top of the list. Almost 80 percent of obese adults have one of these conditions, and nearly 40 percent have two or more. Authorities view obesity as one of the most serious public health problem of the 21st century (Barness LA et al. 2007). A scary warning comes from the United States, where obesity is considered a real pandemic, in addition to adults; it already involves about nine million young people (Sturm R., 2007).

At present, obesity is not only a problem from the clinical point of view; it is also a social issue of considerable importance. We are going to review different phases of obesity since 1970s: Phase 1 of obesity began in the early 1970s and is ongoing: average weight is progressively increasing among children from all socioeconomic levels, racial and ethnic groups, and regions of the country. Today, about one in three children and adolescents is overweight, (with a body-mass index, or BMI, in the 85th to 95th percentile for age and sex), or obese, (BMI above the 95th percentile), and the proportion approaches one in two in certain minority groups. Though it has attracted much attention from the medical profession and the public, childhood obesity during this phase has actually had little effect on public health, because obese child may remain relatively healthy for years. Phase 2, which we are now entering, is characterized by the emergence of serious weight-related problems (Ludwig, 2007). The incidence of type 2 diabetes among adolescents, though still not high, has increased by a factor of more than 10 in the past two decades and may now exceed that of type 1 diabetes among black and Hispanic adolescents. Fatty liver associated with excessive weight, unrecognized in the pediatric literature before 1980, today occurs in about one in three obese children. Other obesity-related complications affecting virtually every organ — ranging from crippling orthopedic problems to sleep apnea — are being diagnosed with increasing frequency in children. There is also a heavy psychosocial toll: obese children tend to be socially isolated and have high rates of disordered eating, anxiety, and depression. When they reach adulthood, they are less likely than their thinner counterparts to complete college and are more likely to live in poverty. It may take many years to reach phase 3 of the epidemic, in which the medical complications of obesity lead to life-threatening disease. Poverty and social isolation would complicate the timely identification and management of such problems. Shockingly, the risk of dying by middle age is already two to three times as high among obese adolescent girls as it is among those of normal weight, even after other lifestyle factors are taken into account (Ludwig, 2007).

Obesity is implicated in 300,000 premature deaths per year in the United States, which is somewhat less than the number associated with tobacco use, but substantially more than the numbers associated with alcohol and illicit drug use (Chou et al. 2004). In addition to physical ailments, obesity has been found to be related to lower satisfaction with work, family relations, partner relationships, social activities and depression (Stutzer 2007).

### Causes of Obesity

There has been an increase in the prevalence of obesity amongst both genders of all ages and ethnic and racial backgrounds. According to the National Association of School Nurses, obesity has more than tripled among adolescents in the past 20 years, and 33 percent of students today are obese or overweight,

with related mental and physical health issues, including depression and the growing number of Type 2 diabetes cases (Table 2).

Table 2: Health Issues among All-School-Aged Children in U.S.

Obese, overweight, 32%	Asthma, 10%
Vision deficiencies, 24%	Food allergies, 5%
Prescribed medication for more than 90 days, 13%	Seizure disorder, 5%
Mental, emotional or behavioral problems, 10%	Hearing deficiencies, 5%
Illness or injury resulting in more than 11 missed school days, 6%	Attention Deficit Hyperactivity Disorder, 5%

Source: National Association of School Nurses and Wall Street Journal, September 25, 2012, D3.

Published scientific research suggest that obesity is caused by the following: excessive consumption of protein, starch, sugar, and fat; by calories and non-caloric sweeteners; by meals and by snacks; by beverages and by solid foods; by eating in fast-food and in full-service restaurants, as well as by eating at home. The only food that has not been linked to obesity is vegetables and fruits (Rolls, Ello-Martin, Tohill, 2004).

Energy-dense foods and energy-dense diets have been blamed for the global obesity epidemic (French, Story, Jeffery, 2001). Energy density of food is defined as the energy per unit weight or volume (kcal/100 g or megajoules per kilogram). The frequency of consuming restaurant food was positively associated with increased body fatness in adults. The increasing proportion of household food income spent on food prepared away from home in the United States may therefore help explain the rising national prevalence of obesity (McCrory, Fuss, Hey, Vinken, Greenberg, Roberts, 1999), snacks, sweets, and desserts (Zizza, Siega-Riz, Popkin, 2001), sweetened soft drinks (Bray, Nielsen, Popkin, 2004) and large portions sizes (Rolls, Morris, Roe, 2002) have all been linked to greater obesity risk.

As Americans debate what is most to blame for the nation's obesity epidemic, researchers say they have the strongest evidence yet that sugary drinks play a leading role and that eliminating them would, more than any other single step, make a huge difference (Science Daily). Three studies published in the New England Journal of Medicine represent the most rigorous effort yet to see if there is a link between sugar-sweetened beverages and expanding U.S. waistlines (Brody, 2012).

"I know of no other category of food whose elimination can produce weight loss in such a short period of time," said David Ludwig, director of the New Balance Foundation Obesity Prevention Center at Boston Children's Hospital, who led one of the studies. "The most effective single target for an intervention aimed at reducing obesity is sugary beverages."

Many observational studies by Gary Beauchamp, Barbara Rolls and Brian Wansink have linked consumption of sugar-sweetened beverages to weight gain in children, and to weight gain and Type 2 diabetes in adults (Brody, 2012). The new research goes well beyond those findings. In one study among women followed for four years, consuming one or more of these drinks per day nearly doubled the risk of developing Type 2 diabetes, compared with women who drank fewer than one a month. As a result, the authors concluded that those who drank more sugary drinks also "increased energy drinks" calories, that is "from other foods, indicating that these beverages may even induce hunger and food intake." (Brody, 2012).

In addition, food choices are made on the basis of taste, cost and convenience and, to a lesser extent health and variety (Glanz, Basil, Maibach, Goldberg, Snyder, 1998). Variety refers to the innate drive to secure a varied diet, whereas health refers to concerns with nutrition, chronic disease, and body weight.

Their results suggest that nutritional concerns are less relevant to most people than taste and cost. One implication is that nutrition education programs should attempt to design to promote nutritious diets as being tasty and inexpensive

Researchers at the US Department of Agriculture (USDA) have pointed out that the American diet is inconsistent with the Food Guide Pyramid (Franzo E, Allshouse J, 2003). The consumption of fat and sweets at the Pyramid's tip far exceeds recommendations compared with the low intake of fruits and green leafy vegetables. The reasons that fats and sweets have come to dominate food supply is they are inexpensive, good tasting, energy dense and convenient to use. Studies support that limited financial resources may be one reason why people are not eating more healthy food (Darmon, Ferguson, Briend, 2002).

The basic idea related to the obesity infrastructure is: The root of the [obesity] problem lies in the powerful social and cultural forces that promote an energy-rich diet and a sedentary lifestyle (Brownell and Horgen 2004). This environment has intensified over the past thirty years by opening more fast food restaurants and more advertising. The authors explore the economics of food and make clear that the profit motive of the food industry is not consistent with the current nutritional needs of the nation. Simply stated, increased food consumption means increased profits—but increased food consumption is not consistent with the health needs of our overnourished population. The authors expose the role of corporations that sell foods that contribute to the obesity epidemic. They warn that “American children may be the first generation in modern history to live shorter lives than their parents”.

Although the dramatic rise in obesity can only be explained by environmental factors, there has been little emphasis on the obese persons' economic environment. In particular there has been little research on diet quality and economics of food choice. The broader problem may lie with growing disparities in incomes and wealth, declining value of the minimum wage, food imports, tariffs, and trade. Evidence is emerging that obesity in America is a largely economic issue (Drewnowski, Darmon, 2005). Jobs have become less strenuous and people must pay high price for exercise. Calories have become relatively cheaper and exercise has become relatively more expensive.

Choice of certain products and eating habits are closely related to preferences, lifestyle, culture, ethnicity and income level. Since World War II, food tradition and culture of the industrialized countries have suffered a sudden and profound change: of course, economic development has led to greater availability and variety of food, but such availability resulted into greater obesity and diseases associated with it (Neel, 1962). In developing countries the food culture is changing, they tend to adopt eating habits similar to those of the western world, and they are particularly influenced by the industrialized American diet and availability of information and access to packaged food. In 1989, Sobel and Stunkard published a seminal review of literature on the relation between socioeconomic status (SES) and obesity. These authors covered the 1960s through mid-1980s and found 144 published studies on the SES-obesity relation in men, women, and children in the developed and developing world. They found a consistently inverse association for women in developed societies with a higher likelihood of obesity among women in lower socioeconomic status. In developing societies, a strong direct relation was observed for women, men, and children, with a higher likelihood of obesity among persons in higher socioeconomic strata.

The objective of this paper is to build on Sobel and Stunkard's (1989) earlier idea and study the impacts of socioeconomic status (education status, income inequality, poverty) on obesity (e.g., body mass index, body weight, overweight).

### Economic Analysis

This analysis is consistent with behavioral economics, the branch of economics that combines insight from economics, psychology and neuroscience to better understand consumers' situations in which actual choice behavior deviates from the predications made by earlier theories, which incorrectly concluded that people were *always* rational, deliberate and unswayed by emotions. Given utility maximizing rule, the consumer allocates his/her money income so that the last dollar spent on each product yields the same amount of extra utility. The rational consumer must compare the extra utility from each product with its added cost (that is, its price). Obesity is the result of individual decisions to choose poor diets and poor life-behavior patterns (including exercise). Unlike in the rational obesity model, these are not decisions of rational economic men or women. The obese person evaluating the long-term expected benefits and costs associated with his/her diet and exercise pattern and choose a combination that leads to obesity. If these benefits and costs were to change, it would be expected that the individual would change his/her diet and exercise pattern accordingly. These expected benefits and costs might change because of changes in external conditions or in the individual's preferences.

Technological change has led to lower food (or calorie consumption) prices and higher exercise (or calorie expenditure) prices. First, the relative price changes for different types of food have been quite different. Although the price of food relative to other goods has declined by 16 percent since 1960, the prices of fresh fruits and vegetables, fish, and dairy products have increased relatively since 1983 (Finkelstein and Zuckerman 2008). Analyses of price increase during the period 1985-2000 for food in different categories shows that cost of sweets, fats and caloric beverages fell substantially in relation to fresh vegetables and fruits (Economic Research Service of the USDA, 2002). Retail price of fresh fruit and vegetables increased 120 percent while price of fats/oils increased by 38 percent from 1985-2000 (Ibid). In February of 2013, CPI for all fresh vegetable rose 6.3 percent over the previous year. If anything, these trends accentuate income-based disparities in the access to healthy diets.

The government has poured billions of dollars into dietary campaigns. Agricultural subsidies undercut those efforts by skewing the market in favor of unhealthful calories. Much of the food we have to choose from and how much it costs is determined by Conservation and Energy Act of 2008, known as the "Farm Bill". Federal support for agriculture began during the Great Depression, as a temporary support to farmers, paying them extra when crop prices were low. Nearly eight decades later the benefits flow primarily to large commodity producers of corn and soy, which are as profitable as ever. The current bill gives some \$4.9 billion a year in automatic payments to growers of such commodity crops, thus driving down prices of corn, corn-based products and corn-fed meats. Cows that are raised on corn, rather than grass make meat that is higher in calories and contain more omega-6 fatty acids and fewer omega-3 fatty acids- a dangerous ratio that has been linked to heart diseases (Scientific American, May 2012).

Cheap corn has also become a staple in highly processed foods from sweetened breakfast cereals to soft drinks. Between 1985 and 2010 the price of beverages sweetened with high-fructose corn syrup dropped 24 percent, and by 2006 American children consumed an extra 130 calories a day from those beverages (Ibid). Over the same period, the price of fresh fruits and vegetables rose 39 percent. For families on a budget, the price difference can be decisive in their food choices. Thus, the evidence supports the view that it is the relative decline in price of unhealthy foods, not food in general, that has contributed to obesity (Tomer, 2011).

The key factor contributing to lowering the food price in general are technological changes and government subsidies. Thus lower the cost of intake of calories and higher the costs of burning calories via exercise are important factors on obesity. Consider the influences deriving from food suppliers, in particular the agricultural, food processing, food distribution, and food preparation industries, especially the food processors and food preparers. There is a great deal of evidence that they are increasingly selling unhealthy foods; foods high in bad fats, sugar and sugary items, processed food, and junk food. Healthy

foods in contrast are whole, unprocessed foods, full of fiber, antioxidants, vitamins, minerals, phytonutrients, and healthy fats (Hyman 2006, 52).

A USDA study showed that low-income households spent approximately \$1.43 less per person per week on healthy food such as fruit and vegetables compared with higher income households (Blisard , Stewart, Jolliffe, 2004). While higher income household did increase fruit and vegetable consumption after an increase in income, lower income household did not. One explanation can be that fruits and vegetables were not a priority among low-income families and that they chose to spend their limited resources on items that were perceived a more essential as meat, clothing or rent.

In general, healthier diets cost more. Developments in agriculture and food technology have made added sugars and vegetable oils accessible globally at remarkable low costs. As a result of added fats, the cost of the daily diet has been holding down. Americans have the lowest cost food supply in the world. The typical American diet derives almost 40 percent of daily energy from added sugars and from added fats which are relatively inexpensive (Frazoa, Allshouse, 2003). Given low price and tasty low quality food, marginal utility per dollar of low quality food can be high and that can lead to higher consumption. Diet quality is influenced by socioeconomic position and may well be limited by financial access to nutrient-dense foods.

Considering globally, Americans have the lowest-cost food supply in the world and spend the lowest proportion of disposable income on food. The typical American devotes about 7 percent of his or her spending to food, but the average Indonesian, devotes 43 percent of his/her spending to food. (Table 2). People with lower incomes continue to spend much more on food in percentage terms than those with higher incomes. Food accounted for 16.1 percent of spending by consumers with the lowest incomes, according to the Labor Department. Consumers with the highest incomes devoted only 11.6 percent of their spending to food (Wall Street Journal, 26 Sep 2012: A.4.).

Table 2: Food as a Share of Total Expenditures, Developing and Advanced Countries, 2011

Developing Country	Food as a percentage of total expenditures	Advanced Country	Food as a percentage of total expenditures
China	32.8%	Austria	11.0%
Guatemala	35.5	Denmark	11.5
India	35.4	Finland	11.19

Until recently, no one has seriously questioned whether a low-cost food supply brought anything but benefits to the United States. However, studies are beginning to link the low cost of foods with the obesity epidemic. One study found that technological advances led to a decline in the price of food, which in turn led to higher energy intakes (Lakdawalla , Philipson , 2005). The drop in food price was said to account for up to 40 percent of the increase in body mass index since 1980 (Ibid). The sad part of this result is that the population subgroups with least resources is more vulnerable to the obesity epidemic and any policy changes in terms of higher taxes on unhealthy food will be punitive measures.

### Poverty and Obesity

As the *Economist* magazine notes in its own survey of obesity, “the rich and well-educated have mostly managed to stay slim.” Also, it said that obesity is prevalent among the Medicaid and thus is burden to tax payers (Jenkins, 2013).

The relationship between obesity and poverty has become more obvious and complex: being poor in one of the poorest countries may be associated with poor nutrition, while being poor in a developing country could mean a higher risk of obesity. This is confirmed by Sobal and Stunkard (1989): in developed countries, there is an inverse relationship between obesity and socioeconomic status, the higher social classes are able to compensate for a sedentary lifestyle, with more information and sport opportunities, plus they can afford better quality food, organic and less processed. In less developed countries, with a \$2,500 GDP per capita, a direct relationship prevails and, excess weight is observed more frequently among the higher social classes (Monteiro et al. 2004).

As the economist magazine notes in its own survey of obesity, “the rich and well-educated have mostly managed to stay slim.” Also it is said that obesity is prevalent among the Medicaid and thus a burden to tax-payers (Jenkins, 2013).

Existing studies suggest that the high cost of healthier diets may contribute to the obesity epidemic especially among the lower-income group and low-educated group (Table 3 & 4). At the individual level, obesity rates are linked to low incomes, low educated, minority status and a higher incidence of poverty. Tomer (2011) in his research indicates that socioeconomic groups with low personal capital, low health capital, and low social capital have higher obesity rates than socioeconomic groups with higher endowments of intangible capital. This has been supported by other studies that indicates that higher diet quality, as measured by the Healthy Eating Index, is associated with higher incomes, more education, and with lower rates of obesity and overweight (Henderson 2007).

According to the following information presented in Table 3 and 4, during 2007-2009, the percentage of obese individuals has been highest for low-income families (35.3 percent) and lowest for higher income family (24.5 percent). Also, higher level of education is a contributing factor to a better diet and healthy weight, those with less than high school education had higher percentage of obese (33.6 percent) and the one with higher education less percentage of obese (22 percent).

Although other factors including addictive personality, stress, depression seeking comfort in familiar foods has been among other factors led to higher consumption of sweets and deserts. In addition, physical access to supermarkets and grocery stores, marketing and distribution of healthy foods, urban sprawl, and the time spent commuting to work have also contributed to failure to adhere to healthy diets (Morland, Wing, Diez, Poole, 2002). This implies that people with weak and/or negative social capital are more likely to be vulnerable to the influences from the infrastructure of obesity and the economic incentives from the markets regarding food and exercise.

Table 3: Percentage of Obese Adults by Household Income, 2007-2009

Percentage of Obese Adults by Household Income, 2007-2009	
Less than \$15,000	35.3%
\$15,000 to \$24,999	31.4%
\$25,000 to \$34,999	29.6%

\$35,000 to \$49,999	29.1%
\$50,000+	24.5%

Table 4: Percentage of Obese Adults by Educational Level, 2007-2009

Percentage of Obese Adults by Educational Level, 2007-2009	
Did not graduate high school	33.6%
Graduated high school	30.3%
Attended college or technical school	29.6%
Graduated college or technical school	22.0%

Source: "F As In Fat: How Obesity Threatens America's Future," Trust for America's Health, June 2010.

Tomer (2008) argues that in the presence of strong positive social relationships, people's imbalances are likely to be more muted and less problematic. Conversely, when social capital (SC) is weak and negative, people's imbalances are likely to be more pronounced and problematic.

Social capital refers to the capacity that is embodied in an individual's social relationships or the bonds and connections between an individual and others. Social capital is embodied in families, institutions, civic communities, and the larger society. The strength and quality of an individual's SC endowment arguably has a relationship to the person's likelihood of becoming obese (Tomer, 2011).

### Consequences of Obesity

Obesity is the second leading preventable cause of death in the United States. Each year approximately 300,000 lives are lost due to direct or indirect consequences of obesity. Obesity is associated with multiple chronic conditions, such as high blood pressure, high cholesterol, heart disease, and stroke, type 2 diabetes, uterine, breast, colon and gall bladder cancer. Sleep apnea, arthritis and depression can also be linked to obesity. There is 50 to 100 percent increased risk of all-cause mortality amongst obese individuals. Around 80 percent of obese individuals have diabetes, high cholesterol, high blood pressure or heart disease. Direct medical costs related to obesity are secondary to preventive, diagnostic and treatment services. Hammond and Levine (2010) measured direct medical costs associated with obesity. They argue that relative medical spending for the obese may be as much as 100 percent higher than for healthy weight adults, and nationwide "excess" medical spending may amount to as much as \$147 billion annually for adults and \$ 14.3 billion annually for children.

Indirect costs focus on premature mortality, higher disability insurance premium, and labor market productivity (morbidity). Mortality costs include future income lost as a result of premature death. Morbidity costs include income lost from decreased productivity, restricted activity and absence from work. As per the indirect costs related to obesity, obese people tend to be less productive than the average healthy person and they are more subject to the phenomenon of presenteeism (the tendency to go to work even if you are not in optimal physical condition) (Finkelstein et al., 2011). There are growing evidences that obese employees have greater rates of absenteeism and presenteeism. In a recent analysis, Finkelstein et al. (2011) combined multiple data sets to quantify medical expenditures and the value of lost productivity resulting from absenteeism and presenteeism for overweight and obese full time employees. The cost of obesity among full-time employees, in the United States, has estimated to be of \$73.1 billion per year (Finkelstein et al. 2011), in details: 18 percent due to sick days, 41 percent due to lack of productivity because of health issues, and 41 percent due to general medical expenses. Hence, the hidden or so-called indirect costs related to obesity are a relevant percentage of the total.

There are different estimates of such costs as a result of confluence of factors such as the date of measurement, representativeness of the sample and the scope of measurement. For example, Thompson

et al (1998) look at total cost of obesity to US businesses, differentiating between health insurance expenditures, paid sick leave, life insurance, and disability insurance. The authors estimate that total non-medical cost of obesity among US businesses were \$5 billion in 1994. Of that, \$2.4 billion was spent on paid sick leave, \$1.8 billion on life insurance, and \$0.8 billion on disability insurance.

The economic loss of productivity caused by excess mortality is estimated at \$49 billion per year in the United States and Canada (Behab, Cox, 2010). The economic loss of productivity caused by overweight or obesity for totally disabled workers is at \$72 billion (Ibid). Behab and Cox estimated that total annual medical cost of overweight and obesity in the United States and Canada caused by medical costs, excess mortality and disability is approximately \$300 billion in 2009.

Due to the health consequences resulting from excess weight, the increase in obesity has also profound economic consequences on employers and government: the loss of productivity caused by obese conditions of employees is as high as the medical expenses attributable to such conditions. As per the so-called direct costs generated by obesity, compared to normal weight individuals, it is estimated that obese adults have an average of 19.5 percent more physician visits (Quesenberry, Caan, and Jacobson, 1998, in Finkelstein, E.A., et al. 2010). Thompson et al. (2001) also found that obese adults have 48 percent more inpatient days per year and 1.8 times more pharmacy dispenses.

#### Food Policy Interventions

Without effective intervention, the costs of obesity might well become catastrophic, arising not only from escalating medical expenses but also from diminished worker productivity, caused by physical and psychological disabilities. Future economic losses could mean the difference between solvency and bankruptcy for Medicare, between expanding and shrinking health care coverage, and between investment in and neglect of our social infrastructure, with profound implications for our international competitiveness. The human costs would be incalculable (Ludwig, 2007).

Although broad consensus exists regarding the dietary and lifestyle habits needed to prevent and treat childhood obesity, we lack anything resembling a comprehensive strategy for encouraging children to eat a healthful diet and engage in physical activity. Such a strategy would include legislation that regulates junk-food advertising, provides adequate funding for decent lunches and regular physical activities at school, restructures the farm-subsidies program to favor nutrient-dense rather than calorie-dense produce, and mandates insurance coverage for preventing and treating pediatric obesity (Ludwig, 2007). Parents must take responsibility for their children's welfare by providing high-quality food, limiting television viewing, and modeling a healthful lifestyle. Fortunately, with the exercise of both personal and social responsibility, we have the power to choose the shape of things to come.

Food policy interventions at the national and international level may be the most promising approach to making healthy food affordable and accessible to all. The World Health Organization stated that the key to maintaining healthy weight is an affordable supply of fresh nutrient-rich foods. Such access could be facilitated through a combination of agricultural subsidies, pricing policies, regulatory action, and consumer education. This approach would require cooperation between government, academia, and the food industry.

Many variables influence diet and lifestyle choices. Food prices and income status are important determinants of what we will consume. Other factors such as taste, convenience, age, family size, knowledge, and health status are just as important. There are two main policy approaches to address obesity. One approach is to reduce the demand for products and lifestyle that contribute to obesity. This approach can be achieved by information, education, taxing products and food labeling etc. The second approach is to reduce the supply side by cutting subsidies of agricultural products to keep the costs low.

There have been several suggestions to not only remove the offending foods from the consumers' reach, but also to discourage consumption and promote alternative healthier diets. This can be achieved through imposing taxes on fats and sweets and nutrition can be improved at schools by limiting access to vending machines containing beverages and snacks and regulating the sales of competitive foods. Agricultural policy options include the provision of economic incentives for the production of healthier foods and removal of existing subsidies. Recent research has uncovered the baneful influence that corn-based sweeteners have had on America's obesity epidemic. It is estimated that Americans consume 73 percent of corn-derived sweeteners per person per year (Sugarcane Profile, Agricultural Marketing Resource Center, 2010). Michael Pollen (2006) points out; the growth of corn-based sweeteners is a direct result of the government's farm policy, which subsidizes corn production. A basic consequence of economic law is that when something is subsidized, more of it will be produced while calories from high-fructose corn syrup are unhealthier than those from natural sweeteners, such as sugar.

Children spend a significant portion of time in schools making it natural that the eating habits acquired during school years become life-long. In America, 17 percent of children under 20 are obese or about 12.5 million people, according to the Centers for Disease Control and Prevention. The rate has tripled since 1980, has leveled off in recent years but has remained at historical highs, and public health experts warn that it could bring long-term health risks (Tavernise, 2012). It is mostly the result of access to foods that have limited nutritional value which are widely promoted. According to the Center for Disease Control's study, 33 percent of elementary schools had canteen, snack shop or vending machines in 2006. Most of the foods sold are of poor nutritional quality. Children in the United States consume on average almost three times as many calories from sugar-sweetened beverages, compared with Dutch children (Ibid).

David Ludwig (2007), suggesting there is a need for public policy changes, speaks to the importance of both education and regulation. "It suggests that if we want long-term changes in body weight, we will need to make long-term permanent changes in the environment for children" (Ludwig, 2012). Education matters, but it is not enough, it must be accompanied by restrictions that curb unhealthy habits and with environmental changes that foster healthier ones.

Soft drinks sold in schools are high in calories and add little nutritional value. Increased consumption of these sweetened beverages is linked with higher incidence of obesity and diabetes.

The following steps can lead to significant change in the food environment in schools and eventually cultivate healthy eating habits in children:

1. Sell only high nutritional food in schools consisting of fruits, vegetables, whole grains and dairy products that are non-fat.
2. Distribute water and low or non-fat milk in schools instead of sweetened beverages and fruit juices.
3. Increase the reimbursement rates so that school administration can serve food that has high nutritional value.
4. Provide training to food service staff on nutrition and healthy eating.

There have been few research reviews, however, that have shown an association between linking increased availability of fruits and vegetables to increased consumption.

### Menu Labeling

Americans consume one third of their caloric intake from fast foods and restaurants because they are inexpensive and convenient. Consumers are mostly ignorant of the food calories, content of sodium, sugar or fat in the food they eat. People who eat outside of their home are more likely to consume supersized

portions and it has been estimated that adults who eat outside consume 250 more calories per day. Portions served in fast foods and restaurant chains have been increasing since 1970s. National public opinion polls show that around 83 percent of Americans are in favor of menu labeling. Adults often read food labels and make purchasing decisions based on it. Menu labeling provides nutritional information regarding calories, carbohydrate, fat and sodium content. Currently, restaurants that have this information mostly have it on posters or websites but do not readily accessible to consumers when they are making food decisions.

### Taxation and Subsidization

A tax placed on a product leads to an increase in its ultimate price. Price increases lead to a reduction in the quantity consumed. This occurs as consumers either cut down or stop purchasing the product. Taxes on items such as alcohol and tobacco have been shown to reduce their consumption. One way to reduce the demand of unhealthy food is to impose tax on items that are most closely associated with obesity. Taxation alone is unlikely to address the problem; however, it does have several benefits. The revenue gained from taxation can be directed towards consumer education, providing exercise facilities and therefore lowering the public costs of health care. Another option is to impose taxes on restaurant franchises, which will ultimately reduce the supply of restaurants. Similar taxes can be imposed on snack vending machine and restaurants. Poor diet by specific populations can be targeted by taxing products in particular locations.

According to data from the Rudd Center for Food Policy and Obesity at Yale University, 17 states filed legislation in 2009-2010 to expand soda taxation; two of these states, Colorado and Washington, passed such legislation. There has been studies to investigate the potential for soft drink taxes to combat rising levels of child and adolescent obesity through a reduction in consumption. Fletcher, Frisvold and Tefft (2010) results, based on state soft drink sales and excise tax information between 1989 and 2006 and the National Health Examination and Nutrition Survey, suggest that soft drink taxation, as currently practiced in the United States, leads to a moderate reduction in soft drink consumption by children and adolescents. However, they showed that this reduction in soda consumption is completely offset by increases in consumption of other high-calorie drinks.

In general, tax distort market functioning and reduce economic efficiency. Proponents of soda taxation argue that it falls into the realm of a “pigovian tax”. Such a tax may actually increase total economic efficiency in the presence of externalities from consumption. Therefore, taxing such a good not only increases revenue for the government, but may also improve overall welfare by reducing “overconsumption” of the good. In the case of the soda tax, reducing consumption may reduce average body weight and obesity rates (McGranahan, Schanenbach, 2011). This in turn, might reduce health problems related to obesity, such as diabetes and heart disease, and could reduce health care expenditures. It usually does not matter whether a tax is imposed on the producers or consumers of a good, because the producers can pass some of the tax on to the consumers, how much of that tax passes on to the consumers depends on elasticity of demand and supply for the product. McGranahan’s found out that average household spending on sugar-sweetened beverages (SSBs) is \$142 in 2008. In addition, SSBs represent a larger share of the spending of the poor than is true for the overall population. Also, SSBs consumption as a share of total spending falls as educational attainment increases. As a result, a soda tax would likely have a disproportionate effect on the less educated and poor groups.

Whether increase in soda taxes can have any potential impacts on public health, we can review a few findings: A recent study by Fletcher (2010) finds that the soda taxes do not reduce obesity rates. Recent proposals, however, suggest raising the tax rates to levels much higher than those that are currently seen and may, therefore, lead to a different outcome if tax is high enough to affect the price to reduce consumption. Recent research suggests that soda consumption is modestly responsive to price changes.

According to Andreyeva, Long, and Brownell (2010), an increase in the soda price of 10 percent would decrease consumption by between 2.7 percent and 8.1 percent (elasticity of .27 to .81). Second, lower soda consumption would need to result in a reduction in overall caloric consumption in order to be effective. An alternative to increased consumption of healthy food is subsidization of healthy foods; lowering their price will eventually lead to an increase in their supply and price.

Research by the University of Illinois's , Chaloupka (2012) and his colleagues found that existing state taxes on sugary drinks haven't reduced soda consumption or obesity significantly. But those taxes are relatively small, and a heftier tax would probably have some impact, he said. Still, he said people have many other sugar sources apart from sodas-which makes a soda tax different from, say, a tobacco or alcohol tax. Chaloupka noted in the Wall Street Journal, August 13, 2012, that some municipalities have taxed sugary drinks in the form of a license fee. The Richmond and El Monte levies are structured as business license fees imposed on merchants-not as taxes on each drink purchase, meaning it would be up to the sellers to decide how to pass along the added costs. Thus, the effectiveness of imposing tax of sugar sources depends on how it affects the price of the products and hence consumptions.

Gradually some actions are being taken in response to corporate responsibilities on obesity. For instance, according to the Vauhini (2012), Coca-Cola Co., PepsiCo Inc. and Dr Pepper Snapple Group will start displaying their drinks' calories on vending machines next year and point consumers toward less sugary versions. This was their latest response to critics who have singled them out for contributing to the nation's obesity epidemic.

Finally, it is suggested that leveling the playing field by extending subsidies and insurance programs more widely to fruits and vegetable producers could be a positive step toward fighting obesity. Any new farm bill should at the very least remove the current perverse incentives for people to eat unhealthy.

#### Access to Healthy Food In Low-Income Areas

There is not equal access of nutritional food to all Americans. Minorities and low income people have insufficient consumption of healthy foods. There are several reasons for this:

1. Increased cost of fresh foods in low income neighborhoods.
2. Lack of public transportation to supermarkets.
3. Few supermarkets and grocery foods in low income areas stock healthy foods.

To increase access to healthy foods the following steps can be taken:

1. Tax incentives to attract supermarkets to low income areas.
2. Increase access to public transportation
3. Provide incentives to create farmers markets.
4. Providing coupons to purchase healthier foods
5. Mechanisms to purchase food directly from farms such as farmers markets, farm stands etc.

One community based intervention showed that WIC recipients who received \$10 weekly vouchers for healthy foods increased their consumption of fruits and vegetables.

#### Advertising

Highly processed foods were mostly focused in advertisements. Analysis of data for more than 13,000 children found that there is a significant association between the amounts of time children spent watching television and the prevalence of obesity. Diets and Gortmaker (1985) concluded that, among 12-to-17 years old, the prevalence of obesity increased by 2 percent for each additional hour of TV viewed, even after controlling for other variables such as prior obesity, race, and socio-economic status. Also, these

hours spend watching television contribute to sedentary life style and increase risk for obesity. According to American Psychological Association, children under the age of two are more to accepting the advertiser's messages as truthful, accurate and unbiased. Food products mostly marketed to children include cereals, candies, sweets, sodas and snack foods. Australia, Canada, Sweden and Great Britain have adopted regulations that prohibit advertising in programs wanted by young children. Media can also be to influence behavior in a positive manner. Options include:

1. Reduce or regulate food advertisements that target children.
2. Promote educational programs that promote healthy eating and exercise.
3. Interventions to reduce the time children spend on media.

## CONCLUDING COMMENTS

Unlike in the rational obesity model, the individual is not maximizing utility or targeting a particular weight or net calorie consumption. The individual may have some outcome aspirations, but these aspirations are likely to be for a complex combination of health, good looks, and weight. Further, the decision-making outcome will be determined to a great extent by the relative strength of the internal and external factors. If the negative external factors (environment) are getting stronger over time, as they apparently were during the last three decades, without any significant changes in the internal factors, this would indicate a rising level of obesity as has been observed.

Richmond's City Council agreed to put a measure on the November 2012 ballot to charge businesses a penny for every ounce of those beverages they sell in the city. If it passes, it would be the first city tax of its kind in the nation and the first to be approved by voters. Meanwhile, health advocates from organizations such as Yale University's Rudd Center for Food Policy & Obesity are saying the measure could help address the nation's obesity problem. Health advocates believe a passage of the tax could set a model for other cities, even as several local soda-tax efforts in various states have foundered amid heavy lobbying. Already, 30 states, including Texas and Iowa, levy a sales tax on purchases of sweetened drinks, averaging about 5 percent, aimed at curbing obesity and raising money. Reduction in unhealthy beverage consumption is needed to help reduce obesity, especially in the lower per capita income areas that have higher obesity prevalence.

Food policy intervention through either public interest groups or through government is the key to fight against obesity. There is no single strategy that can be effective alone and rather a combination of different approaches is needed for success. In preventing addiction to tobacco products, the most effective approach was preventing people from becoming smokers and a similar approach is needed. For any policy to be effective the complex relationship between etiology of obesity, obesity advocacy and marketing must be rewired. Marketing can play a key role in changing consumer preferences. This can include health conscious television, radio and internet advertising. No amount of advertising and consumer education would be useful unless we lower the price of healthy foods so low income residents can afford to buy them. The school environment needs to change as eating habits and choices developed in school are going to last a lifetime.

Thomas Farley, the health commissioner in New York City, reported a 5.5 percent decline in the number of obese schoolchildren from 2007 to 2011. Although this number is small, but some argues that it is an indication that the obesity epidemic, one of the nation's most intractable health problems, may actually has a reversing course (Tavernise, 2012). Some experts note that the current declines, concentrated among higher income, mostly white populations, are still not benefiting many minorities' children. For example, when in New York City, they measured children in kindergarten through eighth grade from 2007 to 2011, the number of white children who were obese dropped by 12.5 percent, while the number of obese black children dropped by 1.9 percent (Tavernise, 2012). Though obesity is now part of the national conversation with aggressive advertising campaign in major cities in the Unites States, many scientists

doubts that anti-obesity programs actually work. Researchers say that it will take a broad set of policies applied systematically to effectively reverse the trend (Institute of Medicine Report, May 2012)

None of this can be accomplished without a policy intervention from the government with support from public interest groups. Stemming the obesity epidemic cannot be separated from stemming the tide of poverty and income inequality gap. Rising obesity rates reflect an increasing unequal distribution of income and wealth. It is by now widely accepted that income poverty is a risk factor for premature mortality and increased morbidity (Subramanian SV, Kawachi I, 2004). Obesity affects poor children disproportionately. Twenty percent of low-income children are obese, compared with about 12 percent of children from more affluent families (Center for Disease Control, 2012). Among girls, race is also an important factor. About 25 percent of black girls are obese, compared with 15 percent of white girls (Ibid).

Is the obesity issue related to rising fast-food outlets and vending machines and too much advertising or falling minimum wage, income inequality gap and lack of health and family benefits? These issues need to be addressed through a concerted program of environmental and policy interventions. There is growing evidence that obesity in America is largely an economic issue.

# IMAX MOVE TO HOLLYWOOD: BLUE OCEAN STRATEGY OR A CASE OF WHO MOVED MY CHEESE

Hilary Becker, Carleton University, Ottawa, Canada

## ABSTRACT

*IMAX is a leading edge technology, film production and Distribution Company which found their niche market, at the turn of the century, to be stagnating with increased competition from other sources of entertainment ranging from home theater and entertainment options to sporting events. The stagnation was made worse with financial problems causing the company to make dramatic changes to their operations. Faced with a challenging future, IMAX made the decision to go Hollywood and move from predominantly educational movies to animation and ultimately full-length Hollywood blockbuster movies.*

*The present paper will examine whether these changes constituted a new blue ocean on the basis of Blue Ocean Strategy or if it was a situation of Who Moved my Cheese.*

**KEYWORDS:** IMAX, Blue Ocean Strategy, Who Moved my Cheese

## INTRODUCTION

Organizations have long sought to create shareholder value as one of the cornerstones of strategic development and execution. Some companies have been able to develop new products, expand on existing product lines or create new market development to achieve new revenue generation growth, while others have focused on cost cutting and improved productivity and efficiencies to reduce costs as a way to enhance overall profitability.

IMAX was no different, being the first to develop technologies to transfer the 35 mm. regular movie going experience into “the IMAX experience” by showing larger than life cinema productions on substantially larger screens (up to 8 stories). IMAX had targeted educational films with showings on their customized unique film and projection equipment in exclusive venues principally within museums and zoos. Although the experience was unique, IMAX soon found themselves in financial difficulties by the mid 2000’s.

This struggle came from various combined sources; principally, the overdevelopment of the movie theater industry in the early 1990’s through rapid growth and market saturation, causing many theaters and chains to go bankrupt and creating receivable issues for IMAX, and the increased diversity of alternative options for movie goers from Home Theaters, DVD and eventually Blue Ray and 3-D video options to the many other forms of entertainment including Sporting Events, Live Theater, Dinners and other means of entertainment for adults and families.

## IMAX

In 1967, IMAX was launched in Montreal, Canada to correspond with the opening of EXPO ’67 as an experimental multi-screen film. The first IMAX film was shown three years later at EXPO ’70 in Japan. In 1994, IMAX went public and started to consider moving into Hollywood films, however, it was not able to capitalize on the venture as the critical mass in distribution was not sufficient to excite Hollywood as there wasn’t sufficient venues to show IMAX format movies. The first venture was to take advantage of this technology was Apollo 13; however, to accommodate this transition meant that there was a significant delay between the initial release of the movie and the IMAX release. (IMAX, 2013)

IMAX, then turned to a new invention creating Digital Re-Mastering or DMR to take existing Hollywood movies and re-mastering them into the IMAX format. This reduced the timeframe of production to allow IMAX to come out with movies almost simultaneously to the Hollywood release and significantly reduced production conversion costs (IMAX, 2013). The conversion of Hollywood blockbuster movies such as the Matrix Re-loaded, the Harry Potter series and Polar Express led other motion picture studios to increase faith in the production and economic viability of IMAX format films.

In the 1990's, IMAX continued to expand beyond their institutional settings by forming alliances with theaters such as AMC, Cinemark and Regal, selling IMAX hardware into these theater chains; however with the rapid expansion of theaters, oversaturation led to many theater owners filing for bankruptcy and IMAX suffered problems of receivable collections, leading to their own financial difficulties. Their stock price plummeted from a high of \$32.69 per share in 1999 to only \$0.58 in 2001 (Institutional Investor, 2002).

In 2004, IMAX stock, which had climbed to nearly \$5, was down to \$4.04, when it was revealed that 11 officers and directors had purchased \$1 million in stock, driving the price to \$5.18. This was prior to the release of Harry Potter, Catwoman and Polar Express. (Blackwell, 2004).

IMAX had a three-pronged strategy for growth. They were in the hardware business of selling IMAX systems into movie theaters. The second business was in movie production business and the third was in movie distribution. A series of patents protected the production business from competitors, and provided a stimulus to help with movie distribution. Due to their financial difficulties, there was a threat that IMAX would be a takeover target.

Questions however began to rise about the move to Hollywood. Should IMAX gamble on a move which is fundamentally different from their core image of providing educational entertainment in a scholarly environment, or put another way, would the move to Hollywood, alienate them from the institutional market that had been the core of their existence and erode their image? Should they stay as a small niche market player, would their financial problems allow them to maintain a “do nothing” strategy.

This paper seeks to ask the question of whether the strategic move from “Edutainment” to Hollywood was a case of Who Moved My Cheese or the creation of a new Blue Ocean. “Edutainment” is described by the American Heritage Dictionary as “The act of learning through a medium that both educates and entertains” (AHDictionary)

## **WHO MOVED MY CHEESE**

“Who Moved My Cheese” is a parable about two mice “Sniff and Scurry” and two little people “Hem and Haw”. Each day they go to a location to eat cheese. One day the cheese is gone. “Sniff and Scurry” foresaw the cheese dwindling and moved on to find new cheese, while “Hem and Haw” continued to return to the same location asking “Who moved my Cheese?”. Eventually Haw goes out into the maze to look for new cheese, but Hem refuses to move, (Johnson, S., 1998).

The parable leads to a discussion about the implications of market stagnation and company responses. It is clear that there was, in the early 2000's a stagnation in the stock price with a dramatic fall in stock price, change in consumer behavior, which would lead to a need for management to make changes to increase shareholder value.

The growth of the tech market with continuing advancements in computer technology, gaming systems such as Sony Playstation, Nintendo Wii and Microsoft Xbox, as well as Apple IPOD, in addition to the

growth of home entertainment systems, created a change in market dynamics and a move away from educational entertainment such as museums and zoos, as well as other forms of entertainment as would be argued by Blue Ocean Strategy below.

With Hollywood studios competing for consumer dollars leading to more “over the top” movie experiences and faster turnaround time, Hollywood movies had a limited amount of time recoup their costs, with new summer release movies coming out every week. This was in stark contrast to IMAX movies which, once released in their theaters would show for years at a time. In essence, the change in consumer behavior could be analogous to IMAX’s cheese being moved.

## **BLUE OCEAN STRATEGY**

Blue Ocean Strategy was developed by Chan and Maubourgne of INSEAD University in France. They developed their hypothesis by analyzing a number of successful products and service launches over the past 100 years and determined commonalities in the method in which these products and services came into being. From this analysis, they introduced a methodology that firms could use to analyze if they could indeed determine “untapped market space” and achieve new revenue streams from previously untapped markets.

IMAX’s introduction of the new “large screen” movie experience in 1970 in Japan did, at the time, create a new blue ocean. It was a revolutionary process printing on films 10 times larger than regular 35mm films, which allowed movies to be displayed on a large screen while (up to eight stories), while maintaining high resolution. The success of IMAX edutainment films were a draw to the museums and zoos where they were situated. Their move to Hollywood, justified the additional \$3-5 that moviegoers paid for the “IMAX experience”.

Using Blue Ocean Strategy we would say that the move to Hollywood would entail a view to the six paths framework, the establishment of an ERRC grid and strategic curve analysis.

In analyzing the six paths framework, IMAX must compare themselves to other alternative industries such as dinner/theater/sporting events or a night out. IMAX is well positioned at a cost of \$10-12 versus other competitors at \$50-\$120 for other forms of entertainment or movies.

The chain of buyers (influencers) looks at demographics. The typical IMAX (institutional museum or zoo) goer is 19-65 years old, university educated and high household income, with a large portion of receipts from school groups (IMAX). This is in contrast to typical movie (theater) audiences which tend to be younger aged (12-24 year old) representing 38% of movie admissions and also more frequent moviegoers (41%), with 25-39 year old representing another 29% of admissions, while 75% of moviegoers make \$35,000 or more, (MPAA, 2007).

In looking at the functional versus emotional path, IMAX’s edutainment focuses primarily on functional, providing information, while the IMAX Hollywood focused on the emotional aspect only promoting big budget blockbuster movies which are visually stunning, action packed and elicits an emotional response in moviegoers.

Although nothing was eliminated, IMAX did reduce the number of film offerings in the IMAX format versus traditional production companies like SONY, Disney, PIXAR, MGM. They raise the size of screen versus traditional theaters, new technology (shooting style), sound, cost of entry, visual experience and sharpness of image and Created a new WOW factor to the large blockbuster films (Harry Potter, StarWars, Spiderman, Shrek, AVATAR, Pirates of the Caribbean: At World’s End and James Bond franchise), and large scale 3-D format.

The second analysis is the ERRC grid:

<b>Eliminate</b>	<b>Raise</b> <b>Size of screen</b> <b>Technology</b> <b>Sound</b> <b>Cost</b> <b>Visual Experience</b> <b>Sharpness of image</b>
Reduce Number of movie offerings (vs. traditional production firms)	Create Wow factor 3D large format

In looking at the strategy curve, we can further see the differential which led to the decision to go with Hollywood movies.

Figure 1: Strategy Canvas of IMAX versus Traditional Theater

Using Blue Ocean Concepts we would say that this strategic move would be considered a blue ocean strategy with a unique value curve which differs significantly from traditional theater curves.

## CONCLUSIONS

IMAX, in going through the value curve definitely did create a blue ocean on paper, but the question still remains as to what caused this need. Was the market that they were in contributing to the need to seek out a new blue ocean? In the early years following the company going public, the stock price of IMAX was depressed (over 90% off their peak), consumer trends were shifting and there was a threat that the company could be in dire financial trouble.

The company could have maintained in the edutainment market as a niche player, while the market slowly dwindled (a case of who moved my cheese), however the management made a conscientious strategic move to look for new cheese (Hollywood). IMAX, converted to a new technology DMR, which reduced the cost and structured new agreements, splitting the cost of retrofitting and installation and also splitting the higher revenues from the IMAX experience, while focusing on a niche portion of Hollywood

movies which are visually stunning and action packed which intensifies the IMAX experience to movie goers.

In conclusion, IMAX did create a new blue ocean, going after a market that they had no revenues in and their gamble, eventually paid off with a much more financially stable organization than prior to the Hollywood move.

# USING DATA ENVELOPMENT ANALYSIS TO EVALUATE THE PERFORMANCE OF ELEMENTARY SCHOOLS IN TEXAS

Kalpana Pai, Texas Wesleyan University

## ABSTRACT

*This paper addresses the question of whether there is a relationship between expenditures on public education and academic performance. Previous research analyzing district-level K-12 school expenditures finds that extra spending does not significantly improve academic performance. Critics of these findings argue that this conclusion is premature, possibly the result of analyzing overly aggregated district-level data rather than school-by-school comparisons. Therefore, to re-examine the issue by undertaking a disaggregated school-level analysis exploiting administrative data from the state of Texas over the period 1994-2002, the technique of Data Envelopment Analysis (DEA) is applied to compute annual efficiency measures for each elementary school in the state. These efficiency measures are then used to compute upper bounds on the fraction of inefficiency that can be attributed to schools as opposed to contextual or demographic factors. By using the technique of Data Envelopment Analysis, we examine the impact of school inputs on multiple school outcomes in a single specification.*

*Estimating a relationship between demographic factors and the efficiency score by using Tobit regression formed the second stage of the DEA analysis. For each campus, apart from an efficiency index, DEA analysis generates so called slack values for each output and input as well as shadow prices for each input. The output slack represents the additional amount of output that a campus should have been able to produce using the same amount of input, had it used the best technology available. The input slack represents the unused portion of the input. Shadow prices provide the imputed value or marginal valuation or worth of each input to the school. Each of the output and input slacks were regressed on the demographic variables used in the second-stage regressions. Shadow prices were used to determine input elasticities for efficient schools, thereby determining how an increase in a particular input affects the outputs.*

# OPTIMIZACIÓN DE MÁRGENES DE CONTRIBUCIÓN DE UN SERVICIO DE ALIMENTACIÓN, MEDIANTE ADAPTACIÓN DE MODELOS DE GESTIÓN DE INVENTARIOS

Fernando Rojas, Universidad de Valparaíso

Víctor Leiva, Universidad de Valparaíso

Javiera Quijada, Universidad de Valparaíso

Melina Fuentes, Universidad de Valparaíso

## RESUMEN

*Este trabajo muestra un sistema de abastecimiento y política de inventarios para un servicio de alimentación. Este sistema maximiza en un 7,7 por ciento los márgenes de contribución totales, obtenidos por absorción, y minimiza los costos totales de almacenar y ordenar inventarios, en un 27 y 40 por ciento, respectivamente. Estos resultados se obtuvieron comparando, una intervención logística proyectada de modelos de optimización, respecto de los márgenes de contribución reales calculados desde un registro de movimientos de inventario. Se realizó un estudio de la demanda para el mix de productos de este servicio durante 27 semanas, lo cual permitió programar una optimización del abastecimiento en el software estadístico R-project. Dicha programación se basó en modelos matemáticos-estadísticos que se adaptaron a cada producto, considerando inventarios perecederos de uso en un solo período (apto para carnes, frutas y verduras), productos con mayor capacidad de almacenaje pero que no admiten escasez (abarrotes).*

**PALABRAS CLAVE:** Gestión de Inventarios, Margen de Contribución, Optimización, Servicios de Alimentación.

## OPTIMIZATION CONTRIBUTION MARGINS OF FOOD SERVICE BY ADAPTING INVENTORY MANAGEMENT MODELS

### ABSTRACT

*In this work, we show a system of supply and inventory policy of food service. This system maximizes at 7.7 percent the total contribution margins, obtained by absorption and minimizing total costs to store and sort inventory by 27 percent and 40 percent, respectively. We compare an intervention planned logistics with the results calculated from a record of actual inventory movements. We perform a study of demand product mix for 27 weeks, which allows an optimization of the supply schedule in the R-project statistical software, based on two statistical-mathematical models adapted to each product, considering use perishable inventory in a single period (meats, fruits and vegetables), as well as products with greater storage capacity but do not support shortages (grocery).*

**JEL:** L, L8, L81.

**KEYWORDS:** Inventory Management, Food Services, Optimization, Contribution Margin.

## INTRODUCCIÓN

En la actualidad, la gran mayoría de los servicios de alimentación chilenos no cuentan con sistemas que optimicen el abastecimiento. Estos sistemas consideren una política de inventarios planeada financieramente en sus prácticas organizacionales, basando el manejo de este recurso en la planificación mensual del menú, llamada “minuta”, la que toma en consideración las especificaciones técnicas de los contratos de licitación. Esto comprende aportes y suficiencia nutricional, frecuencia y cantidades de consumo de alimentos determinados, según el público al que va dirigida la alimentación, en atención a que existen distintas recomendaciones nutricionales que se deben cumplir por normativas técnicas asociadas. Estas deficiencias de manejo impactan negativamente en los márgenes de contribución y son susceptibles de mejorar mediante un manejo correcto de la logística, constituyendo un área importante para la investigación de operaciones aplicada.

Este trabajo está organizado como sigue. En la sección de revisión de la literatura, se esbozan las evidencias que sostienen el uso de modelos estadísticos susceptibles de optimizar la logística y resultados financieros brutos en este sector. Posteriormente, se presenta la metodología utilizada, en donde se describe el procedimiento para registrar los movimientos de ingresos y egresos de inventarios de un servicio de alimentación, modelando probabilísticamente el comportamiento la demanda de productos, permitiendo adaptar modelos estadísticos que optimizan el proceso logístico. Con esta información, se evaluó el efecto de la mejora sobre los márgenes de contribución del servicio. Consecutivamente, se presentan los resultados de la investigación. Finalmente, se presentan conclusiones, limitaciones y futuras líneas de investigación.

## REVISIÓN DE LITERATURA

Los sistemas de abastecimiento y gestión de inventarios impactan en la logística de las organizaciones minimizando el costo total por absorción de los inventarios involucrados (Beltran y Burbano, 2002). Tradicionalmente, es conocido que los costos totales de inventarios se encuentran conformados por los costos variables y directos de las compras, y por los costos indirectos de almacenamiento y emisión de un lote de compra (Kotler, 2004), cuya minimización conjunta permite reducir ineficiencias en la gestión logística (Czinkota, 2001). Es posible adaptar modelos estadísticos de optimización que consideran productos perecederos (Hillier, 2010), donde sólo se puede almacenar el inventario un período limitado de tiempo, como es el caso de carnes, frutas y verduras en un servicio de alimentación. Por su parte, Nador (1966) trabajó con sistemas afines a productos que no admiten escasez, buscando encontrar cantidades económicas de pedido (CEP) y puntos de reordenamiento (ROP), los cuales pueden ser aptos para abarrotes, usados en este tipo de servicios. Finalmente, los sistemas de abastecimiento “just in time” son extensamente reconocidos como útiles para materias primas que pueden proveerse “justo a tiempo” a medida que son requeridas (Taha, 1995).

Los márgenes de contribución corresponden a una variable financiera que mide la rentabilidad bruta de un servicio y resume los movimientos de ingreso, costos variables directos (costeo variable) e indirectos (costeo por absorción), en un periodo de tiempo de las operaciones de una empresa. Estos márgenes están relacionados directamente a los movimientos de inventarios requeridos para generarlos (Brealeys y Myers, 1988). En este trabajo, medimos los márgenes de contribución por costeo por absorción de un servicio de alimentación, los cuales fueron obtenidos de forma optimizada por la adaptación de modelos estadísticos de abastecimientos y políticas de inventarios, afines al tipo de productos utilizados, para posteriormente compararlos con los márgenes de contribución de costeo por absorción reales del servicio en los mismos períodos de tiempo.

## METODOLOGÍA

Siguiendo recomendaciones del área (Yajiong, 2005. Harvey, 2002), se diseñó un sistema de registro de inventarios en Microsoft Access Office ® basando el manejo de información de identificación, costos,

cantidades, precios de venta, fechas y horarios de ingreso y egresos de los productos a través de la individualización mediante códigos de barra. Para determinar el precio (ingreso) de venta y márgenes de contribución unitarios de cada producto utilizado en la preparación de una ración alimentaria, se empleó el cálculo en base a los ingresos semanales del servicio de alimentación descrito por Morillo (2009). Los ingresos semanales del servicio correspondieron al precio de venta de la ración multiplicado por las cantidades vendidas en el respectivo período. Por su parte, se obtuvo el margen de contribución variable total semanal por producto restando los ingresos semanales menos las compras semanales de cada producto. Los márgenes de contribución por absorción se entendieron absorbibles por la venta respecto de los costos indirectos de fabricación tanto fijos como variables, considerándolos costos inventariables, razonando de esta manera a los costos indirectos de fabricación fijos como costo del producto comercializado (Polimeni, 1994). Los costos indirectos considerados fueron los costos de almacenamiento y de ordenamiento Según Morillo (2009), referencia ocupada para el cálculo del costo unitario anual de almacenamiento (CA), éste corresponde a la sumatoria de los distintos costos involucrados en el bodegaje anual prorrateados por las cantidades almacenadas, dado por

$$CA = \frac{\sum_{i=1}^5 Ca_i}{Q_{anual}},$$

donde “Q anual” corresponde al total de unidades anuales almacenadas y los “Cai” están dados en Tabla 1.

Tabla 1: Costos Involucrados En el Almacenamiento de un Producto Anualmente (Cai)

<b>Ca1: costo correspondiente a envases, embalajes, impresos, materiales de limpieza y oficina en que incurre anualmente el almacén.</b>
Ca2: costo anual de energía gastada en el almacén, incluyendo la necesaria para iluminación, equipos de climatización, equipos de procesamiento de la información y carga de baterías de equipos de manipulación.
Ca3: amortización anual de las edificaciones y redes para la recepción, almacenamiento y despachos, y a los equipos de manipulación, climatización, pesaje, procesamiento de información y medios de almacenamiento.
Ca4: costo anual de las mermas, pérdidas, deterioros y obsolescencia que sufren los productos en el período de almacenamiento.
Ca5: costo anual de seguros, impuestos, comunicaciones y alquiler de instalaciones y equipos durante el almacenamiento.

Ca i: costos prorrateados involucrados con el fin de almacenar un producto en el inventario durante un año. Morillo (2009). Elaboración propia.

Por su parte, según Hernández (2011), el costo de ordenar un pedido (CO) se determina como la sumatoria de los costos que se incurren al generar una orden de pedido (Co i) prorrateados por la cantidad de órdenes de compra anuales, dado por

$$CO = \frac{\sum_{i=1}^3 Co_i}{P_{anual}},$$

donde “Panual” corresponde a la cantidad de órdenes de compra llevadas a cabo en un año y los “Co i” están dados en Tabla 2.

Tabla 2: Costos Involucrados En la Generación de una Orden de Pedido

Co1: suma de los costos de transporte exclusivamente vinculados a generar un pedido.
Co2: costos administrativos vinculados al circuito de un pedido (insumos y gastos de servicios generales para generación de orden).
Co3: costos de recepción e inspección (sueldo y leyes sociales bodeguero) vinculados al circuito de un pedido.

Co i: costos prorrateados involucrados en la generación de una orden de pedido. Hernández (2011). Elaboración propia.

Los costos CA y CO fueron llevados a un valor semanal, denotados como CA(s) y CO(s), respectivamente, dividiendo el primero por 52 semanas y multiplicando el segundo por la cantidad de pedidos generados durante una semana. El cálculo del margen de contribución total de la semana para todos los productos se calculó sumando los márgenes de contribución total de la semana por producto (MCTsi) de la totalidad de los productos menos los costos indirectos de almacenamiento (CA(s)) y de ordenar (CO(s)) en forma semanal, cuya expresión se es

$$MCTs = \sum MCVTsi - (CA(s) + CO(s)),$$

Donde

MCTs = Margen de contribución total de la semana para todos los productos,

MCTsi = Márgenes de contribución total de la semana del i-ésimo producto,

CA(s) = Costo de almacenamiento semanal,

CO(s) = Costo de ordenar semanal.

De esta manera, se obtuvo una serie de 27 datos semanales de los márgenes de contribución totales del inventario en dichos períodos de medición. Se elaboraron perfiles de demanda para un total de 88 productos durante 6 meses (27 semanas) y se generaron los datos necesarios para modelar estadísticamente la distribución de la demanda de cada producto (Scherbrooke, 2004), ajustando los siguientes modelos estadísticos: CEP sin escasez (para abarrotes), modelo de productos perecederos de un solo período (para carnes, frutas y verduras) (Hillier, 2010) y modelo “just in time” para productos específicos. Por medio del software estadístico de distribución gratuita R-Project versión 15.2 ([www.R-project.org](http://www.R-project.org)), se calculó para cada producto:

*Tasa de demanda:* la cual correspondió al consumo de productos por unidad de tiempo de un día, calculado como valor esperado según la distribución probabilística que mejor ajustó en el software R-project v15.2, entre las que se encuentran las distribuciones log-normal, Birnbaum Saunders (BS) y Birnbaum Saunders-t (BS-t) (Soman, 2005. Kumar, 2005, Gallego, 2007. Leiva et al, 2012).

*Cantidades óptimas de reposición:* obtenidas aplicando las siguientes ecuaciones según modelo estadístico aplicado a la optimización:

a) Modelo CEP sin escasez:  $Q = \sqrt{\frac{2CO\lambda}{CA}}$ , donde

CO = Costo por orden de compra individual

$\lambda$  = Tasa de demanda diaria (en unidades del producto por esta unidad de tiempo), y

CA = Costo unitario anual de almacenamiento

b) Modelo para productos perecederos de un solo período:  $f(y^o) = \frac{p-c}{p+h}$ ,  
donde

$f(y^o)$  = Función de la cantidad óptima de unidades a pedir acorde a modelo de un sólo período para productos perecederos

$p - c$  = disminución de la ganancia debido a no ordenar una unidad que se pudo haber vendido durante ese período.

$p + h$  = disminución de la ganancia debido a ordenar una unidad que no se pudo haber vendido durante ese período.

c) Modelo “Just in time”. Se consideró “llegada justo a tiempo”, respecto de productos específicos que se solicitan en una cantidad justa para la producción y que no consideran abastecimiento.

*Puntos de reordenamiento (ROP)*: el cual representa el nivel de la cantidad de inventario óptimo para efectuar una orden de compra, considerando un período de latencia o “lead time” (LT). Independiente del modelo estadístico de optimización, este punto se calcula con la ecuación:  $ROP = \lambda LT$ , donde

ROP = Punto de reordenamiento (en cantidad de inventario)

$\lambda$  = Tasa de demanda diaria (unidades del producto por esta unidad de tiempo)

LT = Tiempo de latencia o “lead time”= 3 días.

Se registraron las diferencias en costos indirectos tanto de almacenamiento, unitarios y anuales, como de ordenar en forma anual y semanal, comparando el sistema de abastecimiento real y el optimizado. Los márgenes de contribución por absorción para todo el mix de inventarios real y optimizado con los modelos estadísticos descritos, se contrastaron en 27 semanas, ocupando test estadístico no paramétrico de Wilcoxon (De Capitani y De Martini, 2011), con valor de significancia  $p < 0.05$ .

## RESULTADOS

En la Tabla 3 se muestra una selección ilustrativa de la optimización de la tasa de demanda, distribución de probabilidad que mejor ajusta a la misma, cantidades óptimas de reposición y puntos de reordenamiento obtenidos por la aplicación de los modelos estadísticos a 88 productos que conformaron el mix de inventarios de un servicio de alimentación.

Tabla 3: Selección Ilustrativa de Optimización de Tasa de Demanda, Distribución de Probabilidad de la Tasa de Demanda, Cantidades Óptimas de Reposición y Puntos de Reordenamiento, Obtenidos Por los Modelos Estadísticos Aplicados a Mix de Inventarios de un Servicio de Alimentación.

Producto	Modelo Estadístico ajustado	Tasa de demanda (productos consumidos/días)	Distribución de probabilidad de tasa de demanda	Q sin escasez (Cantidad optimizada en modelo sin escasez) (unidad ó kg)	Y° (Cantidad optimizada modelo productos perecederos) (unidad ó kg)	ROP (punto de reordenamiento) (unidad ó kg)
Fideos mostaccioli	CEP sin escasez	43,03058	lognormal	4745,607	-	94,86087
Flan con leche	CEP sin escasez	3,649823	lognormal	1382,009	-	7,237928
Ganso	Perecible	84,86139	lognormal	-	40,60559	254,5841
Habas	Perecible	9,999978	BS-t	-	10,03132	29,99993
Harina	CEP sin escasez	7,070657	lognormal	1923,681	-	27,95619
Manzana	Perecible	20,38117	BS	-	31,67914	61,14351
Margarina	Perecible	2,073176	lognormal	-	3,751328	6,219528
Melón	Perecible	10,45327	lognormal	-	16,98649	31,35981
Merluza	Just in time	80,38574	BS-t	-	80,38574	241,1572
Morrón	Perecible	10,75432	lognormal	-	13,59984	32,26296
Mortadela lisa	Perecible	5,331739	lognormal	-	5,296378	15,99521
Pan batido	Just in time	1	-	-	-	1

CEP sin escasez = Modelo estadístico de cantidad económica de pedido sin considerar escasez (Scherbrooke, 2004), perecible = Modelo estadístico para productos perecederos de un solo período (Hillier & Lieberman, 2010).

En la Tabla 4 se muestran los cambios en los costos de almacenamiento anuales y unitarios de los sistemas de abastecimiento reales y optimizados. Los costos de almacenamiento se ven disminuidos en un 23,7%, lo que se traduce en un importante ahorro gracias a la optimización por el uso de los modelos estadísticos.

Tabla 4: Diferencias Entre los Costos de Almacenamiento Anuales Y Unitarios de los Sistemas de Abastecimiento Reales y Optimizados.

Costos	Sistema de abastecimiento real			Sistema de abastecimiento optimizado		
	Costo de almacenamiento anual (\$)	Costo de almacenamiento semanal (\$)	Costo unitario anual de almacenamiento (255.480 unidades/año)	Costo de almacenamiento anual (\$)	Costo de almacenamiento semanal (\$)	Costo unitario anual de almacenamiento (251.668 unidades/año)
Ca1: Costo correspondientes a envases, embalajes, impresos, materiales de limpieza y oficina en que incurre el almacén.	\$ 842.200	\$ 16.196	\$ 3,30	\$ 842.200	\$ 16.196	\$ 3,34
Ca2: Costo anual de energía gastada en el almacén, incluyendo la necesaria para iluminación, equipos de climatización, equipos de procesamiento de la información y carga de baterías de equipos de manipulación.	\$ 3.600.000	\$ 69.231	\$ 14,09	\$ 3.600.000	\$ 69.231	\$ 14,30
Ca3: Amortización anual de las edificaciones y redes para la recepción, almacenamiento y despachos, y a los equipos de manipulación, climatización, pesaje, procesamiento de información y medios de almacenamiento.	\$ 1.300.000	\$ 25.000	\$ 5,09	\$ 1.300.000	\$ 25.000	\$ 5,16
Ca4: Costo anual de las mermas, pérdidas, deterioros y obsolescencia que sufren los productos en el periodo de almacenamiento. (Valor cuantificado desde estudio real de 6 meses de duración)	\$ 5.450.000	\$ 104.808	\$ 21,33	\$ 2.725.000	\$ 52.404	\$ 10,83
Ca5: Costo anual de seguros, impuestos, comunicaciones y alquiler de instalaciones y equipos durante el almacenamiento.	\$ 300.000	\$ 5.769	\$ 1,17	\$ 300.000	\$ 5.769	\$ 1,19
<b>Total</b>	<b>\$ 11.492.200</b>	<b>\$ 221.004</b>	<b>\$ 44,98</b>	<b>\$ 8.767.200</b>	<b>\$ 168.600</b>	<b>\$ 34,84</b>

Ca1=Costos prorrateados por unidades totales almacenadas en un año. Morillo (2009). Elaboración propia.

En la Tabla 5 se muestran los cambios en los costos de ordenar anuales y semanales en los sistemas de abastecimiento reales y optimizados. En los costos de ordenar se produce una reducción de un 40% de los órdenes de pedido producto del mejor manejo del abastecimiento y política de inventarios.

Tabla 5: Diferencias Entre Los Costos De Ordenar Anuales Y Semanales En Los Sistemas De Abastecimiento Reales Y Optimizados.

Costos de ordenar	Costos sistema de abastecimiento real (\$)	Costos sistema de abastecimiento optimizado (\$)
Co1: suma de los costos de transporte exclusivamente vinculados al pedido (anual)	\$ 4.800.000	\$ 2.880.000
Co2: costos administrativos vinculados al circuito del pedido (insumos y gastos de servicios generales para generación de orden)(anual)	\$ 240.000	\$ 144.000
Co3: costos de recepción e inspección (sueldo y leyes sociales bodeguero) (anual)	\$ 2.700.000	\$ 1.620.000
<b>Total costo de ordenar anual</b>	<b>\$ 7.740.000</b>	<b>\$ 4.644.000</b>
<b>Cantidad de ordenes semanales</b>	<b>20</b>	<b>12</b>
<b>Total costo de ordenar semanal</b>	<b>\$148.846,15</b>	<b>\$89.307,69</b>

Co i: costos prorrateados por cantidad de órdenes semanales involucrados en la generación de una orden de pedido (Hernández, 2011). Elaboración propia.

En la Figura 1 se muestra una comparación gráfica entre los márgenes de contribución por absorción semanales de 27 medidas de dicha periodicidad, obtenidos desde el registro del sistema de abastecimiento real versus el optimizado. En la semana n°1 podemos identificar que existe una diferencia considerable entre ambos márgenes, lo que se explica debido a la cantidad de productos que se debe abastecer, dado principalmente por los productos que se ajustan al modelo CEP sin escasez, ya que se produce un pedido inicial que es incluso capaz de solventar todo el período de estudio en algunos productos, minimizando los costos directos e indirectos asociados en las semanas posteriores.

Figura 1: Comparación Gráfica Entre los Márgenes de Contribución Por Absorción (En \$ Semanales) del Sistema de Abastecimiento Real Versus el Optimizado.

S1-S27 = Comparativo de márgenes por absorción en \$/Semana. El sistema de abastecimiento optimizado muestra un incremento en los márgenes de contribución totales en aproximadamente un 8%, principalmente debido a la reducción de los costos indirectos de almacenamiento y de ordenar. Elaboración propia.

## CONCLUSIONES

La implementación de sistemas de gestión logísticos en este importante sector económico pueden contribuir a mejorar la rentabilidad, eficiencia y competitividad de estas pequeñas y medianas empresas. Los resultados de esta investigación indican la importancia de incluir modelos estadísticos, que se ajusten según la demanda probabilística de productos en servicios de alimentación, con la posibilidad de

automatizar la gestión de abastecimiento, mejorando la toma de decisiones del área logística de organizaciones. La disminución de los costos indirectos de almacenamiento y de ordenamiento es un argumento válido para afirmar que, ocupando modelos estadísticos para constituir sistemas de abastecimiento y política de inventarios acordes al tipo de productos manejados en servicios de alimentación, existe una mejora en la sistematización de las necesidades de la unidad productiva, rentabilizando la gestión. Es posible validar las mejoras en la gestión del inventario intervenido por medio de la aplicación del modelo estadístico adecuado a través de la medición de la variable margen de contribución total por absorción de costos.

### Limitaciones

Es importante destacar que los modelos de inventario se basan en la minimización de los costos de compra, almacenamiento y ordenamiento involucrados, considerando en algunos casos la posibilidad de quiebres de stock, así como la función basada en la razón de optimización, en el caso de productos perecederos, las cuales generan una eficiencia válida para productos que finalmente obtengan ganancias o márgenes de contribución positivos (Hillier & Lieberman, 2010). Por este motivo, los productos que cuentan con márgenes de contribución variables negativos debieran ser tratados por medio de modelos que consideren esta condición, debido a que en este rubro se debe cumplir con ciertas exigencias básicas que se encuentran estipuladas en las bases de licitación de las concesiones, lo que obliga a la empresa a utilizar alguno de estos productos.

## RESUMEN

*La percepción del trabajador de su salud, bienestar y satisfacción con su entorno de producción y servicios, está relacionado con la calidad de vida laboral. Mediante una investigación transversal, descriptiva y correlacional, con una muestra censal de 50 trabajadores del sector turístico hotelero, se obtiene un modelo predictivo que en forma prudente puede ser utilizado por las organizaciones, para maximizar su productividad, utilizando racionalmente las variables contenidas en las dimensiones que lo configuran como son: soporte institucional, seguridad, integración al puesto, satisfacción, bienestar logrado, desarrollo personal, y administración del tiempo libre. El resultado de la correlación de las variables independientes y dependiente, confirma una asociación casi perfecta, significando que están estrechamente relacionadas y se dan respuesta. Con ello, el modelo predictivo que se propone es adecuado para la toma de decisiones en este tipo de organizaciones.*

Palabras Clave: Calidad de Vida, Condiciones Laborales, Satisfacción Laboral

## PROPOSAL PREDICTIVE MODEL OF QUALITY OF WORKING LIFE IN TOURISM CAMPECHANO. MEXICO

### ABSTRACT

*The worker's perception of their health, well-being and satisfaction with their production environment and services is related to the quality of working life. Using a cross sectional, descriptive, correlational, with a sample of 50 census workers tourism hotel, yields a predictive model that can be wisely used by organizations to maximize their productivity, rationally using variables in levels which are configured as: institutional support, security, the post integration, satisfaction, well-made, personal development and leisure management. The result of the correlation of the independent and dependent variables, confirms an association almost perfect, meaning that they are closely related and respond. Thus, the proposed predictive model is suitable for decision-making in these organizations.*

KEY WORDS: Quality Of Life, Working Conditions, Job Satisfaction

## INTRODUCCIÓN

Estudiar la calidad de vida laboral, es un reto importante en las organizaciones, toda vez que es un elemento que garantiza la productividad de todo tipo de empresas. Esta investigación aplicada al sector turístico hotelero campechano, determina si son cubiertas las necesidades personales de los trabajadores, a

través de su empleo y bajo su propia percepción, lo que al final de cuentas repercute con el servicio al cliente y en forma correlativa con el rendimiento organizacional. Cuando se habla de éxito en las empresas modernas, se asocia con la capacidad de integrar a los empleados en sus planes empresariales, de tal forma que adopten los objetivos organizacionales como propios. El sector que nos ocupa, ha evolucionado en esta comprensión y entiende que el salario ya no es determinante, ni que sea el motivo de retención, hay otros factores que impactan en el grado de satisfacción, y se reflejan en la calidad de vida, como los mencionan Ulmer (1987) y Hopkins (1983), siendo: la humanización del trabajo, la detección de una relación entre éste y la productividad empresarial, así como propiciar el crecimiento teórico de los conceptos. Una fuente que permite tener clientes fieles, es mantener empleados satisfechos (Spinelli y Canavos. 2000), implica que los directivos encuentren a colaboradores cuya personalidad, motivación y habilidades, satisfagan al cliente y promuevan los objetivos organizacionales. En este trabajo se obtiene la calidad de vida laboral, estudiando 7 rubros multidimensionales, en los que se visualiza cuando el individuo se integra al trabajo, a través del empleo y bajo su propia percepción. Se transita por un marco teórico que sustenta el enfoque, para concluir con el modelo de propuesta para su estudio en las organizaciones similares.

## REVISIÓN DE LA LITERATURA

Últimamente la calidad de vida es uno de los temas tratados internacionalmente, motivados porque la situación laboral en forma mundial, pasa por un momento de crisis, donde se observa que el nivel precario aumenta y los logros laborales obtenidas en los dos últimos siglos ha disminuido, debido en gran parte al capitalismo global (Navarrete, 2005). Hay cuatro razones de peso para investigar la satisfacción laboral, como parte de la calidad de vida (Robbins, 1999): 1. Empleados insatisfechos, son los que más faltan al trabajo, y tienen mayor probabilidad de dejarlo, 2. Empleados insatisfechos, se involucran en conductas destructivas, aquí se asocia al alto nivel de quejas e injusticias, recurriendo a sabotajes o agresión pasiva; 3. Empleados satisfechos, son los que tienen mejor salud y calidad de vida; 4. Satisfacción al trabajo, influye en la vida del empleado, dentro y fuera de las áreas productivas.

Poza & Prior (1988) definen a la calidad de vida, como la forma en que se produce la experiencia laboral en condiciones objetivas, por ejemplo: salud laboral, seguridad e higiene laboral, etc, y en condiciones subjetivas del trabajador, en el sentido de cómo lo vive. Es un concepto multidimensional, al tomar en cuenta los aspectos subjetivos y objetivos, permitiendo que no exista sesgo referente a la realidad del trabajo. La calidad de vida presenta dos situaciones antagónicas (Chiavenato, 2004): por una parte, reivindicación de los empleados por el bienestar y satisfacción del trabajo, y por la otra, el interés organizacional por los efectos en la productividad y calidad de vida, bajo esta óptica, se preocupan por el recurso humano, ya que mientras más se les provea, mejor será el rendimiento empresarial.

Las teorías existentes que abordan la calidad de vida laboral, opinan que si es pobre habrá insatisfacción, reducción de la productividad, ausentismo, rotación, entre otros; por el contrario, si es adecuada, propiciará incremento en la productividad. El modelo Nadler y Lawler citado por Chiavenato (2004), explicita que este concepto se fundamenta en cuatro aspectos: participación activa de los trabajadores en los asuntos laborales, innovación del sistema de recompensas de trabajo, mejoramiento de condiciones de trabajo, y, reestructuración de tareas delimitando responsabilidades y roles de empleados, si las acciones a ellos se incrementan, mejorará la calidad de vida laboral. Hackman y Oldhan (Chiavenato 2004), establecen una propuesta basada en el diseño de cargos, que a través de la producción de efectos psicológicos, conducen a resultados específicos que afectan la productividad de la persona. Los cargos se dimensionan en: variedad de habilidades, identidad de la tarea, autonomía e interrelaciones. Estos autores apuestan a que las dimensiones del cargo son determinantes en la calidad de vida laboral, producen recompensas intrínsecas que alientan a los trabajadores.

El instrumento que mide la calidad de vida laboral (CVT), construido por González, Hidalgo, Salazar y Preciado (2010), menciona que: “La CVT es un concepto multidimensional que se integra cuando el trabajador, a través del empleo y bajo su propia percepción, ve cubiertas las siguientes necesidades personales: soporte institucional, seguridad e integración al puesto de trabajo y satisfacción por el mismo, identificando el bienestar conseguido a través de su actividad laboral y el desarrollo personal logrado, así como la administración de su tiempo libre”. Implica la valoración objetiva y subjetiva de siete dimensiones: soporte institucional para el trabajo, seguridad en el trabajo, integración al puesto de trabajo, satisfacción por el trabajo, bienestar logrado a través del trabajo, desarrollo personal del trabajador y administración del tiempo libre. Por la revisión teórica efectuada, es justamente el instrumento elaborado por González, Hidalgo, Salazar y Preciado (2010), el idóneo para medir la calidad de vida de los trabajadores del sector hotelero campechano, siendo el utilizado en esta investigación.

## METODOLOGÍA

Describir la calidad de vida laboral permite establecer estrategias para promover su productividad y rendimiento óptimo. Se desarrolla la investigación descriptiva y correlacional, iniciando con una exploración de los conceptos para seleccionar el instrumento idóneo. Para la oferta turística en el Estado de Campeche, México, existen 12 establecimientos de hospedaje, ubicados en el centro histórico de la ciudad de Campeche, se acudió a 10 (83.33%), al no estar disponible las restantes, convirtiéndose en el 100%, encontrándose a 50 trabajadores a quienes se les aplicó el instrumento, como se observa, se utiliza la población censada, enfrentándose con una muestra de tipo censal (Cárdenas, 1995), en la que participa toda la población, sin necesidad de determinarse la muestra. Se aplica el instrumento, válido y confiable, que percibe la calidad de vida laboral CVT-GOHISALO (González, Hidalgo, Salazar y Preciado, 2010), construido con 74 ítems, los cuales agrupan en 7 dimensiones: soporte institucional, seguridad laboral, integración al puesto de trabajo y satisfacción por el mismo, identificando el bienestar conseguido a través de su actividad laboral y el desarrollo personal logrado, así como la administración de su tiempo libre, las cuales pueden valorarse de manera independiente. Los ítems se encuentran agrupados por tipo de pregunta, y en escala tipo Lickert de 0 (la peor calificación), hasta 4 (la mejor calificación), para su interpretación se recomienda utilizar los límites para el puntaje de satisfacción baja, media y alta, en cada una de las dimensiones. Antes de su aplicación, fue administrado, obteniéndose un alfa de Cronbach de 0.89, considerándolo confiable, ya aplicado, se determinó de nueva cuenta, obteniéndose 0.90, lo que se considera aceptable (Hernández, Fernández y Baptista, 2006).

## RESULTADOS

Siguiendo la metodología aplicada, a los 50 trabajadores de las empresas hoteleras campechanas, se efectuó la descripción de los rasgos característicos de las 7 dimensiones de estudio de la calidad de vida estudiada, y posteriormente se procedió a determinar el coeficiente de correlación múltiple, utilizando el SPSS (versión 18). La variable dependiente (Y) quedó establecida como el nivel de satisfacción por cada una de ellas, y las variables independientes (X) los 74 ítems, que integran el instrumento en sus diferentes desagregaciones. Los resultados para cada una de ellas son:

*Soporte Institucional Para El Trabajo:* El coeficiente de correlación múltiple (R) arroja 87.8% y el coeficiente de determinación ( $R^2$ ) 77%, las 14 variables independientes que corresponden a las preguntas de la dimensión “soporte institucional para el trabajo”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y_1 = -0.461 + 0.059X_1 + 0.134X_2 + 0.014X_3 + 0.033X_4 + 0.110X_5 + 0.089X_6 + 0.121X_7 + 0.165X_8 + 0.078X_9 + 0.069X_{10} + 0.076X_{11} + 0.169X_{12} + 0.095X_{13} + 0.058X_{14}$$

*Seguridad En El Trabajo:* El coeficiente de correlación múltiple (R) arroja 82.1% y el coeficiente de determinación ( $R^2$ ) 67.4%, las 15 variables independientes que corresponden a las preguntas de la dimensión “seguridad en el trabajo”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y_2 = 0.089 + 0.078x_1 + 0.091x_2 + 0.042x_3 + 0.023x_4 + 0.095x_5 + 0.108x_6 + 0.102x_7 + 0.025x_8 + 0.088x_9 + 0.023x_{10} + 0.081x_{11} + 0.053x_{12} + 0.067x_{13} + 0.036x_{14} + 0.052x_{15}$$

*Integracion Al Puesto De Trabajo:* El coeficiente de correlación múltiple (R) arroja 83.4% y el coeficiente de determinación ( $R^2$ ) 69.5%, las 10 variables independientes que corresponden a las preguntas de la dimensión “integración al puesto de trabajo”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y_3 = 0.347 + 0.015x_1 + 0.144x_2 + 0.070x_3 + 0.094x_4 + 0.064x_5 + 0.090x_6 + 0.097x_7 + 0.093x_8 + 0.073x_9 + 0.087x_{10}$$

*Satisfaccion Por El Trabajo:* El coeficiente de correlación múltiple (R) arroja 86.5% y el coeficiente de determinación ( $R^2$ ) 67.6%, las 11 variables independientes que corresponden a las preguntas de la dimensión “satisfacción por el trabajo”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y_4 = 0.296 + 0.047x_1 + 0.082x_2 + 0.110x_3 + 0.084x_4 + 0.065x_5 + 0.045x_6 + 0.107x_7 + 0.073x_8 + 0.077x_9 + 0.033x_{10} + 0.114x_{11}$$

*Bienestar Logrado A Traves Del Trabajo:* El coeficiente de correlación múltiple (R) arroja 83.5% y el coeficiente de determinación ( $R^2$ ) 69.7%, las 11 variables independientes que corresponden a las preguntas de la dimensión “bienestar logrado a través del trabajo”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y_5 = 0.177 + 0.078x_1 + 0.073x_2 + 0.098x_3 + 0.110x_4 + 0.075x_5 + 0.064x_6 + 0.054x_7 + 0.096x_8 + 0.083x_9 + 0.106x_{10} + 0.049x_{11}$$

*Desarrollo Personal:* El coeficiente de correlación múltiple (R) arroja 89.9% y el coeficiente de determinación ( $R^2$ ) 80.9%, las 8 variables independientes que corresponden a las preguntas de la dimensión “desarrollo personal”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y_6 = -0.167 + 0.160x_1 + 0.100x_2 + 0.129x_3 + 0.156x_4 + 0.109x_5 + 0.118x_6 + 0.135x_7 + 0.124x_8$$

*Administración Del Tiempo Libre:* El coeficiente de correlación múltiple (R) arroja 88.1% y el coeficiente de determinación ( $R^2$ ) 77.5%, las 5 variables independientes que corresponden a las preguntas de la dimensión “administración del tiempo libre”, que se identifica como la variable dependiente, fueron incluidas al ser su valor diferente a cero, los valores que adquieren los coeficientes B (Beta), con un intervalo de confianza del 95%, representa cómo los valores de la variable dependiente varían por cada unidad de las independientes, el planteamiento matemático propuesto es:

$$Y_7 = 0.012 + 0.180x_1 + 0.228x_2 + 0.167x_3 + 0.221x_4 + 0.224x_5$$

## CONCLUSIONES

A la luz de los resultados obtenidos, se concluye que es factible considerar las 7 dimensiones de la calidad de vida como modelos predictivos para alcanzar el punto ideal de satisfacción de los trabajadores; hay que tomar en consideración que todas en su conjunto, suman la óptica global de esa calidad. Aseveramos lo expuesto, toda vez que si observamos el resultado de la correlación, en todos los apartados es mayor al 80%, fluctúa entre el 82.1% que es el más bajo y el 89.9% que es el más alto –seguridad en el trabajo y desarrollo personal, respectivamente-, y su coeficiente de determinación es entre el 67.4% y 80.9%, respectivamente, los cuales son bastante aceptables, significa que los 74 ítems están asociados a la calidad de vida del trabajador, responden a ella, en sus diferentes apartados.

Ante ello, se infiere que el modelo que mejor predice la calidad de vida es la dimensión de “desarrollo personal”, al obtener el mayor índice de correlación y coeficiente de determinación, y el apartado menos confiable, aunque bastante aceptable, es el de “seguridad en el trabajo”. Sin embargo, todos los demás están en los parámetros para ser considerados razonablemente adecuados, y que al utilizar cualquiera de ellos, puede inducirse a mejorar la calidad de vida de los trabajadores de las organizaciones hoteleras campechanas. Revisando los modelos resultantes, en los que el coeficiente de determinación supera por muy poco el 50%, habrá que enfatizar y generar estrategias tendientes a:

la mejora de la forma de vivir, que incluye el disfrute de bienes y riquezas logrados gracias a la actividad laboral (bienestar logrado a través del trabajo).

Brindarle al trabajador firmeza en su relación con la organización, que su estructura le de soporte al empleado (soporte institucional para el trabajo).

Propiciarle al trabajador la sensación global de agrado o gusto con relación a su empleo (satisfacción por el trabajo).

Aunque la metodología fue aplicada en el sector hotelero, puede replicarse en los otros sectores económicos, con las adecuaciones pertinentes.

## RECOMENDACIONES

Los modelos predictivos resultantes, deben ser utilizados en forma conjunta para una mejora integral de la calidad de vida de los trabajadores. Es conveniente, continuar con el estudio para determinar cuáles de los 74 ítems contenidos en el instrumento utilizado tienen mayor fuerza predictiva, tanto en lo particular, como la dimensión correspondiente. Esto dará mayor certeza a las aportaciones que se hagan para mejorar el objeto de estudio. El cuestionario se contextualizó al sector turístico hotelero, ubicado en el centro histórico de la ciudad de Campeche, Campeche, por lo tanto, se alcance se circunscribe a él. Podría utilizarse en otras realidades, siempre y cuando se estime que su fiabilidad sea aceptable en ellos.

## **IMPACTO, ACEPTACION Y PROYECCION DE LA INSTALACION DE UN MUSEO DE ARTE SACRO EN LA CIUDAD DE TEOCALTICHE, JALISCO**

Haydeé Aguilar Romero, Universidad Autónoma de Aguascalientes  
Araceli Gutiérrez Guzmán, Universidad Autónoma de Aguascalientes  
Martha González Adame, Universidad Autónoma de Aguascalientes  
Alberto Pontón Castro, Universidad Autónoma de Aguascalientes

### **RESUMEN**

*En la presente investigación es importante dar a conocer el impacto, aceptación y proyección que tendría la instalación de un museo de arte sacro en la ciudad de Teocaltiche, un pueblo y municipio de la Región Altos Norte del estado de Jalisco, México. La ciudad se enfrenta a nuevos retos en el siglo XX, por lo que se busca información necesaria para medir las oportunidades que se le presentan y que conllevan responsabilidades que se deben afrontar. La información que se obtuvo, proporciono herramientas para la elaboración de programas sociales en beneficio de la comunidad, ya que ayuda a formular una proyección del municipio económicamente e incrementar los servicios financieros, profesionales, técnicos, comunales, sociales, turísticos, personales y de mantenimiento, promoviendo así también la vinculación con las organizaciones e instituciones educativas, favoreciendo a estudiantes en el servicio de practicas profesionales, para su desarrollo profesional. Cabe resaltar que es importante conservar las tradiciones y más aún cuando se pretende el educar a las nuevas generaciones el legado histórico y el desarrollo turístico que se puede generar. Pretendiendo que el espacio que el presente proyecto describe, sea muy visual al ver los elementos físicos de estas artes para su mejor apreciación por parte de los visitantes al lugar.*

**PALABRAS CLAVES:** Ciudad, instalación de un museo, proyección

## **IMPACT, ACCEPTANCE AND PROJECTION OF THE INSTALLATION OF A MUSEUM OF SACRED ART IN THE TOWN OF TEOCALTICHE, JALISCO**

### **ABSTRACT**

*In this research is important to make known the impact, acceptance and screening that would be the installation of a Museum of sacred art in the town of Teocaltiche, a village and municipality in the high North Region of the State of Jalisco, Mexico. The city faces new challenges in the 20th century, so it is seeking information necessary to measure the opportunities that are presented to you and which involves responsibilities that must be addressed. The information obtained, provided tools for the preparation of social benefit of the Community programmes, since it helps to make a projection of the municipality economically and increase services financial, professional, technical, communal, social, tourism, personal and maintenance , thus promoting also the link with organizations and educational institutions, encouraging students in the service of professional, for their professional development practices. It should be noted that it is important to preserve the traditions and more still when aims to educate new generations the historic legacy and tourism development that can be generated. Pretending to be the space that the present project describes, very visual to see the physical elements of these arts for its better appreciation by all visitors to the place.*

**KEYWORDS:** City, installation of a Museum, projection

## INTRODUCCIÓN

La verdadera importancia de las ciudades reside más que en su población censada, en su capacidad para atraer e influir de alguna forma sobre el 100% de los individuos. La ciudad se enfrenta a la realidad de un mundo globalizado en el que sólo los más fuertes es decir, los que toman las decisiones más acertadas sobreviven y prosperan. A pesar de todo, el reto no deja de ser apasionante. Las ciudades necesitan optimizar su gestión para no morir. Es un todo contra todos. Del mismo modo que un conjunto de medidas acertadas puede llevar a la cumbre, los errores pueden llevar al fracaso. El éxito significa desarrollo económico y progreso para los ciudadanos; el fracaso significa recesión, paro y decadencia. Esta responsabilidad lleva a los gestores locales a buscar nuevas formulas de gestión que les aporte herramientas con las cuales intentar decidir cuáles son aquellas medidas y decisiones que aportarán mayores beneficios. Por lo anterior buscar la instalación de un Museo sacro en la ciudad de Teocaltiche es un reto que nos lleva no sólo a la promoción de los “atractivos turísticos”, sino al desarrollo y consolidación de diferentes “ciudades marca” con una identidad y atractivo propio que potencialice el desarrollo regional y genere los empleos y la economía que la ciudad y el país necesita con urgencia.

## REVISIÓN LITERARIA

Empezaremos definiendo aquellos términos que son más importantes para nuestro trabajo. Dividimos este apartado en dos bloques: primero definiremos aquellos términos fundamentales con los que son clave para el desarrollo de una ciudad; en segundo lugar hablaremos del término marketing de ciudades y algunos de los conceptos que le son más próximos con el objetivo de delimitar conceptualmente su ámbito de actuación. Por lo tanto Ciudad, según la 25ª edición del diccionario de la Real Academia Española, podemos definir la ciudad como: “Conjunto de edificios y calles, regidos por un ayuntamiento, cuya población densa y numerosa se dedica por lo común a actividades no agrícolas”. Es decir, la ciudad se define en primer lugar por ser un espacio físico caracterizado por la densidad y cuantía de su población.

Esta idea es mantenida por G. Seisdedos (2006) que piensa que la aparición de manifestaciones como la cultura solo es posible en la ciudad, precisamente por esa cualidad de cantidad y densidad de población que hace posible que las relaciones sociales se multipliquen. Además la ciudad se define por su actividad, que deja de ser agrícola para convertirse en industrial primero y posteriormente comercial y de servicios. La segunda acepción habla de ciudad en oposición a lo rural ya que entenderemos que la ciudad es todo lo que el campo no es y viceversa. Se incluyen algunas reflexiones de J. Borja y M. Castells en Local y global (1997) sobre lo que significa la ciudad actualmente. En esta obra la ciudad se define como un conjunto de espacios públicos rodeados de edificios; un espacio donde la gente puede andar y encontrarse, llevando a cabo todas sus actividades. Considera a las ciudades como actores sociales complejos y multidimensionales. Los habitantes a partir de la interrelación que establecen con su medio ambiente circundante, es decir con el espacio que habitan y por el cual transitan, conciben un esquema mental de la ciudad, lo que finalmente se traduce en una imagen de ella. Por tanto, observamos la ciudad como:

Un espacio que alcanza una cierta densidad y cantidad de población.

Un lugar donde se llevan a cabo una serie de actividades económicas relacionadas básicamente con la industria y el comercio.

Un actor social complejo y multidimensional.

Un espacio donde, fruto de sus características físicas y sociales, deben darse las condiciones para que las relaciones humanas impulsen movimientos culturales, económicos.

Si existe un término difícil de definir para las ciencias sociales, posiblemente ese sea el término cultura. Cuando hablamos de cultura nos podemos referir a temas tan dispares como una obra de arte de un pintor italiano del siglo XVI, la forma de vida de una tribu africana o el último disco del intérprete de moda.

La UNESCO define el patrimonio cultural como un “concepto de patrimonio global, producto de un proceso histórico dinámico y el resultado de la interacción de la sociedad y su entorno”. Pero, ¿qué queremos decir con “patrimonio global”? C. Camarero y M.J. Garrido (2004) defienden este concepto moderno de patrimonio cultural que incluye no sólo los monumentos y manifestaciones del pasado si no también sitios y objetos arqueológicos, arquitectura histórica, documentos, obras de arte-, sino también lo que se llama patrimonio vivo, esto es, las diversas manifestaciones de la cultura popular indígena, regional, popular o urbana-, las poblaciones o comunidades tradicionales, las lenguas o dialectos tradicionales, la artesanía y arte popular, la forma de vestir, las costumbres y tradiciones y, en general, las características de un pueblo o cultura. Por lo tanto, estamos refiriéndonos a lo que la UNESCO describe como patrimonio tangible (los edificios, las obras de arte...) y patrimonio intangible (tradiciones, mitos, modos de vida...). Esta es nuestra concepción de la cultura.

Con referencia al marketing de ciudades, aunque muy similares en la mayoría de los casos, existen múltiples definiciones del concepto “marketing de ciudades” desarrolladas por los diferentes autores que han teorizado sobre la materia. J. Malowany (2004), ofrece una visión del marketing de ciudades basada en la “pasión” común que debe promover entre los distintos colectivos motivados por la visión de la ciudad a largo plazo: “Marketing de ciudades es el arte de desarrollar la adrenalina que genera continuamente una pasión y pertenencia a la ciudad de todos los habitantes y sus visitantes junto a las empresas que se sientan identificadas con la visión de la ciudad que los acoge. Destaco visión como un plan de acción de largo plazo y no con las facilidades para su instalación o proyectos de corto plazo”. N. Benach (2000) incide también sobre la capacidad de la disciplina para crear una nueva imagen como base para el desarrollo económico. En este caso destaca el carácter competitivo de esta imagen frente a la de otras ciudades: “El marketing de ciudades implica la reevaluación y representación del lugar con la finalidad de crear y comercializar una nueva imagen para las ciudades, tratando de crear una posición competitiva en la atracción y mantenimiento de los recursos”

En una línea muy similar ya se encuentran F. J. Paniagua Rojano y E. Blanco Castilla (2007) destacando la necesidad de orientar las acciones hacia las necesidades del cliente-ciudadano: “El marketing de ciudades se puede definir como una política activa integrada por un conjunto de actividades orientadas a identificar y determinar las necesidades de sus diferentes públicos, reales y potenciales; y al mismo tiempo desarrollar una serie de productos y servicios en la ciudad para satisfacer dichas necesidades, creando y potenciando su demanda”. A partir de las ideas aquí podemos definir Marketing de ciudades: a la filosofía de gestión y el proceso estratégico de alcance integral para la ciudad, que encabezado por la administración local y con la estrecha colaboración del resto de actores locales de relevancia, trata de dar respuesta a las necesidades de los grupos objetivo con los que la ciudad interactúa a través de la distribución de los productos y servicios oportunos y la puesta en marcha de acciones de comunicación, que en definitiva, intentarán generar una imagen (interna y externa) positiva de la ciudad para favorecer su desarrollo económico y social. La ciudad, entendida como producto, se enfrenta a un mercado competitivo formado por miles de municipios y en donde convergen millones de agentes. Estos, a su vez, integran nuestro público objetivo. Hablamos de marketing de lugares (*place marketing*), marketing de ciudades o *citymarketing*, una disciplina que representa hoy día uno de los aspectos más relevantes e innovadores en el ámbito de la nueva gestión pública local.

Los gobernadores, alcaldes, y funcionarios públicos tienen interés en conocer lo que desean los ciudadanos que habitan en su territorio, sus votantes, sus vecinos; pero también dirigen su punto de mira a los visitantes, los turistas, los inversores potenciales. Todos ellos forman el público objetivo de un (mercado), el de las ciudades o municipios, caracterizado por una competencia cada vez más encarnizada, tanto dentro del propio sector público, como entre éste y la iniciativa privada.

Cuando el producto es la ciudad (museos, lugares recreativos, iglesias etc., y los gestores políticos incorporan a su gestión aproximaciones, modelos e instrumentos de marketing, no hay duda de que se genera un mejor conocimiento de los habitantes de ese municipio, un acercamiento a los distintos públicos objetivo, produciendo, asimismo, entre otros efectos, una actuación más equitativa. Por tanto, es más que evidente que en estos tiempos de modernización y mejora de la gestión pública, los ayuntamientos están obligados a ejercer un protagonismo decisivo en el desarrollo de las ciudades. El rol que desempeñan las administraciones públicas, hoy día, excede del que correspondería a un mero gobierno benefactor, una organización administrativa que se limita a proveer bienes y servicios públicos de interés general. Es el momento de impulsar acciones públicas que se fundamenten en la satisfacción del cliente (ciudadano), la anticipación, la visión estratégica o la competitividad. Más que nunca, el marketing adquiere un sentido global. En México nació el deseo de crear una identidad propia, asentada en el pasado y en el reconocimiento de valores culturales propio de los grupos sociales del territorio nacional; esta idea se extendió entre los intelectuales, finiseculares, pero pronto chocó con las ideas etnocentristas de los grupos cultos de ese momento. A pesar de todo, se rompió con el monopolio cultural y se revaloró la conciencia histórica, lo que despertó al nacionalismo y resaltó identidades.

### Objetivos

Con el desarrollo del museo de arte sacro, se busca lograr la identificación de la raíces de la cultura y arte de la ciudad; promoviendo el civismo, la diversión sana y el rescate de los valores para así disminuir el impacto de la ignorancia y el ocio en la ciudad además de ofrecer información sobre sus orígenes a los habitantes de la ciudad de Teocaltiche. Difundir y promover este arte tan profundamente arraigado en esta ciudad. Mostrar a las nuevas generaciones la trascendencia y el orgullo de sus raíces. Responder a la necesidad de identidad como mexicanos, en una cultura rica en arquitectura y arte.

### **METODOLOGIA**

Para esta investigación se dividió en tres etapas: la primera etapa, llamada de Exploración la cual se lleva a cabo mediante un estudio, el proyecto es de carácter “Descriptivo” con el que se busca comprender, la situación actual de las de las actividades culturales y religiosas de Teocaltiche. La investigación se enfoca a determinar el impacto que deja en las personas que viven en ese lugar, un atractivo turístico para el desarrollo de Teocaltiche; la segunda etapa llamada de Desarrollo, ya que se realiza un sondeo de la situación a través de entrevistas individuales a personas que por su trayectoria tienen acceso a información y material valioso en cuanto a historia y costumbres. Además, de diseñar y aplicar un instrumento de recopilación de la información mismo que se ha sometido a prueba para alcanzar los objetivos que se marca el proyecto y que nos con lleva a la toma de decisiones y el conocimiento de la aceptación de un museo de arte sacro. Y por último la tercera etapa de Validación y divulgación, en ésta se hacen las conclusiones y propuestas en base a la información generada

### Etapas de Exploración

Teocaltiche que significa: lugar junto al templo; también ha sido interpretado como lugar del teocalli o templo. El Municipio se localiza en el estado de Jalisco, México. La población total del Municipio en Teocaltiche es de 36976 personas, de las cuales 17055 son masculinos y 19921 femeninas (La población de Teocaltiche se divide en 14902 menores de edad y 22074 adultos, de cuales los 4216 tienen más de 60

años). Fiestas y Eventos Tradicionales en Teocaltiche. El día 2 de noviembre, “Día de Muertos”, se acostumbra visitar en masa el Panteón de los Ángeles; El Sábado de Gloria, es ya una tradición llevar el Vía Crucis viviente por las calles de la población; El día de Corpus se acostumbra realizar la procesión sacramental por las principales calles de la ciudad.

Tabla 1: Recursos y Atractivos Turísticos

Arquitectura	Artesanías	Centros Culturales	Iglesias	Parques y Reservas	Fiestas Religiosas	Fiestas Populares
Ex hospital de indios. Plaza principal. Construcciones de tipo colonial. Parroquia de Nuestra Señora de los Dolores Templo de san José Santuario de nuestro Padre Jesús	Curiosidades de madera y hueso principalmente como molinillos, ajedreces, cajas, baúles, polveras, alhajeros, jarrones, tarugos, abrecartas, plumas, dominós, trompos, baleros, yoyos entre otros mas, sombreros de palma, cestería de carrizo, textiles en telar de pedal como sarapes, jorongos, rebozos, ceñidores, fajos, tilmas, camisas, las escobetas de lechuguilla, tejidos, bordados, alfarería, curtiduría de pieles, piteado, bordados, deshilados, lapidaria como molcajetes, metates, herrería.	Casa de la Cultura. DIF municipal	Parroquia de Nuestra Señora de los Dolores. Santuario de Nuestro Padre Jesús. Iglesia de la Merced. San José	Ex hacienda Ajojuar. Hacienda Montecillo. Hacienda Los Ojitos. Hacienda de Las Juntas. Balneario, El Ojo caliente. Localizado entre los ranchos, El Tablero y Ciénaga De Mora. Balneario "Las Palmitas" por la carretera Jalostotitlán Balneario La Gloria por carretera Villa Hidalgo el sabino	Fiesta en honor de Nuestra Señora de los Dolores: Del 1 al 11 de noviembre. Fiesta del Santuario: 6 de agosto. Fiesta de Nuestra Señora del Carmen: 16 de julio. Fiesta de San Miguel: 29 de septiembre. Fiesta en El Tablero (virgen del refugio): 4 de julio. Fiesta en Belén Del Refugio (virgen de Guadalupe): 12 de diciembre. Fiesta en San José Del 10 al 19 de Marzo	Las fiestas populares de la Virgen de los Dolores, se celebran del 1º al 12 de noviembre, con charreadas, corridas de toros (dos), peregrinaciones, danzas llamadas de “La Conquista” o “de Apaches”; festividades populares, venta de artesanías, fuegos artificiales y juegos mecánicos

*En esta tabla se muestra los principales atractivos y fiestas del Municipio de Teocaltiche, en la cual se clasifica de acuerdo al tipo de atractivo.*

### Etapas de Desarrollo

Teocaltiche cuenta con grandes obras arquitectónicas que otorgan al visitante un deleitante paseo por cinco siglos llenos de historia, de igual manera sus tradiciones, costumbres y ritos; le otorgan una esencia e identidad a su fe. Sus áreas naturales resultan deleitantes para quien las conoce; por toda su exquisita variedad que le hacen un paisaje único al igual que el de sus atardeceres. Las áreas también sirven para la práctica de turismo de aventura, que es una actividad que ya se está desarrollando y día a día atrae a más personas. Y sus relajantes balnearios naturales con espacios para acampar, seducen a cualquiera que guste de dicha actividad. Se realizó una investigación tipo exploratoria debido a la inexistencia de un proyecto similar desarrollado para la ciudad de Teocaltiche por lo que en una primera etapa se revisó la literatura y demás fuentes secundarias con la finalidad de acercarnos a la instalación de un museo de arte sacro. Después se llevo a cabo la elaboración de la encuesta que nos proporcionara información relevante para que se tome la decisión de contar con un museo.

*Tamaño de la muestra:* Se tomo una muestra representativa de acuerdo de acuerdo a la formula de poblaciones finitas de más de 500,000 elementos con un grado de estimación de entre el 2 y 6% y un nivel de confianza de 95% en forma aleatoria sobre la base de una distribución geográfica que involucraba a mujeres y hombres, por lo que estas fueron un total de 360 personas.

Etapas de Validación y Divulgación

En esta etapa se pudieron validar los siguientes resultados:

1. ¿Te gustaría que en Teocaltiche existieran? (Enumera en orden de importancia).

- a)  Centros recreativos
- b)  Centros culturales
- c)  Otro (por favor especifique)

Las personas si están interesadas en que en la Ciudad de Teocaltiche existan centros recreativos y culturales para un desarrollo de la ciudad ya que se cuenta con un porcentaje de 42% y un 39 % de Centros Culturales. Al juntar los dos podemos observar que se alcanza un porcentaje significativo que nos brinda información de que si es pertinente la creación del mismo.

2. En una escala del uno al cinco, donde cinco es el valor más alto y uno el más bajo. ¿Cómo consideras que son tus conocimientos sobre la historia de Teocaltiche?

5  4  3  2  1

Podemos resaltar que el índice de conocimientos de los habitantes y visitantes de Teocaltiche, acerca de su cultura e historia es elevado del cual podemos observar el 86%.

3. ¿Conoces algún lugar en Teocaltiche que te brinde información acerca de su historia, costumbres y de su cultura?

Si  No

Se puede comprobar que los habitantes y visitantes no conocen algún lugar que les proporcione información. De acuerdo con esta pregunta observamos que un 53.9% conoce donde le pueden brindar información; por lo que se considera la falta de un lugar en Teocaltiche que este visible para que las personas puedan obtener dicha información.

4. ¿Te gusta asistir a museos?

- a) Definitivamente Si
- b) Probablemente Si
- c) Probablemente No
- d) Definitivamente No

Los encuestados contestaron afirmativamente con un 89 % de por lo que se puede considerar la factibilidad de la creación de un museo en el cual se estén representadas sus tradiciones y raíces.

5. Si se construyera un museo religioso en Teocaltiche, ¿estarías dispuesto a visitarlo?

- a) Definitivamente Si
- b) Probablemente Si
- c) Probablemente No
- d) Definitivamente

Al preguntar sobre la posibilidad de contar con un museo religioso las personas el porcentaje baja significativamente hasta un 49%, esto nos ayuda a ir determinando las características de dicho museo.

6. ¿Qué te gustaría encontrar en el museo?

A esta pregunta contestaron que reliquias, antigüedades, pinturas, esculturas, artesanías, fotografías entre otros; lo que explica claramente el arraigo por contar con un acervo cultural.

7. Si se construyera un museo religioso, ¿crees que Teocaltiche sería más atractivo para los turistas?

a) Muy probablemente b) Probablemente c) Es poco probable d) Nada probable

52.2% que las personas de la ciudad de Teocaltiche si están interesadas en que no se pierda el aspecto religioso, cultural, histórico, artístico del lugar.

8. Partiendo de la base que el precio de este servicio le pareciera aceptable. ¿Qué probabilidad hay de que lo utilizase?

a) Muy probablemente b) Probablemente c) Es poco probable d) Nada probable

9. Sexo.

Las mujeres son las que están más interesadas con un 55% por que se cuente con un museo.

Figura 10: Podemos observar que el 55% de las personas interesadas en la ciudad de Teocaltiche son mujeres.

10. Edad.

Se observa que del 57.5 de las personas interesadas en Teocaltiche son adolescentes y jóvenes de 11 a 20 años.

## CONCLUSIONES

Analizar la creación de un museo en Teocaltiche a través de la perspectiva del City Marketing nos obliga a considerar las diferentes infraestructuras con las que cuenta la ciudad, sus atractivos, su imagen percibida y su gente. Con respecto a los atractivos que puede ofrecer la ciudad, además de sus productos turísticos tan bien conocidos y festividades propias de una región con gran acervo cultural, Teocaltiche tiene un gran arraigo de su ciudad su entorno y el que las personas que son de Teocaltiche quieran invertir en su desarrollo. El conocimiento histórico que tienen los residentes sobre la ciudad de Teocaltiche es muy favorable respecto a su patrimonio histórico y demás aspectos culturales, al punto de considerarlos como un gran elemento para el desarrollo del mismo y la participación por parte de sus habitantes en comparación con otras ciudades.

Podemos observar que las personas de Teocaltiche están interesados en que se construyan centros recreativos como museos para tener un desarrollo cultural, que sea adecuado para aprovechar el potencial turístico de las ciudades incrementando la economía de la ciudad. Llevar a cabo una estrategia de citymarketing para reforzar el impulso al turismo es una alternativa viable que producirá un margen neto de beneficios. Un proceso de marketing y la creación de una marca de ciudad pueden generar ventaja competitiva que le permitan aumentar su desarrollo y mejorar su posición. Construir centros recreativos turísticos para Teocaltiche significa institucionalizar el lugar como un destino turístico y posicionarlo como tal en la opinión pública convirtiendo en un signo digno de visitarse.

# **EL "TIMAX": UNA PROPUESTA METODOLÓGICA PARA EL ANÁLISIS DE LOS ESTUDIOS DE EGRESADOS Y EMPLEADORES EN LA EVALUACIÓN CURRICULAR. CASO LICENCIATURA EN CONTADURÍA PÚBLICA**

Alfredo Castañeda Palomera, Universidad de Guadalajara

Alfredo Tomás Ortega Ojeda, Universidad de Guadalajara

Cristina Zepeda Ibarra, Universidad de Guadalajara

## **RESUMEN**

*En el Centro Universitario de la Costa Sur (CUCSUR) de la Universidad de Guadalajara, México, como parte del plan de mejora derivado del proceso de acreditación internacional realizado por la agencia europea AQU Catalunya al CUCSUR se están realizando estudios de seguimiento de egresados y opinión de los empleadores en diversas carreras de pregrado. Tienen su origen en integrar y enlazar la formación académica del propio egresado con la realidad laboral donde se desempeña, constituyendo una herramienta para la mejora de la calidad del modelo educativo y procesos de innovación curricular. El trabajo presenta los resultados y una propuesta metodológica del Estudio de Seguimiento de Egresados realizado entre febrero y junio del 2010, el cual incluyó las competencias genéricas (PROFLEX, 2010) demandadas a los egresados por el mercado laboral, complementándose con el Estudio de Opinión de sus Empleadores, realizado entre septiembre y octubre del mismo año, que evaluó las mismas competencias. En esta investigación se propone una metodología emergente, "TIMAX", para utilizar las competencias genéricas en los egresados de la carrera de Contaduría Pública, contrastando la percepción de egresados y de los empleadores. Se discuten los resultados y sus implicaciones para el diseño curricular.*

**PALABRAS CLAVE:** Egresados, Empleadores, Competencias, Evaluación Curricular y Método Timax

## **THE "TIMAX": A METHODOLOGICAL PROPOSAL FOR THE ANALYSIS OF STUDIES OF GRADUATES AND EMPLOYERS IN CURRICULUM EVALUATION. BACHELOR'S DEGREE IN PUBLIC ACCOUNTING CASE**

### **ABSTRACT**

*The Center University of the Costa Sur (CUCSUR) of the University of Guadalajara, Mexico, as part of the plan of improvement derived from the process of international accreditation by the European Agency AQU Catalunya to the CUCSUR is being carried out studies Alumni tracking and opinion of employers in different undergraduate careers. They have their origin in integrate and link the academic formation of the own graduate with the reality of work where he works, constituting a tool for the improvement of the quality of the educational model and curriculum innovation processes. The work presents the results and a methodological proposal of the follow-up study of graduates conducted between February and June 2010, which included the generic competences (PROFLEX, 2010) required graduates for the labour market, complemented with the study of Opinion of their employers, carried out between September and October of the same year, which evaluated the same powers. This research proposes a pop-up methodology, "TIMAX", to use generic competencies in the graduates of public accounting career,*

*contrasting the perception of graduates and employers. The results and their implications for curriculum design are discussed.*

**JEL:** I210, I240

**KEYWORDS:** Graduates, employers, competences, curriculum evaluation, and method TIMAX.

## INTRODUCCIÓN

Los estudios de seguimiento de egresados y empleadores son una fuente primaria y secundaria de información que contribuye al entendimiento de las contribuciones de la universidad en el mejoramiento social, económico y cultural de la realidad. Es inevitable que se tenga información cuantitativa, objetiva y útil cuando se dé el proceso de la inserción de los egresados en el mercado laboral, para lograr la mejora de los procesos y así por realizar una adecuada evaluación sobre la evolución de las carreras profesionales de los egresados. En el 2009 inició en el Centro Universitario de la Costa Sur (CUCSUR) la investigación educativa ligada al seguimiento de egresados y los estudios de los empleadores para atender recomendaciones de la agencia de evaluación de la calidad académica europea (Agencia per a la Qualitat del Sistema Universitari de Catalunya), AQU Catalunya. Esta investigación está enfocada en valorar la percepción de los egresados y los empleadores, en términos de las competencias genéricas, las necesidades del mercado laboral, el perfil de los egresados y su desempeño. En este trabajo se propone una metodología emergente para utilizar los resultados de los estudios de egresados y empleadores, y su impacto en el diseño curricular.

## REVISIÓN LITERARIA

Según García (2012) el seguimiento de egresados es una serie de estudios que constituyen una herramienta básica que permite conocer el desempeño y desarrollo profesional de los egresados, siendo este estudio el que le permita a los centros de educación mejorar y actualizar de manera permanente los planes y programas de estudio, además de que en él se definen las políticas de desarrollo institucional en los niveles estatal, regional e incluso nacional. La importancia del seguimiento de egresados tiene su origen en integrar y enlazar la formación académica del propio egresado con la realidad laboral donde se desempeña y, por lo tanto conocer la vinculación que existe entre programas y trabajo. De igual manera, el estudio de empleadores es una herramienta imprescindible para comprender los procesos de adaptación de los egresados en la vida profesional, pues su opinión proporcionará información para la actualización permanente de los programas de estudios.

Es importante abundar un poco en la historia sobre los estudios de seguimiento de egresados, que surgieron con el objetivo de analizar la relación entre el gasto en educación y el crecimiento económico así como los vínculos entre la inversión en educación y los beneficios que obtienen los individuos (Ginés, J & Carot, J., 2012). No obstante muchas universidades realizaron estudios parciales de egresados, dos proyectos financiados por la Comisión Europea realizaron un estudio a nivel general en Europa: CHEERS (1998, financiado por el IV Programa Marco de la UE) y REFLEX (2004, VI Programa Marco de la UE), ambos proyectos de reconocida notoriedad internacional (PROFLEX, 2010). Resultado de esta valiosa experiencia, se realizó el proyecto ALFA con el nombre de PROFLEX (2010), que efectuó un estudio de egresados en universidades latinoamericanas basado en la misma encuesta.

El método TIMAX es una herramienta de análisis de dichos estudios de seguimiento de egresados y empleadores; cuya fundamentación se encuentra en la visión global, lo holístico, la teoría de sistemas, el sistema de evaluación mexicano de los programas educativos (CIEES y COPAES), el PROFLEX, las opiniones cruzadas, la estadística descriptiva, entre otras. Se reconoce que la solución para entender lo complejo no está en la simple propuesta de un método como el TIMAX, sin embargo, ésta propuesta es

una alternativa que puede contribuir para entender la dimensión compleja que se presenta en la interacción entre egresado, mundo laboral, empleadores, universidad y sociedad. (Zabala Vidiella, 2006). Dicha herramienta toma su nombre del tiempo máximo en años que deben ser atendidas las sugerencias para mejorar el diseño curricular. Se inspira en la importancia que se le está dando en los últimos años a la evaluación como factor estratégico para la toma de decisiones educativas. *“En México, el Programa Sectorial de Educación 2007-2012 menciona que la evaluación será un instrumento fundamental en el análisis de la calidad, la relevancia y la pertinencia del diseño y la operación de políticas públicas”* (COPAES, 2012). *“El seguimiento de egresados constituye una herramienta imprescindible para comprender los procesos de adaptación de los egresados a la vida profesional”* (PROFLEX, 2010).

También el TIMAX tiene su base en la estadística descriptiva, dentro de la que se encuentran las medidas de tendencia central, las cuales tratan de resumir un conjunto de datos de tal forma que se pueda obtener un panorama general (Weimer, 2004). Sirviendo de punto de referencia para interpretar los valores del sondeo de opiniones de egresados (EG) y empleadores (EM). De las medidas de tendencia central en este modelo se trabaja con la media: valor que se encuentra sumando los valores individuales y dividiendo después la suma obtenida entre el número de valores involucrados (Weimer, 2004). Logrando el promedio aritmético en las categorías sugeridas en este modelo, de los valores ponderados que se obtuvieron de cada opinión de los EG y EM con respecto a cada una de las competencias determinadas. El modelo TIMAX sugiere de forma inmediata la prioridad de atención considerando la opinión ponderada de los EG y EM de cada una de las diecinueve competencias genéricas establecidas por el PROFLEX y que a su vez, en este modelo, se integran en seis categorías para su estudio.

Tabla 1: Categorías en las Que Se Agrupan las Capacidades Genéricas de los Egresados

No.	Categoría	No.	Capacidades genéricas
1	Conocimiento, pensamiento analítico, razonamiento y herramientas.	1	Capacidad de razonamiento lógico matemático (RLM)
		2	Capacidad de pensamiento analítico (PA)
		3	Capacidad para dominar conocimientos de su área o de otras áreas. (DCAODA)
		4	Capacidad para adquirir con rapidez nuevos conocimientos.
		5	Capacidad para utilizar herramientas informáticas.
2	Innovación	6	Capacidad para detectar nuevas oportunidades.
		7	Capacidad para encontrar nuevas ideas y soluciones.
3	Comunicación	8	Capacidad para comunicarse en un segundo idioma.
		9	Capacidad para redactar documentos.
		10	Capacidad para hacerse entender.
		11	Capacidad para presentar en público productos, ideas o informes.
4	Coordinación	12	Capacidad para trabajar bajo presión.
		13	Capacidad para coordinar actividades.
		14	Capacidad para usar el tiempo en forma efectiva.
5	Negociador	15	Capacidad para negociar de forma eficaz.
		16	Capacidad para trabajar en equipo.
		17	Predisposición para cuestionar ideas propias o ajenas.
6	Liderazgo	18	Capacidad para movilizar las capacidades de otros.
		19	Capacidad para hacer valer su autoridad.

En esta tabla se describen las categorías que se utilizaron para su estudio, así como las capacidades que integran a cada una. Fuente: Ortega, Castañeda, Díaz, Preciado, González, Zepeda, De la Torre, Aréchiga (2012).

## METODOLOGÍA

Para efectos de la investigación conclusiva y la realización del estudio se tomó como sub-universo a los egresados y empleadores del programa educativo de Licenciado en Contaduría Pública del Centro Universitario de la Costa Sur (CUCSUR). El estudio a nivel del centro cubrió a 8 carreras con un total de 140 egresados y 119 empleadores de la región. Se tomó como referente la base de datos de la

Coordinación de la Carrera (CUCSUR, 2010). La técnica de muestreo utilizada fue no probabilística, por las características presentadas por la muestra y su tipo por conveniencia (Gutiérrez, 2005). La cuota fue de 17 egresados y 15 empleadores, validando la información con el programa SPSS Versión 15.0.

Para el diseño del cuestionario, se tomó como referencia el establecido por el proyecto PROFLEX (2010), que utiliza más de 150 preguntas, constituido por nueve secciones que cubren aspectos relacionados con; la formación recibida, transición al mundo laboral, competencias y satisfacción, entre otros. En cuanto al requisito de confiabilidad del instrumento, se aplicó como prueba el Alpha de Cronbach, resultando esta con un valor de 0.740, la cual confirmó el grado de pertinencia de los ítems incluidos. Como escala de medición se empleó la tipo Likert. (McMillan, J. H. & Schumacher, S., 2005:240). Respecto al análisis de los resultados, se enfocó principalmente en los dos niveles más altos de capacidad de la competencia correspondiente; “Mucho” y “En Gran medida”, en el que juntos se les denominará como “Alto nivel”. Por la cantidad de datos en el análisis se hace uso de la estadística descriptiva y de metodologías como la categorización de las competencias que se presentan como un resultado de este trabajo de investigación, la ponderación de las opiniones de los EG y de los EM. En esta ponderación se utilizaron los métodos y experiencias de Gómez Guzmán, Mendoza Zamora y Castañeda Palomera (2010:103-105) con algunas adecuaciones. Así es como se definió que el valor de la ponderación de los EG es del 30% ( $EGp=0.30$ ) y el valor de la ponderación de los EM es de 70% ( $EMP=0.70$ %).

En la Tabla 2 se resume la propuesta metodológica del TIMAX para presentar sugerencias de acuerdo a los resultados que se obtengan en el análisis de la opinión de los EG y EM, su ponderación  $EGp$  y  $EMP$ , el Promedio Ponderado (PP) del porcentaje de opinión y el tiempo en años máximo para realizar la revisión, modificación y transformación curricular (TIMAX). La sugerencia del qué y cuándo hacer dependerá del promedio ponderado que obtenga la competencia correspondiente.

Tabla 2: Escenario de Opinión de los EG Y EM, Ponderación  $EGp$  y  $EMP$  y Su Cualificación de Su Situación Actual

No.	Promedio Ponderado del % de opinión de EG y EM	Cualificación de la Competencia	Observación	Sugerencia	TIMAX
1	90-100	Excelente	Continuar así con la afinación de detalles	Afinar detalles y estar pendiente de los cambios disciplinares y del entorno.	3 años
2	80-89	Muy bien	Atención menor	Realizar cambios superficiales y moderados: revisar y precisar las competencias de acuerdo a EG y EM.	2 años
3	70-79	Bien	Atención moderada	Realizar cambios moderados a profundos: Enfatizar en los elementos y pertinencia de las competencias de acuerdo a EG y EM.	1 año
4	60-69	Regular	Atención mayor	Realizar cambios fuertes: Extensión y profundidad en las competencias.	0.75 años
5	50-59	Deficiente	Atención urgente	Realizar cambios muy fuertes: Reestructuración de la currícula y las competencias.	0.75 años
6	<50	Muy deficiente	No aceptar nuevos ingresos	Iniciar una transformación curricular considerando el antecedente “non grato”.	0.5 años

*En esta tabla se resume la propuesta metodológica del TIMAX para presentar sugerencias del tiempo en años máximo para realizar la revisión, modificación y transformación curricular, de acuerdo a los resultados que se obtengan. Fuente: Ortega et al (2012).*

## RESULTADOS

El análisis que se propone mediante el sondeo de opinión es de acuerdo a las seis categorías en las que se agrupan las capacidades de los egresados de acuerdo al nivel requerido en el trabajo y nivel del perfil del egresado. 1. Conocimiento, pensamiento analítico, razonamiento y herramientas. Los resultados de la Tabla 3 indican que los egresados de la carrera tienen una preparación en las competencias de esta

categoría de buena a muy buena. Se observa que la competencia que más contribuye a este resultado es la capacidad para utilizar herramientas informáticas con un 82% y la que menos sufraga es la capacidad de pensamiento analítico con un 70%.

Tabla 3: Opinión de los EG y EM Sobre Nivel Alto de las Competencias Requeridas en el Trabajo y Su Promedio Ponderado (PP CRT), de las Competencias del Perfil del Egresado y Su Promedio Ponderado (PP PEG) y el Promedio Ponderado Total (PP TOTAL) en la Categoría de Conocimiento, Pensamiento Analítico, Razonamiento y Herramientas

Competencia	Nivel requerido en el trabajo			Nivel que tiene el perfil del egresado			
	Porcentaje que opina que el nivel requerido en el trabajo es alto			Porcentaje que opina que el nivel del perfil del egresado es alto			
	EG	EM	PP CRT	EG	EM	PP PEG	PP TOTAL
Capacidad de razonamiento lógico matemático.	88	80	82	88	67	73	78
Capacidad de pensamiento analítico	88	87	87	82	40	53	70
Capacidad para dominar conocimientos de su área o de otras áreas.	88	93	92	71	53	59	75
Capacidad para adquirir con rapidez nuevos conocimientos.	71	93	87	82	60	67	77
Capacidad para utilizar herramientas informáticas.	94	93	94	65	73	71	82
Promedio	86	89	88	78	59	64	76

En la tabla se muestran los resultados de las competencias de la categoría de conocimiento analítico, razonamiento y herramientas. Fuente: Elaboración propia.

En esta categoría se observa como las competencias de razonamiento lógico, pensamiento analítico, dominio de su área o de otras áreas, adquisición de conocimientos requieren de mayor atención en un periodo no mayor a un año, y en cuanto a la capacidad para utilizar las herramientas informáticas se sugieren realizar cambios superficiales y moderados, en un plazo no mayor a dos años. Lo que el TIMAX sugiere al obtener un promedio total del 76% que se realicen cambios moderados y profundos, revisando y precisando las competencias de acuerdo a los EG y EM en un periodo no mayor a un año.

2. Innovación. En la Tabla 4 se presentan los resultados de dichas competencias, resaltándose la capacidad para encontrar nuevas ideas y soluciones.

Tabla 4: Opinión de los EG y EM Sobre Nivel Alto de las Competencias Requeridas en el Trabajo y Su Promedio Ponderado (PP CRT), de las Competencias del Perfil del Egresado y Su Promedio Ponderado (PP PEG) y el Promedio Ponderado Total (PP TOTAL) en la Categoría De Innovación.

Competencia	Nivel requerido en el trabajo			Nivel que tiene el perfil del egresado			
	Porcentaje que opina que el nivel requerido en el trabajo es alto			Porcentaje que opina que el nivel del perfil del egresado es alto			
	EG	EM	PP CRT	EG	EM	PP PEG	PP TOTAL
Capacidad para detectar nuevas oportunidades.	71	80	77	59	47	50	64
Capacidad para encontrar nuevas ideas y soluciones.	88	93	92	82	47	57	75
Promedio	79	87	84	71	47	54	69

En esta tabla se muestran los resultados de las opiniones de los EG y EM respecto a las competencias de la categoría de innovación, resaltándose la capacidad para encontrar nuevas ideas y soluciones. Fuente: Elaboración propia.

Esta categoría está constituida por dos competencias exigidas a los futuros profesionistas. La sugerencia que ofrece el TIMAX ante los resultados del promedio total del 69% obtenido, es que se deben realizar cambios fuertes, prestando atención mayor, en un periodo no mayor a 9 meses.

3. Comunicación. En la siguiente tabla se observan opiniones muy variadas, teniendo la más baja calificación la capacidad para comunicarse en un segundo idioma, y la más alta en la capacidad para hacerse entender.

Tabla 5: Opinión de los EG y EM sobre nivel alto de las competencias requeridas en el trabajo y su promedio ponderado (PP CRT), de las competencias del perfil del egresado y su promedio ponderado (PP PEG) y el Promedio Ponderado total (PP TOTAL) en la categoría de comunicación

Competencia	Nivel requerido en el trabajo			Nivel que tiene el perfil del egresado			
	Porcentaje que opina que el nivel requerido en el trabajo es alto			Porcentaje que opina que el nivel del perfil del egresado es alto			
	EG	EM	PP CRT	EG	EM	PP PEG	PP TOTAL
Capacidad para comunicarse en un segundo idioma.	29	13	18	6	7	6	12
Capacidad para redactar documentos.	65	100	89	59	40	46	68
Capacidad para hacerse entender.	88	93	92	65	53	57	74
Capacidad para presentar en público productos, ideas o informes.	71	87	82	53	40	44	63
Promedio	63	73	70	46	35	38	54

Esta tabla muestra los resultados de competencias de la categoría de comunicación. Fuente: Elaboración propia.

Esta categoría está compuesta por cuatro competencias, en las que nos encontramos con una fuerte alerta en cuanto a la capacidad para comunicarse en un segundo idioma al obtener un promedio ponderado total del 12%, por lo que el TIMAX cualifica esta competencia como muy deficiente y sugiere iniciar una transformación curricular en un tiempo no mayor a seis meses. Respecto a la capacidad para redactar documentos, también se sugiere realizar cambios muy fuertes en un tiempo no mayor a nueve meses. El promedio de esta categoría es del 54% lo que indica que la reacción de respuesta a la mejora de las competencias de esta categoría debe ser en corto tiempo. 4. Coordinación. La Tabla 6 señala que dentro de la categoría coordinación, sobresale la capacidad para coordinar actividades.

Tabla 6: Opinión de los EG y EM Sobre Nivel Alto de las Competencias Requeridas en el Trabajo y Su Promedio Ponderado (PP CRT), de las Competencias del Perfil del Egresado y Su Promedio Ponderado (PP PEG) y el Promedio Ponderado Total (PP TOTAL) en la Categoría de Coordinación

Competencia	Nivel requerido en el trabajo			Nivel que tiene el perfil del egresado			
	Porcentaje que opina que el nivel requerido en el trabajo es alto			Porcentaje que opina que el nivel del perfil del egresado es alto			
	EG	EM	PP CRT	EG	EM	PP PEG	PP TOTAL
Capacidad para trabajar bajo presión	76	93	88	71	53	59	73
Capacidad para coordinar actividades.	76	93	88	82	80	81	84
Capacidad para usar el tiempo en forma efectiva.	82	100	95	76	33	46	70
Promedio	78	96	90	76	56	62	76

En esta tabla sobresale la capacidad para coordinar actividades dentro de la categoría de coordinación de los resultados de EG y EM. Fuente: Elaboración propia.

En promedio, en esta categoría el TIMAX sugiere cambios moderados y profundos, enfatizando en los elementos y pertinencia de las competencias de acuerdo a EG y EM, en un tiempo no mayor a un año.

5. Negociador. En la siguiente tabla se muestra como la capacidad para trabajar en equipo es la más alta, mientras que la más baja es la capacidad para negociar de forma eficaz.

Tabla 7: Opinión de los EG y EM Sobre Nivel Alto de las Competencias Requeridas en el Trabajo y Su Promedio Ponderado (PP CRT), de las Competencias del Perfil del Egresado y Su Promedio Ponderado (PP PEG) y el Promedio Ponderado Total (PP TOTAL) en la Categoría de Negociador.

Competencia	Nivel requerido en el trabajo			Nivel que tiene el perfil del egresado			
	Porcentaje que opina que el nivel requerido en el trabajo es alto			Porcentaje que opina que el nivel del perfil del egresado es alto			
	EG	EM	PP CRT	EG	EM	PP PEG	PP TOTAL
Capacidad para negociar de forma eficaz.	76	87	84	53	20	30	57
Capacidad para trabajar en equipo.	82	93	90	82	67	71	81
Predisposición para cuestionar ideas propias o ajenas.	76	80	79	82	27	43	61
Promedio	78	87	84	73	38	48	66

En la tabla se muestran los resultados de EG y EM respecto a las competencias de la categoría negociador, sobresaliendo como alta la capacidad para trabajar en equipo. Fuente: Elaboración propia.

La competencia que más contribuye al promedio total obtenido en esta categoría es la capacidad para trabajar en equipo con un 81% de promedio ponderado total, y la que menos sufraga obteniendo un promedio ponderado total del 57%, es la capacidad para negociar de forma eficaz. Al obtener un promedio total del 66% en esta categoría el TIMAX sugiere que los cambios que se realicen sean en un tiempo no mayor 9 meses. 6. Liderazgo. En la Tabla 8 se observa que la competencia para hacer valer su autoridad es la más alta.

Tabla 8: Opinión de los Egresados (EG) y Empleadores (EM) Sobre Nivel Alto (Mucho o en Gran Medida) de las Competencias Requeridas en el Trabajo y Su Promedio Ponderado (PP CRT), de las Competencias del Perfil del Egresado y Su Promedio Ponderado (PP PEG) y el Promedio Ponderado Total (PP TOTAL) En La Categoría de Liderazgo

Competencia	Nivel requerido en el trabajo			Nivel que tiene el perfil del egresado			
	Porcentaje que opina que el nivel requerido en el trabajo es alto			Porcentaje que opina que el nivel del perfil del egresado es alto			
	EG	EM	PP CRT	EG	EM	PP PEG	PP TOTAL
Capacidad para movilizar las capacidades de otros.	76	87	84	65	40	47	66
Capacidad para hacer valer su autoridad.	82	87	85	76	53	60	73
Promedio	79	87	84	71	47	54	69

En esta tabla se muestran las competencias de la categoría de liderazgo. Fuente: Elaboración propia.

Esta categoría la integran dos competencias de las cuales la capacidad para movilizar las capacidades de otros obtuvo un promedio ponderado total del 69% y de acuerdo al TIMAX se debe tener una atención mayor y realizar cambios fuertes en la extensión y profundidad de esta competencia en un periodo de tiempo no mayor a nueve meses.

## CONCLUSIONES

El presente trabajo con la aplicación del método TIMAX proporcionó información sobre la identificación de competencias genéricas de los EG, tanto las demandadas por su campo laboral como las que adquirieron en su formación universitaria. Se concluye que la visión que tienen los egresados y los empleadores en general es diferente en cuanto a las capacidades. Generalmente las respuestas de los egresados con respecto al nivel de la competencia que requiere la empresa, estuvieron por debajo de las de los empleadores. Pudiera ser la diferencia en las expectativas que tiene el empleador sobre su empresa y la realidad que percibe el egresado una vez que se encuentra laborando.

Respecto al nivel de competencias del perfil del egresado también se marcan claras diferencias, en las que el empleador aprecia que el nivel de las competencias del perfil del egresado es más bajo que el nivel que establece en su autoevaluación el egresado. Siguiendo con las expectativas altas de los empleadores, ellos están demandando estándares elevados en sus puestos de trabajo, y de la misma manera exige que el perfil del egresado sea compatible a estos; por lo que, el contratante valora rigurosamente al egresado y decide asignarle un nivel generalmente más bajo en su perfil profesional que el que se autoasigna el egresado.

De acuerdo a los resultados obtenidos en el programa de Licenciatura en Contaduría Pública, las tres capacidades que obtuvieron la más alta calificación son las siguientes: Capacidad para coordinar actividades, capacidad de utilizar herramientas informáticas y capacidad para trabajar en equipo. Con el avance tecnológico en herramienta informática, telecomunicaciones y redes sociales en general los estudiantes de este centro universitario están incursionando en esta forma de comunicación, aunado con la infraestructura que se ofrece. Por otra parte, en las competencias en las que el egresado obtuvo una ponderación baja, menor que 61%, son: Capacidad para comunicarse en un segundo idioma (siendo esta la competencia con menor calificación, 12%), la capacidad para negociar de forma eficaz, y la predisposición para cuestionar ideas propias o ajenas. El bajísimo porcentaje ponderado de la capacidad para comunicarse en un segundo idioma se explica en razón de que las empresas de la región no la requieren porque la mayoría de estas no están vinculadas con otras empresas o mercados internacionales; en esta competencia el empleador y el egresado coinciden que es una competencia que no se tiene en el egresado pero tampoco es demanda por la mayoría de las empresas de este mundo laboral regional.

Aún así, el TIMAX señala una atención inmediata a la misma, por lo que se requiere de iniciar una transformación curricular de fondo, implementando acciones radicales que pudieran darles a los alumnos la capacidad necesaria para el campo laboral.

Es importante insistir en atender favorablemente y de manera urgente estas capacidades que son trascendentales en la educación de los estudiantes universitarios, que serán los futuros profesionistas que se enfrentarán a los grandes retos de un mundo globalizado. Respecto a las categorías, es preciso mencionar que las dos que tuvieron el mayor porcentaje ponderado (76%) fueron: Conocimiento, pensamiento analítico, razonamiento y herramientas, y la de Coordinación. Mismas que fortalecen a las competencias de la formación básica y la profesionalizante. Mientras que la categoría con el menor porcentaje fue de la Comunicación con 54%. Es preocupante que ésta categoría sea la de más bajo valor, pues la comunicación es una actividad diaria de todas las personas, y así como es importante en las relaciones humanas, lo es en las organizaciones, sobre todo pensando que se desenvuelven en un ambiente de trabajo de interacción con compañeros, superiores y clientes.

De igual manera, existe un flujo permanente de información y coordinación vertical y horizontal, lo que hace imprescindible la existencia de una buena comunicación en las organizaciones. Finalmente, en cuanto al método propuesto, presenta ventajas para que las academias o cuerpos académicos que participan en la elaboración y revisión de propuestas curriculares, con mayor facilidad y con sugerencias propositivas, identifiquen las competencias en las que no se tiene por qué estar preocupados o aquellas en las que debe dirigirse una mirada de atención para ser resuelta en el tiempo determinado para ello. Lo

anterior con objetivo de articular la formación profesional con el mundo de trabajo, permitiendo la incorporación fluida de los egresados al mercado laboral.

# LA RENTABILIDAD DEL SECTOR INDUSTRIAL DE LA CONSTRUCCIÓN EN HERMOSILLO, SONORA, A PARTIR DEL ANÁLISIS HOLÍSTICO DE LAS CINCO FUERZAS COMPETITIVAS DE PORTER

Luis Enrique Ibarra Morales, Universidad Estatal de Sonora  
Emma Vanessa Casas Medina, Universidad Estatal de Sonora  
Karla María Barraza Martínez, Universidad Estatal de Sonora

## RESUMEN

*Entender mejor la dinámica que influye en una industria o sector industrial, ha sido una de las variables que la gestión administrativa de hoy en día, debe de resolver y para ello, existe el modelo holístico de las cinco fuerzas competitivas de Porter, herramienta de gestión que permite realizar un análisis externo de las empresas que compiten y se establecen en un sector determinado. Para este caso, se analizó la rentabilidad del sector industrial de la construcción, en la ciudad de Hermosillo, Sonora, partiendo de dos hipótesis y de los factores básicos que determinan la propia rentabilidad y lo atractivo de un sector en particular, como los precios, estructura de costos y los requerimientos de inversión. Para la obtención de la información, se utilizó un cuestionario como herramienta cualitativa y de análisis, estructurado con preguntas dicotómicas y respuestas basadas en la escala de Likert; el cual se aplicó en este año 2013, al total de empresas que integran el sector de estudio en la ciudad de Hermosillo, Sonora.*

**PALABRAS CLAVES:** Sector Industrial, Industria, Fuerza Competitiva, Rentabilidad.

## PROFITABILITY IN THE CONSTRUCTION INDUSTRY SECTOR IN HERMOSILLO, SONORA, FROM A HOLYSTIC ANALYSIS OF PORTER'S FIVE FORCES

### ABSTRACT

*Understanding the dynamic that influence an industry or industry sector, it is one of the variables that administration management has to resolve. For that, Porter's five forces holistic analysis becomes an external tool for companies that compete and are established in a specific sector. For this exercise we analyzed Hermosillo, Sonora's construction industry sector profitability from two Hypothesis, and the main factors that determine the profitability and the attractiveness of a particular sector, such as prices, cost, and investment requirements. For acquiring the information a survey was used as a qualitative and analysis tool, structured with dichotomy questions and answers based on Likert's scale, and was applied in 2013 to the entire companies that conformed this study sector in Hermosillo, Sonora.*

**KEY WORDS:** Industrial Sector, Industry, Competitive Force, Profitability

## INTRODUCCIÓN

Mediante el desarrollo de este trabajo de investigación, se pudo constatar que el modelo holístico de las cinco fuerzas competitivas de Porter, es efectivamente, una herramienta de gestión que permite realizar un

análisis externo de la empresa, a través de los factores básicos que determinan la rentabilidad y lo atractivo de un sector o industria, como son los precios, costos y los requisitos de inversión. Partiendo del modelo holístico de Porter, para entender mejor la dinámica que influye en el sector objeto de estudio, se procedió con la aplicación de un cuestionario estructurado en cinco secciones, una para cada fuerza competitiva de estudio: Poder de negociación de los proveedores; poder de negociación de los clientes o compradores; productos sustitutos; amenaza de posibles competidores y la rivalidad interna entre los competidores establecidos en el sector.

De acuerdo a la investigación, se trabajó con cinco variables, las cuales forman parte fundamental del modelo holístico de Porter y que fueron descritas en el párrafo anterior. Asimismo, se plantearon dos preguntas de investigación que en la sección de metodología se describen. Para la validación del instrumento de medición, se procedió con el análisis de consistencia interna mediante Alfa de Cronbach. Dentro de la Teoría Clásica de los Tests (TCT) el método de consistencia interna es el camino más habitual para estimar la fiabilidad de pruebas, escalas o test, cuando se utilizan conjuntos de ítems o reactivos que se espera midan el mismo atributo o campo de contenido. La principal ventaja de este método es que requiere solo una administración de la prueba; además, los principales coeficientes de estimación basados en este enfoque son sencillos de computar y están disponibles como opción de análisis en diferentes programas estadísticos.

Se trata de un índice de consistencia interna que toma valores entre 0 y 1 y que sirve para comprobar si el instrumento que se está evaluando recopila información defectuosa y por tanto, llevaría a conclusiones equivocadas o si se trata de un instrumento fiable que hace mediciones estables y consistentes. Dentro de esta categoría de coeficientes, Alfa de Cronbach es, sin duda, el más ampliamente utilizado por los investigadores y se expresa mediante la siguiente formula como:

$$\alpha = \left( \frac{K}{K-1} \right) * \left[ 1 - \left( \frac{\sum_i S_i^2}{S_{sum}^2} \right) \right]$$

Donde k es el número de ítems de la prueba,  $S_i^2$  es la varianza de los ítems (desde 1...i) y  $S_{sum}^2$  es la varianza de la prueba total. El coeficiente mide la fiabilidad del test en función de dos términos: el número de ítems (o longitud de la prueba) y la proporción de varianza total de la prueba debida a la covarianza entre sus partes (ítems). Ello significa que la fiabilidad depende de la longitud de la prueba y de la covarianza entre sus ítems. Alfa es por tanto un coeficiente de correlación al cuadrado que, a grandes rasgos, mide la homogeneidad de las preguntas promediando todas las correlaciones entre todos los ítems para ver que, efectivamente, se parecen. Su interpretación será que, cuanto más se acerque el índice al extremo 1, mejor es la fiabilidad, considerando una fiabilidad respetable a partir de 0.80; en ese sentido, para el presente trabajo de investigación, el resultado de Alfa de Cronbach, fue igual a 0.8931, lo que significa que el cuestionario aplicado es aceptable y por ende, confiable, lo que indica que el instrumento de medición utilizado tiene un alto grado de confiabilidad, validando su uso para la recopilación de datos.

## REVISIÓN DE LA LITERATURA

Partiendo de la caracterización de la industria de la construcción, esta actividad no solo cubre la edificación de nuevas construcciones o los trabajos de ingeniería civil, sino también el ensamble e instalación de elementos prefabricados, incluyendo a los departamentos de manufactura comprometidos en esa actividad. Además, cubre otras actividades como la remodelación, reparación o demolición de construcciones en general. De acuerdo con Miguel Ángel Gómez Fonseca (2004), la estructura de la industria está caracterizada por tres rasgos: Barreras a la entrada sumamente permeables, capacidad instalada de carácter flexible y desconcentración relativa. Desglosando cada uno de los rasgos, se tiene:

*Barreras de Entrada:* El aspecto más sobresaliente de esta estructura industrial son las bajas o inexistentes barreras de ingreso o de entrada, o sea la facilidad con lo que nuevos empresarios o empresas pueden entrar o suspender sus actividades.

*La Capacidad Instalada de Carácter Flexible:* El hecho de que en esta actividad el objeto y el producto sean inmóviles y el equipo sea móvil, obliga a problematizar el término de capacidad instalada. En la industria de la construcción no hay capacidad instalada propiamente dicha.

*Una Estructura Industrial Desconcentrada:* La dispersión entre la oferta y la demanda y la incapacidad de centralizar geográficamente la actividad constructora, forjan una estructura industrial igualmente desconcentrada. Sin embargo, Porter (2010), menciona que la intensidad de la competencia en la industria no se debe ni a la coincidencia ni a la mala suerte. Por el contrario, se debe a la estructura económica subyacente y va más allá del comportamiento de los competidores actuales. La intensidad en una industria depende de las cinco fuerzas competitivas.

*Determinantes de la Intensidad de la Competencia:* Porter (2010), define de manera funcional a la industria como un grupo de empresas que producen o fabrican productos semejantes entre sí. En la práctica, existe gran controversia sobre la definición correcta; la discusión se centra en el grado de sustitución respecto a los productos, los procesos o las fronteras geográficas de los mercados. La fortaleza de las fuerzas competitivas en una industria determina el nivel de la inversión e impulsa el rendimiento al nivel del libre mercado y, por lo tanto, la capacidad de las empresas para sostener rendimientos por encima del promedio. Las cinco fuerzas competitivas –entrada, riesgo de sustitución, poder de negociación de los compradores, poder de negociación de los proveedores y rivalidad entre los competidores actuales– reflejan el hecho de que la competencia en un sector industrial no se limita en absoluto a los participantes que ya están establecidos. Las cinco fuerzas competitivas combinadas rigen la intensidad de la competencia y la rentabilidad de una industria o sector industrial; la fuerza o las fuerzas más poderosas predominan y son decisivas desde el punto de vista de la formulación de estrategias.

A fin de ubicar la posición competitiva deseada por las empresas que pertenecen al sector industrial del ramo de la construcción, fue necesario comenzar con una evaluación de la industria a la cual pertenecen. El marco más utilizado para medir lo atractivo que resulta una industria es, el modelo holístico de las cinco fuerzas competitivas de Michael Porter, las cuales fueron mencionadas anteriormente. Estas cinco fuerzas delimitan los precios, los costos y requerimientos de inversión, que son los factores básicos que explican las perspectivas de rentabilidad a largo plazo y el atractivo de la industria.

Si se desglosa cada fuerza competitiva en sus principales factores determinantes, el modelo se puede explicar de la siguiente forma: Para la fuerza: Amenaza de posibles entrantes, los factores determinantes están dados por las barreras de ingreso que se instituyan para impedir la entrada y que entre los más comunes se tienen las economías de escala; la lealtad a la marca; la diferenciación del producto; accesos a los canales de distribución; políticas gubernamentales; represalias esperadas y necesidades o requerimientos de capital; mientras que para la fuerza: Amenaza de sustitutos, algunos factores que pueden determinar su impacto es el rendimiento relativo al precio; el costo asociado por cambiar para el comprador y la propensión del comprador a cambiar de marca o proveedor. Para la fuerza asociada al poder de negociación de los proveedores, algunos de los factores determinantes es la concentración y tamaño de los proveedores existentes en el sector; los costos asociados por cambiar de proveedor; la capacidad del proveedor para integrarse de manera vertical hacia atrás o de forma regresiva; la competencia o rivalidad existente entre proveedores; el costo del producto frente al costo total y la diferenciación del producto; mientras que para la fuerza asociada al poder de negociación de los compradores, donde los factores básicos determinantes están dados por la concentración y tamaño de los compradores; por los costos asociados por cambiar; la rivalidad y competencia existente entre

compradores en el mismo sector; la capacidad del comprador para integrarse de manera vertical regresiva; diferenciación de los productos y la relación que existe entre el costo del producto y el costo final. Por último, los factores básicos que determinan la rivalidad entre los competidores de un mismo sector, están dados por la concentración de estos; la diversidad; la rapidez con que crece el mercado; la diferenciación de los productos; las barreras de salida existentes en el sector industrial y las condiciones cambiantes del sector y la economía.

*Particularidad de la Actividad Constructora:* La Tabla 1 muestra como está constituido el Estado de Sonora en cuanto a los sectores predominantes por actividad económica, donde el sector de la construcción se puede decir, no es significativo en puntos porcentuales, ya que no alcanza el 1%; sin embargo, tal y como se muestra en la Tabla 1, su aporte al PIB de la entidad es significativo en cuanto a miles de pesos a precios en valores básicos.

Tabla 1: Sectores Económicos En El Estado de Sonora, 2013.

Agropecuario	Minería	Electricidad y Agua	Construcción	Industria Manufactura	Comercio	Transporte, Comunicaciones y Servicios	Total de Empresas
22 0.3684%	13 0.2177%	3 0.0502%	40 0.6699%	149 2.4953%	4,229 70.8256%	1,515 25.3726%	5,971

Ahora bien, en la Figura 2, se muestra el universo de empresas que integran la industria de la construcción en el Estado de Sonora, repartidas prácticamente en tres municipios: Hermosillo, Navojoa y Cajeme, de acuerdo al Sistema de Información Empresarial Mexicano (SIEM, 2013), base de datos que está a cargo de la Secretaría de Economía (SE); donde se puede apreciar que el 60 por ciento de las empresas radican y operan en la ciudad de Hermosillo, Sonora, con un total de 24 empresas y con las cuales se trabajó la presente investigación.

Figura 2: Número De Empresas Que Integran La Industria De La Construcción En Sonora.

## METODOLOGÍA

La metodología empleada para el desarrollo de esta investigación se efectuó en dos etapas; en la primera parte fue necesaria la revisión y análisis de la literatura ya existente, sobre todo la proveniente de fuentes de información oficial, como la del INEGI, SIEM y SE, entre otras bases de datos. También se obtuvo información de fuentes primarias como la consultada en bibliografía en libros, revistas y documentos electrónicos relacionados con el tema objeto de estudio. En la segunda parte se llevó a cabo un trabajo de campo, mediante la aplicación de un cuestionario estructurado por un conjunto de 40 preguntas, distribuidas en cinco secciones de ocho preguntas cada una, para un igual número de fuerzas competitivas que integran el modelo de Porter. Asimismo, se incluyó por cada una de las cinco fuerzas, dos preguntas dicotómicas del tipo cerrada con opción de respuesta, sí o no, para un total de 10 preguntas.

*Preguntas de Investigación:* Pregunta Uno: ¿Las barreras de ingreso o entrada que implementan las empresas posicionadas en una industria, determinan lo atractivo del sector industrial? Pregunta Dos: ¿El mantener una posición competitiva en el mercado donde se compite, impacta de forma positiva en la rentabilidad de la empresa?

*Instrumento de Medición:* El instrumento que se elaboró para medir los factores básicos determinantes o variables de estudio del modelo holístico de Porter, es un cuestionario estructurado con 50 ítems. Lo constituye 40 ítems, 8 ítems por cada fuerza que se analiza, haciendo uso para su evaluación, la escala de Likert con los siguientes grados y valores: totalmente de acuerdo (+2); de acuerdo (+1); no precisa (0); en desacuerdo (-1) y; en total desacuerdo (-2). Sin embargo, se incluyeron por cada fuerza competitiva del modelo, dos preguntas dicotómicas del tipo cerrada con opción de respuesta, sí o no, para un total de 10 ítems. Los cuestionarios fueron aplicados a los encargados de las empresas, personas conocedoras y relacionadas con el tema de investigación, al menos con las preguntas que se formularon, con amplia experiencia en el ramo y en la actividad que desempeñan, lo que hizo más confiable y válida la información que se recabó.

*Confiabilidad:* Se determinó la confiabilidad del instrumento de medición que se utilizó en el presente trabajo de investigación mediante el cálculo del Alfa de Cronbach, dando como resultado  $0.8931$ , lo que significa que el valor obtenido es aceptable y por ende, confiable, lo que indica que el instrumento utilizado tiene un alto grado de confiabilidad, validando su uso para la recopilación de datos en las 24 empresas de la población sujeta al estudio.

*Población y Aplicación del Cuestionario:* Para esta investigación, los empresarios de las empresas que conforman el sector industrial de la construcción son los que integran la población sujeta de estudio. Para tal efecto, se tomó como marco de referencia universal la información proporcionada por el SIEM 2013, el cual cuenta con un registro de empresas, clasificadas de acuerdo a su entidad, municipio, tamaño y sector, además de ser la base de datos más completa y actualizada que existe. De acuerdo a la información del SIEM, en Sonora existen 5,971 empresas en total clasificadas de acuerdo al sector o actividad económica, de las cuales 40 pertenecen al sector de la construcción, tal y como se muestra en la Tabla 2.

El cuestionario estructurado se aplicó durante el mes de febrero de 2013, al total de las empresas que integran la industria de la construcción en la ciudad de Hermosillo, Sonora, siendo 24 empresas. En ese sentido, se puede considerar que el estudio es de corte transversal, ya que la información obtenida y analizada corresponde a un periodo en particular. De igual forma, es una investigación de diseño no experimental, ya que la información se maneja de forma cualitativa para una mejor interpretación, pero no se modifica los argumentos originales de las fuentes de información primaria. Para la interpretación de los resultados obtenidos de los cuestionarios, se realizó mediante la evaluación y análisis de la industria aplicando el modelo holístico de las cinco fuerzas competitivas de Michael Porter, también llamado modelo de competitividad ampliada de Porter, del cual se analizó la capacidad y poder de negociación de los proveedores y de los compradores; la rivalidad interna existente en el mercado por el cual se compite; la amenaza de entrada de posibles empresas al mercado y la amenaza de los sustitutos. Los factores básicos determinantes del sector industrial o las variables de estudio, son meramente cualitativos y están basados en los distintos enfoques y teorías administrativas existentes tal y como se aprecia en la Tabla 2.

Tabla 2: Fuerzas Competitivas y Factores Básicos Determinantes En la Industria de la Construcción.

Fuerzas Competitivas de Porter	Factores de Evaluación
Amenaza de posibles entrantes o potenciales competidores.	Diferenciación; costos; calidad de MO, materiales e insumos; economías de escala; lealtad de marca; requerimientos de capital; barreras de ingreso.
Poder de negociación de los compradores o clientes.	Características de los productos; número de compradores; información del producto; volúmenes de compra; comportamiento en los precios.
Amenaza de productos sustitutos.	Existencia de productos sustitutos; protección de los productos y firmas; características de desempeño de los sustitutos.
Poder de negociación de los proveedores.	Cantidad de proveedores en el sector; características de los insumos; precios; cantidad; demandas; entregas.
Intensidad de la rivalidad entre los competidores ya establecidos.	Precios, infraestructura; controles administrativos; generación de empleos; mercado que se atiende; calidad en los productos; diversificación.

*En la presente Tabla se muestran las fuerzas competitivas y los factores básicos determinantes para la evaluación de la industria de la construcción en la ciudad de Hermosillo, Sonora. Fuente: Elaboración propia.*

## RESULTADOS

A continuación, se presentan los principales resultados obtenidos por cada una de las fuerzas competitivas que dan sentido al modelo de Porter y que son propiamente derivados de la aplicación del instrumento de medición a las 24 empresas que conforman el sector industrial de la construcción en la ciudad de Hermosillo, Sonora. Partiendo de la primera pregunta de investigación, la cual exige el determinar lo atractivo del sector industrial con base a las barreras de ingreso o entrada que implementan las empresas posicionadas en él; en ese sentido, las respuestas a las preguntas dicotómicas proporcionadas por los encargados de las empresas, indican que el 62.5% de ellas no cuentan o implementan barreras de ingreso para frenar la posible entrada de competidores al sector, lo que hace suponer que la industria es de fácil acceso, siempre y cuando se disponga de suficiente capital de trabajo como inversión inicial. Porter (2010), indica que las utilidades de una industria se vean mermadas en la medida que las empresas ya establecidas en un sector industrial permitan el ingreso a nuevos competidores, lo que hará que el mercado que se atiende, se fraccione aún más, al grado de que la rentabilidad a largo plazo no sea tan atractiva o superior al promedio de la industria, tal y como se muestra en la Figura 3, donde 13 empresas contestaron estar totalmente de acuerdo en que existen pocas o nulas barreras de ingreso por parte de las empresas que ya operan en el sector industrial.

Figura 3: Existen Pocas o Nulas Barreras de Ingreso Por Parte de las Empresas ya Establecidas En el Sector Industrial.

*Fuente: Elaboración propia, a partir de los resultados obtenidos.*

La pregunta más significativa y que le da mayor significancia y peso a la Fuerza 2: Poder de Negociación de los Compradores o Clientes, es la relacionada con la pregunta número dos del tipo dicotómica, siendo, ¿usted tiene una gran cantidad de clientes, cada uno con compras relativamente significativas?, a lo cual el 87.5% de los empresarios respondieron que si, lo que significa que los clientes están en posición de negociar precios bajos, una mayor calidad y cantidad de servicios y productos, hasta el punto donde la industria obtiene la tasa de rendimiento más baja aceptable; lo que propicia batallas de competencia entre las empresas ya establecidas en la industria para que los grupos de compradores puedan alcanzar sus

resultados. En la Figura 4, se muestra el resultado de la pregunta número uno en la escala de Likert, la cual dice, ¿los productos que se compran y/o adquieren en el sector industrial, son considerados de características estándares y de fácil operación?

Figura 4: Los Productos Que Se Compran y/o Adquieren En El Sector Industrial, Son Considerados de Características Estándares y de Fácil Operación.

Con respecto a la Fuerza 3: Poder de Negociación de los Proveedores o Vendedores, la pregunta con mayor peso y significancia es la número dos del tipo dicotómica, la cual dice: ¿tengo o dispongo de muchos proveedores potenciales y/o proveedores ya establecidos?, a la cual el 95.83% respondieron que sí, lo que significa que en el sector industrial existen demasiados proveedores de productos y servicios ya establecidos, lo que representa un bajo potencial de negociación para ellos (proveedores); es decir, no pueden recurrir a sus productos como un medio para ejercer su poder sobre las empresas que compiten en la industria de la construcción. En ese sentido, la pregunta número uno en la escala de Likert, la cual dice: para la empresa, es barato y rápido cambiar entre proveedores que están establecidos en el sector industrial, tiene mucha relación con el anterior resultado, tal y como se muestra en la Figura 5, donde se agruparon los resultados de totalmente de acuerdo y de acuerdo, dando un total de 22 de empresas.

Figura 5: Para La Empresa, Es Barato y Rápido Cambiar Entre Proveedores Que Están Establecidos En El Sector Industrial.

Con respecto a la Fuerza 4: Los Productos Sustitutos, los empresarios concuerdan que existen productos sustitutos que cumplen con las mismas funciones que sus productos, en cuanto a calidad, desempeño y precio, lo que motiva a los compradores a decidirse a obtener un producto similar o igual que los bienes y servicios que proporciona la industria, tal y como se muestra en la Figura 6, donde un 29% de los encuestados contestaron estar de acuerdo de la existencia de tales productos en el sector industrial. En ese sentido, las empresas establecidas en el sector tienen que incurrir en costos más altos para diferenciar sus productos y con ello, minimizar o neutralizar la amenaza de los sustitutos.

Figura 6: Existen Productos Sustitutos Que Cumplen Con Las Mismas Funciones Que Sus Productos, En Cuanto a Calidad, Desempeño y Precio.

Fuente: Elaboración propia, a partir de los resultados obtenidos.

Sin embargo, la probabilidad de que un cliente se decida o cambie a un producto o servicio sustituto es del 75%, de acuerdo a los resultados arrojados por las respuestas a la pregunta dicotómica número 1 del cuestionario aplicado. Por último, se analiza la Fuerza 5: Rivalidad entre los Competidores Existentes, una fuerza que estriba su intensidad dado que las empresas de una industria dependen unas de otras, las acciones que emprende una empresa suele despertar respuestas de otros competidores. En ese sentido y haciendo un análisis a las respuestas más significativas de la fuerza y que tienen relación directa con la segunda pregunta de la investigación, se tiene que en la pregunta número dos, la cual dice, ¿la posición competitiva de mi empresa en el mercado en que compite es poderosa?, el 91.7% de los empresarios respondieron de forma afirmativa. En la Figura 7, se aprecia la opinión en cuanto a la participación de la empresa en el mercado, si éste aumenta o se mantiene estable. Lo que en esta fuerza lo que trata de medir es la intensidad con que se da la competencia en el sector industrial a partir del número de competidores que participan en él y del ritmo en el crecimiento de la industria. Es importante resaltar que si bien es cierto, son 24 empresas las que conforman el sector industrial que se estudió, la rivalidad que existe entre ellas de acuerdo a los resultados obtenidos es de moderado a alto, ya que los competidores (70.8%) están diversificados y no concentrados en una actividad en particular, lo que permite lo anterior descrito.

Figura 7: La Clasificación de la Participación Del Mercado de la Empresa En El Sector Industrial Aumenta o Se Mantiene Estable.

Fuente: Elaboración propia, a partir de los resultados obtenidos.

Con todo lo anterior, se procedió a realizar la evaluación global de la industria de la construcción, a partir de un análisis cualitativo y siguiendo el modelo holístico de las cinco fuerzas competitivas de Michael Porter, que dan sentido o determinan la rentabilidad de un sector industrial específico, tal y como se muestra en la Tabla 3, la cual se presenta a continuación y que en ella se resalta que el sector de la construcción en la ciudad de Hermosillo, Sonora, se desarrolla en un entorno de alto a moderado, dadas las condiciones que en ella se desarrollan.

Tabla 3: Evaluación Global De La Industria De La Construcción, En La Ciudad De Hermosillo, Sonora.

Fuerza Competitiva	Alto	Moderado	Bajo
Amenaza de posibles entrantes o competidores potenciales.	✓		
Poder de negociación de los compradores.	✓		
Poder de negociación de los proveedores.		✓	
Amenaza de productos sustitutos.		✓	
Intensidad de la rivalidad entre los competidores ya establecidos.		✓	

*En la presente Tabla se muestra la evaluación global de la industria de la construcción en la ciudad de Hermosillo, Sonora, destacándose de acuerdo al resultado, una situación de riesgo moderado si se pretende ingresar al sector industrial de la construcción. Fuente: Elaboración propia a partir de los resultados de los cuestionarios aplicados.*

## CONCLUSIONES

Para la presente investigación fue necesaria la consulta de fuentes documentales oficiales; así como una investigación de campo en el sector industrial dedicado a la construcción en el municipio de Hermosillo, Sonora. En ese sentido, se concluye que a partir del análisis del modelo holístico de las cinco fuerzas de Michael Porter y de las relaciones comunes que se dan entre las principales empresas posicionadas en el sector industrial del municipio, que la industria de la construcción está conformada por 24 empresas que se dedican a diferentes actividades económicas dentro del sector de la construcción, las cuales no llevan a cabo de forma efectiva y en ocasiones es nula la implementación de barreras de ingreso para frenar la entrada de posibles competidores al mercado por el cual se compite. Partiendo de lo que dice Porter (2010), las nuevas empresas representan una amenaza, ya que conllevan más capacidad productiva, que si bien es cierto, en este sector en particular la demanda de capital de trabajo es muy alto, no significa que no puedan ingresar cuando las barreras de entrada son casi nulas.

Ahora bien, el sector industrial perderá su atractivo, en la medida en que ingresen más participantes a competir; asimismo, de la capacidad de reacción que tengan las empresas ya establecidas ante el ingreso de nuevos competidores. Un factor importante en este sector industrial, es el poder de negociación de los compradores, ya que es tan fuerte que pueden “exprimir” las ganancias o utilidades del sector, exigiendo y negociando precios más bajos, negociando índices de calidad más altos y volúmenes de compra. Este fenómeno está dado por la estandarización de los productos y servicios que se ofrecen en el sector industrial, lo que al comprador no le es significativo cambiar de proveedor, en otras palabras, no existe una verdadera identidad o lealtad con la marca.

# **IMPORTANCIA DE SERVICIOS E INFRAESTRUCTURA PARA PERSONAS ADULTAS MAYORES Y DISCAPACITADAS EN COMUNIDADES RECEPTORAS DE TURISMO, CASO SAN JOSÉ DE GRACIA, AGUASCALIENTES**

Araceli Gutiérrez Guzmán, Universidad Autónoma de Aguascalientes  
Haydeé Aguilar Romero, Universidad Autónoma de Aguascalientes  
José Gabriel de la Rosa Ponce, Universidad Autónoma de Aguascalientes  
Juan Carlos Moreno Aguilera, Universidad Autónoma de Aguascalientes

## **RESUMEN**

*En este trabajo se ha examinado la firme tendencia de ofertar productos turísticos orientados a cubrir necesidades de los consumidores reales y potenciales, segmentando los mercados por variables orientadas a identificar las preferencias y carencias de esos mercados, sin dejar de lado las variables socioeconómicas y demográficas que apoyan las particularidades de los segmentos. Es necesario resaltar la importancia de contar con los servicios e infraestructura en comunidades receptoras de personas de todo nivel social y capacidad para disfrutar los atractivos que constituyen el elemento básico para el desarrollo del turismo. Por lo cual, se puede enfatizar que la comunicación y convivencia son elementos básicos para el desarrollo del ser humano, pero con frecuencia son negados a los ancianos; esto puede deberse a que el mundo contemporáneo está acostumbrado a dar oportunidad principalmente a personas en edad productiva o con poder adquisitivo considerable. Asimismo suele suceder con las personas discapacitadas o minusválidas. Cabe mencionar que en el Estado de Aguascalientes, en lo referente a desarrollos turísticos, aún existen zonas marginadas, ya sea por carecer de recursos naturales o de técnicas y financiamiento para su explotación. Particularmente el Municipio de San José de Gracia que la mayor parte de su población son comunitarios que cuidan de sus tierras.*

**PALABRAS CLAVES:** Servicios e infraestructura turística, desarrollo, cultura

## **IMPORTANCE OF SERVICES AND INFRASTRUCTURE FOR ADULTS, ELDERLY AND DISABLED IN COMMUNITY RECIPIENTS OF TOURISM, SAN JOSÉ DE GRACIA, AGUASCALIENTES CASE**

## **ABSTRACT**

*This work examined the strong trend of offering tourism products orientated to meet needs of actual and potential consumers, segmenting markets by targeted variables to identify the preferences and needs of these markets, without forgetting the socio-economic and demographic variables that support the particularities of the segments. It is necessary to highlight the importance of services and infrastructure in receiving communities of people from all social levels and ability to enjoy the attractions that constitute the basic element for the development of tourism. Therefore, it can be emphasized that communication and coexistence are basic elements for the development of the human being, but they are frequently denied to the elderly; This may be due to which the contemporary world is accustomed to mainly give opportunity to people in productive age or with considerable purchasing power. It also often happens with disabled or handicapped persons. It is worth mentioning in the State of Aguascalientes, in relation to touristic developments, there are still marginalized areas, either by lack of natural resources or*

*techniques and financing for their exploitation. The municipality of San José de Gracia that most of its population in particular are community that they care for their land.*

## INTRODUCCIÓN

El Turismo es y ha sido considerado un fenómeno social, económico, cultural y político en México y el mundo, por lo que se debe alentar particularmente a los Estados para que destinen mayores recursos a su desarrollo y fundamentalmente a la capacitación de los prestadores de servicios e infraestructuras especializadas que este requiere. Situándonos en Aguascalientes podemos mencionar el desarrollo que se ha llevado a cabo en el municipio de San José de Gracia donde se implemento una infraestructura para reactivar la economía en este lugar ya que era el municipio con menor desarrollo y mas pobre del estado; el proyecto fue enfocado principalmente al sector de turismo religioso con el cual se buscaba hacer mas atractivo el lugar y aumentar el numero de visitantes atrayéndolos con este segmento.

Sin embargo, a pesar de los efectos visibles en la infraestructura y economía, el turismo puede contribuir a generar cambios socioculturales en las sociedades anfitrionas, incluyendo cambios en los sistemas de comportamiento, estilos de vida tradicionales, reacciones familiares e incluso a la estructura comunitaria, pues se tiene que reconocer que dichas comunidades son un componente fundamental en cualquier sistema turístico pues son las que tendrán un trato directo con el turista. Por lo anterior se realizo la investigación sobre los impactos económicos, sociales y de infraestructura ocasionados por el desarrollo turístico así como el perfil del visitante en San José de Gracia de la cual se obtuvo la percepción de los residentes y visitantes sobre los efectos del turismo en su comunidad.

Es evidente que al conocerse los diversos grupos sociales que habitan en un estado se estrechan más las relaciones entre los hombres que los constituyen. Por tal motivo es conveniente analizar el aspecto social. Por ello es que se debe considerar al ser humano, desde el momento de su concepción quien esta protegido por las leyes naturales y jurídicas, las cuales en el momento de su nacimiento se convierten en derechos inherentes al individuo, como son la alimentación, la vivienda, el vestido y la recreación y de manera más subjetiva el amor, la comprensión, cuidado, libertad y respeto de sí mismo y de sus semejantes. Aún cuando los avances tecnológicos y médicos nos aseguran una existencia más prolongada que en generaciones anteriores, no siempre nos preocupamos por establecer las mejores condiciones para esa etapa de nuestra vida a la que conocemos como vejez; no se habla de los cuidados que cada cual debe procurar hacia su salud individual, sino a la que en general brindamos como sociedad a las personas adultas mayores y/o discapacitadas. Por lo que en éste trabajo se ha realizado un análisis de los servicios que se ofrecen por parte de los prestadores turísticos, para poder implementar algunas mejoras en sus instalaciones con el fin de cubrir las necesidades de este tipo de turismo.

## REVISIÓN LITERARIA

Primeramente debemos conocer las necesidades de las personas para determinar y clasificar los servicios e instalaciones que se deben contemplar en el sector turístico, para así poder brindar la atención que se merecen todos y cada una de las personas que hagan turismo, porque según "El Turismo es un fenómeno social que consiste en el desplazamiento voluntario y temporal de individuos o grupos de personas que fundamentalmente por motivos de recreación, descanso, cultura y salud, se trasladan de su lugar de residencia habitual a otro en el que no ejercen alguna actividad lucrativa ni remunerada, generando múltiples interrelaciones de suma importancia económica y cultural" (De la Torre Padilla, Oscar, El Turismo Fenómeno Socioeconómico, Social y Cultural, Textos Universitarios, p.17).

Turismo cultural.- La SECTUR (Secretaría de Turismo), define el turismo cultural como: Aquel viaje turístico motivado por conocer, comprender y disfrutar el conjunto de rasgos y elementos distintivos, espirituales y materiales, intelectuales y afectivos que caracterizan a una sociedad o grupo social de un destino específico (SECTUR-CESTUR, Estudio Estratégico de Viabilidad de Turismo Cultural, 2002).

Turismo religioso.- es el desplazamiento de personas a los lugares de culto por motivación religiosa o por el afán de conocer un sitio, según Adela Mariscal (El Fenómeno Religioso. Presencia de la Religión y la Religiosidad en las Sociedades Avanzadas Sevilla junio de 2007). En este orden de ideas la competitividad del turismo implica calidad de los productos y servicios bajo criterios de sustentabilidad y productividad empresarial, a fin de estar en posibilidad de generar ingresos superiores al promedio de los competidores y crear bienestar entre la población. Asimismo se debe mejorar la calidad de vida de la sociedad a través de una correcta prestación de los servicios a la comunidad en un espacio físico urbano y/o rural, mediante la capacitación a los prestadores de servicios para la plena integración de las personas adultas mayores y con capacidades restringidas (PCR), durante el tiempo libre dedicado al turismo y la recreación en un ámbito cultural o natural.

Es importante como referencia establecer la diferencia entre VALIA Y CAPACIDAD. "Tradicionalmente encontramos dos conceptos: discapacidad y minusvalía, muchas veces utilizados como sinónimos, que marginan consciente o inconscientemente a un grupo numeroso de personas. En primer lugar se presenta la necesidad de diferenciar las capacidades/discapacidades y las valías/minusvalías a fin de comprender que esta problemática social nos involucra a todos y no solo a un grupo reducido de personas. Las capacidades son cuestiones propias del individuo y hay distintos tipos de discapacidades: las motrices, las visuales, las auditivas, etc. En cambio la "valía es la relación entre la capacidad de uno y el medio físico que lo rodea. Podemos decir que por un lado las capacidades o discapacidades son temas médicos, y por el otro que las valías o minusvalías son temas de todos porque todos somos minusválidos en algún momento de nuestra vida. Como ejemplo de esta afirmación se puede decir que:

Un niño es minusválido cuando no alcanza a pulsar las teclas de una maquina despachadora de refrescos, Una mujer embarazada o un anciano que no puede acceder a un hotel o restaurante por distintos impedimentos físicos (una escalera por ejemplo), Una persona enyesada o persona adulta mayor, carece de equipamiento urbano en los espacios públicos para sus necesidades de descanso. Se define a la "Persona en edad senil, último periodo de la vida, que comienza generalmente a los sesenta años" (Nuevo Diccionario Enciclopédico, Editorial Gijalbo). También aquellos que tienen restricciones motoras, visuales y auditivas - que de acuerdo a la UNESCO son el 10% de la población mundial -, que son poco advertidos debido a la eficiencia de las barreras arquitectónicas y urbanísticas que impiden su integración a la vida activa y que junto con sus parientes directos según estadísticas mundiales afectan en conjunto al 40% de la población mundial..." (Jorge Barroso- Luis Grünwald. "Turismo Accesible: una propuesta educativa", Turismo Accesible: reflexiones y experiencias en el campo de la accesibilidad, Editor Fundación Delia Lascano de Napp, 1996). Por lo antes descrito se contempla a las personas adultas mayores en un crecimiento significativo y en aumento constante en el caso de las personas con capacidades restringidas siendo así un mercado potencial muy grande para cubrir sus necesidades.

El concepto de Producto Turístico ha sustituido el concepto de Destino Turístico por considerarse más adecuado a los efectos de la actual concepción del marketing turístico, así, se define al "Producto Turístico como la integración de los recursos naturales y/o culturales con los respectivos servicios, en una unidad que justifique un desplazamiento turístico" (Plan Federal de Marketing Turístico: Consideraciones Preliminares. Comisión de Marketing Turístico, Consejo Federal de Turismo, 1992). "Los espacios turísticos deben ser el ámbito del encuentro y de la acción social. Deben constituir armazones que favorezcan la creación de oportunidades para una vida individual y social enriquecida e integra. Sin embargo, la falta de planes y profundas razones sociales y económicas han ido afectando esa función

social y las han convertido en fuentes de tensión, de divergencia y frustración. Si estas circunstancias son de consecuencias negativas para las personas en plenitud de sus capacidades y sentidos, son de efectos aún más agudos para aquellas cuyas capacidades han sufrido una merma.

Si como asevera Lewis Mundford "... el idioma y la ciudad son las más altas expresiones de cultura del hombre...", resulta inconcebible que se siga diseñando y usando patrones socioculturales que marginan a importantes núcleos de la población. No sólo las ciudades, sino su organización vivencial, ignoran y segregan a los que no concuerdan con el modelo humano adoptado (III Congreso Interdisciplinario sobre Barreras Arquitectónicas, Urbanísticas y del Transporte- "Tiempo Libre: Turismo y Recreación" Documento de Base, noviembre de 1992). Las barreras arquitectónicas son todo obstáculo que dificulta, entorpece o impide a personas adultas mayores, discapacitadas o minusválidas su libre desplazamiento en lugares públicos, exteriores o interiores, o el uso de servicios comunitarios. Las barreras arquitectónicas, urbanísticas y del transporte son particularmente crueles con:

*Los niños:* El tránsito parece estar concebido en la suposición que el peatón es un remanente de la población motorizada; el niño pierde en este esquema la posibilidad de transitar, de acceder, inclusive de utilizar la ciudad sin el cuidado paranoico de los mayores.

*Personas Adultas Mayores:* Su "espacio defendible", el que pueden recorrer sin excesiva angustia, es de escasa extensión y está acotado por la falta de enseres urbanos y toda muestra de que la comunidad los entiende en su peculiar forma de vida.

*Los discapacitados:* Si sólo advertimos en el uso de la ciudad una proporción sensiblemente menor, se debe a la eficacia de las barreras arquitectónicas, urbanísticas y del transporte que marginan e impiden su integración a una vida activa.

*Los discapacitados transitorios:* Embarazadas, enyesados, discapacitados viscerales.  
(III Congreso Interdisciplinario Sobre Barreras Arquitectónicas, Urbanísticas y del Transporte - "Tiempo Libre: Turismo y Recreación" Documento de Base, noviembre 1992)

### Objetivos

Lograr la participación de todos los que prestan el servicio de atención a visitantes al Cristo Roto.  
Identificar los servicios turísticos que se ofrecen en el Municipio de San José de Gracia para comparar sus condiciones y diferencias en atención a las Personas Adultas Mayores y discapacitadas, que visitan el lugar. Proponer acciones a los organismos y ejidatarios para implementar servicios acordes en las instalaciones turísticas para el uso por Personas Adultas Mayores, y toda aquella que así lo requiera.

### **METODOLOGIA**

Primeramente se realizó la investigación mediante el método de observación, que consistió como su nombre lo indica en concentrar la atención en aquellos aspectos involucrados con las personas adultas mayores, que manifiestan por una parte lo difícil que es para ellos visitar el lugar por las condiciones geológicas que este tiene y por otra la atención que se proporciona por parte de las personas que prestan los servicios turísticos así como las instalaciones con que se cuenta. También se aplicó un Análisis Documental, mediante el cual se revisan los documentos que sustentan las acciones a realizar por parte de entidades, organismos y personas involucradas, mismo que requieren de una interpretación en la información de carácter social. Por último se reafirmó mediante el método de la Encuesta, el cual se puede tratar en forma abierta el tema y los principales problemas a los que se enfrentan las Personas Adultas Mayores, utilizando para ello un cuestionario estructurado para obtener la información requerida.

Encuesta para Visitantes a San José de Gracia, Aguascalientes.

Folio \_\_\_\_\_

Solicitamos su atención para responder esta encuesta, ya que mediante esta investigación deseamos conocer sobre las necesidades y la falta de servicios por parte de los visitantes tanto de personas adultas mayores como personas con discapacidad o minusvalía. Esta información será confidencial y servirá principalmente como casos de estudio para estudiantes de la Lic. En Gestión Turística.

1. Sexo:      Masculino ☐      Femenino ☐      Edad: \_\_\_\_\_
2. Motivo por el cual visita el municipio de San José de Gracia.  
a) Cultura      b) Recreación      c) Religión      d) otro \_\_\_\_\_
3. Considera que existe algún lugar en San José de Gracia que le brinde información completa acerca de su historia, costumbres y su cultura?  
Si ☐      No ☐
4. Le gustaría que en San José de Gracia se contará con los servicios de: (Enumere en orden de importancia).  
d) \_\_\_\_\_ Hoteles  
e) \_\_\_\_\_ Restaurantes con todos los servicios  
f) \_\_\_\_\_ Servicio de asistencia para personas con minusvalía (sillas de rueda o elevador para llegar hasta el cristo roto)
5. Conoce los atractivos y recursos turísticos que se encuentran en San José de Gracia como:  
a) Santuario del Cristo Roto      b) Parque Boca de Tunel      c) Sierra Fría  
d) Presa Presidente Calles
6. Gusta de asistir a lugares religiosos  
a) Definitivamente Si      b) En ocasiones Si      c) Casi No      d) Definitivamente No
7. Consideras la visita al Cristo Roto como Turismo Religioso.  
Si ☐      No ☐
8. La cuota que se paga por visitar el Santuario del Cristo Roto, en San José de Gracia le parece.  
a) excesivo      b) aceptable  
c) poco aceptable      d) nada aceptable
9. Regresaría Usted al lugar  
☐      Si ☐      No
10. Consideras que existe la atención para personas adultas mayores y personas que requieran de atenciones especiales para trasladarse en San José de Gracia (especialmente en el Santuario del Cristo Roto) en cuanto a servicio turístico.

Si ☐ ☐ No

¡ ¡ ¡ Gracias ! ! !

#### Encuesta/Entrevista a Prestadores de Servicio Turístico Y Dependencias del Municipio

1. Acciones que se han llevado a cabo para atender a las personas que requieran de atenciones especiales.
  - a) Renta o préstamo de sillas de ruedas para desplazarse en el lugar
  - b) Acondicionamiento del lugar con la construcción de caminos para llegar hasta el Santuario del Cristo Roto.
  - c) Verificar que los restaurantes ofrezcan alimentos higiénicos y con una dieta balanceada
  - d) Contemplar espacios para personas discapacitadas o personas adultas mayores
2. En San José de Gracia, Aguascalientes, ¿cómo se consideran los factores tales como: la edad avanzada, falta de coordinación y reflejos, disminución de capacidades físicas y o mentales, en las Personas?
3. De implementarse programas de mejora para los servicios que se ofrecen en el lugar de San José de Gracia, ¿Quiénes estarían involucrados?
  - a) Dependencia estatales
  - b) Organismos independientes
  - c) Ejidatarios
  - d) Prestadores de Servicios

#### RESULTADOS

Mediante la observación se concentro la atención en aquellos aspectos, que representan ser la parte difícil para las personas adultas mayores y lo difícil que significa para ellos visitar el lugar por las condiciones geológicas que este tiene y por otra la atención que se brinda por parte de las personas que prestan los servicios turísticos así como las instalaciones con que se cuenta. También mediante el Análisis Documental, se revisaron datos que sustentan la importancia del estudio del lugar tales como que: El municipio de San José de Gracia se localiza en la región noroeste del estado, a 57 kilómetros de la ciudad de Aguascalientes, en las coordenadas 102°25' longitud oeste y 22°09' latitud norte, y a una altura de 2,050 metros sobre el nivel del mar. La población total en el Municipio es de 7631, y se divide en 3541 son menores de edad, 4090 son adultos de los cuales 695 tienen más de 60 años.

##### Atractivos del Lugar

*Santuario del Cristo Roto:* Monumental obra de 25 mts. De altura con una base de 3 mts. que se encuentra en el corazón de la Presa Plutarco Elías Calles, hecha en honor a la mutilación que sufrió el antiguo Pueblo de San José de Gracia, debido a la construcción de la Cortina de la Presa Plutarco Elías Calles.

*Parque de aventura Boca de Túnel:* Destino eco-turístico que se localiza al norte del Municipio, anhelado por los visitantes que buscan diversos espacios para desarrollar actividades relacionadas con la naturaleza

y el turismo de aventura en el cual hay un circuito compuesto por 560mts. de 13 puentes colgantes y 2 tirolesas, rapel, escalada, caminata, una pista de 9 kms. de ciclismo de montaña, entre otros ;explorando y conociendo la flora y la fauna que identifica la identidad del sitio. Es un proyecto totalmente independiente, impulsado en un principio por el gobierno del estado y siendo apoyado actualmente solo en promoción; este proyecto es manejado al 100% por la comunidad receptora sin la intervención de terceros.

## ESTRUCTURA

Lugar que cuenta con una magnífica Pista de Ciclismo de montaña con un perímetro de 9 Km. de recorrido. Así mismo, cuenta con 13 puentes colgantes y dos tirolesas una de 90 mts. y la otra de 120 mts. 3 cabañas para 8 personas, así como centros de consumos de alimentos

*Personal:* Se obtuvo la información que el personal fue preparado en un inicio por expertos en el área, con fines de otorgar un servicio mas profesional y de mayor calidad.

*Mercado Promedio:* El promedio del visitante oscila en una edad de 20 a 35 años, personas con características aventureras. Gasto Promedio en el Sitio por persona es de: \$225 Servicios especiales  
Es un lugar totalmente contraindicado para personas con discapacidades, ya que no cuenta con facilidades ni infraestructura para el apoyo de las mismas.

*Sierra Fría:* Misma que es considerada el gran pulmón de Aguascalientes y su principal manto acuífero Comprende una extensión de 74 mil hectáreas de sierra, bosques y parajes extraordinarios, llenos de una belleza natural impresionante. En estas tierras también se encuentran 8 ranchos cinegéticos considerados UMAS donde se practica la caza controlada.

*Cortina de la Presa Presidente Calles:* Localizada al sur de la cabecera Municipal, construida por el General Plutarco Elías Calles del 30 de mayo de 1927 al 30 de junio de 1928, con una longitud de 283.42 mts. y con una altura de 63 mts. del lecho del río al cimientito y 66.40 mts. del lecho del río hasta la Corona. Cuenta con 3 válvulas de 54” las cuales desaguan 16 mil lts. por segundo y los cuales son usados para regar hectáreas de temporal en los municipios circunvecinos. La Presa Presidente Calles, tiene una capacidad de almacenamiento de hasta 340 millones de metros cúbicos de agua, con una profundidad de 63mts, lugar en el cual se encuentra el parque San José; donde se realizan Paseos en Lancha visitando los principales atractivos tales como Santuario del Cristo Roto, Los cañones Naturales, el Cerrito de En medio, Cerrito del Meco y El Cajón del Muerto, lugares en donde se dieron los primeros asentamientos chichimecas.

*Cañones Naturales:* Localizados al sur de la presa Calles. Son sitios naturales ecológicos que nos deslumbran con su estético paisaje entre cañadas y barrancas en un promedio de 2km de recorrido en lancha, hasta llegar al cerrito de en medio, el grandioso lugar del mundo Chichimeca. Por último mediante el método de la Encuesta, se aplicaron 60 encuestas a visitantes en 5 ocasiones (fines de semana) de manera aleatoria que involucraba a mujeres y hombres, por lo que estas fueron un total de 300 personas encuestadas. También fueron aplicadas 20 encuestas entre prestadores de servicios turísticos y empleados de las dependencias y organismos (ejidatarios). Por lo cual se logro recabar información de las acciones que se puedan realizar o hayan sido realizadas por parte de la entidad, organismos y personas involucradas, y que para ello se requiere de una interpretación y capacitación en la información de carácter social, el cual se puede tratar en forma abierta el tema y los principales problemas a los que se enfrentan las Personas Adultas Mayores, así como personas discapacitadas y/o minusválidas.

*Complejo San José de Gracia (Cristo Roto):* Encargado del complejo comandante Quezada (encargado del proyecto) C.P José Antonio Félix (administrador general del proyecto) El restaurante las playas

ubicado a un costado de la presa calles en el complejo cristo roto, esta administrado por una persona la cual es contratada por una serie de comuneros siendo un total de 253, en este complejo la mayor parte de los negocios ubicados son acreedores y administradores los locales o comunales. Asistencia a Minusválidos Las instalaciones del cristo roto no están al 100% desarrolladas para recibir a gente con capacidades especiales o minusválidas, ya que no cuenta con zonas especiales, con la excepción de que los sanitarios si cuentan con infraestructura necesaria, así como la central camionera, aunque el patronato del lugar facilita a las personas sillas de ruedas para poder acceder a las embarcaciones y así poder llegar al destino que es el cristo roto, lugar donde no se cuenta con rampas para poder acceder con las sillas; tampoco se cuenta en el lugar con señalización específica para minusválidos, haciendo creer al visitante que no existe ningún tipo de apoyo.(actualmente se encuentra en proceso de autorización la asignación de recursos para la instalación de señalización.)

*Actualidad de la Presa:* Para mayo del 2012, la presa se encontraba al 10% de su capacidad, lo cual ha sido motivo para que la gente se desanime a visitar el lugar, ya que se muestra un ambiente desolador, lo cual afecta de forma directa a toda la comunidad.

*Permisos:* Los lancheros para poder laborar con sus embarcaciones tienen que dirigirse al lago de Chapala, donde se encuentra la dependencia para poder tramitar su permiso llamada capitania de puertos, siendo la sede principal en puerto Vallarta.

*Control:* Las instalaciones del cristo roto, es sometido de forma mensual por chequeos y revisiones por parte de: Protección Civil: esta dependencia ayuda mas que nada como apoyo en eventos masivos como lo es la semana santa y días de muertos.

PROFEPA (La Procuraduría Federal de Protección al Ambiente: se encarga de que el lugar cumpla con las reglas de protección ambiental y no contamine a nivel nacional (como chequeos del cambio de aceite de las embarcaciones). PROESPA (Procuraduría Estatal de Protección al Ambiente), que se encarga de que el lugar cumpla con las reglas de protección ambiental y no contamine a nivel estatal. SAGARPA (Secretaría de Agricultura, Ganadería, Desarrollo Rural, Pesca y alimentación): encargados de apoyo y control en la ganadería y pesca del lugar. SEMARNAT (Secretaría de Medio Ambiente y Recursos Naturales): el cuidado de los recursos naturales e hidráulicos. SCT (Secretaría de Comunicaciones y Transportes): chequeo de permisos y papeles para el uso de las embarcaciones y transportes terrestres. IMAE (Secretaría del Medio Ambiente del Estado): cuidado y chequeo de la protección ambiental y cuidado del mismo. Todo esto para que pueda laborar de la forma correcta sin romper los protocolos establecidos, el complejo de San José de Gracia.

*Promedio de edad de visitantes al lugar:* El comandante Quezada hizo énfasis que el turismo religioso promedio que asiste al lugar tienen edad de entre 30 a 35 años, los que suelen trazar una ruta desde Zacatecas, Aguascalientes y Jalisco, visitando todos los santuarios existentes. Sin embargo también asisten familias en edad que va desde 1 a 90 -98 años, quienes tienen la dificultad para llegar hasta el Santuario.

*Régimen:* El patronato rige estacionamiento, Central camionera, sanitarios; se le cobra a los locatarios una tarifa mensual, los lancheros otorgan el 25% del costo del boleto como apoyo. El patronato esta conformado por 67 personas, los cuales son administrativos, seguridad, limpieza, entre otros. El complejo Cristo Roto y el municipio en general de San José de Gracia cuentan con establecimientos de hospedaje, centros de consumo, servicios en general, y operadores de recorridos.

## CONCLUSIONES

El proyecto Cristo Roto realizado en San José de Gracia, es un plan que en años pasados fue muy ambicioso y en el cual se pusieron muchas expectativas, sin embargo actualmente por las contingencias ambientales pueden frustrarse, ya que la presa es el factor principal para la consolidación del proyecto turístico, pues los paseos realizados en lanchas podrían extinguirse, y estos podrían ser sustituidos por paseos a caballo, o en cuatrimotos, esperando que la naturaleza beneficie a la población con el vital líquido para poder prevalecer y crecer en materia turística y la recepción de visitantes. La comunidad depende al 100 por ciento de este proyecto ya que es de donde se vienen beneficiando en materia económica y social. Siendo necesario revisar la infraestructura turística, identificando el tipo de adaptaciones que es necesario realizar para facilitar el desplazamiento, la estadía y satisfacción de estas personas que requieren de la comprensión y apoyo de los profesionales del turismo así como de las empresas dedicadas a la actividad Turística. En otro tema el lugar tiene que llevar una mejor administración y mayor control, dándole prioridad en tema de infraestructura para las personas minusválidas, pues es un mercado que bien llevado de la mano puede traer muchos beneficios.

En este trabajo de investigación, también se pudo observar como se desarrolla un proyecto enfocado hacia un beneficio de la comunidad, con un enfoque de desarrollo social y promoción turística del Municipio, el complejo del santuario del Cristo Roto, aunado al parque de aventura boca de túnel y el conjunto de presas que lo hacen un destino que se podría aprovechar de mayor manera, sin embargo se pudo apreciar algunas limitantes en este proyecto, con respecto a que éste pudiera tener un respaldo estatal y un apoyo más notorio de organismos como SECTURE (Secretaría de Turismo del Estado) y a nivel federal, se obtuvo la información por parte de encargados e involucrados que el apoyo es casi nulo que más que nada tienen que hacer del proyecto algo muy personal y con gente del municipio únicamente, en cuanto a la infraestructura se requiere una mayor atención y más apoyo para personas con capacidades limitadas. Considerando también la falta de capacitación por parte de los organismos y las dependencias involucradas para asesorar y capacitar al personal de la zona y así poder ofrecer el servicio con calidad y de manera integral.

# MONTOS A PAGAR POR UN MEJOR SERVICIO DE AGUA EN LOS HOGARES DE LA CIUDAD DE AGUASCALIENTES

Roberto González Acolt, Universidad Autónoma de Aguascalientes

Manuel Díaz Flores, Universidad Autónoma de Aguascalientes

Luís Lenin Herrera Díaz de León, Universidad Autónoma de Aguascalientes

## RESUMEN

*El estudio presenta los resultados de una encuesta a hogares en la ciudad de Aguascalientes. Un aspecto central de la encuesta fue preguntar cuánto pagarían por mejorar el servicio de agua doméstica, las cantidades de pago serán utilizadas en una investigación posterior donde se preguntará a las familias su disposición a pagar (DAP) por un servicio que implique una mayor cantidad y calidad del agua que consumen. Los resultados derivados arrojan que las cantidades a pagar fueron: 120, 150, 200, 250, 300, 350, 450, 550, 700. También, con base a otras preguntas de la encuesta se encontró que las familias invierten en cisternas y tinacos, compran garrafones de agua y/o refrescos, lo cual sugiere que el servicio de agua no es eficiente y de calidad en la ciudad de Aguascalientes.*

**PALABRAS CLAVE:** disposición a pagar, método de valoración contingente, servicio de agua, hogares y ciudad de Aguascalientes.

## AMOUNTS PAYABLE FOR IMPROVED WATER SERVICES IN THE HOUSEHODS OF THE CITY OF AGUASCALIENTES

### ABSTRACT

*The study shows the results of a survey for households in the city of Aguascalientes. A central point of the survey was to ask how much money they would pay to improve the domestic water service, payment amount will be to used in a future research, with the objective to question a households their willingness to pay (WTP) for changes in the quality domestic water service. The results show that household would be willing to pay the following amounts: 120, 150, 200, 250, 300, 350, 450, 550, 700. Also with the results of the survey, we show a perspective of the obstacles that face these households with the service. The households invert in tanks and water tanks and they buy bottles of water and sodas, because the domestic water service is inefficient.*

**JEL:** Q25, Q59, R23

**KEYWORDS:** willingness to pay, contingent valuation method; water service, households and city of Aguascalientes

## INTRODUCCIÓN

El municipio de Aguascalientes está asentado en la región occidental de la Altiplanicie Mexicana con superficie de 960.5 km<sup>2</sup> y una altura de 1,870 metros sobre el nivel del mar. En el municipio destaca la ciudad, la cual está en el grupo de ciudades con un índice general de competitividad adecuada (INCO, s.f.). La dinámica económica de la ciudad se expresa en el crecimiento poblacional, tan solo en quince años (1995-2010) la población total creció en alrededor de 36 por ciento (INEGI, s.f.), y junto con la zona conurbada del municipio de Jesús María aglutina el 83 por ciento del PIB estatal (COTAS, 2006). Esta

pujanza económica implica un mayor consumo de agua en un contexto donde la disponibilidad natural base de agua promedio por habitante ha decrecido de 416.9 m<sup>3</sup>/hab/año en 1990 a 281.6 m<sup>3</sup>/hab/año en 2005, y una sobreexplotación del acuífero Ojocaliente-Aguascalientes-Encarnación -el principal abastecedor del vital líquido para la ciudad-, que conlleva un aumento en la profundidad de los niveles de bombeo y un mayor cantidad de reparaciones a los pozos de abastecimiento. Los cada vez más elevados costos de extracción del agua y disminución de su calidad se manifiestan en hundimientos y agrietamientos del suelo, con efectos dañinos en la infraestructura (COTAS, 2006).

Es evidente que el simple aumento de las tarifas de agua de uso doméstico en la ciudad de Aguascalientes no mejorará la sustentabilidad del servicio. Los análisis por el lado de las políticas de oferta proporcionan información sobre la tarifa de agua que debe ser fijada. Sin embargo, en los últimos años las políticas por el lado de la demanda vienen cobrando fuerza, un enfoque consiste en cuestionar a las familias su disposición a pagar (DAP) por un mejor servicio del agua en su hogar. A simple vista este método puede parecer contradictorio o erróneo, no obstante, en la actualidad los hogares de la ciudad de Aguascalientes están gastando en la compra de agua embotellada o invirtiendo en almacenar o mejorar la calidad del agua que llega a sus hogares. Además, la DAP ofrecería información sobre la valoración ambiental del recurso por parte de los consumidores (Soto, 2007; Sanjurjo, 2008; Avilés et al, 2010).

El objetivo de este documento fue obtener con el apoyo de una encuesta piloto las cantidades de la DAP de los hogares en la ciudad de Aguascalientes por tener un servicio de agua doméstica de calidad, cabe mencionar que estos montos serán incluidos aleatoriamente en la encuesta final, en la pregunta relacionada con la DAP por un servicio satisfactorio del agua. Además, con otra información de la pre-encuesta se muestra una perspectiva de la problemática que afrontan las familias de la ciudad con el servicio de agua.

## REVISIÓN LITERARIA

El método de valoración contingente (MVC) se basa en un cuestionario donde se les pregunta a las personas la valoración que le proporciona un determinado bien ambiental, el encuestador diseña el mercado para conocer la disposición a pagar del entrevistado por mantener, mejorar o cualquier otro cambio positivo del bien; o su disposición a ser compensado para renunciar a éste. Para una mayor credibilidad del método es vital que el pago se identifique fácilmente y sea aceptable. Los formatos de la pregunta pueden ser de la siguiente forma (Azqueta, 2007).

*Formato abierto:* El encuestador lanza la pregunta y espera la respuesta de la persona

*Formato subasta (bidding games):* El entrevistador presenta una cantidad, y cuestiona al encuestado si pagaría esa suma o no, dependiendo de la respuesta, la cifra original se modifica, si esta es positiva se eleva, y si es negativa disminuye, hasta que el encuestado se queda con una cifra final.

*Formato dicotómico:* El entrevistado sólo tiene dos opciones: si o no para responder sobre su disposición a pagar por el bien ambiental. Este formato es el de mayor uso y aceptación.

El MVC puede presentar ciertos problemas que tienen que ver con los sesgos en la respuesta del entrevistado. A continuación se describen los principales sesgos de actitud de los encuestados (Riera, 1994):

*Sesgo estratégico:* El entrevistado tiene motivos favorables o desfavorables para revelar el verdadero precio que estaría dispuesto a pagar, lo que refleja que su respuesta es estratégica.

*Sesgo de complacencia con el promotor de la encuesta:* El individuo que responde tiende a contestar lo que cree que el entrevistador espera de él, porque supone que una imagen solidaria o preocupada por la problemática que se le plantea le granjeará la simpatía de quién lo entrevista.

*Sesgo Interpretación de las medidas:* El encuestado responde al cuestionamiento de la determinación del valor con una disposición a pagar distinta al valor utilizado.

*Sesgo de restricciones presupuestarias:* Sucede, por ejemplo, cuando en el diseño de un cuestionario se restringe que el entrevistado valore el bien basado en su ingreso personal, sin embargo, implícitamente, lo valora considerando su ingreso familiar. Riera (1996) describe nueve pasos principales que debe cubrir un estudio de VC:

1. Definir con precisión lo que quiere medir en unidades monetarias
2. Definir la población relevante
3. Elegir que método de valoración utilizar
4. Tipo de entrevista: personal, telefónica o por correo
5. Definición de la muestra
6. Redacción del cuestionario
7. Llevar a cabo las entrevistas
8. Trabajo estadístico de los datos
9. Interpretación de los resultados

## METODOLOGÍA

La demanda de agua puede ser modelada como la de cualquier otro bien o servicio, por lo mismo bajo el análisis de la teoría microeconómica se puede partir de una función de gasto que se busca minimizar sujeta a una función de utilidad (Casey et al, 2006):

$$M(W, X) \quad (1)$$

Sujeto a

$$U = U(W, X) \quad (2)$$

M es el ingreso del consumidor, W el servicio de agua doméstica, X un bien compuesto, U la utilidad del consumidor. La solución implica que la minimización del gasto dada la restricción de la utilidad tome la siguiente forma:

$$M^* = M(P_W, P_X, U) \quad (3)$$

Donde  $P_W$  es el precio del servicio de agua doméstica y  $P_X$  precio del bien compuesto. Ahora bien si suponemos que el servicio de agua es un bien ambiental, entonces el consumidor no observa  $P_W$ , y en su elección de  $W$  puede elegir pagar o no pagar por éste, por lo que la función de gasto se presenta como:

$$M^* = M(W, P_X, U) \quad (4)$$

En esta situación la disposición a pagar (DAP) por mejorar el servicio de agua es la diferencia entre dos funciones del gasto con  $W_1 > W_0$ , y el excedente del consumidor (EC) puede ser estimado por medio de la siguiente diferencia

$$EC(W_0, W_1) = M(P_X, W_0, U_0) - M(P_X, W_1, U_0) \quad (5)$$

El cálculo de la DAP por un mejor servicio de agua doméstica se realiza mediante la estimación del excedente del consumidor, en otros términos, la DAP es el monto de dinero que cada familia está dispuesto a renunciar, permaneciendo constante su nivel de utilidad. Un prerrequisito importante para el cálculo de la DAP consiste en tener las cantidades de pago por un mejor servicio de agua potable. En nuestro trabajo, este monto de dinero fue estimado mediante una pre-encuesta con formato abierto, donde se le pregunto al entrevistado “Existe la posibilidad de financiar un programa que elevara los estándares del servicio de agua en la ciudad de Aguascalientes, con lo cual tendrá mejores condiciones en términos de recortes mínimos y una mayor calidad del agua que recibe en su hogar. ¿Cuánto estaría dispuesto a pagar en su recibo de agua para financiar este programa?” Por otra parte, la pre-encuesta permitió identificar puntos débiles o limitaciones de la encuesta final, de hecho ambas encuestas tienen las mismas preguntas excepto la referente a la DAP. Además, con los datos obtenidos se tuvo una primera aproximación de la percepción que tienen las familias en la ciudad de Aguascalientes con respecto al servicio de agua. La encuesta piloto se aplicó en 62 viviendas de la ciudad, en el mes de Noviembre del 2011.

La pre-encuesta se dividió en las siguientes partes:

1. Introducción. Se le describió al entrevistado el objetivo de la encuesta.
2. Perfil del encuestado. Incluyó aspectos como edad, sexo, integrantes del hogar, grado de estudio y colonia donde vive.
3. Percepción sobre el servicio del agua (color, presión, etc.) y aspectos ligados a su consumo (consumo de garrafones de agua y/o refresco).
4. Planteamiento del escenario. La cantidad  $x$  que estarían dispuestos a pagar por un buen servicio de agua.

## RESULTADOS

Con la información de la pre-encuesta se obtuvo las siguientes cantidades de la DAP: \$ 120, \$ 150, \$ 200, \$ 250, \$ 300, \$ 350, \$450, \$ 550 \$ 700. En cada una de las encuestas finales se utilizará de manera aleatoria uno de los montos obtenidos en la pregunta relacionada con la DAP. Por otro lado, los resultados de la pre-encuesta nos permiten describir algunos rasgos de los hogares encuestados (Tabla 1 y 2).

Tabla 1: Aspectos socio demográficos de los encuestados

Variables Demográficas	Porcentaje de Encuestas (%)
Sexo	
Femenino	63
Masculino	37
Personas que viven en el hogar	
1	2
2-5	75
6-10	19
Más de 10	4
Grado de estudio	
No fue a la escuela	3
Primaria	30
Secundaria	23
Preparatoria	24
Universidad	18
Postgrado	2
Edad	
23-35	26
36-45	39
46-60	25
Más de 60	10

La tabla muestra información de carácter sociodemográfico de los individuos encuestados: más de la mitad son mujeres; tres cuartas partes de los encuestados viven en hogares conformados entre 2 y 5 personas; un poco más del 50 por ciento tiene niveles de instrucción básica (primaria y secundaria) y, casi todos son jóvenes y adultos maduros. Fuente: elaboración propia.

Tabla 2: Nivel de satisfacción con el servicio y la presión del agua

Nivel de Satisfacción	Esta usted satisfecho con el servicio del agua (%)	Esta usted satisfecho con la presión del agua (%)
No satisfecho	26	29
Poco satisfecho	11	8
Satisfecho	61	63
Muy satisfecho	2	—

Obsérvese en la tabla 2 que más de la mitad de los entrevistados se encuentra satisfecho con el servicio y la presión del agua. Sin embargo el 68 por ciento de los entrevistados no cuenta con el servicio las 24 horas del día. Fuente: elaboración propia.

Estas carencias en la calidad del servicio con lleva que las familias de Aguascalientes toman acciones de protección para minimizar el problema de la falta de este recurso las 24 horas del día. Así, el 34 % y 42 % de los entrevistados señalo, respectivamente, que almacena el agua en cisternas y tinacos (véase Figura 1). El 84 % no consume directamente agua de la llave (véase Figura 2), el 82 % compran entre uno y tres garrafones de agua semanales (véase Figura 3), de hecho solo el 15 % manifestó no consumir ningún refresco a la semana. Estas últimas acciones implican mayores gastos en el consumo de agua por parte de las familias y por lo mismo estos costos se deben considerar al estimar lo que pagan las familias en la ciudad de Aguascalientes por el servicio de agua.

Figura 1: Almacenamiento de agua

En la figura se presenta la forma en que los entrevistados almacenan el agua. La mayoría lo hace en tinacos y cisternas, lo que refleja que las familias en la ciudad de Aguascalientes tienen que destinar recursos económicos para poder acceder las 24 horas del día al vital líquido.

Figura 2: Consume agua de la llave

Es altamente probable que la mala calidad del agua sea un elemento que explique porque los encuestados no consumen agua de la llave directamente, tal y como se describe en la figura 2.

Figura 3: Garrafones (G) de agua comprados por las familias a la semana

*El mal servicio de agua potable puede ser un factor que explique la compra de garrafones de agua por parte de los encuestados como se refleja en la figura 3*

## CONCLUSIONES

Con base a la encuesta piloto, se definió un conjunto de cantidades a pagar, para mejorar el servicio de agua domestica que actualmente se brinda en la ciudad de Aguascalientes, dichas cantidades fueron: \$ 120, \$ 150, \$ 200, \$ 250, \$ 300, \$ 350, \$450, \$ 550 \$ 700. Las cantidades serán utilizadas en la encuesta final para saber los valores de la DAP. Por otra parte los resultados que se obtuvieron nos permitieron tener un acercamiento en la problemática de agua que se vive diariamente en la ciudad de Aguascalientes, como es el no contar con el vital liquido las 24 horas el día, provocando que las familias almacén el agua en tinacos y/o cisterna. Aunque el 84% manifestó que están conformes con el color y cantidad de agua, sin embargo, no la consumen directamente de la llave creando cierta inseguridad de la calidad, esto provoca que las familias tomen acciones como consumir garrafones de agua y/o refrescos, generando un gran gasto afectando a su economía, estos mayores gastos no se contemplan a la hora de implementar políticas públicas ligadas a las tarifas del agua. Una tarea futura es utilizar el vector de pagos de la DAP en una encuesta final, con el objetivo de estimar cuanto estarían dispuestos a pagar los hogares de la ciudad de Aguscalientes para mejorar el servicio de agua potable.

# GRADO DE INNOVACIÓN TECNOLÓGICA DE EMPRESAS GACELA

Ana Patricia Huacuja Zamudio, Universidad Nacional Autónoma de México

Carlos Eduardo Puga Murguía, Universidad Nacional Autónoma de México

## RESUMEN

*Actualmente las empresas alrededor del mundo, enfrentan enormes retos para incrementar e incluso mantener la productividad y la competitividad, para los países emergentes es aún más complicado y una de las herramientas más importantes para conservar e incrementar su competitividad es a través de la innovación de sus productos/servicios, procesos, su forma de comercialización o su organización. En México, según cifras publicadas por la Secretaría de Economía el 99.8 por ciento de las empresas pertenecen al grupo de las micro, pequeñas y medianas empresas (Pymes), generan entre ellas el 52 por ciento del Producto Interno Bruto y representan el 90 por ciento del empleo formal. Dentro de la Pymes existe un grupo especialmente competitivo, productivo e innovador, el de las empresas denominadas "Gacela", para las cuales se han diseñado programas e instancias oficiales que apoyan y fortalecen su crecimiento. De ahí la importancia de establecer mecanismos para medir el grado de innovación tecnológica de estas empresas Gacela, siguiendo los principios indispensables de comparabilidad a nivel internacional, estabilidad, objetividad, medibles y directos, entre otros, dictados en primer lugar por la OCDE y regionalizados a nuestro entorno Latinoamericano y del Caribe por la RICYT. El objetivo de esta propuesta es: Proponer un indicador tecnológico, acorde con las normas internacionales, que permita medir el grado de innovación tecnológica de las empresas denominadas "Gacela" en México.*

**PALABRAS CLAVE:** Innovación tecnológica, empresas gacela, grado de innovación

## INNOVATION GRADE OF GACELA ENTERPRISES IN MÉXICO

### ABSTRACT

*Currently companies around the world, face enormous challenges to increase productivity and also maintain competitiveness, emerging countries is even more complicated and one of the most important tools to preserve and increase their competitiveness is through innovation of its products / services, processes, the way of how they market or its organization. In Mexico, according to figures released by the Ministry of Economy 99.8 percent of the companies belong to the group of small and medium enterprises (SMEs), generating 52 percent of the product GDP and representing the 90 percent of formal employment. Within the SMEs there a particularly competitive, productive and innovative group, the companies called "Gazelle", for which they have designed programs and official institutions that support and strengthen its growth. Hence the importance of establishing mechanisms to measure degree of technological innovation of these gazelles, following the essential principles of international comparability, stability, objectivity, measurable and direct, among others, issued in first by the OECD and regionalized to the Latin American and Caribbean environment by RICYT. The objective of this proposal is: Offer technical indicator, according to the international rules, that measure the degree of technological innovation companies called "Gazelle" in Mexico*

**JEL:** O32, O47, M15

**KEYWORDS:** Technology innovation, gacela enterprises, innovation degree

## INTRODUCCIÓN

En un mundo como el que actualmente vivimos, donde cada vez existe una mayor competencia por los mercados, donde el bienestar económico y social de las naciones depende de su capacidad para adaptarse a las nuevas condiciones, es esencial contar con una planeación y proyección del crecimiento económico. Es un hecho que México, durante los últimos años, ha ido perdiendo gradualmente competitividad, lo que implica la pérdida de atracción de dinero, tanto en el caso de inversión nacional como extranjera y esto se ha reflejado en la consecuente pérdida de productividad por parte de las empresas, las cuales al no poder competir en los mercados internacionales tienen que ceder el trabajo que no pueden realizar a favor de otras empresas ubicadas en naciones, mejor preparadas y que ofrecen mejores condiciones lo que trae consigo una disminución en la oferta de trabajo interna con las consecuencias económicas que actualmente enfrentamos. Es por ello que es tan importante aprovechar nuestra creatividad e imaginación y unir nuestros esfuerzos, en la interdisciplinariedad para proponer nuevas opciones, desde diferentes perspectivas, que nos permitan reflexionar sobre nuestra situación actual y plantear alternativas viables para superar las deficiencias de nuestra actual administración.

En este contexto, una herramienta útil para apoyar el crecimiento sería la utilización de la tecnología, la cual junto con el desarrollo de políticas públicas y el apoyo de la sociedad pueda ayudarnos a encontrar los medios para incentivar la creatividad y la innovación que se reflejen en una mayor competitividad de las empresas nacionales, para comenzar debemos conocer nuestras capacidades y potencialidades actuales para, ubicados en el contexto global establecer mecanismos que nos permitan revisar y evaluar periódicamente nuestra situación real y planear la manera de impulsar las áreas clave ya que como se afirma en el Manual de Bogotá (2001) “la innovación constituye el principal determinante de la competitividad en el contexto económico actual y además es el factor fundamental para resolver los problemas sociales en el contexto, más amplio de las sociedades del conocimiento”.

Un elemento importante que puede ayudarnos a medir nuestras capacidades y el resultado de las políticas y mecanismos de apoyo a la industria es la definición de indicadores tecnológicos comparables y compatibles con nuestra realidad, dirigidos a analizar nuestra trayectoria y contrastar nuestros cambios de manera objetiva, ya sea a nivel local, nacional, regional o internacional pero que a la vez cumplan con estándares internacionales. Existen organizaciones que desde mediados del siglo pasado se han preocupado por emitir recomendaciones respecto de las diferentes maneras y perspectivas con que nos podemos valorar internamente y comparar frente al mundo, el caso más relevante de estos esfuerzos ha sido el de la OCDE quien a través de la convocatoria de expertos de diferentes latitudes se ha avocado a la tarea de analizar cada tema tecnológico y emitir definiciones y reglas básicas como punto de partida para la obtención de datos alrededor del mundo.

Por su origen los lineamientos emitidos por la OCDE se basaron en la experiencia y condiciones de los países desarrollados, que no corresponden a las circunstancias de los países en vías de desarrollo como es nuestro caso donde la Red Iberoamericana de Ciencia y Tecnología (RICYT) dependiente de la Organización de los Estados Americanos se ha ocupado en adaptar los conceptos ya definidos por la OCDE a las circunstancias propias de la región y a partir de éstas establecer normas propias para construir indicadores tecnológicos adecuados, útiles para analizar la situación regional particular y compensar las brechas entre las diferentes economías pero que a la vez puedan ser utilizados para establecer parámetros de medición comparables que nos permitan evaluar periódicamente los resultados obtenidos, de forma metódica a todos niveles, sin perder de vista su capacidad para ser contrastados, tanto al nivel de pares como dentro de otros contextos como el global, en particular.

Por otro lado, según reporta la Secretaría de Economía, el 99.8 de las empresas en México son de tipo Pyme, entre ellas aportan el 52% del PIB y el 90% del empleo, pero dentro de ellas existe un grupo de

empresas medianas, las más prometedoras en cuanto a crecimiento y uso de la tecnología, aquellas que arriesgan más, invierten más, innovan más y que generan fuentes de trabajo de alto valor agregado, aquellas que por sus características propias pueden impulsar el crecimiento económico del país, nos referimos a las denominadas empresas Gacela, que se distinguen por su preocupación por la competitividad y la sustentabilidad, es por ello que es especialmente importante observar e impulsar su desarrollo.

Figura 1: Representación Gráfica de la Pirámide de Empresas en México

Fuente: Secretaría de Economía (Informe de labores 2009)

Es bajo estos tres grandes temas: la innovación que impulsa la productividad, las empresas Gacela que se distinguen por su alta competitividad y la medición que nos servirá para evaluarlos como se construye esta propuesta.

## REVISIÓN DE LITERATURA

A partir de la década de 1960 la mayor parte de los países miembros de la OCDE, encabezados por Estados Unidos, Japón, Canadá, Reino Unido, Holanda y Francia comenzaron a recolectar información estadística acerca del campo de la investigación y el desarrollo experimental (I+D), pero se enfrentaron con algunas dificultades teóricas al momento de tratar de contrastar sus resultados, debidas principalmente a diferencias en el alcance, los métodos y la definición de los conceptos; de ahí surgió la necesidad de hacer una normalización y como consecuencia, en junio de 1963, la OCDE celebró una reunión donde convocó a expertos en estadísticas de investigación y desarrollo (I+D) de diferentes latitudes en la Villa Falconieri de Frascati, Italia. Derivado de estos trabajos se obtuvo la primera versión oficial de la “Propuesta de Norma Práctica para encuestas de Investigación y Desarrollo Experimental”, más conocida como el “Manual de Frascati”.

Aunque el Manual de Frascati (OCDE, 2002) es esencialmente, un documento técnico, constituye uno de los pilares de las acciones desarrolladas por la OCDE con la intención de que se comprenda de mejor manera el papel de la ciencia y la tecnología, mediante el análisis de los sistemas nacionales de innovación. Posteriormente se observó que la medición de la innovación tecnológica no podía ser dimensionada desde la perspectiva de la I+D sino, que la I+D representaba únicamente un parámetro, entre muchos otros necesarios para evaluarla; fue entonces que se elaboró un manual específico para recoger e interpretar los datos sobre innovación que se conoce como Manual de Oslo.

Entre los objetivos del Manual de Oslo están: la aportación de criterios para el levantamiento e interpretación de datos sobre innovación desde diferentes ópticas; en especial el análisis en su relación con el desarrollo económico; como por ejemplo, las actividades innovadoras que impactan directamente los resultados de la empresa y los factores que afectan su capacidad de innovar o la de aportar elementos que ayuden en la evaluación de resultados a nivel nacional; con la finalidad de definir políticas, para medir nuestros resultados a diferentes niveles como puede ser el nacional, en cuyo caso servirá para definir políticas específicas, a nivel regional o, finalmente, para ubicarnos comparativamente a nivel internacional. Desde su origen el Manual de

Oslo fue elaborado atendiendo a las condiciones de los países desarrollados y no necesariamente corresponden con las condiciones de los países que no alcanzan sus niveles de desarrollo, es por ello que se han elaborado algunos manuales para adecuar las recomendaciones emitidas en el Manual de Oslo a las condiciones específicas de otras regiones, tal es el caso de la RICYT quien a través de la convocatoria de expertos de la región ha producido el manual de Normalización de Indicadores de Innovación Tecnológica en América Latina y el Caribe, mejor conocido como Manual de Bogotá (RICYT, 2001). La intención del Manual de Bogotá es entonces, impulsar la realización de encuestas y estudios sobre los procesos de innovación tecnológica específicos de la región, apoyar la construcción de indicadores de innovación a partir de las especificidades de la región, cuidando que las cifras obtenidas a partir de estos procesos sean comparables a nivel internacional y sin descuidar la importancia de que correspondan con las características nacionales, sectoriales y particulares de los países de América Latina y el Caribe.

### Empresas Gacela

En el año 1994 la empresa estadounidense *Cognetis Inc*, fundada por David Birch; (Landström, 1996) en su reporte anual denominado “*Almanac*” utilizó por primera vez el término *Gazelle*, o su traducción al español Gacela, para identificar a las empresas que duplicaban su volumen de negocios en cuatro años, en ese momento en los Estados Unidos se identificaron 250,000 empresas de este tipo. El reporte arrojó información importante sobre el comportamiento y las características de estas empresas como el que ellas generaban por sí mismas el 70% del incremento del empleo, asumían mayores riesgos que sus competidoras, su progreso se basaba en la innovación y presentaban una gran volatilidad de sus beneficios. El impacto de los hallazgos encontrados en Estados Unidos dentro un entorno de una economía globalizada, impulsó el interés de diferentes naciones por identificar e impulsar el modelo de las empresas Gacela dentro de sus economías.

Si bien alrededor del mundo se definen a las Gacela como empresas de alto crecimiento, con un desarrollo acelerado, un incremento importante en términos de empleo y facturación; eficientes ya que presentan una mayor rotación de activos respecto a otras empresas similares; su estructura flexible y ligera les permite adaptarse al mercado en cada momento; con habilidad para crecer aún en las épocas de recesión y de crisis, invierten más tiempo y dinero en innovación que la media de las empresas de sus sectores; por su dinámica, pueden llegar a tener un impacto importante para la economía del país. Los parámetros para evaluar una empresa como Gacela varían de nación a nación, en México, para que una empresa sea reconocida y pueda ser incluida dentro del grupo de las empresas Gacela debe cumplir con las tres características siguientes (Secretaría de Economía, 2010b): tener más de tres años de operación; haber generado, durante alguno de los tres últimos años de operación, un crecimiento en las ventas superior al 15% y contar con una planta de más de 50 empleados. Las empresas Gacela, por definición, forman parte de las Pymes y ésta es la razón por la cual las políticas económicas para apoyarlas e impulsarlas, donde se consideran bajo condiciones preferenciales sus necesidades financieras y de fomento se incluyen en un apartado especial en el sector que atiende a la Pymes.

### ¿Qué es innovación?

“Una innovación es la introducción de un nuevo, o significativamente mejorado, producto (bien o servicio), de un proceso, de un nuevo método de comercialización o de un nuevo método organizativo, en las prácticas internas de la empresa, la organización del lugar de trabajo las relaciones exteriores” Manual de Oslo (OCDE, EUROSTAT, 2005)

En relación al nivel de novedad, la innovación puede ser de tres tipos: radical, progresiva o disruptiva.

*Innovación radical:* aquella innovación que implica una ruptura y tiene un impacto significativo tanto en la actividad económica de la empresa como dentro del mercado.

*Innovación progresiva o incremental:* se caracteriza por ser un proceso continuo, que alimenta el cambio de igual manera.

*Innovación disruptiva:* es aquella que plantea un nuevo uso para un producto ya existente.

Por el tipo de innovación se pueden distinguir cuatro clases, de producto, de proceso, de organización y de comercialización:

*“Una innovación de producto:* se corresponde con la introducción de un bien o de un servicio nuevo, o significativamente mejorado, en cuanto a sus características o en cuanto al uso al que se destina. Esta definición incluye la mejora significativa de las características técnicas, de los componentes y los materiales, de la informática integrada, de la facilidad de uso u otras características funcionales” (OECD, EUROSTAT, 2005)

*“Una innovación de proceso:* es la introducción de un nuevo, o significativamente mejorado, proceso de producción o de distribución. Ello implica cambios significativos en las técnicas, los materiales y/o programas informáticos” (OECD, EUROSTAT, 2005)

*“Una innovación de organización:* es la introducción de un nuevo método organizativo en las prácticas, la organización del lugar de trabajo o las relaciones exteriores con la empresa” (OECD, EUROSTAT, 2005)

*“Una innovación de mercadotecnia:* es la aplicación de un nuevo método de comercialización que implique cambios significativos del diseño o el envasado de un producto, su posicionamiento, su promoción o su tarificación” (OECD, EUROSTAT, 2005)

Por lo que se refiere a la novedad de las actividades de innovación que implementan, se puede diferenciar entre:

*Nuevo para la empresa:* hace referencia a un producto, proceso, método de comercialización o de organización que puede haber sido aplicado previamente en otras empresas pero que representa una novedad para la empresa en cuestión. (OECD, EUROSTAT, 2005)

*Nuevo para el mercado:* Se refiere al hecho cuando una “empresa es la primera en lanzarla en su mercado”(OECD, EUROSTAT, 2005) y mercado “se refiere a la empresa y sus competidores, puede referirse a una región geográfica o a una gama de productos” (OECD, EUROSTAT, 2005)

*Nuevo para el mundo entero:* “cuando la empresa es la primera en lanzarlo en todos los mercados y en todos los sectores de actividad nacionales e internacionales” (OECD, EUROSTAT, 2005)

La innovación tecnológica según afirma el Manual de Bogotá se considera como la principal fuente para alcanzar mejoras competitivas genuinas (a partir de la acumulación del conocimiento, el desarrollo de habilidades y el aprovechamiento de capacidades ya sea naturales o adquiridas); sustentables (aquellas que utilizan tecnologías “limpias” o que se preocupan por la preservación del medio ambiente) y acumulativas (vinculadas a los procesos de aprendizaje y mejoramiento tecnológico)

#### Qué son los indicadores:

La Comisión Europea afirma: “Un indicador puede definirse como la medición de un objeto a conseguir, de un recurso a movilizar, de un efecto alcanzado, de una estimación de calidad, o de una variable de contexto. Un indicador produce información cuantificada con la intención de ayudar a los involucrados con la toma de decisiones públicas a comunicarse entre sí, negociar y tomar acciones, dentro del marco de evaluación...” (European Commision, 1999). Para garantizar la utilidad de la información obtenida se recomienda:

Los indicadores deberán corresponder con criterios y procedimientos que aseguren la comparabilidad, tanto a escala nacional (al detectar las características propias de cada entidad o en conjunto como país) como en el plano internacional, ya sea a nivel región o en el contexto global. Los indicadores deberán considerar tanto las características nacionales y de los diferentes sectores productivos, como las de los diferentes tipos de empresas.

Deberán servir para contrastar y analizar los resultados obtenidos, tanto de las características actuales, como de los cambios que puedan presentarse con el tiempo (su dinámica).

La información que aporten los indicadores deberá corresponder con la necesidad de detalle requerida para definir tanto las acciones públicas como las privadas, en los campos relacionados con la ciencia, la tecnología y la productividad.

Desde la perspectiva de la RICYT:

Los indicadores deben capturar y dar cuenta de las especificidades de los procesos de innovación tecnológica de la región.

Los indicadores construidos deberán permitir el análisis compartivo del estado y dinámica de los procesos de innovación tanto a nivel global como internacional.

La información necesaria para construir los índices se obtiene a través de la realización de encuestas y la RICYT propone como punto de partida el uso de un cuestionario mínimo común para la región denominado como Formulario Básico para Encuestas de Innovación en América Latina (RICYT, 2011).

## **METODOLOGÍA**

Objetivo: Proponer un indicador tecnológico, acorde con las normas internacionales, que permita medir el grado de innovación tecnológica de las empresas denominadas “Gacela”, en México. La investigación se basó en un meta-análisis, se trata de una revisión bibliométrica de la documentación y los principales documentos de referencia que abordan los temas que forman el eje para construir un indicador que sirva para medir la innovación tecnológica de las empresas Gacela en México y que cumpla con las recomendaciones dictadas por los principales organismos involucrados. El estudio es exploratorio, uno de los objetivos de la RICYT es promover la cultura de la medición en la región pues son muy pocos los países de la zona donde se han realizado algunos levantamientos de información con estos propósitos y

muy pocas publicaciones relacionadas con la medición de la innovación ya que no existe un consenso para la definición de indicadores a nivel mundial. El estudio también es transversal, descriptivo, pues propone, a partir de tipo, novedad e impacto de las innovaciones tecnológicas para una empresa la definición y el cálculo de un *indicador*, que sirva para establecer rangos dentro de los cuales el grado de innovación de una empresa pueda considerarse como: Alto, Medio, Bajo o Nulo, según sea el caso.

### Propuesta del Indicador

La construcción del indicador que proponemos parte del Formulario Básico para Encuestas de Innovación en América Latina (RYCYT, 2011). Los ocho temas abordados en el cuestionario, (Figura 2) presentan preguntas específicas para obtener información concreta sobre elementos que considera los más importantes para la región y son:

*Variables de desempeño, útiles para:* Construir indicadores relativos a las especificidades y características de la empresa Analizar el impacto de la innovación tanto en la empresa como en su entorno Conocer las diferentes trayectorias en materia de desempeño en relación con la dinámica de innovación.

*Recursos Humanos:* Competencias y calificación del personal Proporciona información sobre el impacto y la dinámica innovadora como causa y efecto de la introducción de tecnología

*Estrategias de Innovación para:* Conocer las características de los procesos de innovación y el impacto de los resultados alcanzados Medir el nivel de compromiso de la empresa con la innovación Medir la importancia estratégica de la innovación para alcanzar la rentabilidad

*Impacto en las ventas:* Estimación sobre el porcentaje de ventas y exportaciones que corresponde con la comercialización de productos nuevos o significativamente mejorados

*Apropiabilidad:* Capacidad de las empresas para capitalizar los esfuerzos empleados para desarrollar nuevos productos y procesos Mecanismos de protección para evitar la imitación o copia de los nuevos conocimientos Para conocer mecanismos de competencia, el alcance de los resultados y los obstáculos que frenan la innovación

*Vinculación y Fuentes de información:* Definir la interrelación de la empresa con otros agentes del Sistema Nacional de Innovación Acceso a la información

*Instrumentos Públicos:* Para diseñar y monitorear el desempeño de las políticas públicas orientadas a promover la innovación Evaluar la capacidad del gasto público para generar un cambio en el comportamiento de las empresas

*Obstáculos:* Para identificar las dificultades que han enfrentado las empresas al plantear e implementar sus actividades de innovación

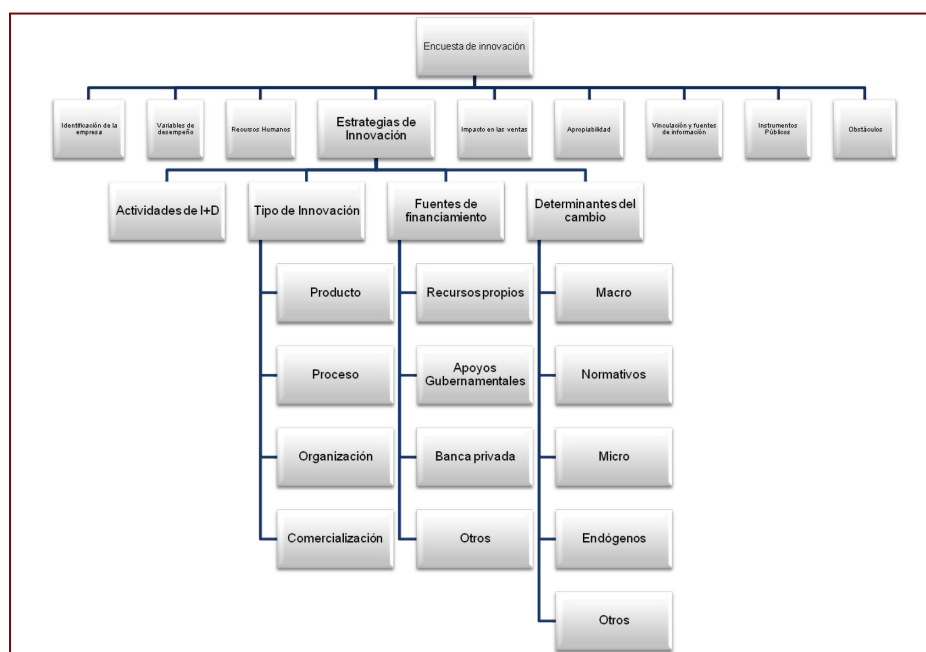

Figura 2: Temas Que Incluye el Formulario Básico Para Encuestas de Innovación en América Latina.

Fuente: Elaboración propia

A partir de nuestra definición de Grado de Innovación como la capacidad de una empresa para generar innovaciones de los cuatro tipos: procesos, productos/servicios, organizativas o comercialización en relación a la novedad y la trascendencia de sus actividades innovativas.

Figura 3: Estrategias de Innovación

Fuente: Elaboración propia

Tomando como punto de partida para la construcción de nuestro indicador la sección que se refiere al desarrollo de estrategias de innovación (Figura 3) y en especial en la parte que se refiere al tipo de innovación, donde las preguntas son:

Indique en la tabla siguiente, si durante el período de referencia la empresa logró: Introducir al mercado un producto o servicio nuevo o significativamente mejorado, Incorporar un proceso nuevo o significativamente mejorado. En caso afirmativo, señale el alcance máximo de la novedad: para la

empresa, para el mercado nacional, para el mercado internacional. Marque una sola opción, la que implique la mayor novedad alcanzada. Si desconoce el alcance, indique simplemente, para la empresa.

Durante los años 1 y 2 la empresa ha logrado introducir o incorporar un:	Sí o no			Novedoso para:	
	Si	No	la empresa	el mercado nacional	el mercado internacional
1. Bien nuevo					
2. Servicio nuevo					
3. Un nuevo uso a un producto, bien o servicio					
4. Bien significativamente mejorado					
5. Servicio significativamente mejorado					
6. Dio un nuevo uso a un producto ya existente					
7. Proceso nuevo					
8. Proceso significativamente mejorado					

### Durante el período de referencia (en los años 1 a 2) la empresa

*¿Modificó de forma significativa su organización?*

*Ya sea para cambiar las prácticas de la empresa, la organización del lugar del trabajo, al interior de la firma, o el modo de vincularse con el exterior)*

*SÍ \_\_\_\_\_ NO \_\_\_\_\_*

*Si es así, dé una estimación, en moneda nacional, sobre los recursos destinados durante el período. Considere las actividades de planificación, diseño y elaboración de los nuevos métodos, adquisición de equipo, compra de licencias, contratación de consultoría, gastos de capacitación de personal, y otros gastos necesarios para su puesta en marcha). (No incluya IVA ni otros impuestos).*

*\$.....*

### Durante el período de referencia (en los años 1 a 2) la empresa

*¿Modificó de forma significativa su comercialización? Introdujo cambios en el diseño o envasado del producto, en los métodos de tarificación, en la distribución del producto, y/ o en su promoción.*

*SÍ \_\_\_\_\_ NO \_\_\_\_\_*

*En caso afirmativo dé una estimación, en moneda nacional, sobre los recursos que destinó durante el período a ello, considere las actividades: de planificación, diseño y elaboración de los nuevos métodos, adquisición de equipamiento, compra de licencias, contratación de consultoría, gastos de capacitación de personal, y otros gastos necesarios para su puesta en marcha. (No incluya IVA ni otros impuestos).*

*\$.....*

Con el fin de incluir el caso de las innovaciones disruptivas, se realizará una adecuación al cuestionario propuesto por la RICYT, para ello se agrega una opción más a la tabla: *Dió un nuevo uso a un producto ya existente*. El indicador GIEGM (Grado de Innovación de las Empresas Gacela de México) que proponemos, será planteado considerando las características de empresas mexicanas, dentro del grupo de las Pymes, específicamente en el rango de las empresas pequeñas y medianas, las identificadas como empresas Gacela.

Figura 4: Construcción de un Indicador Para Medir el Grado de Innovación de las Empresas Gacela en México

Fuente: Elaboración propia

Para la construcción de nuestro indicador y partiendo de nuestra definición sobre el grado de Innovación, se deberán tomar en cuenta factores como el tipo de innovaciones que se hayan realizado durante el periodo de observación y la novedad que sus esfuerzos han producido. (Figura 4.) Determinaremos entonces el grado de innovación considerando:

Tipo de innovación, de acuerdo con el Manual de Oslo:  
de producto/servicio,  
de proceso,  
de mercadotecnia (comercialización),  
de organización

La novedad de las innovaciones o alcance de la novedad:  
nuevas para la empresa,  
nuevas para el mercado nacional  
nuevas para el mercado internacional

El Manual de Oslo recomienda especialmente, preguntar por las innovaciones de producto o proceso introducidas en el periodo y que representen una novedad para el mercado. El **impacto** de las innovaciones que se han llevado a cabo en la empresa:

incrementales,  
radicales,  
disruptivas

La trascendencia de la innovación, se asignará un factor de ponderación en el caso de las innovaciones en producto/servicio y proceso, debido a que las innovaciones de estos dos tipos son las que influyen directamente sobre la competitividad y la productividad de una empresa; a diferencia de las mejoras en comercialización y organización, que a veces vienen como consecuencia de las primeras.

Para respaldar esta ponderación consideraremos lo que el Manual de Oslo dice al respecto "...algunos nuevos métodos de organización pueden ser específicos para una empresa dada, lo que complica la comparación con otras empresas". Respecto de las innovaciones en comercialización (mercadotecnia) el mismo Manual de Oslo afirma que "el concepto de novedad se puede aplicar a la mayoría de las

innovaciones de mercadotecnia (como nuevos métodos de contratación, de colocación y de promoción de los productos) aunque no es ciertamente tan pertinente para los nuevos diseños de productos” en este caso, debido a la dificultad para discernir entre los casos de novedad, al igual que el anterior tampoco se le asigna un peso especial. A las innovaciones radicales se le dará asimismo un peso mayor, sobre los casos de innovaciones incrementales y disruptivas ya que representan un esfuerzo mayor, frente a los otros dos tipos, por involucrar productos/servicios o procesos totalmente nuevos para el mercado; en comparación, al esfuerzo desarrollado con el objetivo de modificar un producto ya existente o al de encontrar un nuevo uso para un producto ya existente y conocido en el mercado, en estos dos últimos casos, el peso que se les asignará será el mismo. El cálculo del GIEGM (Grado de Innovación de las Empresas Gacela en México) como sigue:

$$\text{GIEGM} = \frac{7}{\sum_{i=1}^7 (inp_i im_i fp_i)} + io + ic$$

Donde:

inp = tipos de innovación de producto/servicio o proceso realizados, se evaluará con una escala binaria:

1 = SÍ

2 = NO

im = novedad de la innovación, se evaluará con una escala que va del uno al tres con:

1 = nuevo para la empresa

2 = nuevo para el mercado nacional

3 = nuevo para el mercado internacional

fp = esfuerzo de la innovación, los valores que recibirá estarán entre dos y tres con:

3 = producto nuevo

2 = producto mejorado o un nuevo uso para un producto existente

io = innovación en organización, evaluado por medio de una escala binaria:

1 = SÍ

2 = NO

ic = innovación en comercialización, evaluado con una escala binaria:

1 = SÍ

2 = NO

De acuerdo con los límites dados antes, podemos definir una escala para el grado de innovación de una empresa Gacela de México como: alto, medio, bajo o que no realizó innovaciones durante el periodo de referencia cuando:

Grado de innovación alto cuando GIEGM está entre 27 y 35

Grado de innovación medio cuando GIEGM está entre 13 y 26

Grado de innovación bajo cuando GIEGM está entre 3 y 12

Grado de innovación nulo en el caso de que GIEGM sea menor que 3

El Grado de innovación máximo, el que corresponde con el valor máximo, (GIEGM=35 puntos) representa el caso cuando la empresa analizada realizó innovaciones radicales, de producto, servicio y proceso simultáneamente, con impacto en el mercado a nivel internacional, a la vez que introdujo cambios en su forma de comercialización y organización, además de haber encontrado un nuevo uso para alguno de los productos existentes. En la Figura 5 se presenta gráficamente los espacios donde se moverán los diferentes grados de innovación definidos por el indicador GIEGM.

Estas definiciones sobre las fronteras entre los diferentes grados de innovación podrán y deberán ser ajustados de acuerdo con las experiencias que se vayan obteniendo a partir de la aplicación de la fórmula. En caso de que alguna pregunta no haya sido respondida, como sugiere el Manual de Oslo, la respuesta se puede tomar de la información correspondiente del levantamiento anterior, es por ello que se recomienda

tener una muestra representativa de empresas que se conserve en el tiempo, hasta donde sea posible, con el fin de poder observar los cambios que presentan. Otro punto importante a definir será la periodicidad de las encuestas, para ello nuevamente haremos referencia al Manual de Oslo, donde se propone que el plazo entre dos encuestas subsecuentes no sea menor a un año ni mayor de tres; la sugerencia en nuestro caso, es que dado que no se tiene ningún registro; inicialmente el levantamiento se realice únicamente sobre un grupo representativo de las empresas Gacela, de forma anual, para empezar a conocer las características particulares de nuestras empresas y dar seguimiento a su dinámica; posteriormente se podrá ajustar, de acuerdo a los resultados y conclusiones obtenidos. Debido a que la base para calcular el indicador es una propuesta a nivel de la región de Latinoamérica y el Caribe elaborada por la RICYT con base en el Manual de Bogotá el indicador GIEGM propuesto tiene las características de:

*Comparabilidad:* Consistencia Interna El indicador puede ser calculado para las empresas Gacela de una región del país o a nivel nacional Estabilidad Temporal El indicador está planteado para “q” Validez De Constructo comparable tanto a nivel de los indicadores desarrollados en los países de la región, como respecto a otros producidos en el resto del mundo

### Externa

*Normas de calificación:* Define fronteras entre los diferentes grados de innovación

Figura 5 Rangos de Valores Que Toma la Tabla Para Producto, Servicio, Proceso y Nuevo Uso

Fuente: Elaboración propia

## CONCLUSIONES

La innovación tecnológica es básica para incrementar la competitividad de las empresas, existe una relación directa entre el grado de innovación de las empresas y el nivel de desarrollo de un país, es por ello que es tan importante conocer las capacidades de las empresas a nivel país. Un elemento estratégico es la definición de indicadores tecnológicos comparables, que cumplan con los estándares internacionales, compatibles con nuestra realidad, dirigidos a analizar nuestra trayectoria y que sirvan para contrastar nuestros resultados de manera objetiva a diferentes niveles, ya sea local, nacional, regional o internacional. Si bien es cierto que en general la región de Latinoamérica no se distingue por presentar innovaciones radicales, es importante poder establecer un parámetro que nos dé un marco de referencia útil para determinar la categoría donde se encuentra el grado de innovación de las empresas que son más proclives a la novedad, las Gacela.

El cuestionario propuesto es un punto de inicio, la tarea de tratar de definir un indicador es complicada, ya que debe cumplir con condiciones específicas y ser lo suficientemente general como para incluir las condiciones no sólo locales o regionales sino que debe considerar otros entornos; su definición no es estática, sino que debe ser revisada periódicamente para verificar su validez y, en caso necesario, ser adaptada a las nuevas necesidades o circunstancias. Existen diferentes temas tecnológicos que pueden ser evaluados, algunos más estudiados que otros, aunque en la mayor parte, hasta el momento, sólo se encuentran disponibles publicaciones de resultados locales o regionales parciales debido a la falta de acuerdos. Se hizo un esfuerzo para proponer una alternativa que permita medir el grado de innovación de las empresas Gacela en México, definiendo como grado de innovación la capacidad de la empresa para generar innovaciones de los cuatro tipos: proceso, producto/servicio, organización o comercialización en relación a la novedad y trascendencia de sus actividades innovadoras diferenciando entre un grado alto, medio, bajo o nulo.

Para México es muy importante poder disponer de información sobre evaluaciones de este tipo, desde diferentes perspectivas; por ejemplo, desde el punto de vista de la empresa la información le será útil para satisfacer su interés por reconocer su desarrollo y su capacidad de competencia tanto dentro del ámbito nacional como internacional y el gobierno puede obtener información valiosa para conocer el impacto de los procesos de innovación de las empresas Gacela y definir programas dirigidos al apoyo, desarrollo y fomento de la generación de fuentes de trabajo que puedan ofrecer oportunidades mejor remuneradas y con mejores condiciones laborales, además de aprovechar la capacidad del sector de empresas de este tipo, para convertirse en un detonante que mejore el desarrollo y la competitividad del país.

# DESEMPEÑO DE LOS FONDOS DE PENSIONES CHILENOS EN EL EXTRANJERO

Renato Balbontín, Universidad Andrés Bello

## RESUMEN

*Teniendo en consideración el ciclo de altas volatilidades que se generó a partir de la crisis financiera del año 2008, se analiza el desempeño de los Fondos de Pensiones Chilenos a través de los índices de Jensen, Sharpe y Treynor. La comparación se hace en base mensual para el período septiembre 2007 – agosto 2012. Se concluye que los fondos de pensiones tuvieron un desempeño similar al índice global MSCI-ACWI, pero no lograron entregar un premio por unidad de riesgo por encima del rendimiento promedio de los bonos del Tesoro Americano. Al desagregar el riesgo total de los fondos de pensiones en sus componentes sistemática e idiosincrática, se confirma la dificultad para eliminar el riesgo no sistemático y las conclusiones sugieren que las restricciones que impone la normativa en Chile les permite alcanzar niveles de retorno similar al de una cartera activa global, pero con un sustancial incremento en el riesgo total.*

**PALABRAS CLAVES:** Diversificación, retorno, volatilidad, riesgo, sistemático, idiosincrático.

## OVERSEAS PERFORMANCE OF CHILEAN PENSION FUNDS

### ABSTRACT

*Considering the cycle of high volatility that was generated on account of the financial crisis of 2008, we analyze the performance of Chilean Pension Funds by means of Jensen's measure, Sharpe's ratio and Treynor's ratio. Comparisons are made on a monthly basis from September 2007 to August 2012. We conclude that the pension funds had a similar performance to the MSCI-ACWI global index, but failed to deliver a premium per unit of risk above the average yield of U.S. Treasury bonds. By breaking down the total risk of the pension funds into their systematic and idiosyncratic components, we confirm the difficulty involved in eliminating unsystematic risk. Our findings suggest that the restrictions imposed by Chilean law allowed the funds to reach return levels similar to an active global portfolio, albeit with a substantial increase in overall risk.*

**JEL:** C01, C12, C20, G15, G23, G32

**KEYWORDS:** Diversification, return, volatility, risk, systematic, idiosyncratic.

## INTRODUCCIÓN

La mayor parte de la inversión extranjera de los fondos de pensiones chilenos se diversifica a través de fondos mutuos accionarios que operan en los mercados de capitales de Norteamérica, Europa y Asia.

El presente documento analiza el nivel de eficiencia con que se ha administrado, en los últimos años, aquella parte de la cartera accionaria invertida en mercados extranjeros. La eficiencia en la administración activa de carteras de inversión dice relación con lograr rendimientos superiores a los que eventualmente se obtendrían con una estrategia pasiva asociada, por ejemplo a la inversión en un índice accionario bien diversificado o alternativamente, a la generación de valor a través de un premio por unidad de riesgo por encima del rendimiento de un instrumento de renta fija de referencia. Para llevar a cabo este análisis plantearemos las siguientes hipótesis de estudio:

Primero, que al menos como industria, el desempeño de los fondos de pensiones en el extranjero, durante los últimos cinco años, ha sido similar en retorno al de un índice global de diversificación como lo es el Morgan Stanley All Country World Index (MSCI-ACWI). Segundo, que el rendimiento promedio de los fondos de pensiones por unidad de riesgo no ha sido inferior al de los bonos del Tesoro Americano de largo plazo. Tercero, que la diversificación de los fondos de pensiones en mercados globales se ha logrado con un nivel de riesgo sistemático similar al asociado a muestras representativas de los fondos mutuos que canalizan una significativa proporción de la inversión en el extranjero.

## REVISIÓN DE LA LITERATURA

### Desempeño de los Fondos de Pensiones

Los últimos estudios realizados en esta área se han llevado a cabo con la colaboración de la Organización para la Cooperación y el Desarrollo Económico (OCDE) y el Banco Mundial. Antolín (2008) resume los resultados de análisis comparativos en desempeño efectuados a fondos de pensiones privados que operan en Latinoamérica y Europa, destaca la necesidad de desarrollar a futuro estándares internacionales para poder comparar efectivamente resultados entre países. Se refiere específicamente a Walker e Iglesias (2007) quienes analizan el desempeño de fondos de pensiones en base al Ratio de Sharpe, explicitando la volatilidad del activo de renta fija y, siguiendo a Lo (2002), concluyen que en general los fondos de pensiones en varios países han tenido un buen rendimiento al compararse con un activo libre de riesgo de corto plazo, pero esta situación no se da cuando el *benchmark* utilizado es un bono libre de riesgo de largo plazo.

### Riesgo Sistemático Vs. Riesgo Idiosincrático

De acuerdo a la teoría financiera, una cartera de inversiones bien diversificada debería tener asociado un riesgo idiosincrático próximo a cero Ross, Westerfield y Jaffe (2000). El modelo CAPM asume que los inversionistas pueden eliminar todos los riesgos excepto aquel asociado a la covarianza de sus retornos con los de un índice representativo del retorno total de mercado, el cual no es diversificable Copeland y Weston (1979). Si  $\sigma_C^2$  representa el riesgo total de la cartera C, éste se puede descomponer en su riesgo sistemático  $\beta_C^2 \sigma_M^2$  e idiosincrático  $\sigma_\varepsilon^2$  tal como queda expresado en la siguiente ecuación:

$$\sigma_C^2 = \beta_C^2 \cdot \sigma_M^2 + \sigma_\varepsilon^2 \quad (1)$$

Proponemos que  $\sigma_\varepsilon^2$  se exprese como la fracción  $(1 - [\rho_{CM}]^2)$  del riesgo total  $\sigma_C^2$ , donde  $\rho_{CM}$  representa el coeficiente de correlación entre los retornos de la cartera C y los de un índice de mercado, entonces concluimos que con  $\rho_{CM}$  superior a 0.995 se logra que  $\sigma_\varepsilon^2$  represente menos de un 1% de  $\sigma_C^2$ . Muchos estudios se han hecho entorno a este tema, Campbell et al. (2000) destacan el aumento en la volatilidad a nivel de activos individuales en comparación con la volatilidad a nivel de mercado, lo que ha provocado una disminución en el poder explicativo del mercado respecto al grado de correlación entre activos. También este estudio hace notar que ha aumentado el número de acciones necesarias para lograr una cartera bien diversificada. Bennett y Sias (2010), por su parte se refieren a las actuales dificultades empíricas para conformar carteras con riesgo diversificable próximo a cero y sugieren que la razón de esta anomalía estaría en burbujas de precios que los arbitadores no han sido capaces de eliminar. Resulta de interés en nuestro análisis medir qué tan bien diversificada se encuentra la parte de los fondos de pensiones chilenos invertida en el extranjero, y cómo se compara su riesgo idiosincrático con el asociado a las carteras de fondos mutuos que concentran sus inversiones en mayor medida.

## METODOLOGÍA Y FUENTE DE DATOS

Unas de las prácticas más usuales en países que tienen mercados de capitales desarrollados es la medición del desempeño financiero en empresas que administran fondos de terceros a través de índices.

Los utilizados en nuestra investigación son: el índice de Jensen, el índice de Sharpe y el índice de Treynor, los cuales son explicados a continuación:

### Índice de Jensen

Este índice, más conocido como “alfa de Jensen” Jensen (1968, 1969), es una medida absoluta del desempeño de una cartera. Su determinación se basa en el modelo CAPM Sharpe (1964), Lintner (1965), Mossin (1966) y resulta de efectuar un análisis de regresión lineal entre el exceso de retorno de una cartera sobre el retorno de un instrumento de renta fija libre de riesgo, y el exceso de retorno de un índice de mercado sobre el activo de libre riesgo en un determinado período de tiempo, de acuerdo a la siguiente ecuación:

$$R_{Ct} - R_{Lt} = \alpha_C + \beta_C \cdot (R_{Mt} - R_{Lt}) + \varepsilon_{Ct} \quad (2)$$

Donde  $R_{Ct}$  representa el retorno de la cartera C en el período (mes) t,  $R_{Lt}$  representa el retorno del instrumento de renta fija libre de riesgo en el período (mes) t,  $R_{Mt}$  representa el retorno de un índice asociado al comportamiento promedio de mercado en período (mes) t,  $\varepsilon_{Ct}$  representa el error en la medición del retorno de la cartera C, que se obtiene en el período (mes) t al efectuar la regresión lineal. Finalmente  $\alpha_C$  y  $\beta_C$  representan el intercepto y la pendiente de la regresión respectivamente.

### Índice de Sharpe

Este índice ( $S_C$ ) se construye tomando como base la línea de mercado de capitales y se calcula dividiendo el exceso de retorno esperado de una cartera C sobre el valor esperado del retorno de libre riesgo en un cierto número de períodos (N), por la cantidad de riesgo asumida para obtener dicho retorno, representado por la desviación estándar de los retornos de la cartera C, Sharpe (1966).

$$S_C = \frac{[E(R_C - R_L)]}{\sigma_{R_C}} \quad (3)$$

Este índice mide en términos relativos la eficiencia en la administración de una cartera C, al corregir el exceso de retorno por unidad de riesgo total de la cartera. Dicho indicador es bastante utilizado para comparar eficiencias relativas entre carteras, y también para efectuar comparaciones contra una cartera representativa del comportamiento del mercado en un cierto número de períodos  $S_C$  vs.  $S_M$ . Una forma alternativa de construir este índice es considerar, para el retorno libre de riesgo, su variabilidad en el tiempo de modo explícito:

$$S_{(C-L)} = \frac{[E(R_C - R_L)]}{\sigma_{(R_C - R_L)}} \quad (4)$$

Lo (2002) desarrolla una metodología para determinar si este índice es significativamente diferente de cero y explica que, en caso no lo sea, eso significaría que los retornos de la cartera analizada son equivalentes a los del activo de libre riesgo. Asumiendo, para el exceso de retorno de la cartera C sobre el

activo de libre riesgo, independencia e idéntica distribución (i.i.d.), el error estándar ( $SE$ ) del estimador del índice de Sharpe queda determinado por:

$$SE\left(\hat{S}_{(C-L)}\right) = \sqrt{\frac{1 + \frac{S_{(C-L)}^2}{2}}{N}} \quad (5)$$

### Índice de Treynor

Este indicador de eficiencia ( $T_C$ ) es similar al índice de Sharpe. La diferencia se encuentra en el denominador, al corregir el exceso de retorno de la cartera C sobre el activo de libre riesgo dividiendo por el parámetro beta de la cartera, obtenido a partir del modelo CAPM Treynor (1965), el nivel de eficiencia queda entonces determinado al comparar  $T_C$  entre diferentes carteras.

$$T_C = \frac{[E(R_C - R_L)]}{\beta_C} \quad (6)$$

Este índice normaliza los retornos considerando sólo la componente sistemática ( $\beta_C$ ) del riesgo, por lo tanto es más adecuada su utilización cuando las carteras se encuentran bien diversificadas (eliminado el riesgo idiosincrático).

### Fuente de Datos y Su Análisis Preliminar

En Chile las Administradoras de Fondos de Pensiones (AFP) gestionan cinco tipos de fondos (A, B, C, D y E) que se caracterizan por estar constituidos y poseer diferentes límites de inversión en instrumentos renta variable, los que en definitiva determinan los niveles de riesgo para cada uno de ellos. El fondo tipo A es el más riesgoso, al admitir una mayor proporción en instrumentos de renta variable y el tipo E el con menor nivel de riesgo. Son los afiliados al sistema privado de pensiones los que eligen en qué tipo de fondo invierten sus ahorros de acuerdo a su disposición para asumir riesgos, al nivel de ahorro que han acumulado, a su edad y horizonte de tiempo que mantendrán su fondo hasta que se jubilen. La Tabla 1 muestra la evolución de la diversificación, a nivel agregado, en renta variable extranjera para los diferentes tipos de fondos.

Tabla 1: Diversificación Renta Variable Extranjera en Porcentaje

Mes	Fondo A	Fondo B	Fondo C	Fondo D
dic-07	55.8	41.6	26.0	11.7
dic-08	52.2	38.1	19.6	8.4
dic-09	61.5	41.1	22.6	10.5
dic-10	57.5	37.2	19.2	8.8
dic-11	56.0	34.8	17.3	6.7
ago-12	54.9	33.6	17.2	6.5
Promedio	56.3	37.7	20.3	8.8

*En esta tabla no se ha incluido el fondo tipo E por la baja proporción en instrumentos de renta variable que considera. El total de inversión en renta variable extranjera al mes de septiembre 2007 ascendía a 37487 millones de dólares, en tanto a septiembre 2012 fue de 36005 millones de dólares. Fuente: Superintendencia de Pensiones.*

La serie de datos, base de esta investigación, se construyó a partir de los retornos mensuales nominales base dólar, para cada tipo de fondo obtenido a partir de los Informes de Inversiones y Rentabilidad, sitio

web (<http://www.safp.cl/portal/informes/581/w3-propertyvalue-5975.html>). En la Tabla 2 se detallan los retornos mensuales nominales anualizados expresados en base dólar.

Tabla 2: Retorno Promedio Aritmético Anualizado en Porcentaje

Período	Fondo A	Fondo B	Fondo C	Fondo D	Bonos TB LP
Sep - Dic 07	61.7	57.9	51.0	53.3	4.7
Ene - Dic 08	-55.6	-56.4	-55.9	-58.2	4.3
Ene - Dic 09	93.1	89.7	77.0	72.7	3.8
Ene - Dic 10	22.0	26.5	24.9	21.5	3.9
Ene - Dic 11	-16.6	-17.7	-20.1	-18.9	3.6
Ene - Ago 12	20.6	19.0	17.3	15.4	2.5
Promedio Anual	4.1	3.5	0.8	-1.1	3.8

Los retornos son nominales y están expresados en base dólar. Independiente del tipo de fondo, se ha verificado una fuerte oscilación en retornos, lo cual ha significado que el volumen total de fondos administrados (nacional más extranjero) haya caído de 110000 millones de dólares a mediados del año 2008 a 69000 millones de dólares a fines de ese año para luego recuperarse a 153000 millones de dólares administrados en agosto 2012. Para efectos comparativos se ha incluido en última columna el retorno promedio de los bonos del Tesoro Americano. Fuente: Superintendencia de Pensiones, Banco Central de Chile y Treasury.gov/resource-center EUA.

El principal vehículo de inversión en el extranjero que han utilizado las AFP chilenas son los fondos mutuos accionarios, de hecho más del 80% de la inversión en el extranjero a nivel agregado se canaliza a través de más de 400 fondos mutuos autorizados por una Comisión Clasificadora de Riesgo local. Como complemento a la determinación del desempeño para cada una de los cuatro tipos de fondos de pensiones según indicadores de eficiencia propuestos, incluimos un análisis comparativo en base a muestras de 10, 20 y 40 fondos mutuos extranjeros (ver en Anexo Tabla 11: Códigos Bloomberg). El criterio para seleccionar estos 40 fondos fue básicamente identificar aquellos más transados por los fondos de pensiones, ver: Sitio web

([http://www.safp.cl/safpstats/stats/inf\\_estadistica/cinvAFP/2012/09/cinv201209.html#SEXT](http://www.safp.cl/safpstats/stats/inf_estadistica/cinvAFP/2012/09/cinv201209.html#SEXT)) Las selecciones de carteras con 10 y 20 fondos mutuos corresponden a subconjuntos, según ranking de rentabilidad en base al retorno promedio mensual obtenido en los últimos cinco años. En la Tabla 3 se incluye, para las diferentes selecciones de fondos mutuos, los retornos promedio mes nominales anualizados, expresados en base dólar.

Tabla 3: Retorno Promedio Aritmético Anualizado en Porcentaje

Período	Selección 40 FM	Selección 20 FM	Selección 10 FM	MSCI - ACWI	Bonos TB LP
Sep - Dic 07	44.7	52.8	59.5	10.3	4.7
Ene - Dic 08	-48.6	-47.4	-48.2	-41.7	4.3
Ene - Dic 09	84.9	95.1	102.4	34.9	3.8
Ene - Dic 10	22.4	25.9	27.6	12.6	3.9
Ene - Dic 11	-14.2	-13.1	-10.4	-8.0	3.6
Ene - Ago 12	11.4	11.8	12.4	13.0	2.5
Promedio Anual	4.8	7.8	9.6	-1.5	3.8

En esta tabla se ha incluido, además de las selecciones de fondos mutuos extranjeros, los retornos promedio del índice global MSCI-ACWI y de los bonos del Tesoro Americano. Al comparar los retornos de los fondos de pensiones con los de la selección de fondos mutuos extranjeros, se concluye que estos últimos han oscilado en menor medida. Si la comparación se efectúa contra el índice global, el retorno promedio de los fondos mutuos y fondos de pensiones es superior. Fuente: Bloomberg y Treasury.gov/resource-center EUA.

La otra variable cuya evolución hay que analizar en detalle es la volatilidad. En Tabla 4 y Tabla 5 se puede observar la evolución de esta variable medida como desviación estándar de los retornos para los fondos de pensiones y fondos mutuos seleccionados e índice global Morgan Stanley All Country World Index (MSCI-ACWI). Al comparar estas cifras se confirma una mayor volatilidad en los fondos de pensiones chilenos.

Tabla 4: Volatilidad Base Mensual de los Fondos de Pensiones En Porcentaje

Período	Fondo A	Fondo B	Fondo C	Fondo D
Sep - Dic 07	9.4	9.3	8.4	8.3
Ene - Dic 08	10.1	9.9	9.7	9.3
Ene - Dic 09	6.1	5.8	5.8	5.3
Ene - Dic 10	6.6	6.6	6.6	7.0
Ene - Dic 11	8.1	8.2	8.3	8.5
Ene - Ago 12	7.3	7.3	7.1	7.1
Promedio Anual	8.3	8.2	8.1	8.1

En esta tabla se detallan las volatilidades promedio de los fondos de pensiones medidas como las desviaciones estándares de sus retornos mensuales. Destaca el alto nivel de volatilidad durante el período enero- diciembre 2008, coincidente con las fuertes oscilaciones en retornos en los meses críticos de la crisis subprime. Los fondos de pensiones logran sus menores volatilidades en el año 2009. En los años 2010 y 2011 se observa una tendencia alcista, para decaer en los primeros ocho meses del año 2012. Cabe destacar que en promedio las volatilidades asociadas a los diferentes tipos de fondos son similares en magnitud. Fuente: Elaboración propia.

Tabla 5: Volatilidad Base Mensual de los Fondos Mutuos E Índice MSCI-ACWI En Porcentaje

Período	Selección 40 FM	Selección 20 FM	Selección 10 FM	MSCI – ACWI
Sep - Dic 07	7.9	8.0	7.1	4.5
Ene - Dic 08	8.8	8.9	8.6	7.2
Ene - Dic 09	7.6	7.7	7.8	6.8
Ene - Dic 10	5.5	5.7	5.2	5.9
Ene - Dic 11	6.5	6.7	6.6	5.3
Ene - Ago 12	5.8	6.0	5.9	4.9
Promedio Anual	7.6	7.7	7.6	6.3

En esta tabla se detallan las volatilidades promedio de los fondos Mutuos e Índice MSCI medidas como desviaciones estándares de sus retornos mensuales. En todos los períodos se observan volatilidades de menor magnitud al compararlas con las correspondientes a los fondos de pensiones chilenos. Fuente: Elaboración propia.

### Regresiones Lineales

Para calcular los índices de desempeño se efectuaron siete regresiones lineales, según ecuación (2), para el período septiembre 2007 - agosto 2012. Dichas regresiones fueron diseñadas en base a retornos nominales en dólares: cuatro asociadas a los fondos de pensiones tipo A, B, C y D, y tres asociadas a carteras de fondos mutuos extranjeros con 40, 20 y 10 fondos mutuos respectivamente. La variable independiente quedó representada por el exceso de retorno de mercado ( $R_{Mt}$ ) sobre el activo de libre riesgo ( $R_{Lt}$ );  $R_{Mt}$  asociada a los retornos nominales mensuales calculados en base al índice de renta variable global MSCI-ACWI, código Bloomberg MXWD:IND y  $R_{Lt}$  a los retornos del bono del Tesoro americano a 20 años plazo, ver sitio web (<http://www.treasury.gov/resource-center/data-chart-center/interest-rates/Pages/TextView.aspx?data=longtermrateYear&year=2012>). La variable dependiente en cada una de las siete regresiones quedó representada por el exceso de retorno de cada una de las carteras analizadas ( $R_{Ci}$ ) sobre el activo de libre riesgo ( $R_{Lt}$ ).

## RESULTADOS

### Análisis Índice de Jensen (Primera Hipótesis En Estudio)

De la Tabla 6, que da cuenta de los valores asociados al parámetro alfa de Jensen según la ecuación (2), se desprende que sólo las carteras de los fondos tipo A y B lograron un desempeño superior al promedio de mercado con un nivel de significancia del 10%, en tanto los fondos tipo C y D no tuvieron un rendimiento significativamente superior al índice global MSCI-ACWI.

Tabla 6: Estadísticos Descriptivos de Regresiones Fondos de Pensiones

	Fondo A	Fondo B	Fondo C	Fondo D
Alfa de Jensen	0.009944*	0.009500*	0.006704	0.005531
Error estándar	0.005127	0.005186	0.004952	0.004994
Beta	1.1756***	1.1539***	1.1474***	1.1414***
Error estándar	0.09213	0.09319	0.08899	0.08974
R <sup>2</sup> de la ecuación	0.843	0.837	0.841	0.843

\*\*\*, \*\* y \* significativo al 1%, 5% y 10% respectivamente. Estadísticos descriptivos del alfa y beta de las rectas asociadas a las regresiones para cada fondo de pensiones. Se concluye que, para estos fondos, con un nivel de significancia del 5% no es posible rechazar la hipótesis nula de alfas de Jensen igual a cero, vale decir, los fondos de pensiones tuvieron un desempeño similar al de una cartera pasiva representada por el índice MSCI-ACWI. Destaca el alto nivel de representatividad de las regresiones asociado a sus respectivos R<sup>2</sup>. Dado los betas superiores a 1.0 se concluye que todos los fondos analizados poseen un riesgo levemente superior al promedio de mercado. Cabe consignar que se detectaron y corrigieron problemas menores de heteroscedasticidad en los fondos analizados. Fuente: Elaboración propia.

De la Tabla 7, que da cuenta de los valores asociados al parámetro alfa de Jensen para los fondos mutuos extranjeros, estos registran un rendimiento superior al de los fondos de pensiones chilenos, destacando las selecciones de 10 y 20 fondos mutuos con un desempeño por encima del índice MSCI-ACWI a un nivel de significancia del 1%, en tanto la selección de 40 fondos mutuos lo hace con una significancia del 5%.

Tabla 7: Estadísticos Descriptivos de Regresiones Selección Fondos Mutuos

	Selección 40 FM	Selección 20 FM	Selección 10 FM
Alfa de Jensen	0.007072**	0.009897***	0.011515***
Error estándar	0.003231	0.003586	0.003737
Beta	1.1418***	1.1512***	1.1213***
Error estándar	0.05811	0.06445	0.06715
R <sup>2</sup> de la ecuación	0.907	0.893	0.883

\*\*\*, \*\* y \* significativo al 1%, 5% y 10% respectivamente. Estadísticos descriptivos del alfa y beta de las rectas asociadas a las regresiones para cada fondo mutuo. Se concluye que, para estos fondos, con un nivel de significancia del 5% es posible rechazar la hipótesis nula de alfas de Jensen igual a cero, vale decir, los fondos mutuos tuvieron un desempeño superior al de una cartera pasiva representada por el índice MSCI-ACWI. Destaca el alto nivel de representatividad de las regresiones asociado a sus respectivos R<sup>2</sup>. Dado los betas superiores a 1.0 se concluye que todos los fondos analizados poseen un riesgo levemente superior al del promedio de mercado. Fuente: Elaboración propia.

### Análisis Índice de Sharpe E Índice de Treynor (Segunda Hipótesis En Estudio)

De las Tabla 8 y Tabla 9, los valores asociados al índice de Sharpe, según la ecuación (4), para los fondos de pensiones y fondos mutuos analizados no dan cuenta de un rendimiento superior por unidad de riesgo respecto al rendimiento de los bonos del Tesoro Americano de largo plazo. Cabe destacar signos positivos en los índices de Sharpe y Treynor sólo para el fondo de pensiones tipo A y todos los fondos mutuos seleccionados. En todo caso hay que señalar que todos los fondos analizados tuvieron un desempeño superior al del índice MSCI- ACWI.

Tabla 8: Estadísticos Descriptivos de los Índices de Sharpe y Treynor Para los Fondos de Pensiones

	Fondo A	Fondo B	Fondo C	Fondo D	MSCI-ACWI
$E(R_C - R_L)$ mes (%)	0.0269	-0.0237	-0.2394	-0.3997	-0.433
$\sigma(R_C - R_L)$ mes (%)	8.34	8.24	8.12	8.10	6.30
Índice de Sharpe	0.003	-0.003	-0.029	-0.049	-0.068
Error estándar Índice de Sharpe	0.1291	0.1291	0.1291	0.1292	0.1292
Índice de Treynor	0.023	-0.020	-0.209	-0.350	-0.433

\*\*\*, \*\* y \* significativo al 1%, 5% y 10% respectivamente. Los valores asociados a los índices de Sharpe y Treynor son negativos en todos los fondos de pensiones analizados a excepción del fondo tipo A. De igual forma el índice MSCI-ACWI también es negativo pero en mayor magnitud. Dado el nivel de significancia en cada uno de los casos analizados no se logra un premio por unidad de riesgo significativamente superior al rendimiento promedio de los bonos del Tesoro Americano de largo plazo. Fuente: Elaboración propia.

Tabla 9: Estadísticos Descriptivos de los Índices de Sharpe y Treynor Para los Fondos Mutuos

	Selección 40 FM	Selección 20 FM	Selección 10 FM	MSCI-ACWI
$E(R_C - R_L)$ mes (%)	0.0794	0.3148	0.4583	-0.433
$\sigma(R_C - R_L)$ mes (%)	7.59	7.73	7.60	6.30
Índice de Sharpe	0.010	0.041	0.060	-0.068
Error estándar Índice de Sharpe	0.1291	0.1292	0.1292	0.1292
Índice de Treynor	0.070	0.273	0.409	-0.433

\*\*\*, \*\* y \* significativo al 1%, 5% y 10% respectivamente. Los valores asociados a los índices de Sharpe y Treynor son indicativos que las selecciones de fondos mutuos extranjeros analizados son todos positivos, pero no lograron entregar un premio por unidad de riesgo significativamente superior al rendimiento promedio de los bonos del Tesoro Americano de largo plazo. Fuente: Elaboración propia.

### Análisis de Riesgo Sistemático Vs. Riesgo Diversificable (Tercera Hipótesis En Estudio)

La Tabla 10 compara el riesgo diversificable o idiosincrático asociado a los fondos de pensiones con los correspondientes a los fondos mutuos seleccionados. De la tabla se desprende que estos últimos logran reducirlo en promedio a un nivel aproximado a la mitad del logrado por los primeros. En consecuencia los fondos mutuos seleccionados se encuentran mejor diversificados. No obstante lo anterior, este análisis confirma lo señalado en últimos estudios respecto a la dificultad de lograr carteras bien diversificadas eliminando el riesgo idiosincrático.

Tabla 10: Desagregación del Riesgo Total en Riesgo Sistemático y Riesgo Idiosincrático

	R. Total	R. Sistemático	R. Idiosincrático	R. Sistemático (%)	R. Idiosincrático (%)
Fondo A	0.0070	0.0055	0.0015	78.6	21.4
Fondo B	0.0068	0.0053	0.0015	77.9	22.1
Fondo C	0.0066	0.0052	0.0014	78.8	21.2
Fondo D	0.0066	0.0052	0.0014	78.8	21.2
Selección 40 FM	0.0058	0.0052	0.0006	89.7	10.3
Selección 20 FM	0.0059	0.0052	0.0007	88.1	11.9
Selección 10 FM	0.0058	0.0050	0.0008	86.2	13.8

Una cartera bien diversificada, según la ecuación (1), debería tener un riesgo idiosincrático próximo a cero. Los valores obtenidos son indicativos que en los fondos de pensiones persiste un alto nivel de riesgo idiosincrático, aproximadamente el doble del asociado a las selecciones de fondos mutuos extranjeros. Fuente: Elaboración propia.

## CONCLUSIONES

En la introducción de esta breve investigación se formularon tres hipótesis, la primera y segunda relativas a la evaluación del desempeño de la proporción invertida en el extranjero por los fondos de pensiones chilenos y la tercera relativa al nivel de riesgo sistemático vigente en estos fondos al compararlos con el riesgo asociado a muestras de fondos mutuos extranjeros, principal vehículo de inversión fuera de Chile por parte de las AFP. Todo lo anterior en un contexto de mercado caracterizado por bajos retornos y altas volatilidades. Respecto a la evaluación del desempeño, no fue posible rechazar la primera hipótesis. En efecto, se confirmó que los fondos han tenido un resultado similar a la del índice global MSCI-ACWI. Esto se validó a través de índices absolutos (alfas de Jensen) que resultaron no ser diferentes de cero para todos los fondos de pensiones (nivel de significancia del 5%).

La segunda hipótesis, también debe ser confirmada, por cuanto los fondos de pensiones no han tenido un rendimiento por unidad de riesgo inferior al desempeño de los bonos del Tesoro Americano. Esto se validó a través de los índices de Sharpe y Treynor, que consignaron valores negativos para los fondos tipo B, C y D. El fondo A fue el único con signo positivo, pero en todos los casos analizados estos índices no fueron significativamente diferentes de cero. Cabe señalar que resultó más apropiado aplicar el índice de Sharpe que estandariza dividiendo el retorno de cada fondo por el riesgo total de la cartera. Para todos los

fondos analizados, sólo con riesgo idiosincrático próximo a cero, el índice de Treynor hubiese adquirido relevancia. La tercera hipótesis se rechaza de momento que el nivel de riesgo idiosincrático asociado a los fondos de pensiones duplica al observado en las selecciones de fondos mutuos. Se podría sugerir que esta última conclusión dice relación con restricciones impuestas por la normativa previsional chilena. En todo caso, se confirma la evidencia empírica en relación a la dificultad actual para lograr eliminar el riesgo no sistemático mediante diversificación.

# CALIDAD DE LA ENSEÑANZA Y EL APRENDIZAJE ESTRATÉGICO EN LA EDUCACIÓN SUPERIOR

Marianita Marroquín Yerovi, Universidad Mariana

## RESUMEN

*La enseñanza y el aprendizaje en la educación superior con niveles de calidad se han propuesto en esta investigación doctoral. Los temas fundamentales constituyen la metacognición y el aprendizaje de estrategias en el aula. La parte fundamental de la investigación corresponde a la Aplicación del Programa de Metacognición y Estrategias de Aprendizaje en el quehacer docente en la Universidad Mariana en Pasto - 2009. Como objetivo se propuso identificar el efecto de la aplicación del programa con estudiantes de Enfermería y de Trabajo Social, en términos de avances en el aprendizaje y mejoramiento del rendimiento académico con Grupos Experimentales y de Control. El diseño metodológico vincula los paradigmas: cuantitativo y cualitativo cuyo diálogo paradigmático proporciona mejores formas de tratar el objeto de conocimiento. El estudio matemático probabilístico permitió la comprobación de la hipótesis que afirma que los Grupos Experimentales tienen un mejor rendimiento académico que los Grupos de Control. Ni el perfil psicológico de los estudiantes ni el programa de estudio influyen en el alto rendimiento académico, se concluyó. Desde lo deductivo-inductivo se verificó el avance de procesos metacognitivos y estratégicos, con aportes conceptuales de autores como: Beltán y Genovard (1998) Monereo (2006) Posso (2008); Díaz y Hernández (2006) preferencialmente.*

**PALABRAS CLAVE:** Investigación pedagógica, estrategias educativas, metacognición

## TEACHING AND LEARNING IN HIGHER EDUCATION

### ABSTRACT

*This research proposes the teacher and learning processes in an upper education with high levels of quality. The underlying topics are meta-knowledge and learning strategies in the classroom. The essential part of the research relates to the Application of the Program of Meta-Knowledge and Learning Strategies in the Teacher Performances inside Universidad Mariana in Pasto – 2009. It was proposed to identify the effect of the application of the program with nursing and social worker students as the main objective, in terms of progress in the learning process and the improvement of the academic performance. Experimental and Control Groups were used. The methodological design bonds the paradigms quantitative and qualitative, which paradigmatic dialogue provides better ways of treating the knowledge object. The mathematical statics studio allowed the testing of the hypothesis: the Experimental Groups have a better academic performance than the Control Groups. The conclusion states that neither the psychological profiles of the students, nor the program they study in have any influence in the high academic performance. From the deductive-inductive manner it was verified the advancement in the meta-knowledge and strategic processes, with conceptual contributions from authors like: Beltrán and Genovard (1998), Monereo (2006), Posso (2008); Díaz and Hernández (2006) preferably.*

**JEL:** 12

**KEYWORDS:** Educational research, Educational Strategies, Metacognition

## INTRODUCCIÓN

Este artículo de resultados de la investigación Doctoral responde al interés de compartir la experiencia respecto de la docencia y el aprendizaje en la Educación Superior. Existe consciencia de las necesidades y retos de la calidad en la enseñanza en todos los niveles educativos y en todas las áreas del conocimiento y de manera especial, en el nivel universitario. La Tesis Doctoral fue la oportunidad para lograr mejores niveles de docencia y aprendizaje de estudiantes. El estudio implica el trabajo desde dos paradigmas de investigación, el cuantitativo y cualitativo los cuales, en diálogo epistemológico favorecen el objeto de estudio. En este trabajo se articula la pedagogía y la investigación; la docencia y el aprendizaje en contextos socio-culturales y académicos; la experiencia como directora del seminario permanente de capacitación docente de la Universidad Mariana y la prospectiva institucional. Los temas tratados tienen su novedad en el contexto socioeconómico y cultural y académico, si se tiene en cuenta que este estudio permitirá la profundización a nivel institucional. Los temas sobre metacognición y estrategias de aprendizaje son pertinentes en el contexto donde se labora.

La revisión literaria, la metodología, resultados y conclusiones están orientados a la aplicación del Programa de metacognición y estrategias de aprendizaje, con objetivos definidos para ser desarrollados en el aula de clase, proponiendo formas para alcanzar mejores niveles de rendimiento académico en estudiantes universitarios de Grupos Experimentales. Los resultados del análisis estadístico ofrecen las razones por las cuales se verificaron las hipótesis formuladas, la incidencia o no incidencia de los factores de comparación en el logro del alto rendimiento académico y los estadísticos que establecieron la dinámica de causa y efecto. Al verificar las hipótesis permitió afirmar que existe correspondencia entre la Aplicación del Programa de Metacognición y Estrategias de Aprendizaje en los espacios académicos con estudiantes de IV Semestre de Enfermería y II de Trabajo Social como Grupos Experimentales y el mejoramiento del rendimiento académico.

Además en las conclusiones se expresa el aporte que se consiguió establecer desde el proceso de análisis e interpretación de resultados como por ejemplo: ninguno de los factores como el perfil psicológico, ni el género ni la pertenencia a un Programa Académico determinado fueron la causa del alto rendimiento académico, dejando en claro que la causa fue la Aplicación del Programa de Metacognición y Estrategias de Aprendizaje y por ende el acompañamiento responsable de los docentes participantes en la Aplicación del Programa y la corresponsabilidad estudiantil. Además de lo expresado hasta aquí el documento cuenta con el informe estadístico, el proceso cualitativo como proceso deductivo-inductivo, construcción de redes semánticas conceptuales, triangulación por categorías deductivas, construcción de categorías inductivas, análisis de resultados y conclusiones; las mismas que evidencian el rigor metodológico desde la triangulación paradigmática.

## REVISIÓN LITERARIA

### Antecedentes

La temática propuesta forma parte de todo un movimiento del aprender a aprender y del aprender a enseñar. Se consultaron autores considerados pioneros en lo cognitivo como Novak y Gowin (1988) Piaget (1990, 1997), Ausubel, Novak y Hanesian (1996), Bandura (1982), Vygotsky (1978) y Novak (1991). De igual manera se contó con el aporte fundamental de Flavell (1970, 1971; 1078) y Mayor, Suengas y González (1995) Herrera (2009) entre otros en lo metacognitivo. En relación con las estrategias de aprendizaje se ha contado con las bases conceptuales de los autores como Beltrán (1998), Beltrán y Genovard (1998) Sternberg (1997, 1999), Monereo, Castelló, (1997 Monereo, Castelló, Clariana, Palma y Pérez (2006) Pozo y Monereo (1999) Pozo (2008), Román y Gallero 1994), Díaz-Barriga y Hernández (2007) entre otros cuyas propuestas teóricas ayudaron a cumplir con los objetivos.

Para el tema de “metacognición” se encontraron aportes de autores como: Flavell (1970, 1971; Flavell 1976), Beltrán y Genovard (1998) Beltrán (1998); Herrera F. (2009) y un estudio de Mayor, Suengas y Gonzales (1995) apoyado en los estudios de Flavell (1981, 1987); Lombana (2003), quien trabajó en la relación metacognición y educación en ciencias, cambio conceptual y metacognición en el contexto de aprendizaje. Sobre estrategias de aprendizaje se consultaron a autores como: Beltrán y Genovard (1998), Pozo y Monereo (1999); Monereo y Castelló (1997), Monereo, Castelló, Clariana, Palma y Pérez, (2006) Justicia, citado en Beltrán (1998) Pozo (2008) entre otros.

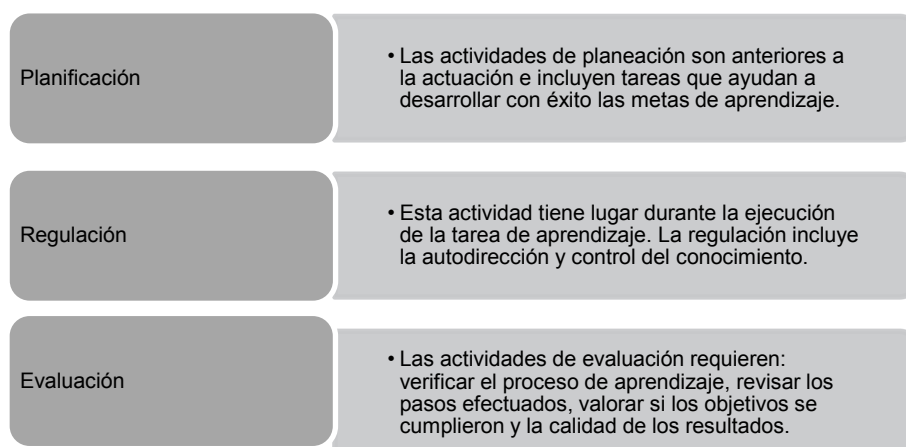

### Fundamentos Teóricos

Sobre metacognición Flavell (1971) afirmó que “el conocimiento de uno mismo concerniente a los propios procesos y productos cognitivos o a todo lo relacionado con ellos, puede ser evaluado Flavell (1971) considera cuatro elementos metacognitivos: *metas cognitivas*, *conocimiento metacognitivo* (con las tres variables de tarea, persona y estrategia), *experiencias metacognitivas* y *acciones o estrategias*. El *conocimiento metacognitivo* se refiere a “aquella parte del conocimiento del mundo que se posee y que tiene relación con asuntos cognitivos o quizá psicológicos”, Flavell, (1987).

El conocimiento metacognitivo está estructurado a partir de tres tipos de variables o categorías que se relacionan entre sí: 1. *Variables personales* o conocimiento de las capacidades y limitaciones cognitivas propias, 2. *Variables de tarea* o de conocimiento de las características y dificultades específicas de una tarea determinada y 3. *Variables de estrategia* o conocimiento de las ventajas o inconvenientes de los diferentes procedimientos en la realización de las tareas. Brown (1983) citado por Beltrán (1998 p. 371) señalan que la metacognición representa el conocimiento que los sujetos tienen de sus propios estados y procesos cognitivos y también el control que el individuo ejerce sobre dichos procesos; tanto en la descripción abierta del conocimiento, como en el uso efectivo que los sujetos hacen del mismo. La metacognición para Justicia (Beltrán 1998, p. 371), la identifica como un “*macroproceso de orden superior*”, caracterizado por un alto nivel de *consciencia y de control voluntario*, que tiene como finalidad gestionar otros procesos cognitivos más simples y elementales. La base de la metacognición reside en la posibilidad de utilizar, de forma conjunta y flexible, los procedimientos más elementales del procesamiento humano de información integrándolos en operaciones más claras y adaptadas que facilitan el aprendizaje. Brown (1987) destaca tres principales: *la planificación, la regulación y la evaluación*. Estas actividades son consideradas como procesos *altamente interactivos, superpuestos y recurrentes*. Estos procesos se pueden identificar como nodos de actividades, las cuales deben conocerse, distinguirse y ejecutarse. El conjunto es el que producen los resultados esperados

Figura 1: Macroproceso Metacognitivo

### Metacognición Según Mayor, Suengas y González

Mayor, Suengas y González (1995, pp. 54-59) orientan su pensamiento hacia los postulados de la psicología cognitiva, y desde allí profundizan en los temas claves de este estudio, como el conocimiento y la memoria (...) La actividad metacognitiva incorpora tres componentes básicos en su modelo de metacognición; es decir, la consciencia, el control y la “autopoiesis”. La toma de *consciencia* como actividad metacognitiva puede tener niveles como la intencionalidad, como aspecto fundamental que se refiere a la actividad mental se remite siempre a un objeto distinto de ella misma. El *control*, es una acción dirigida a las metas Ginsburg, Brenner y Von Cranach, (1985), Frese y Sabini (1985) o de una manera más específica, como control ejecutivo en Sternberg (1985), Brown y Palinscar (1987), Borkowsky y Truner (1990). La *autopoiesis*, significa un “salto de nivel” que crea algo diferente de lo ya existente en el aprendizaje estudiantil.

### Epistemología de la Metacognición

La metacognición para Justicia (Beltrán 1998, p. 371), la identifica como un “*macroproceso de orden superior*”, caracterizado por un alto nivel de *consciencia y de control voluntario*, que tiene como finalidad gestionar otros procesos cognitivos más simples y elementales. La base de la metacognición reside en la posibilidad de utilizar, de forma conjunta y flexible, los procedimientos más elementales del procesamiento humano de información integrándolos en operaciones más claras y adaptadas que facilitan el aprendizaje. El efecto último de la metacognición con este papel regulador del sistema cognitivo no es otro que hacer más adaptativa la conducta del individuo a los requerimientos del medio. Por ejemplo, la lectura es una actividad compleja en la cual se puede descomponer en elementos simples como: perceptivos, fonéticos, sintácticos, semánticos, motores, etc. Entre las actividades metacognitivas que conforman este macroproceso, Herrera (2009, p. 35) expresa que la “Metacognición se refiere, entre otras cosas, al control activo y a la consecuente regulación y orquestación de estos procesos en relación con los objetos de conocimiento a los que se refieren, normalmente al servicio de alguna meta concreta u objetivos” (Flavell, 1976, p. 232).

### Evolución del Concepto de Estrategia de Aprendizaje

Pozo y Monereo (1996, p. 17) recogen una interesante referencia respecto de las diferentes concepciones que han tenido las estrategias de aprendizaje en relación a las tendencias de cada época; así respecto del conductismo, cognitivismo y constructivismo. Además Beltrán (1998) y Pozo (2008) ofrecen una amplia

aportación sobre lo conceptual y aplicativo de las estrategias de aprendizaje. En la obra de Monereo, Castelló, Clariana, Palma y Pérez (2006, p. 23), establecen una distinción entre técnica y estrategia expresando: “Son muchos los autores que han explicado qué es y qué supone la utilización de estrategias a partir de esa distinción entre una “técnica” y una “estrategia”. Las técnicas pueden ser utilizadas de forma más o menos mecánica, sin que sea necesario para su aplicación que exista un propósito de aprendizaje por parte de quién las utiliza; *las estrategias, en cambio, son siempre conscientes e intencionales, dirigidas a un objetivo relacionado con el aprendizaje.*

Beltrán (1998, p. 50 expresa que “las estrategias hacen referencia, más bien a operaciones o actividades mentales que facilitan y desarrollan los diversos procesos de aprendizaje escolar. A través de las estrategias podemos procesar, organizar, retener y recuperar el material informativo que tenemos que aprender, a la vez que planificamos, regulamos y evaluamos esos mismos procesos en función del objetivo previamente trazado o exigido por las demandas de la tarea.” Pozo (2008) está entre los autores que han proporcionado una definición de estrategia de aprendizaje. La diferencia entre una técnica o estrategia casi nunca está en lo se hace, sino en cómo se hace, o dicho en otras palabras, es un mismo procedimiento que puede usarse de modo técnico o estratégico, dependiendo de las condiciones en que se haga. No es, por tanto, cuestión de categorizar los procedimientos como técnicos o estratégicos, sino de diferenciar cuándo un mismo procedimiento se usa de modo técnico (es decir rutinario, sin planificación ni control) y cuando se utiliza de un modo estratégico. Monereo y Castelló (1997); Pozo y Postigo (2000); Pozo, Monereo y Castelló (2001); Pozo (2008, pp. 498-500).

Díaz-Barriga y Hernández (2006). Se han incluido varias definiciones sobre “estrategias de aprendizaje” sin embargo es importante anotar las expresiones resumidas de Díaz-Barriga, et al. (2006, p. 234). La estrategia de aprendizaje: es controlada y no automática; requiere necesariamente de una toma de decisiones, de una actividad previa y planificada y de un control de su ejecución. Es necesaria la aplicación de un proceso metacognitivo y sobre todo autorregulador. La aplicación experta de las estrategias de aprendizaje requiere de una reflexión profunda sobre el modo de emplearlas.

## METODOLOGÍA

### Formulación del problema de investigación

¿Cuál es el efecto de la aplicación del Programa sobre Metacognición y Estrategias de Aprendizaje de estudiantes de Programas de Enfermería y de Trabajo Social, en términos de procesos de aprendizaje y mejoramiento del rendimiento académico con Grupos Experimentales y de Control en la Universidad Mariana?

*Objetivo general:* Identificar el efecto de la aplicación de un programa sobre Metacognición y Estrategias de Aprendizaje con estudiantes de Programas de Enfermería y de Trabajo Social, en términos de procesos de aprendizaje y mejoramiento del rendimiento académico con Grupos Experimentales y de Control en la Universidad Mariana.

*Objetivos específicos:* Reconocer un perfil psicológico, de los estudiantes de Grupos Experimentales y Grupos de Control, mediante la aplicación de Pruebas de Aptitudes Generales y Diferenciales (DAT-5), Personalidad (16PF-5) e Inteligencia (WAIS-III).

Proponer un Programa pedagógico-disciplinar sobre Metacognición y Estrategias de Aprendizaje mediante el diseño y aplicación en asignaturas del currículo de programas de Grupos Experimentales.

Analizar la información de tipo cuantitativo y cualitativo sobre procesos metacognitivos y aprendizaje de estrategias de aprendizaje de los estudiantes participantes y docentes orientadores del Programa pedagógico-disciplinar de Metacognición y Estrategias de Aprendizaje. Verificar los resultados cuantitativos de la Aplicación del Programa de Metacognición y Estrategias de Aprendizaje, mediante análisis estadísticos de los resultados del Rendimiento Académico.

### Hipótesis

La hipótesis de trabajo es: existe correspondencia entre la aplicación del Programa de Metacognición y Estrategias de Aprendizaje en los Espacios Académicos con estudiantes de IV Semestre A- de Enfermería y II Semestre de Trabajo Social como Grupos experimentales y el mejoramiento del rendimiento académico. La hipótesis estadística: los Grupos Experimentales, tienen un mejor comportamiento en el rendimiento académico que los Grupos de Control. La hipótesis alterna: los Grupos Experimentales, tienen igual comportamiento en el rendimiento académico que los Grupos de Control. El objeto de estudio desde lo cuantitativo se propone como un análisis probabilístico sobre la relación de causa y efecto de la aplicación del Programa de Metacognición y Estrategias de aprendizaje y el Rendimiento Académico.

### Diseño Metodológico de la Investigación

Paradigma. El objeto de estudio requiere la vinculación de dos paradigmas: el cuantitativo y el cualitativo. Se pretende, en términos de Guillermo Briones (1998, p. 36), aceptar su planteamiento: “Todo conocimiento empírico se relaciona (...) con alguna observación directa, pero las teorías y las hipótesis permiten observaciones indirectas (...) El conocimiento puede referirse a entes individuales o a relaciones que se dan entre los fenómenos.” Esta afirmación es un respaldo al trabajo realizado: Grupos con alto rendimiento académico, mediante análisis estadísticos globalizados, dando origen a múltiples relaciones entre el “fenómeno”, como la aplicación del Programa pedagógico-disciplinar de Metacognición y Estrategias de Aprendizaje y sus efectos académicos. En relación a lo cualitativo, se identificó y analizó un proceso denominado: “Bitácora metacognitiva y estratégica”, durante la aplicación del Programa de Metacognición y Estrategias de Aprendizaje. Se ha cuidado la confiabilidad y la validez de los datos.

Enfoque. Este estudio es, empírico analítico y hermenéutico. Porque el criterio de validez de los datos se basa en las evidencias tomadas directamente de la realidad y los datos empíricos son analizados estadística y clínicamente. Es hermenéutico porque el estudio corresponde a un proceso interpretativo – comprensivo, buscando los significados que para los sujetos tiene las acciones percibir los procesos de aprendizaje Nivel. El estudio pretende ir más allá de la descripción de conceptos. Este tipo de investigación explicativo supera los niveles anteriores como la exploración, la descripción y la correlación. El interés estuvo en explicar el por qué se dieron los resultados y bajo qué condiciones estos resultados se produjeron dando explicaciones de la relación existente entre las variables.

Tipo. Se trata de un tipo experimental de más de dos Grupos, según la taxonomía de D’Ancona (2001, p. 100). En este diseño, se ha considerado una variable independiente con dos categorías o subtemas globales: Metacognición y Estrategias de Aprendizaje y, la variable dependiente, el efecto de la intervención. En el modelo de experimento se ha tomado la relación causa-efecto en el mismo sentido en los cuatro Grupos Experimentales. Se ha considerado importante la validez externa del estudio, cuyas posibilidades se presentan en el entorno social local y nacional e internacional. Identificación de variables: Desde lo cuantitativo, procesamiento de la información obtenida en la aplicación de las Pruebas Psicológicas y su respectivo análisis estadístico y clínico, (Co-variables), los Informes de Rendimiento Académico de los Grupos Experimentales (Variable dependiente). La aplicación del Programa de Metacognición y Estrategias de Aprendizaje pedagógico-disciplinar (Variable independiente).

Desde lo cualitativo. El estudio sobre Metacognición y Estrategias de Aprendizaje amerita la interpretación y comprensión de relaciones significativas dadas por los destinatarios. Briones (1998) El proceso se realizó mediante el diseño de matrices, vaciado de información, sistematización y análisis e interpretación descubriendo sus categorías inductivas. Categorías de análisis. Se proponen tres categorías: 1. Conocimiento metacognitivo, habilidades metacognitivas y procesos de aprendizaje metacognitivos de estudiantes de Grupos Experimentales. 2. El aprendizaje de Estrategias de Aprendizaje en relación con técnicas y estrategias. 3. El saber pedagógico referido a la Metacognición y Estrategias de aprendizaje y su repercusión en el quehacer docente y estudiantil.

Figura 2: Estructura del Programa de Metacognición y Estrategias de Aprendizaje.

Programa de Metacognición y estrategias de aprendizaje.		Espacio Académico: Adulto anciano. Grupo Experimental		
Temas pedagógicos		Temas curriculares	Técnicas	Estrategias

*Esta estructura permitió la integración de 13 temas diseñados desde el contenido teórico de la metacognición y estrategias de aprendizaje con los temas del curso con la posibilidad de utilizar técnicas y estrategias adecuadas según el temario. Cada docente debió realizar las sesiones de aula con esta planeación en las clases de los Grupos Experimentales.*

## RESULTADOS

En esta versión reducida se hace referencia a la definición de un perfil psicológico sobre Aptitudes generales y diferenciales, con la aplicación de la batería DAT - 5 que mide: Razonamiento verbal (VR), razonamiento numérico (NR), Rapidez y exactitud perceptiva (PSA), Relaciones espaciales (SR), Ortografía (OR), Aptitud académica (VR + NR) (Manual DAT-5, p. 62).

Tabla 1: Resultados estadísticos post-test aptitudes DAT-5.

	Control n=133		Experimental n=144				
	Media	Desviación Típica	Media	Desviac. Típica	TE	Z	Valor p
VRPC	20,02	25,29	18,43	24,77	,06	-1,36	0,175
NRPC	28,87	30,92	26,39	31,75	,08	-1,30	0,194
<b>SRPC</b>	<b>40,98</b>	<b>26,69</b>	<b>31,41</b>	<b>28,23</b>	<b>,35</b>	<b>-3,46</b>	<b>0,001</b>
<b>ORPC</b>	<b>37,82</b>	<b>27,00</b>	<b>30,13</b>	<b>24,98</b>	<b>,30</b>	<b>-2,55</b>	<b>0,011</b>
PSAPC	56,65	31,68	55,08	33,65	,05	-,38	0,703
VRNRPC	20,08	26,76	18,88	26,96	,04	-1,49	0,136

La Tabla 4, muestra los resultados en el post-test en las pruebas Aptitudes generales y diferenciales. En las pruebas que miden, SRPC, ORPC las diferencias entre los grupos fueron estadísticamente significativas ( $p < 0.05$ ); sin embargo el tamaño del efecto encontrado fue muy bajo. Estos resultados globalizados constituyeron un insumo para concluir que el perfil psicológico no es determinante en los resultados del rendimiento académico.

**Capacidad intelectual: CI.** En las escalas globales los grupos mostraron diferencias estadísticamente significativas en el Coeficiente Intelectual verbal (CIV) y en el Coeficiente Intelectual de Ejecución (CIE). A nivel del Coeficiente Intelectual Total (CIT), se perciben diferencias clínicamente y estadísticamente importantes. En los índices de Comprensión Verbal (ICV), organización perceptual (IOP) y Memoria de Trabajo (IMT) se evidencian diferencias estadísticamente significativas,  $p < 0.05$ . Solamente en la Capacidad Intelectual Total CIT, el  $TE = 0,75$  en las demás escalas fue inferior a este valor

**Rasgos de personalidad :** Los resultados de la prueba 16PF-5, evidenciaron que no existen diferencias significativas entre los grupos Control y Experimental, debido a que la diferencia estandarizada entre las aplicaciones de la prueba es  $< 0,7$  en todos los factores de personalidad evaluados, excepto en las escalas

de Tensión y Dureza donde el valor  $p < 0,05$ , aunque los tamaños de los efectos fueron bajos ( $TE = 0,24$ ).

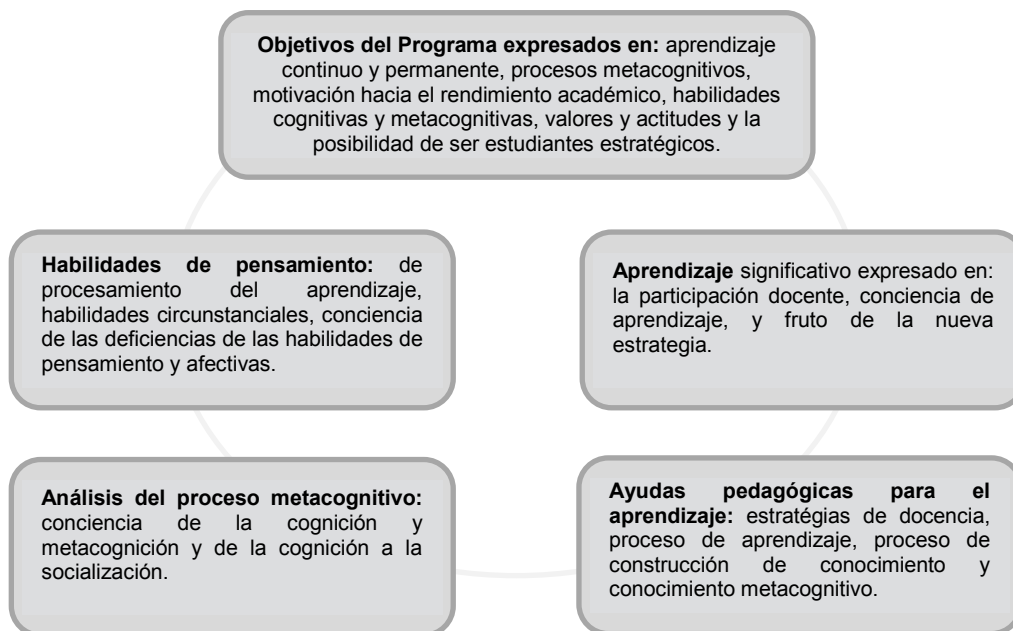

Figura 3: Resultados del Rendimiento Académico Según Nota Definitiva en los Grupos de Estudio.

La figura 3, muestra el rendimiento académico según nota final definitiva en los grupos de estudio. Después de realizado el Programa sobre Metacognición y Estrategias de aprendizaje con estudiantes de Programas de Enfermería y de Trabajo Social, el grupo experimental mostró un rendimiento significativamente mayor ( $Z=10,5$ ;  $p<0.001$ ), mostrando un Tamaño del efecto alto igual a  $TE=1,42$ .

### Resultados del proceso cualitativo

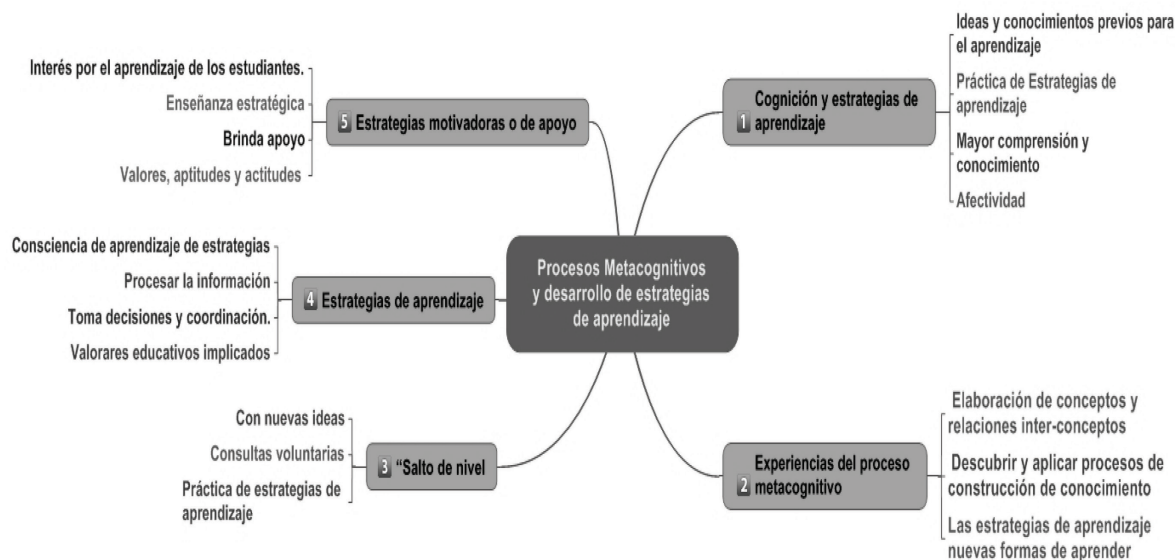

Figura 4: Campo semántico – Metacognición y aspectos básicos, I Parte- 2009 desde la comprensión de los participantes en el programa.

Esta información corresponde a la construcción de categorías inductivas resultantes del procesamiento de datos recogidos en el trabajo de campo. Las categorías inductivas han resultado del proceso inductivo dentro del análisis de la información como apoyo indispensable para la triangulación e interpretación de los datos. Bonilla-Castro y Rodríguez (2005)

Figura 5: Red causal de evidencias de la Bitácora metacognitiva y estratégica II Parte 2009.

La Figura 5, contiene los siguientes elementos: En el centro la segunda categoría de análisis identificada como procesos metacognitivos y desarrollo de estrategias de aprendizaje, las categorías deductivas y el resultado de la construcción de categorías inductivas. Fuente: esta investigación.

## CONCLUSIONES

Los resultados del análisis estadístico expresan que el Grupo Experimental y el Grupo Control, fueron comparables; es decir, que el número de estudiantes vinculados en diferentes Programas académicos como Enfermería o Trabajo Social donde se haya aplicado el Programa no incidió en el rendimiento académico; en razón de que las diferencias de número de participantes por Programa académico dentro de Grupos de Control y Experimental, muestran que no fueron estadísticamente significativos ( $\chi^2=0,11$ ; 1gl;  $p=0,731$ ). Los resultados del rendimiento académico, relacionando los Grupos Experimentales tanto de Enfermería como de Trabajo Social sobre los Grupos de Control de los mismos Programas, muestran un rendimiento significativamente mayor a favor del Grupo Experimental. En el caso del Programa de Enfermería Grupo Experimental, la diferencia fue significativa ( $Z=7,9$ ;  $p<0.001$ ), con un tamaño del efecto alto igual a  $TE=1,13$ , sobre el Grupo de Enfermería Control. De igual manera en el caso de Trabajo Social – Experimental, la diferencia fue significativa ( $Z=6,7$ ;  $p<0.001$ ), mostrando un tamaño del efecto alto igual a  $TE=2,79$  esto es, superior al Grupo de Control del mismo Programa. Fig.2

Por los resultados del análisis de Varianza se concluye que el efecto de la aplicación del Programa sobre Metacognición y Estrategias de Aprendizaje en relación con el rendimiento académico, fue independiente del Programa académico al que pertenecían los estudiantes; es decir que es aplicable a todas las áreas del conocimiento. Con el análisis de covarianza (ANCOVA), el cual mostró que el resultado del rendimiento académico se puede atribuir a la aplicación del Programa de Metacognición y Estrategias de Aprendizaje y no a los cambios en el perfil psicológico. Se ha demostrado por el rendimiento académico que las estrategias de aprendizaje fueron los medios para enseñar y aprender contenidos. Desde el estudio docente-discente se ha demostrado que: el aprender a aprender no se refiere al aprendizaje directo de contenidos, sino al aprendizaje de habilidades con las cuales aprender contenidos.

Los estudiantes percibieron que sus esquemas mentales se enriquecieron mediante un aprendizaje significativo, fueron conscientes de la capacidad de construir el conocimiento, de percibir resultados de procesos metacognitivos actuando desde su propia conciencia, evaluar y controlar su aprendizaje. Fue una novedad para ellos la percepción que al avanzar en el aprendizaje de estrategias se hicieron los temas disciplinares “más sencillos”, “más fáciles de aprender”.

# **AFECTACIÓN A LOS TRABAJADORES DE LA REFORMA A LA LEY FEDERAL DEL TRABAJO MEXICANA**

Miguel Ángel Díaz Marín, Instituto Tecnológico de Ciudad Juárez  
Sergio Enrique Blanco Pegueros, Universidad Autónoma de Ciudad Juárez

## **RESUMEN**

*Esta investigación tendrá como objetivo determinar de qué manera consideran los trabajadores mexicanos que les va a afectar la reforma a la Ley Federal del Trabajo, aprobada por el Congreso mexicano y publicada en el Diario Oficial de la Federación con fecha 30 de noviembre de 2012, lo anterior tiene como objeto que los departamentos de recursos humanos de las empresas conozcan los resultados de esta investigación, con el objeto de que tomen las medidas necesarias para minimizar el impacto de las reformas en sus trabajadores presentes y futuros, incluyendo el hecho de orientar a sus trabajadores sobre esta reforma evitando malos entendidos y mejorando el clima organizacional de la empresa.*

**PALABRAS CLAVE:** Ley Federal del Trabajo, Afectación, Reforma, Recursos Humanos

## **MEXICAN WORKERS AFFECTATION WITH THE AMENDMENTS TO THE MEXICAN FEDERAL LAW**

### **ABSTRACT**

*This investigation pursue determine the Mexican workers affectation with the amendments to the Federal Labor Law approved by the Mexican Congress and published in the Official Federal Gazette on November 30, 2012, the above mentioned has the object that the companies human resources departments will know the results of this investigations, and take the necessary steps for minimized the impact of the amendments mentioned with the current workers and with the future workers, including the fact to give advice to their workers avoiding misunderstandings and improving the company organization climate.*

**JEL:** J01, J24, J81, K31

**KEYWORDS:** Federal Labor Law, Affectation, Amendments, Human Resources

## **INTRODUCCIÓN**

La reforma laboral en México, causó un gran impacto tanto en los trabajadores, como en las empresas, tan es así que se han presentado por parte de los trabajadores mexicanos miles de amparos contra la misma, de ahí la importancia de determinar las afectaciones que perciben los trabajadores mexicanos en contra de dicha reforma, cuyos resultados beneficiarán a las empresas mexicanas, ya que de ésta manera los departamentos de recursos humanos podrán minimizar los efectos adversos y dar asesoría a sus trabajadores sobre los efectos reales de la reforma. Esta investigación se presenta organizada como sigue. En la sección de revisión de la literatura se presentan las principales modificaciones que se hicieron a la Ley Federal del Trabajo. Posteriormente se presenta la metodología utilizada, en donde se describe el procedimiento que se siguió para determinar las afectaciones que los trabajadores mexicanos tienen relacionadas con las modificaciones a la Ley Federal del Trabajo, utilizando el método cualitativo de

aplicaron encuestas a trabajadores de toda la República Mexicana, para determinar la afectación de la reforma a la ley mencionada. Finalmente, las conclusiones, limitaciones y futuras líneas de investigación son presentadas.

## REVISIÓN DE LITERATURA

Con fecha 30 de enero de 2012, se publico en el Diario Oficial de la Federación (Federación, 2012), las reformas a la Ley Federal del Trabajo, de dichas reformas destacan los siguientes puntos:

El trabajo en régimen de subcontratación es aquel por medio del cual un patrón denominado contratista ejecuta obras o presta servicios con sus trabajadores bajo su dependencia, a favor de un contratante, persona física o moral, la cual fija las tareas del contratista y lo supervisa en el desarrollo de los servicios o la ejecución de las obras contratadas.

Las relaciones de trabajo pueden ser para obra o tiempo determinado, y se agrega en la reforma, que también pueden ser por temporada o por tiempo indeterminado y en su caso podrá estar sujeto a prueba o a capacitación inicial. A falta de estipulaciones expresas, la relación será por tiempo indeterminado.

En las relaciones de trabajo por tiempo indeterminado o cuando excedan de ciento ochenta días, podrá establecerse un periodo a prueba, el cual no podrá exceder de treinta días, con el único fin de verificar que el trabajador cumple con los requisitos y conocimientos necesarios para desarrollar el trabajo que se solicita. (TRABAJO OPERATIVO)

El periodo de prueba a que se refiere el párrafo anterior, podrá extenderse hasta ciento ochenta días, sólo cuando se trate de trabajadores para puestos de dirección, gerenciales y demás personas que ejerzan funciones de dirección o administración en la empresa o establecimiento de carácter general o para desempeñar labores técnicas o profesionales especializadas.

Durante el período de prueba el trabajador disfrutará del salario, la garantía de la seguridad social y de las prestaciones de la categoría o puesto que desempeñe. Al término del periodo de prueba, de no acreditar el trabajador que satisface los requisitos y conocimientos necesarios para desarrollar las labores, a juicio del patrón, tomando en cuenta la opinión de la Comisión Mixta de Productividad, Capacitación y Adiestramiento en los términos de esta Ley, así como la naturaleza de la categoría o puesto, se dará por terminada la relación de trabajo, sin responsabilidad para el patrón.

Se entiende por relación de trabajo para capacitación inicial, aquella por virtud de la cual un trabajador se obliga a prestar sus servicios subordinados, bajo la dirección y mando del patrón, con el fin de que adquiera los conocimientos o habilidades necesarios para la actividad para la que vaya a ser contratado.

La vigencia de la relación de trabajo a que se refiere el párrafo anterior, tendrá una duración máxima de tres meses o en su caso, hasta de seis meses sólo cuando se trate de trabajadores para puestos de dirección, gerenciales y demás personas que ejerzan funciones de dirección o administración en la empresa o establecimiento de carácter general o para desempeñar labores que requieran conocimientos profesionales especializados. Durante ese tiempo el trabajador disfrutará del salario, la garantía de la seguridad social y de las prestaciones de la categoría o puesto que desempeñe. Al término de la capacitación inicial, de no acreditar competencia el trabajador, a juicio del patrón, tomando en cuenta la opinión de la Comisión Mixta de Productividad, Capacitación y Adiestramiento en los términos de esta Ley, así como a la naturaleza de la categoría o puesto, se dará por terminada la relación de trabajo, sin responsabilidad para el patrón.

La relación de trabajo con periodo a prueba o de capacitación inicial, se hará constar por escrito garantizando la seguridad social del trabajador; en caso contrario se entenderá que es por tiempo indeterminado, y se garantizarán los derechos de seguridad social del trabajador.

Los periodos a prueba y de capacitación inicial son improrrogables. Dentro de una misma empresa o establecimiento, no podrán aplicarse al mismo trabajador en forma simultánea o sucesiva periodos de prueba o de capacitación inicial, ni en más de una ocasión, ni tratándose de puestos de trabajo distintos, o de ascensos, aun cuando concluida la relación de trabajo surja otra con el mismo patrón, a efecto de garantizar los derechos de la seguridad social del trabajador.

Tratándose de salario por unidad de tiempo, se establecerá específicamente esa naturaleza. El trabajador y el patrón podrán convenir el monto, siempre que se trate de un salario remunerador, así como el pago por cada hora de prestación de servicio, siempre y cuando no se exceda la jornada máxima legal y se respeten los derechos laborales y de seguridad social que correspondan a la plaza de que se trate. *El ingreso que perciban los trabajadores por esta modalidad, en ningún caso será inferior al que corresponda a una jornada diaria.*

*El Pago de Salarios Caídos* serán computados desde la fecha del despido hasta por un período máximo de doce meses.

Si al término del plazo señalado en el párrafo anterior no ha concluido el procedimiento o no se ha dado cumplimiento al laudo, se pagarán también al trabajador los intereses que se generen sobre el importe de quince meses de salario, a razón del dos por ciento mensual, capitalizable al momento del pago. Lo dispuesto en este párrafo no será aplicable para el pago de otro tipo de indemnizaciones o prestaciones.

En caso de muerte del trabajador, dejarán de computarse los salarios vencidos como parte del conflicto, a partir de la fecha del fallecimiento.

De acuerdo con (Camarena, Salvador, 2012), será legal en México contratar a trabajadores por horas y no necesariamente por jornadas de ocho horas al día, con un contrato de prueba o capacitación y no forzosamente con uno definitivo, agregar fuerza laboral mediante outsourcing o subcontratación, y el pago por salarios caídos (los que el empleado deja de percibir entre su despido y una sentencia judicial favorable) tendrá un tope de un año, más intereses, en los casi siempre eternos litigios por despido.

De conformidad con (Vergara, Rosalia, 2013), informo que durante una reunión realizada en la sede del Sindicato de Trabajadores de la Universidad Nacional Autónoma de México (STUNAM), a la que asistieron los dirigentes de los sindicatos de Telefonistas de la República Mexicana (STRM) y de Trabajadores de la UNAM (STUNAM) Francisco Hernández Juárez y Agustín Rodríguez, respectivamente, se informó que a la fecha la UNT ha presentado más de 2 millones de amparos y el FSM alrededor de 1 millón 200 mil, en contra de la reforma laboral, señalando que la reforma laboral afecta los derechos y conquistas de los trabajadores mexicanos.

De acuerdo con (@adnpolitico, 2013), el Sindicato Nacional de Trabajadores de la Educación (SNTE) convocó a sus más de 1.5 millones de afiliados a sumarse al amparo colectivo que alista contra la reforma laboral, según información de El Universal. El plan -de acuerdo con el diario- forma parte de la estrategia del gremio que lidera Elba Esther Gordillo en rechazo a la reforma educativa, la cual prevé mecanismos de evaluación para los maestros a los cuales se opone el Sindicato.

De acuerdo con (Mendez, Alfredo, 2013), Eduardo Miranda Esquivel refirió que “sindicatos y grupos de trabajadores del país, con apoyo de la coordinadora de abogados contra la reforma laboral y otros equipos de asesores sindicales e independientes, presentaron del 3 de diciembre de 2012 al 15 de enero de 2013, alrededor de 2 millones de amparos, impugnando la modificación constitucional de cerca de 300 artículos

de la Ley Federal del Trabajo, que por su sola entrada en vigor afectó los derechos laborales de los mexicanos y las garantías adquiridas por los trabajadores activos o potenciales.

Este autor también señaló que los amparos contra la reforma laboral están sustentados en el interés legítimo que reconoce la Constitución para todo individuo o una colectividad, en virtud de que la sola publicación de una ley contraria a los derechos humanos, como la contenida en la reforma laboral reciente, obliga a los juzgadores a revisar los actos del Poder Legislativo de manera inmediata por afectarse los derechos de la clase obrera en su conjunto, expuso.

De acuerdo con (Ferrer, Eduardo 2012), la reforma laboral afecta a los trabajadores mexicanos, afecta el principio de estabilidad laboral, mantiene también la tesis de los contratos temporales, (a prueba, por tiempo fijo y para capacitación), con lo que supuestamente se busca abrir espacios para la contratación de desempleados pero que en los hechos, al fenecer un contrato temporal, la desocupación aumentará y seguirá en vigor la falta de mercado que tanto deplora la iniciativa privada.

También este autor señala que la reforma ratifica “uno de los peores instrumentos de la irresponsabilidad laboral, es decir, el outsourcing o subcontratación” de acuerdo a información proporcionada por el Dr. Nestor de Buen.

El (Sindicato Nacional de Trabajadores de la Educación, 2013), señaló las principales afectaciones para los trabajadores por la reciente aprobación de la Reforma Laboral, entre las que destacan:

1. Anula por completo la estabilidad en el empleo y permite el libre despido sin indemnización y sin importar si fue justificado o injustificado.

Permite el libre despido, pues ya no será obligatorio para el patrón entregar personalmente al trabajador el aviso de rescisión ya que lo podrá hacer por correo certificado o por medio de la Junta de Conciliación y Arbitraje quien podrá comunicarlo “por cualquier medio que se estime conveniente”.

2. Incrementa las causales de despido, al aceptar las quejas de los clientes. (Un ejemplo adelantado de esto es la Evaluación Universal, Enlace Pisa, etc., que al no acreditarla un alumno es causal para el cese del Trabajador de la Educación porque se equipara como una falta al cliente).

3. Desaparece el derecho del aviso de despido para l@s trabajador@s domésticos.

4. Legitima las renunciias “en blanco” al modificar el artículo 53 de la Ley Federal de Trabajo que actualmente requiere de un acuerdo entre las partes.

5. Crea “Normas nuevas” dirigidas a los jornaleros agrícolas, que se refieren a un “Registro Especial de trabajadores eventuales o de temporada” para justificar el despido libre y sin costo para ellos.

6. Legaliza el contratismo de terceristas que hoy es ilegal, permitiendo que los patrones no asuman sus obligaciones laborales y lo hagan por ellos los contratistas materializándose “fraudes legales” contra los trabajadores al suprimirse la responsabilidad solidaria en el artículo 13 de la Ley Federal del Trabajo.

7. Permite su fijación de manera unilateral por parte del patrón sin intervención sindical.

8. Legaliza la polivalencia (el multiusos) del trabajador con el mismo salario.

9. Con la certificación laboral permite la imposición de condiciones unilaterales de trabajo, es decir, el patrón te puede bajar el salario sin consultarte previamente.

10. Permite la fijación del monto de bonos, incentivos y comisiones de manera unilateral, sin necesidad de revisarlos anualmente.

11. Desaparece el salario mínimo y se crea “el salario infinitesimal”, porque el artículo 83 de la Ley Federal de Trabajo permite que el salario se pueda pagar de manera proporcional por el tiempo laborado, con la base de un salario mínimo, \$7.47 pesos por hora. Así una persona que labore 4 horas diarias se le pagarían \$29.90 diarios, la mitad del salario mínimo.

12. Derivado de lo anterior, desaparecen las plazas de base, porque el gobierno y las empresas privadas, despedirán a la mayoría de sus trabajadores de base, para contratarlos con estas nuevas y esclavizantes condiciones laborales.

13. Legaliza la subcontratación vía “outsourcing” que reduce el salario y permite que en una empresa haya trabajadores con las mismas funciones, con diferente salario y prestaciones.

*Condiciones de Trabajo:*

14. Permite la ampliación o reducción de las horas de trabajo, las cuales se pueden ajustar diariamente, de acuerdo a las necesidades de la empresa o Centro de Trabajo. Además de ahora en adelante los sábados y domingos se considerarán días laborales sin derecho de pago de tiempo extra, ni de pago de prima dominical, es decir, desaparecen los días de descanso, rige el principio de hora pagada hora trabajada.

## METODOLOGÍA:

Se siguió el método cualitativo, la muestra consistió en encuestar a 20 trabajadores de diversas regiones de la República Mexicana, preguntándoles cuáles son las principales afectaciones que consideran a su persona, derivadas de la publicación de la Reforma a la Ley Federal del Trabajo, del día 30 de noviembre de 2012. También se determina el número de trabajadores encuestados de acuerdo a su edad, es decir menores de 20 años, entre 20 a 30 años y mayores de 30 años. Lo anterior fue buscando que la muestra encuestada fuera representativa de las diversas regiones de México, así como de diferentes edades buscando de acuerdo con (Hernández Sampieri, Roberto, 2006), para consolidar la credibilidad desde el trabajo de campo, ambiente o escenario, es conveniente escuchar todas las “voces” en la comunidad bajo estudio, en entrevistas estar pendientes de la comunicación verbal, pero también de la no verbal.

## RESULTADOS

Figura 1: Edad de las Personas Encuestadas

*Representa el porcentaje del rango de edades de las personas encuestadas.*

Figura 2: Incidencia en las afectaciones a los trabajadores por la Reforma a la Ley Federal del Trabajo (2012).

*Representa el numero de respuestas de cada afectación a los trabajadores mexicanos por la Reforma a la Ley Federal del Trabajo (2012).*

## CONCLUSIONES

Después de analizar los resultados de esta investigación podemos concluir que de las respuestas obtenidas de los encuestados 10 señalaron que la afectación mayor es lo relacionado con los contratos de relación laboral temporales, que se incluyen en la reforma laboral como contratos de prueba, en donde el patrón puede despedir a los trabajadores que considere no reunieron los requisitos para ser contratados.

La segunda respuesta con 9 afectaciones es la relacionada con que la reforma laboral afecta directamente los derechos de los trabajadores, coincidiendo con algunos autores referidos en el marco teórico que señalan que la reforma laboral solo beneficia a los patrones y que los únicos perjudicados por la misma son los trabajadores.

La tercera respuesta con 4 afectaciones es la relativa al pago por hora a los trabajadores, que por primera vez se incluye en la reforma a la Ley Federal del Trabajo, en donde se permite esta figura, aunque señalando que en ningún caso el trabajador podrá recibir menos del salario mínimo diario, aunque trabaje pocas horas, sin embargo los trabajadores consideraron que sí se afecta sus derechos laborales con esta reforma.

La cuarta respuesta en que los trabajadores se consideran afectados con 4 respuestas es la relativa a que la reforma laboral solo beneficia a los trabajadores, coincidiendo con diversos autores señalados en la revisión bibliográfica y siendo este uno de los argumentos para los millones de amparos que se han presentado en contra de la reforma a la Ley Federal del Trabajo Mexicana.

Por último, con 3 respuestas, los trabajadores encuestados señalaron que la reforma laboral solo beneficia a la autoridad por agilizar los tiempos en litigio, y esto tiene que ver con la reforma que señala que en caso de litigio laboral, se limita el pago de salarios caídos a un año, aunque con pago de intereses posterior a dicho año, en comparación con la ley antes de ser reformada que no establecía límites al pago de salarios caídos, de manera tal que si el juicio duraba 5 años y el patrón perdía, este último tenía que pagarle al trabajador 5 años de salario caídos.

## LIMITACIONES

Dentro de las limitaciones hay que resaltar, por una parte, el número reducido de trabajadores encuestados, por otra parte, los resultados pueden estar influenciados por el periodo y la muestra de estudio. Futuras investigaciones podrán evaluar la validación de los resultados obtenidos.

# COMPETITIVIDAD E INTERNACIONALIZACIÓN TASA Y MASA DE BENEFICIO

Daniel Villalobos Céspedes, Universidad Nacional & Universidad de Costa Rica

## RESUMEN

*La investigación sobre la competencia y la competitividad de la empresa medida según el nivel de la tasa y/o masa de beneficios, ha sido planteada desde diversas perspectivas teóricas. La presente investigación propone un modelo que pretende ser una herramienta útil para evaluar la posición competitiva de las empresas en una industria o rama de la producción, con base en el nivel de la tasa y/o masa de beneficios. La teoría de los recursos TR provee un marco conceptual y analítico que sustentan el desarrollo del modelo. Se busca aportar a la TR un instrumento con el cual examinar al nivel de sector o industria, cómo la competencia nivela los beneficios en razón del valor de los activos globales de las empresas. La posible influencia de variables como experiencia y grado de internacionalización, modo de entrada, localización, condiciones de mercado cm (recesión, depresión, crecimiento y prosperidad económica), entre otras, en el nivel de la tasa y/o masa de beneficios y como consecuencia en la posición competitiva de la firma en la industria o ramo de producción, puede ser evaluada en el modelo propuesto. El modelo podría permitir un mejor conocimiento acerca del valor estratégico de los recursos de la empresa.*

**PALABRAS CLAVE:** Modelo; teoría de los recursos; competencia; competitividad; activos; tasa y masa de beneficio.

## COMPETITIVENESS AND INTERNATIONALIZATION RATE AND MASS OF PROFIT

### ABSTRACT

*Research on competition and competitiveness of the company measured by the rate or mass of profit has been raised from different theoretical perspectives. This research offers a model that pretends to be a useful tool to evaluate the companies competitive positioning in any particular industry or production branch based on the rate and/or mass level of profits. Resource theory (RT) provides a conceptual and analytical framework that supports the proposed model. This research aims to contribute to the TR with a tool capable of examining the sector or industry level and how the competition levels profits in reason of the value of the aggregate firms' assets. The possible influence of experience and internationalization level, entry mode, location, market conditions cm –recession, depression, growth and prosperity–, among others, in the rate or mass level of profits and firm competitive position in the industry or production branch, could be evaluated in the proposed model. The model could allow a better knowledge about the strategic value of the firm's resources.*

**JEL:** G32, L10, L20, L22, M16

**KEYWORDS:** Model; resource theory; competition and competitiveness; assets; rate and mass of profit.

## INTRODUCCIÓN

Diversos autores han realizado importantes trabajos que proveen de herramientas para analizar la influencia de factores endógenos y exógenos en la competitividad de las empresas (Barney, 1991, 2001;

Peteraf, 1993; Priem y Butler, 2001). Buckley y Casson (1998) se han planteado *la volatilidad del ambiente de los negocios* como factor de *incertidumbre*. En esos ambientes la volatilidad de los *beneficios* constituye el eje central de las estrategias empresariales. En recesión/depresión la oscilación de los beneficios es brusca e impulsada por la intensificación de la competencia en comparación a periodos de crecimiento y prosperidad. Porter (1996) recomendó las adquisiciones durante la recesión/depresión justificando *rendimientos potenciales encima del promedio* en crecimiento y prosperidad. *Renovar la posición* de una empresa en el mercado (Haspeslagh y Jemison, 1991; Salama et al, 2003), destaca el nivel de beneficios competitivos de la empresa de una industria en el mercado. El mismo sentido cobran las frases *rendimientos potenciales encima del promedio* (Porter, 1996), *retornos por encima de lo normal* (Barney, 1986; Markides e Ittner, 1994) o bien *creación de valor* (Lee y Caves, 1998).

Aquí opera la *furia* de la competencia (Currie, 2000) como elemento dinamizador de la distribución de los beneficios del sector o industria entre las empresas. La oscilación de los beneficios depende de la *extensión -número y tamaño de las empresas-* en una industria e *intensidad* de la competencia. La extensión e intensidad de la competencia pueden operar en tanto mecanismos de asignación de beneficios entre las empresas en función del valor de los activos, la estrategia competitiva y competitividad con influencia de factores exógenos -experiencia internacional, modo de entrada, grado de internacionalización, formas de integración y condiciones de mercado-.

Estos factores podrían intervenir en la valuación del carácter estratégico de los recursos de una firma operando como un *proceso sistémico continuo* (Buckley y Casson, 1998). Esta investigación se propone plantear al nivel teórico un modelo útil para el análisis de la competencia y la competitividad de las empresas evaluada según el *nivel* de la *tasa* o *masa* de beneficios de la empresa en la industria y la posición competitiva de la empresa. El primer apartado plantea las principales motivaciones teóricas basadas en la TR y la teoría de la internacionalización en torno a la competencia, la competitividad y los beneficios. El segundo apartado muestra la utilidad del concepto de activos contables para el análisis de la competencia y la competitividad internacional según el nivel de la tasa o masa de beneficios. En el tercer apartado se configura el modelo que establece el efecto útil de los activos en tanto eje central de la competencia y la competitividad. Finalmente surgen la contribución, orientación y futura investigación.

## REVISIÓN DE LITERATURA

La TR define a la empresa como un *conjunto de recursos* diferenciados y distribuidos de manera heterogénea (Barney, 1986). Algunos de esos recursos son calificados de *raros*, *valiosos*, *inimitables* e *insustituibles*. Peteraf (1993) califica de *superiores* a esos recursos a causa de su escasez relativa. Las condiciones de mercado *cm* en que se adquiere un recurso tienen implicaciones para el desarrollo de la estrategia competitiva de la firma en los periodos siguientes (Priem y Butler, 2001). La *utilidad* y la *abundancia relativa* de los recursos pueden influir en el nivel de los beneficios de una firma. Los conceptos *tecnología apropiada* (Vernon, 1966) y *recursos apropiados* (Barney, 1991) refieren al criterio de *utilidad* según el nivel de la tasa y/o masa de beneficios que contribuyen a generar.

Los *recursos intangibles* reflejan capacidad innovadora (Barney, 1986) de la empresa que la crea y/o explota. El valor de algunos de esos recursos -patentes, marcas, investigación y desarrollo- se transfiere al producto en la forma de *amortización*. El valor amortizado contribuye en la formación de la tasa y masa de beneficios de la empresa a igual que los recursos tangibles y financieros. Ese evento es potenciado por la *reputación* de los recursos intangibles (Porter, 1996, 2005; Barney, 1986), factor de mercado relevante para la reputación de una empresa (Barney, 1986). Una marca *ej.* con elevada reputación es un recurso superior debido a su *rareza* y a su *valor* para la estrategia de una empresa (Barney, 1986). Los atributos de los recursos pueden definir *oportunidades de explotación* y/o de *neutralización de amenazas* (Barney, 1991). Lo *atractivo* (Grant, 1991) que sea la industria y la ventaja competitiva o *nivel de la firma* (Barney, 2001) influyen en los beneficios. El valor de un recurso debe evaluarse en el ambiente

competitivo en el cual opera una firma Barney (2001). En ese caso el *desempeño histórico* de una empresa (Bruton et al, 1994) puede ser útil en el análisis de la ventaja competitiva.

Determinar el valor estratégico de un recurso exige trascender sus propios atributos y valorar a partir de su efecto útil actual y potencial. Un recurso no tiene valor estratégico a causa de sus atributos *per-se* sino en tanto recurso útil a un fin en determinada estrategia competitiva deliberada y cierta *cm*. Contrario a lo que planteara Grant (1991) la unidad de análisis ha de ser el efecto útil del recurso en vez del recurso mismo. La posición de una empresa en los beneficios medios del sector puede ser una señal de pobre desempeño por *escases* o *uso inadecuado* de los recursos (Burton et al, 1994). Una firma con beneficios por encima de la media del sector podría denotar elevada competitividad y alto valor estratégico de sus recursos. Lo que hace atractivo a un determinado ramo de la producción no son los recursos *per se* utilizados por la empresa competitiva sino los beneficios derivados de su uso productivo.

Dado que la *eficiencia* y *efectividad* de los recursos se pone de manifiesto en un entorno competitivo cambiante, el valor estratégico de los recursos puede ser conocido tanto por su contribución en la creación de valor de la empresa (Lee y Caves, 1998) como por su utilidad efectiva (Woodcock et al, 1994; Lieberman y Montgomery, 1998) medida en tanto tasa o masa de beneficio. El valor estratégico de los recursos puede ser influido por el ambiente competitivo, el mercado específico y las características de la empresa (Barney, 1986, 1991, 2001), la efectividad del recurso en diferentes circunstancias (Lieberman y Montgomery, 1988; Porter, 1996), el ambiente externo (Grant, 1991) y el ambiente económico (Buckley y Casson, 1998). En este panorama de la TR se puede analizar el desempeño de los recursos según su contribución en la generación de beneficios y en la *posición* sectorial de una empresa. La selección de una estrategia basada en la maximización de los beneficios se guía por la estructura de ingreso/costo de los recursos (Buckley y Casson, 1998; Porter, 1996).

#### Balance General y Beneficios Contables

El balance general contable registra una condición de equilibrio financiero de una empresa (Weston y Brigham, 1999) en términos de las posesiones y manera en que éstas se financian (Ross et al, 1997). Destaca que el valor de los activos globales  $A_i$  de una empresa equivale al valor global de los pasivos  $P_i$  y el patrimonio  $\dot{P}_i$ . En el análisis de los beneficios contables tanto de la tasa  $\bar{b}_i$  como de la masa  $b_i$ , prima la cuenta de valor de los *activos globales*.  $P_i$  refiere a deudas y obligaciones con terceros y buena parte de las mismas se encuentran representadas en  $A_i$ . Algunas deudas se materializan en  $A_i$  y otras en la contratación de personal, compra o renta de bienes y servicios -entre ellos *intangibles* de diverso tipo-.  $\dot{P}_i$  destaca el aporte de capital y los beneficios capitalizados por la empresa. El concepto de balance general se expresa como sigue:

$$A_i = P_i + \dot{P}_i \quad (1)$$

Si  $b_i$  se representa a partir de la tasa de beneficio  $\bar{b}_i$  sobre  $A_i$  entonces:

$$b_i = \bar{b}_i A_i \quad (2)$$

Al despejar  $A_i$  de (2) el resultado es:

$$A_i = b_i / \bar{b}_i \quad (3)$$

Al sustituir (3) en (1) se desprende que:

$$b_i / \bar{b}_i = P_i + \dot{P}_i$$

Al resolver para  $b_i$  se deriva:

$$b_i = \dot{b}_i (P_i + \dot{P}_i) \quad (4)$$

En (4) se denota que  $P_i$  y  $\dot{P}_i$  contribuyen en la generación de  $b_i$  según  $\dot{b}_i$  que la competencia establece en la industria. De acuerdo con (1) de (4) se obtiene (2), con lo cual se conceptualiza el *estado de resultados* financieros de una empresa. Contablemente  $b_i$  se define por la diferencia entre los ingresos  $I_i$  y gastos globales  $G_i$ :

$$b_i = I_i - G_i \quad (5)$$

Al sustituir esta expresión en (4) surge que:

$$I_i - G_i = \dot{b}_i (P_i + \dot{P}_i)$$

Luego, por medio de (1) se obtiene:

$$I_i - G_i = \dot{b}_i A_i \quad (6)$$

Al suplantar (2) en la expresión derecha de (6) el resultado es (5). Los beneficios contables se derivan del *estado de resultados* financieros de una empresa expresados en volumen o masa dineraria. Su relación con los *activos* contables globales que contribuyen en su generación determina una *tasa de beneficio* contable. De aquí la importancia de la cuenta de los *activos* globales del *balance general contable* que representan el valor dinerario al costo de los recursos *-tangibles* (propiedad, planta y equipo), *intangibles* (patentes, marcas, franquicias, derechos de autor y fiduciarios y las pericias, habilidades y destrezas del *recurso humano*) y *financieros*-. En términos contables esos recursos denotan la situación financiera de la empresa (Ross et al, 1997:32). Los activos tangibles participan en la generación de beneficios en razón de su depreciación o transferencia directa o indirecta de su valor al producto mientras los intangibles en función de su *amortización*. La proporción entre los distintos tipos de activos y su uso productivo difiere entre empresas de una misma industria. Estos eventos están en función de la naturaleza de la empresa y sector de la producción donde opera, de la estrategia organizacional y competitiva y *cm*. En la presente investigación interesa analizar los beneficios contables en función de los *activos*, con el propósito de develar su utilidad en el estudio de la competitividad y posibles ventajas competitivas. La investigación se plantea al nivel teórico pretendiendo ser un aporte a la *teoría de los recursos* y por su medio a la dirección de empresas. El objetivo es posicionar la tasa y masa del *beneficio* contable como posibles indicadores de competitividad.

#### Competencia y Competitividad: un Modelo de Análisis

$A_i$  de una empresa particular  $e_i$  representa el valor global de un conjunto de recursos estratégicos. El uso productivo de esos recursos genera beneficios contables  $b_i$ . La tasa de beneficio efectiva  $\dot{b}_i$  es:

$$\dot{b}_i = b_i / A_i \quad (7)$$

Al despejar  $b_i$  de (7) se obtiene (2) del apartado precedente. Para conocer el nivel competitivo de  $e_i$  se supone que la competencia asigna los beneficios globales  $b_s$  generados por el conjunto  $e_i$  en la industria. El mercado opera definiendo la tasa media de beneficio  $\dot{b}_m$  que asigna a cada  $e_i$  una fracción  $b_s$  en razón a  $A_i$  de  $e_i$  en los activos globales  $A_s$  en la industria acorde al número  $n$  de  $e_i$ . El valor medio  $A_m$  de los activos en la industria es:

$$A_m = A_s / n \quad (8)$$

En (8) se funda la empresa media  $A_m$  conforme a la composición de  $A_s$ . Dado  $b_s$  se puede obtener la tasa media de beneficio de la industria  $\bar{b}_s$ :

$$\bar{b}_s = b_s / A_s \quad (9)$$

Al igualar (7) y (9) se deriva el beneficio que la competencia determina para  $A_i$  en tanto fracción de  $b_s$  que le correspondería en razón de su participación en  $A_s$ :

$$b_{e_i} / A_i = b_s / A_s$$

Siendo  $b_{e_i}$  el beneficio esperado:

$$b_{e_i} = b_s A_i / A_s \quad (10)$$

O lo que brinda el mismo resultado a partir de sustituir (9) en (10):

$$b_{e_i} = \bar{b}_s A_i \quad (11)$$

Si  $A_i = A_m$  en (8) a  $b_{e_i}$  le corresponde un beneficio medio  $b_m$  tal que  $b_{e_i} = b_m$ . Al sustituir (8) en (11) y haciendo  $b_{e_i} = b_m$  el resultado es:

$$b_m = n \bar{b}_s A_m \quad (12)$$

Se define para  $A_m$  una tasa media de beneficio  $\bar{b}_m$ . Para  $A_m$  se establece que:

$$\bar{b}_m = b_m / A_m \quad (13)$$

Al sustituir (12) en (13) se deriva:

$$\bar{b}_m = n \bar{b}_s A_s / A_m \quad (14)$$

Al reemplazar  $A_m$  según (8) el resultado es:

$$\bar{b}_m = n \bar{b}_s A_s / n A_s$$

Luego,

$$\bar{b}_m = \bar{b}_s \quad (15)$$

(15) confirma que  $\bar{b}_s$  es la tasa media de beneficio para la industria.  $\bar{b}_s$  es un parámetro de las  $e_i$  en tanto tasa de beneficio que el mercado determina como referencia en la industria y en torno a la cual gira  $b_{e_i}$ . En competencia las  $e_i$  actúan *como si*  $b_{e_i}$  estuviese dado. No siempre  $e_i$  obtendrá  $b_{e_i}$  sino una entre esta tasa y  $\bar{b}_s$  y cada  $e_i$  aplicará dicha tasa a su estructura de activos para el cálculo de  $b_{e_i}$  competitivo. *Proposiciones* relativas al *tamaño y ventaja competitiva* de  $e_i$ :

1. Si  $A_i = A_m$ , entonces por (10) se sabe que:  
 $b_{e_i} = b_s A_m / A_s$ , por lo que al sustituir (8) se obtiene:  
 $b_{e_i} = 1/n b_s (A_s / A_s)$ , luego:

$$b_{e_i} = b_s/n = b_m \quad (16)$$

Con lo cual  $e_i = e_m$  representa  $e_i$  *mediana con ventaja competitiva media*.

2. Si  $A_i \neq A_m$ , se tienen dos eventos posibles:
  - 2.1. Si  $A_i < A_m$  se cumple  $b_{e_i} < b_m$ , con lo cual  $e_i$  representa  $e_i$  *pequeña con ventaja competitiva baja o nula*.
  - 2.2. Si  $A_i > A_m$  se satisface  $b_{e_i} > b_m$ , con lo cual  $e_i$  representa  $e_i$  *grande con de ventaja competitiva alta*.

De esas proposiciones se puede formular el cálculo de las *pérdidas o beneficios*  $p_i$  que la competencia establece para  $e_i$ :

$$p_i = b_{e_i} - b_m \quad (17)$$

De (17) surge el segundo conjunto de axiomas:

1. Si  $A_i = A_m$  entonces  $b_{e_i} - b_m = 0$ , lo que indicaría que  $e_i$  *mediana con ventaja competitiva media* obtiene *beneficios normales*.
2. Si  $A_i \neq A_m$  se tienen dos eventos posibles:
  - 2.1. Si  $A_i < A_m$  se cumple  $(b_{e_i} - b_m) < 0$  e indica que  $e_i$  *pequeña con ventaja competitiva baja o nula* obtiene *pérdidas*.
  - 2.2. Si  $A_i > A_m$  se satisface  $(b_{e_i} - b_m) > 0$  y revela que  $e_i$  *grande con ventaja competitiva alta* obtiene beneficios “*anormales*” o *extraordinarios*.

Como resultado de la dinámica competitiva se puede esperar se anulen las diferencias de  $p_{e_i}$ :

$$\sum_{i=1}^n p_{e_i} = \sum_{i=1}^n b_{e_i} - \sum_{i=1}^n b_m = 0$$

Surge la siguiente proposición:

La competencia entre  $e_i$  determina que al nivel de sector o industria la *suma* de los beneficios debe ser igual a la *suma* de las pérdidas.

Respecto del *valor del producto*  $VP_i$  de  $e_i$  se postula que:

$$VP_i = A_i (1 + b_s) \quad (19)$$

Para el caso de  $A_m$  donde  $VP_i = VP_m$  se formula que:

$$VP_m = A_m (1 + b_s) \quad (20)$$

Al despejar de (20) la expresión  $(1 + b_s)$  y al sustituir el resultado en (19) se determina:

$$VP_i = (A_i / A_m) VP_m \quad (21)$$

Se deriva de (21) el tercer conjunto de proposiciones relacionadas con las anteriores:

1. Si  $A_i = A_m$  entonces  $VP_i = VP_m$  para  $e_i = e_m$ , definida como  $e_i$  *mediana con ventaja competitiva media y beneficios normales*.

2. Si  $A_i < A_m$  entonces  $VP_i < VP_m$  para  $e_i$  definida como  $e_i$  *pequeña con ventaja competitiva baja o nula y pérdidas*.
3. Si  $A_i > A_m$  entonces  $VP_i > VP_m$  para  $e_i$  definida como  $e_i$  *grande con ventaja competitiva alta y beneficios “anormales” o extraordinarios*.

En última instancia  $A_i/A_m$  media la posición competitiva de  $A_i$ . La competencia nivela los valores  $VP_i$  en proporción al tamaño de  $e_i$  respecto de  $e_m$ . Se puede estimar  $b_{e_i}$  esperado para cada  $A_i$  en caso de que en competencia operen circunstancias externas propias de  $cm$  y/o del entorno de  $e_i$ , que la impelen a vender sus productos a precios medios. Al reemplazar  $b_s$  por  $b_{e_i}$  en (19) e igualar con (20), se obtiene:

$$A_i (1 + b_{e_i}) = A_m (1 + b_s)$$

Al resolver para  $b_{e_i}$ :

$$b_{e_i} = A_m/A_i (1 + b_s) - 1 \quad (22)$$

De (22) se derivan las siguientes proposiciones anotadas en el panel 2 de la figura 1:

1. Si  $A_i = A_m$  entonces  $b_{e_i} = b_s$  para  $e_i = e_m$ , definida como  $e_i$  *mediana con ventaja competitiva media, beneficios normales y valor de producto medio*.
2. Si  $A_i < A_m$  entonces  $b_{e_i} > b_s$  para  $e_i$  definida como  $e_i$  *pequeña con ventaja competitiva baja o nula y con posibilidad de disminuir pérdidas*.
3. Si  $A_i > A_m$  entonces  $b_{e_i} < b_s$  para  $e_i$  definida como  $e_i$  *grande con ventaja competitiva alta y con posibilidad de disminuir los beneficios “anormales” o extraordinarios*.

Se denota de tales proposiciones una tendencia oscilante de  $b_{e_i}$  en torno a  $b_s$ . El tamaño  $A_i$  de  $e_i$  influye en la definición de  $b_{e_i}$  por parte de la competencia, que la mide según  $A_m$  y  $b_s$ . (22) establece que conforme  $e_i$  de la industria se vuelven idénticas en tamaño ( $A_i = A_m$ ) obtendrán la misma  $b_{e_i}$  equivalente  $b_s$ .  $e_i$  será tan pequeña en relación con el mercado total que no podrá ejercer influencia alguna o perceptible en  $b_s$ . Se trata solo de un postulado general debido a que el tamaño de  $e_i$  según el valor de los activos oculta factores endógenos y exógenos que inciden en la definición de  $b_s$ . Incluso cuando el producto de  $e_i$  tiende a ser homogéneo este tipo de factores diferenciados podría influir en el precio, y por tanto en  $b_{e_i}$ .

Lo que hace la competencia es nivelar las semejanzas y diferencias entre las  $e_i$ , no suprimirlas. El *conjunto de recursos* diferenciados y distribuidos de manera heterogénea; *su capacidad para definir oportunidades de explotación* y/o de *neutralización de amenazas* y su valor estratégico (Barney, 1986); sus caracteres *rareza*, *valioso*, *inimitable* e *insustituible* (Barney, 1991), *apropiado* (Vernon, 1966; Barney, 1991), *específico* (Markides e Ittner, 1994), *útil* y *superior según la abundancia o escasez relativa* (Peteraf, 1993; Lieberman y Montgomery, 1998), *reputación* (Porter, 1996, 2005; Barney, 1986), *capacidad de amortización*, *desempeño histórico* y uso *inadecuado* (Burton et al, 1994) y *efectividad* (Porter, 1996) así como el uso eficiente -deficiente- de los activos fijos (Aybar y Ficici, 2009) son nivelados, nunca suprimidos, por la competencia.

La internacionalización puede ser una fuente de ventaja sostenible para  $e_i$  (Aybar y Ficici, 2009; Lieberman y Montgomery, 1998). Con base en las proposiciones planteadas en el apartado precedente se puede sugerir la posición competitiva y el *nivel de valor estratégico de los recursos*  $A_i$  de  $e_i$ . Las proposiciones enunciadas definen un valor estratégico *medio*, *bajo* y *alto* respectivamente según el nivel

de  $VP_i$  -dado por (21)- que cada  $e_i$  podría, *ceteris paribus*, generar en competencia. El nivel de  $VP_i$  puede ser influido por factores específicos de la internacionalización de las  $e_i$ . La competencia actúa nivelando las ventajas y desventajas de la participación internacional de las empresas a la vez que asigna los beneficios en razón de  $A_m/A_i$  dada en (22) según  $cm$ . En  $VP_i$  se pone de manifiesto la capacidad de  $e_i$  para obtener el máximo beneficio de su participación internacional en un sector o industria. Se puede esperar que la oscilación en  $b_s$  se deba en parte a la influencia de la internacionalización y  $cm$  y que afecta a  $b_{e_i}$ . La internacionalización de  $e_i$  y  $cm$  pueden influir  $b_s$  según afectan la intensidad de la competencia internacional. La internacionalización de  $e_i$  puede hacer variar  $A_i$  y como consecuencia  $A_m$ . La dirección del cambio en  $A_m$  depende tanto de la extensión como de la intensidad de la competencia.  $A_i$  podría aumentar, disminuir o permanecer sin cambio, razón por la que no se puede conocer a priori la dirección del cambio en  $A_m$  y por tanto de  $b_s$  a causa de la internacionalización y  $cm$ .

No obstante posibles efectos de la internacionalización en  $b_s$  -y por tanto en  $VP_i$ - se pueden reflejar en (22). En (8), dado cierto número ( $n$ ) de  $e_i$  compitiendo en el sector o industria en cierta  $cm$ ,  $A_s$  puede variar a causa de la internacionalización. De presentarse esas condiciones  $A_m$  variará en razón directa a  $A_s$ . Si  $b_s$  se mantiene invariable en cierta  $cm$  el cambio en  $A_s$  provocaría una variación de  $b_s$  en sentido inverso tal como lo reflejaría (9). Surge la siguiente proposición:

Dada  $n$ ,  $b_s$  y  $cm$ , una variación en  $A_s$  inducida por internacionalización de las  $e_i$  provocaría un cambio en la misma dirección en  $A_m$  y un cambio en sentido inverso de  $b_s$ .

En tal circunstancia  $e_i$  con mayor grado de internacionalización podrían obtener -conservar y hasta aumentar- beneficios “*anormales*” o extraordinarios. Sustituyendo (8) en (22) se deriva:

$$b_{e_i} = A_s/A_i (1 + b_s) 1/n - 1 \quad (23)$$

De (23) se desprende un conjunto de resultados posibles. Dada  $cm$  y siendo  $b_s$  y  $n$  estables, el grado de internacionalización de  $e_i$  podrían mostrar las siguientes situaciones:

1. Un mayor incremento en  $A_i$  respecto de  $A_s$  y dada la caída en  $b_s$  inducida por el aumento en  $A_s$ , podría gestar un aumento de  $b_{e_i}$  para  $e_i$  y elevar los beneficios “*anormales*” o extraordinarios.
2. Un menor incremento en  $A_i$  respecto de  $A_s$  la caída en  $b_s$  podría gestar una disminución de  $b_{e_i}$  para  $e_i$  y reducir los beneficios “*anormales*” o extraordinarios.
3. Si  $A_i = A_s$  la caída en  $b_s$  podría gestar una disminución de  $b_{e_i}$  para  $e_i$  y reducir los beneficios *normales*.

De las proposiciones anteriores se desprende que las  $e_i$  que no modifican su estrategia de internacionalización podrían ver reducida su participación en  $b_s$  y por consiguiente  $b_{e_i}$  decrece y propicia pérdidas. No obstante en crecimiento y prosperidad económica, cuando es más probable que la demanda se torne más intensa y las empresas de mayor tamaño no la satisfacen, las  $e_i$  medianas y pequeñas podrían influir en los precios internacionales. Dado ese escenario esas  $e_i$  podrían aumentar sus beneficios -normales o extraordinarios- mientras aquellas con beneficios por debajo de los normales podrían disminuir pérdidas. Se deriva la posibilidad de comparar la ventaja del grado de internacionalización según tamaño de  $e_i$ , por cuanto  $e_i$  del mismo tamaño pueden diferir en el grado de internacionalización. Esta presunción establece que cada grado de internacionalización se podría corresponder con  $e_i$  grandes, medianas o pequeñas según  $A_i$  y respecto de  $A_s$ . Además, sugiere que todas esas posibles relaciones podrían asociarse a una  $b_{e_i}$  alta, media o baja respecto de  $b_s$ .

### Contribución, Orientación y Futura Investigación

Esta investigación podría tener importantes implicaciones teóricas y prácticas en el ámbito de la administración, en especial para la dirección de empresas. El modelo propuesto sirve a un análisis exploratorio que explicaría la *situación real* de las empresas según estados contables. Se supera ese estadio en tanto el objetivo es evaluar esa situación contable respecto de una *situación posible* en el marco de la competencia. De aquí la diferencia entre  $b_i$  y  $b_{ei}$ . En la tasa y masa de beneficios que la competencia determina para cada empresa puede influir de distinta manera la estrategia competitiva, el tamaño de la empresa, lo atractivo del negocio, los atributos de los recursos que definen los activos, las condiciones de mercado y diversos factores de internacionalización. El análisis de esas variables podría ayudar a indentificar y anticipar el valor estratégico efectivo *versus* el valor estratégico potencial de los activos de una empresa. La iformación derivada del análisis explotarorio puede ser útil para un análisis inferencial a partir de bases de datos.

# **PENSAMIENTO ESTRATÉGICO: BASE PARA LA RESPONSABILIDAD SOCIAL EN UNIVERSIDADES PÚBLICAS AUTÓNOMAS**

Darcy Luz Mendoza, Universidad de La Guajira, Colombia,  
Yolmis Nicolás Rojano, Universidad de La Guajira, Colombia

## **RESUMEN**

*En este estudio se presentan las estrategias que permiten insertar a la Responsabilidad Social Universitaria en el Pensamiento Estratégico de las Instituciones Educativas. Para lograr este propósito, se parte de la revisión de teorías y postulados de autores que han avanzado en estas dos temáticas o variables de estudio, utilizando la metodología de corte cualitativo mediante un grupo focal objeto de estudio que son las universidades públicas autónomas ubicadas en el estado Zulia, en Venezuela y el departamento de La Guajira en Colombia, bajo un tipo de investigación descriptiva de campo, correlacional con un diseño transaccional no experimental. La investigación da respuesta a la pregunta ¿Cómo será el Pensamiento Estratégico base para establecer Responsabilidad Social en universidades públicas autónomas? La guía de tópicos fue diseñada y validada por expertos. La contribución más importante del estudio es la formulación de lineamientos teóricos estratégicos gerenciales que permiten incluir a la Responsabilidad Social en el Pensamiento Estratégico de las Universidades Públicas Autónomas.*

**PALABRAS CLAVES:** Pensamiento Estratégico, Responsabilidad Social, Universidades Públicas Autónomas.

## **STRATEGIC THINKING: BASE FOR SOCIAL RESPONSIBILITY AUTONOMOUS PUBLIC UNIVERSITIES**

### **ABSTRACT**

*In this study we present strategies for inserting University Social Responsibility in Strategic Thinking Educational Institutions. For this purpose, is part of a review of theories and postulates of authors who have advanced in these two themes or variables study, using qualitative methodology using focus group under study are autonomous public universities located in the state of Zulia, in Venezuela and the department of La Guajira in Colombia, under a kind of descriptive research field, with a correlation transactional experimental design. The research answers the question: How will the basis for Strategic Thinking Social Responsibility in autonomous public universities? The topic guide was designed and validated by experts. The most important contribution of the study is to formulate theoretical guidelines that enable strategic management include Social Responsibility in Strategic Thinking autonomous public universities.*

**JEL:** M14

**KEY WORDS:** Strategic Thinking, Social Responsibility, autonomous public universities

## **INTRODUCCIÓN**

En el mundo de las organizaciones, en pleno siglo XXI, la incertidumbre es el común denominador, de allí que el principio de Heissenberg dice que la imagen del mundo es la imagen de la incertidumbre.

Ninguna institución u organismo se escapa de este síndrome, es por ello que toda organización debe estar atenta a los cambios, y estar a la vanguardia de las situaciones de actualidad, pues eso las obliga a tener una capacidad de pensamiento trascendental, lo cual da como resultado la generación de nuevos conocimientos que les permite mejorar la capacidad de concebir alternativas viables para definir objetivos y transformarlos en resultados. Así las cosas, el futuro, se convierte para las organizaciones en el tiempo que aun no ha acontecido y se visualiza como un espacio de incertidumbre o de construcción social, de tal manera que hablar de futuro es hablar de deseos, posibilidades y, sobretodo, de creatividad. Así, la capacidad humana siempre inquieta y retada a construir territorios y organizaciones mejores, se ha valido de diversas formas para anticipar el futuro, con el ánimo de no dejarse sorprender por él. Una de esas herramientas es el Pensamiento Estratégico.

Hablar del Pensamiento Estratégico es hablar de aquel talento que es aplicado por los directores y rectores de manera creativa y continua para generar ideas estratégicamente viables que garanticen el éxito de la organización o universidad, sin importar que se encuentre en un entorno cambiante. En este sentido, Garrido (2007), considera que el Pensamiento Estratégico es el ADN de la planificación estratégica y la estrategia el centro neurálgico de la empresa, mientras que Morrissey (1996), establece que el Pensamiento Estratégico incorpora valores, misión, visión y estrategia.

En este sentido, las universidades al momento de plasmar ese Pensamiento Estratégico en su planificación, vale decir, construir su filosofía institucional, deben involucrar la Responsabilidad Social Universitaria, teniendo en cuenta lo que François Vallaey, (2010) sugiere respecto de los impactos propios de los cuatro ámbitos en los que la Universidad despliega su actuación, estos son el Ámbito Organizacional como entidad con una estructura propia que consume, tiene personal contratado, genera residuos; el Ámbito Educativo como entidad que se encarga de la formación de alumnos; el Ámbito del Conocimiento como entidad que investiga, que produce saber y lo trasmite y el Ámbito Social como entidad que está presente e interactúa con otros agentes, colectivos, comunidades y subsistemas sociales, lo anterior es concomitante con De La Cuesta (2003), quien manifiesta que las instituciones deben estar claras en plasmar de manera implícita y explícita la Responsabilidad Social respecto a la triple línea de resultados como es lo social, económico y medio ambiental

La manera como se aborda el presente estudio, está estructurado de la siguiente manera. Un primer momento donde se esboza el área del problema, se establecen los objetivos y se delimita el estudio. Un segundo momento que permite visualizar las bases teóricas referenciales con teorías y postulados de autores que han avanzado en las dos temáticas o variables de estudio, como son el Pensamiento Estratégico y la Responsabilidad Social. El tercer momento presenta la metodología utilizada o marco metodológico que esboza el método y tipo de investigación, las universidades del Zulia en Venezuela y de La Guajira en Colombia, como informantes claves, el instrumento aplicado así como la técnica de análisis de resultados. Seguidamente se presente un cuarto y último momento que describe el análisis y discusión de los resultados de la investigación con la debida confrontación con los postulados teóricos abordados para llegar a la formulación de lineamientos teóricos estratégicos gerenciales que permitan incluir a la Responsabilidad Social en el Pensamiento Estratégico de las Universidades Públicas Autónomas. De igual manera se presentan las debidas conclusiones y recomendaciones.

En este orden de ideas, la transformación en la que se está inmersa propone transitar desde un presente modelo de administración universitaria muy enraizado en el pasado, hacia un modelo lanzado hacia el futuro, aunque muchas veces parezca solo un deseo, en el que los actores educativos presenten un Pensamiento Estratégico donde la gestión educativa sea verdaderamente efectiva, teniendo como visión ser Responsable Socialmente, lo que en la actualidad convoca el presente siglo, además, que el personal directivo de las universidades implemente la Responsabilidad Social como una gestión empresarial, pensando en el hombre como ser social que requiere bienestar, y en un ecosistema con características

sustentables, esto debe estar plasmado en su carta de navegación, constituyendo de esta forma el Pensamiento Estratégico Institucional.

## REVISIÓN LITERARIA

En cuanto a la sustentación teórica de la investigación, la variable Pensamiento Estratégico, estará soportada en las teorías de reconocidos autores tales como: Morrissey (1996), Garrido (2010), Silvestri (2010), Vivas (2000), Cendros (2001), Thompson y Strickland (2004), entre otros, mientras que la variable Responsabilidad Social, se fundamentará en los postulados y principios teóricos de autores como De la Cuesta (2003), De la Cruz (2008), Drucker, (1993), ISO 26.000 de RSE, (2010), entre otros.

## METODOLOGÍA

El presente estudio se ubica metodológicamente dentro del paradigma post-positivista o cualitativo pues tiene un diseño emergente y flexible, propio de este tipo de investigación, dado que el investigador cualitativo, según Martínez (2007), no hace un diseño previo detallado, este emerge al progresar la investigación, de las condiciones cambiantes de los contextos y situaciones concretas. Ahora bien, la investigación se considera etnográfica, por lo que se han producido estudios analíticos-descriptivos de las prácticas sociales, conocimientos y comportamiento de una cultura particular, en este caso de las instituciones educativas, donde a través de entrevistas y grabaciones de audio, se obtuvo la información pertinente que sirvió de apoyo a las evidencias necesarias para el análisis de las categorías, permitiendo profundizar detalladamente aspectos relacionados con el Pensamiento Estratégico y la Responsabilidad Social de las Universidades públicas autónomas.

Dadas las características de esta población, se tomaron como unidades de estudio, sin ningún criterio muestral a los directivos encargados de la decanatura y docentes de la facultad de Ciencias Económicas de la Universidad del Zulia –LUZ- en Venezuela y la Universidad de La Guajira, en Colombia. Se diseñó un Guion de Entrevista semiestructurada, la cual contempla diecinueve (19) interrogantes que dieron luces para conseguir los propósitos establecidos, se estuvo atenta a todos los eventos que ocurrieron en el escenario, utilizando al máximo su percepción visual, analítica, kinestésica y los sentidos con sutileza; obteniendo resultados confiables como verificables. Los cuales fueron confrontados a través de la técnica de triangulación con la teoría expresada por los autores expuestos en la revisión literaria.

## RESULTADOS

Como resultado de la presente investigación, se presentan los lineamientos estratégicos gerenciales orientados a la inclusión en el Pensamiento Estratégico a la Responsabilidad Social Universitaria en instituciones públicas autónomas, los cuales tienen la finalidad de generar un plan de acción conducente a que las universidades sean Socialmente responsables desde su filosofía institucional: Los lineamientos estratégicos orientados al pensamiento estratégico como base para establecer la responsabilidad social se vislumbran como paradigma para acometer la modernización administrativa en universidades públicas autónomas, focalizada al cambio de roles donde las mismas deben velar por el interés social de acciones por encima del interés particular, para cumplir con la Responsabilidad Social universitaria.

### I. Conformación de Métodos Que Permitan a los Actores Universitarios Desarrollar el Pensamiento Estratégico en las Universidades Públicas Autónomas

El Pensamiento Estratégico en la gestión académica permite elaborar planes y programas estratégicos para mejorar las prácticas de la planificación en las instituciones educativas de nivel superior, participando en el proceso de construcción de escenarios que visualizan un cierto nivel de certidumbre, las posibilidades de éxito en los objetivos trazados, identificando oportunidades así como amenazas,

detectando también el potencial con el cual se cuenta para el logro de metas y objetivos trazados. En este alcance, se presentan acciones gerenciales en correspondencia con diversos lineamientos, donde se generan dinámicas acordes a unos objetivos y filosofía, a través de herramientas útiles para vencer dificultades mediante una visión sistemática, creativa y participativa con la intervención del entorno y actores sociales. Para el desarrollo de este lineamiento se requiere la implementación de las siguientes estrategias:

- a) Revisar el concepto del Pensamiento Estratégico. Con el fin de unificar un criterio del significado del mismo exigido como base para establecer la Responsabilidad Social.
- b) Instituir el Pensamiento Estratégico en la gestión universitaria bajo un compromiso real, congruente entre la institución, miembros y colectivo mediante reuniones, jornadas, encuentros comunitarios.
- c) Examinar el contenido del Pensamiento Estratégico actual y adecuarlo a las exigencias sociales del mercado.
- d) Incentivar a los directivos a poner en práctica el Pensamiento Estratégico, con el fin de internalizar el mismo como crecimiento personal y herramienta eficaz para prestar el servicio que requiera la universidad.
- e) Establecer programas dirigidos a los directivos con el fin de lograr el desarrollo efectivo del Pensamiento Estratégico.
- f) Programar jornadas con otras universidades, para comparar enfoques estratégicos, maneras de asunción, divulgación, fomentando la participación flexible de una visión sistemática entre miembros, grupos de intereses y colectivo en general.
- g). Desarrollar hábitos de conducta en los directivos universitarios, con el fin de aplicar de forma inconsciente las políticas plasmadas en el Pensamiento Estratégico, las cuales deben estar descritas en la misión, visión, políticas, objetivos y estrategias institucionales.

## II. Afianzamiento del Pensamiento Estratégico Como Proceso Liberador del Potencial Humano en las Universidades Públicas Autónomas

El Pensamiento Estratégico, es una de las principales competencias que se debe desarrollar no sólo a nivel profesional, sino también en lo personal. El saber dónde se está hoy, para dónde se quiere ir mañana, cuáles son las fortalezas y oportunidades, cómo visualiza el mañana, es lo que se denomina Pensamiento Estratégico, Ahora, la forma cómo se va a hacer esa realidad mañana, los caminos que se van a tomar, es lo que se denomina planificación estratégica. Una estrategia es una declaración de intenciones que define dónde desea ubicarse en el largo plazo.

Entender los procesos que implica la manera de evitar dificultades, es parte de la competencia del Pensamiento Estratégico que se debe desarrollar. Contar con una estrategia que permitirá asegurarse de las decisiones cotidianas corresponde a los intereses a largo plazo de la organización. Sin una estrategia, las decisiones tomadas hoy podrían tener un impacto negativo en los resultados futuros. La mayoría de las organizaciones exitosas cuentan con un plan estratégico a nivel superior, pero a veces no se comunica a los niveles inferiores. Una estrategia cobra igual importancia cuando sirve a los clientes externos o internos. En ese orden de ideas, se despliega un conjunto de acciones o lineamientos orientados a afianzar los valores como medio para evitar antivalores en la empresa. Estos son:

- a) Revisar el Pensamiento Estratégico institucional como proceso liberador del potencial humano en las

universidades públicas autónoma con el fin de equilibrar la existencia de la honestidad, transparencia, justicia en relación a valores instrumentales entre los cuales se encuentran: mejoramiento continuo, eficiencia, calidad, trabajo en equipo para ajustarlos a los cambios sociales imperantes.

b) Identificar la cultura universitaria como sistema de identidad, coadyuvando a la consecución de fines sociales y económicos.

c) Verificar que exista un criterio coherente del Pensamiento Estratégico desde una perspectiva individual-organizacional-social para evitar la presencia de opacidad, así como prácticas excluyentes que destruyen valores desde un punto de vista general.

d) Impulsar el Pensamiento Estratégico en el entorno para hacer de la universidad una unidad productora eficaz y efectiva en valores.

e) Iniciar programas para dar a conocer, promover y divulgar el Pensamiento Estratégico declarado en la universidad para que sea identificado claramente por el grupo de interés, desde la perspectiva individual-organizacional-social de manera eficaz, pertinente, implementando jornadas, talleres, charlas con el personal y demás grupo de interés.

### III. Fortalecimiento de la Responsabilidad Social Apoyando Acciones Sociales en Universidades Públicas Autónomas.

Los cambios sociales emergentes representan un desafío para la universidad pública autónoma, las acciones desarrolladas por ellas deben estar ajustadas a la Responsabilidad Social sustentable, en correspondencia a los múltiples grupos de interés, conducente a establecer una organización que maximice su servicio; además de interactuar progresiva, permanente y consustanciada con el entorno social. Visto desde un enfoque estratégico, la universidad debe practicar principios de un modo permanente en el proceso de gestión, que la identifique y distinga en correspondencia a otras organizaciones. Por tanto, se siguieren las siguientes acciones para maximizar la Responsabilidad Social en las universidades públicas autónomas.

a) Estimular la asunción de ser Responsable Socialmente para responder a compromisos sociales, a través de convenciones intermunicipales y regionales donde se promueva la Proyección Social, Extensión, Impacto Social, Integración con la Comunidad, Impactos organizacionales y ambientales, los cuales deben ser liderados por las universidades públicas autónomas con la participación de los distintos stakeholders.

b) Desarrollar programas de Responsabilidad Social que persigan principios éticos, desarrollo social equitativo sostenible, producción y transmisión de saberes responsables.

c) Formación de profesionales socialmente responsables, a través de las decanaturas y coordinaciones de áreas de las universidades públicas autónomas.

d) Desarrollar estrategias que permeen los procesos académicos y el currículo, que permitan aumentar los niveles de eficiencia, motivación, comunicación y creatividad de egresados y funcionarios universitarios donde se de la autoevaluación, proceso de toma de decisiones.

e) Presentar periódicamente un diagnóstico de la Responsabilidad Social que muestre las acciones sociales desarrolladas por la universidad a través de un Balance Social.

### IV. Implantación de un Modelo Socialmente Responsable en Universidades Públicas Autónomas.

Un criterio de Responsabilidad Social vinculado a un Pensamiento Estratégico con basamento trascendental y uniforme determinará las acciones institucionales, en consecuencia el desarrollo de una sociedad y participación ciudadana. Para tal efecto, se solicita un conjunto de acciones dirigidas a estos argumentos:

a) Desarrollar estrategias sobre métodos que permitan innovar y activar en los actores universitarios el Pensamiento Estratégico de manera equitativa, equilibrada y justa como modelo valorativo e interventor entre la sociedad sus diferentes miembros, direccionada a introducir mejoras significativas bajo un funcionamiento socialmente responsable, en base a las disposiciones normativas, organización y procedimientos.

b) Implementar las políticas de Responsabilidad Social Universitaria RSU, tales como: - Una Universidad que aplique la Ética en su quehacer institucional, que sea Ecológica en su actuar; que genere Comunidades de Aprendizaje y Desarrollo con actores externos; donde se dé la Integración en los currículos el aprendizaje basados en proyectos sociales con conocimientos socialmente útiles según una agenda de desarrollo concertada con otros actores.

#### V. Visionar Desde El Pensamiento Estratégico la Universidad Socialmente Responsable.

Es claro que en el Pensamiento Estratégico está inmersa la visión institucional, de allí que es clave para las universidades tener un horizonte de tiempo de largo plazo plasmado en una visión que involucre la Responsabilidad Social en sus distintos campos de acción. A partir de ese momento, el reto es poner en práctica ese Pensamiento Estratégico, para que no se convierta en letra muerta. En el siglo XXI, las exigencias a las universidades son cada día mayor, se requiere mayor reflexión, un análisis profundo de la situación interna y externa, universidades que fomenten la innovación, que adecuen su currículo a las necesidades de la región donde operan. Así las cosas, las universidades deben buscar la respuesta a los interrogantes de los distintos grupos de interés, donde se les exige tomar conciencia de la responsabilidad que les asume en esta nueva era, puesto que están llamadas a contribuir al desarrollo económico, político, social y ambiental. La invitación es a que las universidades se conecten con el entorno social, con su contexto local, a fin de contribuir con el desarrollo de la sociedad.

Con esas consideraciones, se propone para visionar desde el Pensamiento Estratégico una universidad socialmente responsable, llevar a cabo las siguientes acciones:

a) Dejar plasmada en la visión y misión universitaria, como resultado de un Pensamiento Estratégico, el compromiso que se tiene con relación a la Responsabilidad Social Universitaria.

b) Formular directrices a partir del Proyecto Educativo Institucional universitario, para la realización de un autodiagnóstico que refleje las fortalezas y debilidades de la institución en relación con su Responsabilidad Social.

c) Diseñar en los planes estratégicos, las estrategias a implementar relacionadas con la Responsabilidad Social universitaria.

d) Concebir desde la filosofía gerencial de las universidades la contrastación de los resultados arrojados en el diagnóstico institucional, lo expuesto en la misión de las universidades públicas autónomas.

e) Describir en los planes de desarrollo y agendas prospectivas, las estrategias de socialización de la Responsabilidad Social Universitaria como política institucional.

f) Estructurar los informes o balance social donde se refleje la realidad de la Responsabilidad Social universitaria.

g) Establecer en el Proyecto Educativo Institucional PEI, la forma de evaluar y controlar las acciones descritas en el Pensamiento Estratégico universitario.

## CONCLUSIONES

Alcanzado los resultados plasmados en los propósitos iniciales, se presentan las siguientes conclusiones obtenidas en la investigación: El pensamiento estratégico involucra un conjunto de acciones relacionadas con los instrumentos rectores de las Universidades públicas autónomas como son el Proyecto Educativo Institucional, Planes de Desarrollo, Agenda Prospectiva. Las universidades dejan plasmado todo su pensamiento estratégico en ellos, donde están explícitas la Visión y Misión Institucional. En universidades públicas autónomas el pensamiento estratégico presenta las fases de Reflexión participativa, Procesos de construcción y empoderamiento, Evaluación de la Gestión, Toma de decisión, Proceso de autoevaluación y Control de la Gestión, Acciones correctivas y el impulso hacia la acción.

Las universidades deben dar respuesta social al quehacer institucional, de allí que se han establecido cuatro (4) dimensiones en este sentido: La dimensión Social, que involucra la Proyección Social, la Extensión, la Integración con la Comunidad; la dimensión cognitiva, relacionada con generar conocimientos, investigaciones científicas; la dimensión educativa, impartir y compartir conocimiento, y la dimensión organizacional como una empresa que es, debe atender a su planta de personal y el medio ambiente. Los elementos de la responsabilidad social en las universidades, lo constituyen los valores, los principios de la Institución, las normas descritas en la plataforma ética, se evidenció que las Universidades tienen identificada la estructura de valores y la manera como debe ser aplicada, sin embargo, no se aplica por lo cual no se logra una eficiencia en la puesta en marcha del Código de Ética, por ende no existe una cultura universitaria que convoque a una Filosofía de acción basada en los valores descritos. Se concibió un plan de acción para el fortalecimiento del Pensamiento Estratégico como base para establecer la Responsabilidad Social en universidades públicas autónomas: el cual involucra las siguientes etapas: a) Conformar métodos que permitan a los actores universitarios desarrollar el pensamiento estratégico en universidades públicas autónomas. b) Afianzar el Pensamiento Estratégico como proceso liberador del potencial humano en universidades públicas autónomas. c) Fortalecer la Responsabilidad Social apoyando acciones sociales en universidades públicas autónomas. d) Implantar un modelo socialmente responsable en universidades públicas autónomas. e) Estructurar desde la planificación estratégica, universidades públicas autónomas socialmente responsables, visionando desde el pensamiento estratégico la universidad socialmente responsable.

**BIOGRAFIA**

Darcy Luz Mendoza es Doctora en Ciencias Gerenciales, por la Universidad Rafael Belloso Chacín en Venezuela. Profesora Asociada en la Universidad de La Guajira. Adscrita a la Cátedra de Análisis Financiero. Miembro activo del Consejo de Facultad de Ciencias Económicas. Investigadora principal en varios trabajos sobre Responsabilidad Social. Ubicación: Universidad de La Guajira, kilómetro 5 vía Maicao en Riohacha, La Guajira (Colombia). Correo electrónico [dmendoza@uniguajira.edu.co](mailto:dmendoza@uniguajira.edu.co)

Yolmis Nicolás Rojano Alvarado, es Máster Business Administrations de la Universidad del Norte Barranquilla (Colombia), actualmente vinculado a la universidad de La Guajira como docente investigador, adscrito a la cátedra Marketing Internacional, se puede contactar en la facultad de Ciencias Económicas y Administrativas de la Universidad de la Guajira, kilómetro 5 salida a Maicao en Riohacha, La Guajira (Colombia). Correo electrónico [yrojanao@uniguajira.edu.co](mailto:yrojanao@uniguajira.edu.co)

# INVESTIGACIÓN ORGANIZACIONAL IMPLICACIONES METODOLÓGICAS

Lucia Elizabeth Algrávez Uranga, Universidad Autónoma de Baja California

## RESUMEN

*Este documento revisa algunas de las herramientas metodológicas para estudiar a las organizaciones y comprender a través del análisis estructural su comportamiento y con los resultados obtenidos de esta forma evidenciar las desviaciones atribuibles tanto al diseño como a la estructura organizacional. Los parámetros que se recomiendan revisan los determinantes estructurales sencillamente pero con resultados útiles para los administradores.*

**PALABRAS CLAVES:** Estructura, herramientas metodológicas, Diseño organizacional.

## METHODOLOGY IN INSTITUTIONAL RESEARCH

*This document reviews some of the methodological tools to study the organizations and to understand through structural analysis its behavior and with the obtained results, demonstrate the deviations attributable to the design as to the organizational structure. The parameters that are recommended simply review the structural determinants but with useful results for the administrators.*

**JEL: M1** Business Administration and Business Economics; Marketing; Accounting

**KEY WORDS:** Structure, methodological tools, organizational design.

## INTRODUCCION

Casi todas las empresas pasan por cambios estructurales en algún momento y en la actualidad, muchas están cambiando y reorganizándose para atender los desafíos tanto internos como del entorno. Los cambios estructurales son provocados por los cambios en el ambiente, la tecnología, el tamaño y la estrategia competitiva, los ejecutivos deben de reconocer el desafío que significa comprender en qué forma abordan el estudio de la organización y los cambios que afectan el diseño y la estructura y con ello el desempeño organizacional.

La teoría organizacional es una forma de pensar en las organizaciones, es una forma de vislumbrar a las organizaciones de manera profunda y precisa, se observan patrones y regularidades del diseño organizacional y el comportamiento a través de investigación que pueden ayudar a los administradores a trabajar con eficiencia y eficacia fortaleciendo la calidad de vida organizacional (Daft, 2011, p.22).

## REVISION DE LA LITERATURA

Las Organizaciones son entidades sociales, dirigidas a metas diseñadas con una estructura deliberada y con sistemas de actividad coordinados y vinculadas con el ambiente externo (Daft, 2011, p.10). Para estudiar a la organización es imprescindible hacerlo con el enfoque de sistemas, que es el enfoque que determina que las organizaciones desarrollan un proceso de conversión que inicia con los insumos que son transformados para lograr resultados (French y Bell, 1996, p. 91). En general entre las diferentes partes del sistema existe una relación de causa y efecto, de este modo el sistema experimenta cambios y el ajuste sistémico es continuo, los elementos que interactúan significan que la gente y los departamentos dependen uno del otro y deben trabajar conjuntamente (Chiavenato, 1999, p.772).

Una organización está formada por varios subsistemas. Las funciones específicas que se requieren para la supervivencia de la organización corren por cuenta de departamentos que actúan como subsistemas. Los subsistemas organizacionales desempeñan cinco funciones esenciales: servir de enlace sobre los límites de la organización, producción, mantenimiento, adaptación y administración, este último es un subsistema distinto, que tiene a su cargo la dirección y coordinación de los demás subsistemas de la organización. La administración proporciona dirección, estrategias, metas y políticas para toda la organización, además el subsistema de administración tiene la responsabilidad de desarrollar la estructura de la organización y de dirigir las tareas de cada subsistema (Daft, 2011, p. 27). Una de las perspectivas para el estudio del diseño organizacional es reconocer las cinco partes básicas que conforman a las organizaciones, las cuales según Mintzberg (2005), son: el centro técnico, compuesto por las personas quienes realizan el trabajo básico de la organización; el soporte técnico, que ayuda a la organización a adaptarse al entorno; soporte administrativo es responsable de que la operación marche sin dificultades y del mantenimiento de la organización, incluyendo el de sus elementos humanos y físicos; la dirección responsable de dirigir y coordinar las diferentes partes de la organización y los mandos medios gerenciales, que son responsables de la implementación y coordinación en el nivel departamental (Mintzberg, 2005, p. 43). Estas partes están unidas entre sí por medio de distintos flujos como la autoridad, los materiales, la información y el proceso de decisión y afectan de una manera directa el diseño estructural de las organizaciones.

### Entendiendo la Administración

Es relevante contextualizar a la administración para ubicar la importancia de la organización como parte de la administración, así como su desarrollo como una teoría de estudio.

Una economía creciente y el desarrollo industrial en los Estados Unidos y Europa, aunado al desarrollo de la tecnología y del comercio, a los medios de transporte y comunicación que ampliaron los horizontes y complejidad de los negocios, los que a su vez incrementan los problemas de desperdicio e ineficiencia, crearon una necesidad de investigar los conceptos de diseño en las organizaciones, y favorecen los primeros intentos de estudios sistemáticos para el estudio del diseño estructural de las organizaciones, lo que sucede en las dos últimas décadas del siglo 20 (Bedeian & Zammuto, 1991, p.607).

El inicio de las corporaciones industriales aparece en gran Bretaña en los últimos años de 1700, y comienza la revolución Industrial como la conocemos ahora, y el significado más profundo de los cambios por venir se da en los artesanos que transfieren sus habilidades a las máquinas, lo que causa el advenimiento de las organizaciones modernas. Esta época proponía que la administración podía ser aprendida por la observación o práctica si es que se podía, y era considerada como un arte y por otros como un don divinamente adquirido más que un conocimiento adquirido (Hernández, 2002, p.52).

Henry R. Towne, cofundador de Yale & Towne Manufacturing Company, en 1886 presenta un trabajo ante la Asociación Americana de Ingenieros mecánicos (ASME), en donde argüía que la administración como un campo de estudio, era tan importante como la ingeniería, pues observaba que la administración del trabajo era completamente desorganizado, que no tenía medios del intercambio de experiencias y se encontraba sin asociación profesional y urgía a la ASME para que remediara este asunto por lo este documento se considera como el inicio de la investigación de una ciencia de la administración. El impacto de las ideas de Towne, convirtieron las sesiones de la ASME como el principal foro para la discusión de los retos administrativos (Bedeian & Zammuto, 1991, p. 609)

Frederick W. Taylor (1856-1915) presenciaba las sesiones en donde Towne presentaba sus ideas y se impresionó por ellas, ya que como ingeniero veía los negocios como un sistema de cooperación humana que sería exitosa solo si todo lo concerniente al trabajo se dirigiera al mismo objetivo, lo que llamó la Revolución mental, en donde ambos lados dan atención a incrementar los excedentes, en donde la

preocupación de la labor y la administración deberían basarse en la mutualidad de los intereses, ofreciendo satisfacción a los trabajadores y al empleador. Taylor estaba resuelto a eliminar las prácticas de ineficiencia y el desperdicio del pasado por lo que consideró a la administración científica como destinada a ser una herramienta para la productividad. Taylor sumó su trabajo en lo que ahora se conoce como los Cuatro Principios de la Administración Científica pero no fue hasta 1910 que el sistema de Taylor recibió amplia publicidad dado que Louis D. Brandeis acuñó el término de Administración científica para describir los principios y filosofía del trabajo de Taylor, este hecho histórico permite que los trabajos de Taylor sean conocidos en todo el mundo, aunado a que en 1911 se edita el libro “Los principios de la administración científica” (Hernández, 2008, p.34-37)

Las ideas de Henry Fayol (1841-1925) han tenido un impacto duradero en el desarrollo de la teoría Organizacional, ya que tras más de 50 años de experiencia industrial, formuló 14 principios de la administración, algunos de estos principios como la división del trabajo, unidad de mando y cadena escalar se refieren a los principios de organización. Estas ideas llamaron la atención por la publicación de sus trabajos en 1916 bajo el título de “Administration Industrielle et Generale” el cual se convirtió en “el catecismo de la educación de los ejecutivos en jefe” El trabajo de Fayol no fue conocido en Estados Unidos hasta que fueron traducidos al inglés en 1930. Todas estas ideas fueron revolucionarias en su época, y la validación constante de las mismas le han ganado a Fayol el título del “Padre de La Administración Moderna” (Daft, 2011, p.25).

Mientras que la atención primaria tanto de Taylor como de Fayol, estaba dirigida a resolver problemas prácticos administrativos, para lograr la efectividad en las metas, el interés de Max Weber (1864-1920) estaba en los hechos fundamentales de cómo las estructuras están conformadas. Sus ideas concebidas al inicio del siglo 20 pero fueron conocidas hasta que fueron publicadas en 1920, eran prescriptivas en su naturaleza contrastaban con las recomendaciones de Taylor y Fayol, y su contribución fue diseñar las características del término Burocracia. Burocracia era un ideal, no existente en la realidad, era un modelo o estándar, para construir empresas y para contemplar por comparación su desarrollo (Bedeian & Zammuto, 1991 p. 612).

Los autores clásicos propusieron que el trabajo administrativo consta de varias funciones que al agruparse conforman el proceso administrativo, el cual ha cambiado en funciones y en procesos a través del tiempo. Sin embargo se consideran básicas las funciones de planeación, organización, dirección y control y se pueden definir con precisión suficiente aunque se pueden incluir otras acorde a las expectativas específicas de los gerentes que practican la administración en las diferentes organizaciones (Gibson J., Ivancevich J., Donnelly, & J. Konopaske, R., 2011, p. 16). Coincide (Hellriegel, D., Jackson.S., & Slocum,J., (2002) que la administración se refiere a las tareas y actividades asociadas con la planeación, organización, dirección y control: con la dirección de una organización o alguna de sus unidades. En ese sentido una forma de enfrentar los cambios es lograr una administración eficaz que permita el dinamismo necesario para lograr la competitividad. Según Rincón (2002) la nueva organización necesitará de una estructura que se dirija a obtener el mejor y más efectivo uso de sus empleados, en apoyo a sus capacidades y ventajas competitivas.

La organización se refiere al proceso de organizar, la manera en que se dispone del trabajo, se asigna entre los integrantes de una organización para alcanzar eficientemente las metas de la organización (Garza, 2000, p. 93). El proceso organizacional lleva la creación de la estructura, la cual define la división de tareas y la movilización de recursos, y la estructura organizacional la define Daft (2010) como el conjunto de tareas formales asignadas a los individuos y departamentos; las relaciones de subordinación formales, incluidas las líneas de autoridad, responsabilidad de la decisión, el número de niveles jerárquicos y el tramo de control de los administradores así como el diseño de sistemas para asegurar una coordinación eficaz de los empleados a través de los departamentos (Daft, 2010, p. 249). El propósito fundamental del proceso de organizar es crear una estructura estable, con jerarquías y puestos de trabajo,

con autoridad y responsabilidad, que defina los cauces de la comunicación formal y la competencia de cada puesto y lograr que las unidades se complementen sinérgicamente. Esto es que los elementos que componen la empresa se apoyen mutuamente y produzcan más que la simple suma de sus resultados individuales (Hernández, 2002, p. 259).

### Fundamentos del diseño.

La teoría clásica menciona principios de la administración que determinan la organización, acorde a la definición de estructura se estudian los principios de: departamentalización, que subdivide el trabajo en puestos y tareas y los asigna a unidades especializadas en una organización. El diseño de normas para el desempeño de los puestos y las tareas y aborda los cuatro elementos básicos de la función de organización: especialización y estandarización, coordinación y autoridad (Hellriegel, 2002, p. 272).

En la búsqueda de la competitividad de las organizaciones existen factores determinantes para que sea factible el trabajo organizado orientado al alcance de sus metas. Uno de esos factores es la estructura que provee de un marco para que se desarrollen las actividades gerenciales y que se dirijan a ese propósito. La estructura debe proporcionar todos los elementos para que la organización trabaje con efectividad y eficiencia, por lo que al revisar los aspectos que intervienen en la estructura se podrán determinar algunas de las situaciones que pueden ocasionar sus deficiencias mismas que impactan el logro de las metas organizacionales (Algrávez, 2009).

La estructura es la distribución formal de los puestos en una organización y el diseño es el desarrollo o cambio de la estructura de una organización (Robbins & Coulter, 2010, p.234). El diseño organizacional comprende elementos de la función de organización: su alineación, e interrelación de las funciones de planeación, dirección y control y los complejos intercambios que deben considerarse para lograr una correspondencia entre las funciones (Hellriegel, 2002, p.268). La estructura es el patrón de los puestos y grupos de puestos que existe en una organización y el diseño organizacional se refiere a las decisiones y acciones de la administración que generan una estructura organizacional específica (Gibson, 2011, p.389).

La estructura organizacional es la representación formal de las relaciones laborales, define las tareas por puestos y unidad y señala como deben coordinarse (Hellriegel, 2002, p.271). La estructura debe cumplir con dos objetivos primarios: proporcionar una estructura de responsabilidades, relaciones de subordinación y los grupos, además de ofrecer mecanismos de vinculación y coordinación de todos los elementos organizacionales. Es importante buscar el correcto balance entre los controles verticales y horizontales, el no hacerlo ocasiona fallas estructurales (Daft, 2011, p.127). Los departamentos se crean para desempeñar tareas que se consideren de importancia estratégica para la compañía. Las líneas de reporte a menudo llamadas cadenas de mando, se representan con líneas verticales en un organigrama. La cadena de mando debe ser una línea continua de autoridad que liga todas las personas de una organización y muestra quien reporta a quien (Daft, 2011, p.127).

La estructura de la organización se refleja en el organigrama. Este es la representación gráfica de todo un conjunto de actividades y proceso subyacentes en una organización. Estos tres elementos de la estructura corresponden tanto a los aspectos verticales como a los horizontales de la organización. Sumarizando los conceptos de la definición de la estructura de la organización tenemos:

1. La estructura de la organización designa las relaciones formales de subordinación, incluso el número de niveles de la estructura jerárquica y el tramo de control de gerentes y supervisores.
2. La estructura de la organización identifica el agrupamiento de individuos en departamentos y de estos en la organización total.
3. La estructura de la organización incluye el diseño de sistemas para asegurar la comunicación, coordinación e integración efectivas de esfuerzos en todos los departamentos (Daft, 2011, p.90).

Los elementos de la estructura corresponden tanto a los aspectos verticales como a los horizontales de la organización, los primeros dos elementos corresponden al marco estructural, el cual conforma la jerarquía vertical, el tercer elemento pertenece al patrón de interacciones entre empleados organizacionales. Así mismo la estructura es determinada por las dimensiones estructurales que están conformadas por la formalización, la especialización, la estandarización, la jerarquía de autoridad, la complejidad, la centralización, el profesionalismo y razones de personal. De las citadas, se consideran las primeras cuatro como elementos básicos de la función de organización (Hellriegel, et.al. 2002, p.269). De la misma manera afectan a la estructura las dimensiones contextuales que corresponden a: el tamaño, la tecnología organizacional, la cultura organizacional, el entorno, las metas y estrategia de la organización que definen el propósito y las técnicas competitivas que la distinguen de otras organizaciones (Daft, 2007, pp.17-20).

El diseño organizacional debe facilitar la comunicación necesaria entre los empleados y departamentos para lograr la tarea global de la organización (Daft, 2011, p.92). La interdependencia recíproca entre departamentos precisa una comunicación y coordinación sustancialmente mayores de lo que se necesita en la interdependencia agrupada, de manera que la organización deben diseñarse para estimular el flujo de información, tanto en dirección vertical como horizontal. Los vínculos se definen como la medida de comunicación y coordinación que existe entre los elementos de la organización. Los vínculos verticales se usan para coordinar las actividades entre las partes superiores e inferiores de una organización. Entre estos se cuentan: referencia jerárquica, normatividad o reglas y planes, agregar puestos a la jerarquía. Existen sistemas que son otra estrategia para aumentar la capacidad de manejo de la información vertical. Los sistemas de información hacen que la comunicación suba y baje por la estructura de una manera más eficiente entre ellos los sistemas de información vertical y los sistemas de información horizontal. Por otra parte los vínculos horizontales se refieren al volumen de comunicación y coordinación horizontales entre los departamentos de la organización (Daft, 2011, p.93).

#### Opciones de agrupamiento departamental

Los departamentos se crean para realizar trabajos importantes para la organización, luego se conjuntan esos departamentos con los trabajos o actividades para conformar un agrupamiento que en forma básica se pueden enumerar como sigue:

- El agrupamiento departamental tiene impacto en los empleados porque comparten un supervisor y recursos comunes, son responsables del desempeño y tienden a identificarse y colaborar.
- El agrupamiento funcional coloca juntos a los empleados que desempeñan funciones o procesos de trabajo similares o que aportan un conocimiento o habilidades parecidas.
- El agrupamiento divisional significa que la gente se organiza de acuerdo con lo que la organización produce.
- El agrupamiento geográfico significa que los recursos se organizan para servir a los clientes o consumidores de un área geográfica particular.
- El agrupamiento de enfoque múltiple significa que una organización adopta al mismo tiempo dos posibilidades de agrupamiento. Estas formas estructurales reciben frecuentemente el nombre matriciales o híbridas.

En cuanto a los agrupamientos más utilizados en las organizaciones se han mencionado los más frecuentes sin embargo existen otras formas como las redes virtuales y el outsourcing.

#### Síntomas de deficiencia estructural:

Se pueden evidenciar síntomas del sistema estructural cuando se presentan situaciones como las que se describen a continuación:

1. La toma de decisiones se retrasa o carece de calidad. Los encargados de tomar los acuerdos pueden sufrir una sobrecarga debido a que la jerarquía canaliza demasiados problemas y resoluciones hacia ellos.
2. La organización no responda de manera innovadora ante un entorno cambiante. Una razón de la falta de renovación es que los departamentos no están coordinados en forma horizontal.
3. El desempeño de empleados se deteriora y las metas no están siendo alcanzadas. La calidad laboral puede disminuir debido a que la estructura no proporciona metas, responsabilidades y mecanismos para la coordinación bien definidos.
4. Demasiado conflicto es evidente: La estructura organizacional debe permitir que las metas departamentales con cierto nivel de dificultad combinen en una sola meta para toda la organización  
(Daft, 2011, p.126).

Estos síntomas se pueden atender a través de las herramientas de diseño, las cuales en la mayoría de los casos pueden escogerse para solucionar los problemas a través del diseño adecuado, sin necesidad de realizar una reestructuración total, tales como los enlaces verticales y horizontales previamente discutidos en este documento.

#### Estrategias para estudiar a las organizaciones

Desde 1970 particularmente ha existido una explosión en el estudio de las organizaciones con la multiplicidad de enfoques disciplinarios, intereses substantivos, escenarios y conceptos fundamentales emergentes que surgen para explicar el comportamiento organizacional, la selección de una metodología de investigación para el estudio de las organizaciones se ha convertido en una necesidad (Bedeian & Zammuto, 1991, p. 619).

Los estudios organizacionales requieren de una metodología que dirija la investigación hacia resultados pertinentes, de tal manera que se pueden desarrollar a través de varias etapas como: visión del estudio, planeación del estudio, recopilación de datos, análisis de los datos, formulación de recomendaciones, implantación y evaluación (Franklin, 2009, p.33).

#### Métodos utilizados para estudiar a las organizaciones

Para el estudio de las organizaciones existen estrategias de análisis administrativo las cuales pueden utilizarse en combinación o solas según el alcance de la investigación de tal manera que la decisión de escoger cada una de ellas es relativa al objetivo de estudio, entre algunas de estas estrategias se estudian temas como: reorganización, reingeniería, simulación, auditoría administrativa y desarrollo organizacional (Franklin, 2004, p.18-21). Al abordar el tema de las estrategias es necesario tomar en cuenta la validez interna y externa refiriéndose la primera a la extensión en los que los resultados de un estudio pueden ser atribuidos a una sola explicación, la segunda es la generalización de los resultados de la investigación (Bedeian & Zammuto, 1991, p. 620-621).

Existen diferentes maneras para conceptualizar los elementos formales del diseño de organización, nos abocaremos en este estudio en términos de estructura, medidas de los sistemas, sistemas de recompensas y sistemas de selección y desarrollo.

Estructura. Los elementos de la estructura formal, incluyen (departamentos-divisiones) una jerarquía administrativa, reglas y planes y comités o fuerzas de tareas. Estas herramientas de diseño son utilizadas generalmente para influenciar la conducta al clarificar específicamente las responsabilidades de los individuos, en donde deben de trabajar y con quien, que autoridad tienen y ante quien son responsables de su actuación (Kotter, J., Schlesinger, L., & Sathe, V., 1986, p.7).

Sistemas de medición. Estos intentan influenciar el comportamiento humano al recoger, agregar, diseminar y evaluar información de las actividades. Estos sistemas de mediciones están enfocados en actividades presentes o en actividades desarrolladas en el pasado. Dos tipos de sistemas de medición son los sistemas de control y los de reconocimiento (Kotter, et.al., 1986, p.9).

Los sistemas de recompensa están diseñados para orientar el trabajo hacia la estructura y hacia ciertos objetivos.

En cuanto los sistemas de selección y de desarrollo estos son separados pero son sistemas interrelacionados formales, tienen un efecto indirecto en los patrones de comportamiento al influenciar el conocimiento, habilidades, valores y personalidades de los emplea

Al diseñar la estructura así como los sistemas de medición, recompensas, selección y desarrollo, se enfrentan varias decisiones. Entre éstas: el tipo de estructura, el tramo de control, el perfil del empleado acorde a sus actividades, y la medida de desempeño. El diseño organizacional presenta alternativas para escoger la estructura que optimice los resultados.

#### Conceptualización del diseño organizacional entre las subunidades especializadas.

En el contexto de las subunidades especializadas el análisis organizacional consiste en los siguientes pasos. (Kotter, et.al., 1986, p.29).

1. identificar y entender las actividades de la unidad considerando:

El ambiente general de la organización en términos de las características y los factores claves de éxito.

La estrategia general de la organización y su relación con la subunidad de la organización. La tecnología de la subunidad.

2. identificar y entender las características más relevantes de los empleados tales como: numero, experiencia, habilidades y destrezas, valores y normas, expectativas especialmente aquellas que se refieren al trabajo y a la organización.

3. identificar los elementos del diseño organizacional actual. Estructura, sistema de medición, sistema de recompensas, sistemas de selección y desarrollo.

4. Identificar el desarrollo actual de la subunidad así como problemas o síntomas de problemas.

5. Trazar la historia de la subunidad especialmente los cambios que ha enfrentado.

Identificar las relaciones entre la historia de la subunidad su diseño y su desempeño actual.

Diseñar la organización o tratar de resolver problemas desde el punto de de la compañía entera requiere una forma de análisis que puede ser sumariado así:

1. identificar las actividades claves de la compañía.

2. identificar los recursos humanos de la organización.

3. analizar como la organización empata con el negocio de la compañía.

4. finalmente se necesita identificar los diseños organizacionales alternativos.

Es importante reconocer la escasa investigación realizada sobre el funcionamiento de la empresa en si (Mintzberg, 2005, p. 41), es necesario realizar investigación organizativa y compartir tanto las herramientas como los resultados de investigación.

## **METODOLOGIA**

Para la presente investigación se utilizó el método de síntesis bibliográfica, técnicas de sistematización bibliográfica, publicaciones técnicas de negocios y consultas a la red electrónica y como instrumentos fichas de trabajo bibliográficas.

## DISCUSIÓN

La teoría de la organización implica el estudio de las organizaciones desde un punto de vista total, considerando como conceptos básicos los subyacentes al diseño y a la estructura organizacional. Idealmente todos los lineamientos de los clásicos que han estudiado las organizaciones y los nuevos estudios sobre la práctica de la organización en las empresas, ofrecen un panorama de medición que se puede utilizar para hacer investigación organizacional. Los parámetros que han sido estudiados en las organizaciones y que pueden ser replicados en futuras investigaciones no solo son un desarrollo teórico sino también práctico por lo que resultan útiles. Al conocer cómo se comporta la organización en la parte estructural, ofrece posibilidades para el entendimiento y mejora de los procesos organizacionales, buscando lo que los clásicos determinaban como la productividad en base a la eficiencia y eficacia. Las empresas conformadas por diferentes factores organizacionales tanto relativos al diseño y a la estructura pueden ser sujetas a estudio precisamente buscando información a través de documentos, encuestas, entrevistas y revisando información externa a la empresa y así determinar sus fallas o aciertos los cuales pueden ser atendidos propiamente. Los autores mencionados en el presente trabajo indican algunos pasos de sentido común para el estudio de las organizaciones y contemplan desde la definición de las actividades empresariales, la identificación de los recursos humanos, el empate de las actividades que se realizan con las que el negocio necesita y por último pensar en diseños pertinentes dadas las características organizativas.

Al existir en principio la metodología de investigación para el estudio de las organizaciones, al utilizar las herramientas a propósito de investigación organizacional, y reconocer las experiencias de investigadores en la materia, se conforma un cúmulo de conocimiento que puede guiar a los gerentes en la búsqueda del diseño organizacional propicio para el logro de los objetivos de las empresas. El estudio en términos de estructura, medidas de los sistemas, sistemas de recompensas y sistemas de selección y desarrollo, proporciona un marco investigativo que ofrecerá posibilidades de obtener información acerca de los procesos organizacionales

## CONCLUSIÓN

Conocer las organizaciones es fundamental para llevarlas al logro de los objetivos de una manera eficiente y eficaz, es a través de la investigación organizacional que estudia todos los aspectos relativos a la organización, a su estructura y diseño, como se puede obtener información necesaria para lograr que la estructura proporcione los elementos necesarios para que se desarrolle óptimamente el trabajo gerencial. Es necesario proponer tal como lo hicieron los clásicos de la administración que se siga desarrollando investigación organizativa, para el aumento de conocimientos y comprensión de las organizaciones.

# PRINCIPALES BARRERAS A LA EXPORTACIÓN QUE IMPIDEN LA INTERNACIONALIZACIÓN COMPETITIVA

Beatriz Flores Romero, Universidad Michoacana San Nicolás de Hidalgo  
Jesús Merlos García, Universidad Michoacana San Nicolás de Hidalgo

## RESUMEN

*Este trabajo trata de identificar las barreras de exportación que más perciben las empresas exportadoras y no exportadoras en estos primeros 12 años que van del siglo, para determinar cuáles son los más frecuentes en el tiempo mencionado. Se revisaron estudios sobre barreras a la exportación en las empresas manufactureras y comerciales que se han realizado en diferentes países de los cinco continentes. Los principales problemas para las empresas con operaciones de exportación son: barreras de competencia en los mercados extranjeros, barreras gubernamentales en el propio país y barreras en los canales de distribución. En el caso de empresas que no tienen actividad de exportación de los principales obstáculos son: barreras de conocimiento, las dificultades de financiamiento, dificultades para obtener el pago y la falta de ayuda gubernamental o asistencia.*

**PALABRAS CLAVE:** Barreras de exportación, obstáculos a la exportación, negocios internacionales, exportaciones, proceso internacional de la empresa.

## MAIN EXPORT BARRIERS THAT PREVENT THE COMPETITIVE INTERNATIONALIZATION

### ABSTRACT

*This paper attempts to identify the barriers to Export that most perceive both exporters and non-exporters in these first 12 years of this century to determine which are the most frequently occur in the time mentioned. Were reviewed studies of barriers to export in manufacturing and trading firms that were made in different countries from the five continents. The main problems for companies with export operations are: barriers to competition in foreign markets, own government barriers at home and barriers to distribution channels. In the case of companies that have no export activity the main obstacles are: knowledge barriers, financing, difficulties to obtain payment and lack of government aid or assistance.*

**JEL:** M16, M31, M39, M51, P33

**KEY WORDS:** Export barriers, export obstacles, international business, exports, internationalization process of the firm

## INTRODUCCIÓN

Muchos pueden ser los motivos que impulsen a las empresas a buscar oportunidades de negocios en los mercados internacionales y cuando esto sucede, difícilmente lo hacen con una gran infraestructura de distribución (Nieto, 1995), lo hacen exportando algún producto o servicio ya sea por detectar un problema en el mercado local o para aprovechar alguna oportunidad (Reid, 1981) hasta lograr un posicionamiento importante en el extranjero. Johanson & Wiedersheim-Paul en 1975 desarrollaron lo que se llama hoy en día el modelo de Uppsala, el cual indica que la internacionalización de las empresas se da a través de un

proceso de cuatro etapas secuenciales y en la medida en que se va avanzando en el proceso la organización va adquiriendo mayor conocimiento acerca de los mercados internacionales, aumentan también la inversión y los recursos destinados a las actividades desarrolladas en el extranjero y por consiguiente el control que tiene sobre los recursos, la distribución y la promoción que en un principio fueron desarrolladas por otras personas. En ese primer estudio se aborda también de forma inicial el tema de las barreras a la exportación pues Johanson & Wiersma-Paul asumen que los obstáculos más importantes son la falta de conocimiento y recursos. Numerosas han sido las investigaciones que se han desarrollado a partir de la realizada por la escuela de Uppsala para comprender y determinar cuáles son las barreras que afectan a las exportaciones además de las mencionadas por Johanson & Wiersma-Paul. Por lo que el presente trabajo intenta determinar cuáles son las barreras que más perciben tanto las empresas exportadoras como las no exportadoras en estos primeros 12 años del presente siglo.

## REVISIÓN DE LITERATURA

En los estudios que se han realizado y se siguen haciendo sobre las exportaciones, uno de los aspectos que más relevancia tiene es analizar y comprender cuáles son los inhibidores y obstáculos o barreras que se presentan en el proceso de exportación (Julian & Ahmed, 2005), ya que la comprensión de las barreras en el rendimiento de la exportación es vital tanto en el nivel microeconómico como en el macroeconómico, pues puede ayudar a determinar por qué muchas empresas no logran exportar o incurren en pérdidas financieras, de igual forma, por qué las empresas exportadoras no son capaces de explotar todo su potencial (Leonidou, 1995), además es necesario entender los problemas dentro de cada etapa de la exportación, pues muchas veces estos obstáculos impiden el movimiento de la organización entre las etapas de exportación (Leonidou y Katsikeas 1996), por tanto se puede suponer que las barreras determinan el éxito de una empresa en las actividades de negocios internacionales (Pinho & Martins, 2010). De tal forma al ser identificados los obstáculos que se presentan en la actividad de exportación, los responsables de las políticas públicas de los países y demás organismos de ayuda a la exportación podrán orientar su apoyo de una mejor manera para que las empresas puedan superar esos problemas en la exportación (Kedia & Chhokar, 1986, Leonidou, 1995, Trimeche, 2003, Smith, Gregoire y Lu, 2006), así también dentro de las firmas el éxito y el aumento de las exportaciones depende de cómo los gerentes puedan percibir y hacer frente a los impedimentos ambientales, cambios y estímulo que se presentan en los negocios internacionales (Smith et al., 2006).

Kedia & Chhokar (1986) y Moini (1997) en sus estudios agruparon los diferentes problemas en las siguientes categorías: barreras de mercadotecnia, barreras de conocimiento en general y de las prácticas en los mercados internacionales, barreras de financiamiento y barreras técnicas; Katsikeas & Morgan (1994) también las categorizaron en: barreras de información y comunicación con los mercados de exportación, adaptación de productos, limitaciones en la fijación de precios para exportar, adaptación en la comercialización de la empresa, limitaciones en la logística externa, políticas nacionales de exportación, complejos procedimientos para exportar, devaluación en la moneda doméstica; Leonidou (1995) por su parte, menciona que las barreras pueden clasificarse como internas y externas de la empresa y estas a su vez pueden ser de casa (del país de origen) y en el extranjero; Colaiácovo (1996) los agrupa en problemas de capacidad física, económica, gerencial, conciencia exportadora problemas con la demanda internacional y de infraestructura. Leonidou (2004) sugiere que la mayor parte de los estudios de barreras de exportación se hicieron en las décadas de los 80s y 90s y a partir de estos se han desarrollado los actuales, por lo que hace una nueva agrupación de barreras ampliando la ya elaborada por él mismo en 1995 tomando como base los trabajos realizados durante las últimas cinco décadas para clasificarlas de la siguiente manera:

*Barreras internas:* información, funciones de la empresa y mercadotecnia.

*Barreras externas:* Procedimiento, gubernamentales, quehacer, ambientales (que a su vez se subdividen en económicas, político-legal y sociocultural).

Además menciona que las barreras afectan (o afectaron) a los siguientes tres grupos de empresas: no exportadores, es decir, empresas que no exportan actualmente; los exportadores actuales, es decir, empresas que actualmente tienen actividades de exportación; y ex-exportadores, empresas que exportaron en el pasado pero ya no lo hacen.

## METODOLOGÍA

Esta es una revisión de los diferentes modelos y estudios que se han hecho acerca de los problemas a la exportación desarrollados en el presente siglo. Se tomaron en cuenta artículos publicados en diferentes *journals* de comercio internacional elaborados en varias partes del mundo que presentaban un estudio empírico de las barreras a la exportación para comparar su estructuras metodológica, determinar el ambiente en el que se desarrollaron y comprobar la frecuencia en que se presentaba cada problema en cada una de las investigaciones, para establecer cuáles son los que más se intervienen en las empresas de diferentes partes del mundo en las que se han desarrollado los estudios, es decir, este trabajo no intenta crear un nuevo modelo de problemas a la exportación sólo saber qué barreras son los más frecuentes a la exportación.

## RESULTADOS

### Aspectos Metodológicos de los Estudios Revisados

Todos los estudios examinados fueron publicados en los últimos 12 años, así como el trabajo de campo, es decir en el siglo XXI que es la finalidad de esta revisión. Los países donde se realizaron son: Arabia Saudita, Australia, Brasil, Canadá, Eritrea, Estados Unidos de América, España, Grecia, India, Irán, Japón, Jordania, Líbano, Nigeria, Pakistán, Portugal, Tanzania. Las mediciones se hicieron con empresas grandes, medianas y pequeñas con actividad industrial y en algunos casos de comercialización, las selecciones de empresas se realizaron en las diferentes bases de datos de las dependencias de gobierno y/o de exportaciones de cada país. Las variables de segmentación en su gran mayoría fueron que las empresas desarrollaran actividades de exportación, algunas otras que las empresas pertenecieran a determinadas regiones, o bien que correspondieran a cierto tipo de industria. El tamaño de la muestra varía entre 11 y 1200 que sumados da un total de 4764 empresas encuestadas, el porcentaje de respuesta varía de entre 17% y 100%, el instrumento de medición fue el cuestionario a excepción de un estudio donde se realizó una entrevista, el informante clave, fue el director o gerente de la empresa, altos funcionarios y personal que tiene que ver con exportaciones. Las teorías que se tomaron como base fueron la internacionalización de las empresas, las barreras a la exportación, la actitud, estímulos para exportar, teoría de redes, estrategias de exportación y el modelo de barreras de exportación de Leonidou (2004).

### Principales Barreras Detectadas

Las barreras que se presentaron con mayor frecuencia en las empresas exportadoras son: barreras de competencia, barreras gubernamentales y barreras de distribución.

*Barreras de competencia:* La fuerte competencia en el mercado meta fue la barrera que más se mencionó en los estudios revisados, quizá en ninguno de los casos fue la causa principal, sin embargo estuvo posicionada en alguna de las primeras cinco barreras en los trabajos de: Da Silva & Da Rocha (2001), Ahmed et al. (2004), Julian & Ahmed (2005), Khattak et al. (2011), Al Hyari et al. (2012). Aunque una empresa puede disfrutar de una ventaja competitiva en el mercado nacional, al exportar puede no tener esta ventaja y puede encontrar situaciones competitivas más complejas, ya sea con empresas nacionales, de otros países o el anfitrión debido a que quizá operen en una base diferente de costos, productos o

protección de gobierno o que manejan diferentes estrategias de mercadotecnia (Leonidou, 2004). Julian & Ahmed (2005) mencionan que la capacidad de una empresa y las limitaciones (fortalezas y debilidades) influyen en la elección de estrategias para lograr un mayor rendimiento en la comercialización de productos en el extranjero, por lo que los recursos de una empresa constituyen sus fuentes de ventaja competitiva, y que estos recursos incluyen ventajas de tamaño, la experiencia internacional, recursos humanos y los recursos disponibles para el desarrollo de las exportaciones. Da Silva & Da Rocha (2001) indican también que un aspecto importante de la fuerte competencia en los mercados internacionales es colocar los precios por debajo de los de la competencia o incluso igualarlos como lo señalan Liargovas y Skandalis (2008) y Al Hyari, et al. (2012).

*Barreras gubernamentales:* Las barreras gubernamentales influyen definitivamente en las operaciones de exportación en la empresa, y en este sentido puede ser para impulsarlas o ahuyentarlas. En este estudio se encontraron tres diferentes formas de cómo influye el gobierno de manera directa en barreras a las exportaciones, mediante el uso inadecuado de incentivos a la exportación, requisitos burocráticos y ayuda y/o apoyo a las empresas exportadoras. El uso inadecuado de incentivos a la exportación se presentó como la principal barrera en los estudios de Da Silva & Da Rocha (2001), de igual forma para las investigaciones de Julian & Ahmed (2005) y Al Hyari et al. (2012) fue uno de los factores principales. Bernard & Jensen (2004) mencionan que los políticos creen que hay beneficios sociales importantes cuando las empresas exportan, así como a la estimulación de exportaciones (Da Silva & Da Rocha, 2001).

El otro factor ampliamente mencionado como barrera a la exportación y que implica al gobierno son los requisitos burocráticos, como se puede observar en los estudios de: Da Silva & Da Rocha (2001), Pérez & Camarero (2007), Liargovas y Skandalis (2008) y Milanzi (2012). Smith et al. (2006) indican que los exportadores tienen la percepción de que las barreras de su propio gobierno reduce la capacidad de sus empresas para competir, ya que en muchos países las firmas tienen que cubrir una serie de requisitos necesarios que generan tiempo y dinero que muchas veces en lugar de incentivar a las organizaciones a exportar las desanima en su intento, sobre todo para las pequeñas y medianas empresas Pérez & Camarero (2007).
