Se define al mercado que será objeto de estudio, en este caso los alumnos de nuevo ingreso de la Universidad Tecnológica de Chihuahua, donde se analizarán algunas de las variables sociodemográficas como son: la edad, sexo, nivel socioeconómico o estatus social, características familiares, psicográficas, escuela de procedencia, entre otras. Los elementos, material o instrumentos que se utilizarán para llevar a cabo el análisis de información serán las bases de datos con las que cuentan el departamento de servicios escolares en la Universidad Tecnológica de Chihuahua, las cuales son proporcionadas por el Centro Nacional de Evaluación (CENEVAL) cuando se entregan los resultados del EXANI, los cuales presentaron los sustentantes; dicha información se analiza a través de la elaboración de bases de datos.

La investigación se lleva a cabo en la Universidad Tecnológica de Chihuahua, la información obtenida se entrega a las instancias correspondientes para la elaboración de estrategias que se requieran de acuerdo a las necesidades de la institución.

## RESULTADOS

El nivel socioeconómico de los alumnos de nuevo ingreso de la Universidad Tecnológica de Chihuahua que se obtiene después de un análisis de información arroja que tienen un nivel D+. De acuerdo al análisis realizado se obtiene que el 20% de los alumnos que ingresan a la Universidad Tecnológica de Chihuahua (UTCH) provienen del Centro de Bachillerato Tecnológico e Industrial y de Servicios (CBTIS) y el otro 80% son de diversas escuelas públicas y privadas. Los alumnos que se encuentran económicamente activos estudian o le dedican solo una hora diaria a sus responsabilidades académicas. Con respecto a las características de la familia se obtiene que la escolaridad promedio de la madre es de 7.5, es decir, hasta primero de secundaria y el promedio del padre es de 9, lo cual significa que termino sus estudios de nivel básico, hasta secundaria.

## CONCLUSIONES

En la presente investigación se logra el objetivo general que es conocer el perfil sociodemográfico de los alumnos de nuevo ingreso a la Universidad Tecnológica de Chihuahua, a partir del análisis de las bases de datos que son proporcionadas por Centro Nacional de Evaluación (CENEVAL), con el fin de obtener información para la elaboración de diferentes estrategias, como puede ser disminuir la deserción por motivos económicos en un 10%. Se tiene como referencia que la media nacional de deserción por diferentes motivos, en el primer cuatrimestre es del 45%, mientras que en los últimos años en la universidad donde se lleva a cabo la investigación la deserción en el primer cuatrimestre es del 40%.

Por otro lado, también se tiene como meta a partir de la obtención y análisis de la información, incrementar en un 10% la participación de los alumnos en las actividades extraescolares u ofrecer actividades de acuerdo a las habilidades y aptitudes de los alumnos, además de diseñar estrategias de promoción donde se vea reflejado el incremento de la matrícula en un 10% en comparación al año anterior inmediato. A partir de este análisis sociodemográfico, se puede lograr el incremento de la eficiencia terminal en un 20%, ya que se tiene detectado a los alumnos más vulnerables, además también se pueden gestionar el incremento en un 15% las becas académicas y alimenticias, así como apoyos a alumnas madres solteras.

## RETOS Y OPORTUNIDADES DEL SECTOR COMERCIO EN BAJA CALIFORNIA, MÉXICO

Nancy Imelda Montero Delgado, Universidad Autónoma de Baja California

Daniel Muñoz Zapata, Universidad Autónoma de Baja California

Jorge Alfonso Galván León, Universidad Autónoma de Baja California

### RESUMEN

*El sector comercio en Baja California, es importante en cuanto al número de empresas activas, población empleada, derrama económica y aportación al PIB nacional; sin embargo, no logra recuperarse después de la crisis económica del 2008, tan sólo en Tijuana registró un índice de ventas de -4.2 % y Mexicali de -10.8% en 2013 y se reporta una fuga de consumo a los condados del Sur de California en Estados Unidos de 6 mil millones de dólares anuales (Díaz, 2012), esto sin contar el efecto negativo que se experimentará por el encarecimiento de los bienes y servicios en la franja fronteriza en un 25% por la diferencia de impuestos, producto de la nueva reforma hacendaria (Brugues y Díaz, 2014). Bajo el esquema anterior, la "Cámara Nacional de Comercio" en la entidad enfrenta un escenario inquietante y reconoce la importancia de identificar la mejor manera de hacerle frente a tal situación, para lograrlo se llevó a cabo un análisis comparativo de la competencia y se retoma el estudio de mercado de consumo fronterizo, con la intención de identificar las áreas de oportunidad para innovar y proponer una estrategia de comercialización acorde a las nuevas condiciones de consumo identificadas en el estado.*

**PALABRAS CLAVE:** Comportamiento de Compra, Estructura de Mercado, Comportamiento de Mercado

## CHALLENGES AND OPPORTUNITIES OF THE SECTOR I TRADE OF BAJA CALIFORNIA, MEXICO

### ABSTRACT

*The sector I trade in Baja California, it is important as for the number of active companies, direct employment, economical distribution and contribution to the national GDP; however, it does not manage to recover after the economic crisis of 2008, only Tijuana registered an index of sales of -4.2 % and Mexicali -10.8 % in 2013 and an escape of consumption is brought to the counties of the South of California in The United States of 6 billion annual dollars (Díaz, 2012), This without counting the negative effect that will be experienced by the increase in prices of the products and services in the frontier band in 25 % by the difference of taxes, product of the new tax reform (Brugues and Díaz, 2014). Under the previous scheme, the "National Chamber of Trade" in the entity faces a worrying scene and recognizes the importance of identifying the best way of facing it such a situation, to achieve it a comparative analysis of the competition was carried out and there is taken again the market research of frontier consumption, with the intention of identifying the areas of opportunity to innovate and to propose a strategy of commercialization for the new conditions of consumption identified in the region.*

## INTRODUCCIÓN

La importancia del sector comercio en el desarrollo de un país no es tema que se encuentre en discusión, lo primordial es como éste afronta los cambios en el mercado y la capacidad de los empresarios para adaptarse a los nuevos modelos de negocios impuestos por una dinámica de comercialización distinta a la doméstica. Este es el caso del sector comercio en Baja California, México, el cual no ha logrado recuperarse de la caída sufrida por la crisis económica del 2008, de hecho se puede decir que la situación actual no deslumbra un escenario optimista para esta franja fronteriza. Bajo este esquema y con la convicción de proveer información a la "Cámara Nacional de Comercio" de la entidad se emprendió el proyecto para identificar las áreas de oportunidad y en consecuencia los retos a los cuales se enfrenta el sector comercio; para lograrlo se desarrollo un análisis comparativo de la competencia y un estudio de mercado a partir de la información proporcionada por una investigación de hábitos de consumo desarrollada en esta zona en el 2012, la cual permite identificar los productos de mayor adquisición por los consumidores fronterizos. El proyecto describe con claridad las condiciones comerciales que prevalecen en la región y deja en claro que la fuga de consumidores fronterizos al Estado de California en Estados Unidos es multifactorial, y poco puede hacer al respecto el comercio doméstico, al no contar con estrategias de comercialización lo suficientemente competitivas para retener a los consumidores de la frontera, que se estima podría alcanzar los 1200 millones de dólares anuales en compras para el 2020 si no se buscan nuevos esquemas de comercio (Fuentes, 2013).

La información obtenida muestra que la innovación en procesos es el eje rector que deberá seguir el sector comercio en Baja California para salir adelante, así como valorar al consumidor doméstico que no cuenta con visa para ingresar a Estados Unidos y por tanto realiza sus compras en la región. En relación a los retos, el empresario bajacaliforniano debe aprender del modelo de negocios del sector comercio en California que se caracteriza por centrar su estrategia en el sistema de mercadotecnia vertical, lo que permite generar acciones comerciales lo suficientemente atractivas que sin importar la diferencia cambiaria de la moneda y las horas de espera para ingresar a los Estados Unidos, los consumidores fronterizos no renuncian a su estilo de compra. De la misma manera, es preciso mencionar que las nuevas acciones comerciales deben favorecer a los servicios que estimulan la compra, ya que estas estrategias son altamente valoradas por los consumidores de esta zona. En suma el presente documento muestra los desafíos que el sector comercio debe afrontar con inteligencia y entereza, así como las coyunturas de mercado que aprovechadas al máximo podrían beneficiar en mayor proporción que la pérdida de mercado registrado por la fuga de consumidores fronterizos, ya que éstos representan tan sólo el 38 por ciento de la población del estado (Secretaría de Relaciones Exteriores, 2013). El escuchar y cultivar al consumidor doméstico será la estrategia más apropiada para el desarrollo del sector comercio en la entidad.

## REVISIÓN LITERARIA

### Sector Comercio en Baja California

El sector comercio representa uno de los pilares más importante en la economía de Baja California con el 38.4 por ciento de la actividad económica del estado, contribuye con las de la mitad del empleo y aporta las tres cuartas partes del producto interno bruto estatal. Este panorama es el reflejo de la actividad comercial en el país, ya que este sector contribuye con el 29.9% del empleo formal en México y cuenta con cuarenta y tres tratados internacionales que lo han impulsado para convertirse en uno de los sectores de mayor crecimiento (Secretaría de Economía 2013). Sin embargo el panorama anterior se vio frenado a raíz de la crisis económica del 2008 y al crecimiento del comercio informal por la desaceleración de la economía en México. Tan sólo en el 2009 el Instituto Mexicano del Seguro Social registro una disminución en su padrón de 7 mil 319 patrones, de los cuales el 42 por ciento fueron del sector comercio; en la actualidad el escenario prevalece al registrar una pérdida de unidades de negocio de 16 mil 560 en los últimos cinco años (INEGI, 2012).

Desafortunadamente la situación se agrava en la zona fronteriza del país, tan sólo en Baja California se registró fuga de 6 mil millones de dólares por consumo hacia el sur de California en EE.UU. específicamente en San Diego y condados circundantes (Chalita, 2013) y las dos Ciudades principales del Estado muestra un avance nulo en su esfuerzo por recuperar al consumidor fronterizo. Mientras que a nivel nacional el sector comercio interno observa en diciembre del 2013 un incremento de 2.35 por ciento en ventas al por mayor y al por menor disminuyó -2.12 por ciento en comparación al año anterior (INEGI, 2014). El panorama en Baja California es igualmente sobrio, ya que Tijuana y Mexicali (municipios principales del Estado) presentan una recuperación en sus ventas al por menor de 1.7 por ciento y al mayoreo de 1.3 por ciento a finales del 2013, lo cual no es suficiente ya que estos han registrado números negativos en los últimos cinco años, tan solo Tijuana y Mexicali registraron -2.3 y -4.3 respectivamente en el comportamiento de ventas al mayoreo en diciembre del 2012, colocándose en la tercera y segunda posición a nivel nacional entre las ciudades que no logran remontar la pérdida de mercado, en cuanto a las ventas al menudeo, el comportamiento se agravó al registrar -10.8 Mexicali y -4.6 por ciento en Tijuana posición que las coloca en el nivel 3 y 11 de las 19 ciudades que no logran registrar ventas positivas (CONCANACO, 2013).

Este escenario es inquietante ya que el sector terciario en Baja California alberga al 60.8 por ciento de la población económicamente activa y aportan el 63.52 por ciento al Producto Interno en el Estado (INEGI, 2012). La vulnerabilidad observada en el sector comercio del Estado se atribuye en gran medida a la incapacidad del gobierno federal para establecer un equilibrio entre la política pública y la realidad del mercado fronterizo, lo que dificulta la labor del empresario bajacaliforniano al no contar con recursos para invertir en investigación y desarrollo, a diferencia del sector comercio en California que se caracteriza por su dinámica y capacidad para diseñar estrategias comerciales lo suficientemente atractivas e innovadoras que a pesar de la diferencia cambiaria de la moneda y tiempo de espera para ingresar a EUA mantienen el comportamiento de compra que caracteriza a la región (vives en B.C. – compras en California), entre las que destaca el alto nivel de integración del sector comercial a través de redes de colaboración desarrolladas bajo el enfoque de mercadotecnia vertical. (Díaz, 2012).

Este sistema de mercadotecnia se reconoce como una forma de colaboración entre los distintos niveles y miembros de un canal de distribución en la que trabajan juntos para promover la eficiencia y la economía de escala, de tal forma que los productos son promocionados entre los consumidores bajo un esquema en donde el factor crédito y tasas de interés juegan un papel importante, así como las políticas de compra, devolución, atención a clientes y servicios posventa (Lamb, Hair, Mc Daniel, 2011). En EUA el sistema de mercadotecnia vertical toma fuerza en la década de los noventa debido a la importancia que adquiere el cliente como centro de la estrategia de comercialización tanto a nivel doméstico como internacional. Partiendo del esquema anterior el Gobierno Federal mexicano en forma conjunta con la Secretaría de Economía y las agrupaciones más importantes de empresarios en el país lanzó en el 2011 una estrategia innovadora para el comercio doméstico denominada el “Buen Fin”, la cual consiste en estimular a las empresas a diseñar ofertas e implementarlas el fin de semana del Aniversario de la Revolución Mexicana (18 al 21 de noviembre). En la primera edición se reportó un incremento de 30 a 35 por ciento.

Sin embargo los especialistas identificaron que sólo se adelantaron las ventas de diciembre por tanto el efecto económico neto fue oscuro por dos razones: primero en México no existe la cultura de colocar altos volúmenes con bajos márgenes de ganancia y segundo las empresas no tenían contemplado el proyecto por lo que no pudieron hacer una planeación financiera adecuada para aplicar promociones de mayor impacto, limitándose a promover descuentos ligeros (Mayoral, 2011). Para el 2012 la Asociación Nacional de de Tiendas de Autoservicios y Departamentales A.C (ANTAD) lo calificó como exitoso en comparación al 2011, al registrar un crecimiento por encima del 30 por ciento. Para el 2013 el Buen Fin supero la meta del 2012 en un 16% (Santa Rita, 2013). Sin embargo en Baja California esta medida no se puede calificar

como exitosa ya que el consumidor fronterizo prefiere esperar el ya tradicional “Viernes Negro” (Black Friday); en la edición del 2013 los bajacalifornianos gastaron 100 millones de dólares diariamente en una celebración que ya se extendió a tres días, mientras que el “Buen Fin” dejó una derrama económica en el Estado de 3 mil millones de pesos (Sánchez, 2013), mostrando la preferencia del consumidor en el Estado de Unión Americana.

En este mismo sentido el COLEF elaboró en el 2012 (Díaz) un estudio del comportamiento del consumidor fronterizo e identificó que gastan en promedio 300 dólares en cada visita y 4 de cada 10 acuden al viernes negro y consumen en promedio 1150 dólares, de la misma forma el estudio reconoce que el consumidor fronterizo ha adoptado el viernes negro dentro de sus tradiciones. Por tanto tienen más de 38 años aprovechando descuentos que oscilan entre el 50 y 80 por ciento, con políticas de venta flexibles, devoluciones sin restricciones, y estrategias que estimulan la compra por internet. El presidente de la "Cámara Nacional del Comercio" (Chalita, 2012) en Tijuana afirma que los comerciantes no cuentan con armas para enfrentar a la competencia y no encuentran la manera de combatir al “monstruo de la fuga de consumidores”, aún así, el sector comercio busca renovarse y enfocarse a las necesidades que impone la regionalización de su economía, la mayor libertad en el comercio y el tránsito de personas, lo que hace evidente que la reorganización del comercio requieren de acciones innovadoras que le permitan recuperar el mercado que han perdido en los últimos años.

#### Reformas Hacendarias 2014

México se encuentra en una dinámica de cambios estructurales que pretenden fortalecer el nivel de competencia mostrado a la fecha, entre los más importantes para el sector empresarial se encuentran las reformas hacendarias las cuales entraron en vigor en enero del año en curso. En este sentido la homologación del Impuesto al Valor Agregado (IVA) en Baja California se convirtió en el punto focal del sector comercial de la región ya que diversos estudios muestran que la decisión empeorará la situación del sector comercio en Baja California, específicamente se estima que la fuga de consumidores alcanzará los 1200 millones de dólares anuales para finales del 2014, una caída en las ventas del sector comercio tanto minorista como mayorista entre el 4 y 5.7 por ciento respectivamente y en consecuencia una contracción directa del Producto Interno Bruto Estatal entre el 1.8 y 2.2 por ciento (Fuentes, 2013). En cuanto a la capacidad para competir del sector comercio no presenta signos de poder revertir la situación actual y continuará a la sombra del sector comercio de California, en Estados Unidos.

Se pudiera pensar que las estimaciones anteriores son dramatizadas para justificar el amparo colectivo que se interpuso en contra del IVA, en donde más de 60,000 quejosos de la frontera dieron a conocer su descontento por la homologación, estimulados en gran medida por un 2013 que cerró con un desempleo del 6.4 por ciento en Baja California, una baja en el sector comercio, vivienda e infraestructura que llevó a catalogar al 2013 como un “año con cierre catastrófico” por parte del Consejo Coordinador Empresarial (Gracias, 2013).

#### Comportamiento de Compra del Consumidor Fronterizo

Sierra y Serrano (2012) estudian el modelo de consumo en Baja California e identifican que la historia del comercio de bienes y servicios está marcado por la cercanía con los condados del sur de California. Todavía a principios de los años ochentas los productos básicos que se consumían eran de procedencia estadounidense. Esta vinculación favoreció el desarrollo de hábitos de consumo similares, lo que no ha cambiado con el paso de los años. Dentro de los resultados obtenidos destaca que el 74 por ciento de la población que percibe más de cinco salarios mínimos cuenta con visa para ingresar a EE.UU. y gasta en promedio 275 dólares por visita, en cuanto al propósito de cruce el 63.6 por ciento lo hace para ir de compras y tan sólo el 8.1 por ciento por trabajo y el 25.6 por ciento ingresa a EE.UU. una vez a la semana,

un 18 por ciento cada quince días y 15 por ciento de forma mensual. De la misma forma se identificó que el 29.2 por ciento visita por lo menos 3 tiendas y la calidad y precio son las razones por las que el consumidor fronterizo decide comprar en EE.UU. En relación a los artículos que adquieren con mayor frecuencia en California, destaca la ropa con un 42.2 por ciento, seguido de los alimentos con un 33.8 por ciento. El estudio concluye diciendo que “los hábitos de consumo de la población en Baja California son resultado de una serie de acontecimientos geográficos, económicos, políticos, sociales y culturales. La manera en que eligen los productos que incluyen en su canasta de consumo necesariamente está influida por el estilo de vida del estado de California, en Estados Unidos, esto se traduce en particular en el deseo y en ocasiones en la posibilidad de acceder a los mismos satisfactoria de aquella población. Por los años de residencia en el estado, se reconoce la prevalencia de patrones de consumo consolidados” (Sierra y Serrano, 2012)

### Otros Aspectos

Para ampliar la imagen del sector comercio en Baja California es necesario mencionar que éste guarda las mismas proporciones identificadas a nivel nacional en el cual se observa que el sector empresarial en México se compone de 95.2 por ciento de microempresas, 4.3 por ciento de pequeñas, 0.3 por ciento de medianas y 0.2 por ciento son grandes empresas. En cuanto a su agrupamiento el sector comercio alcanza el 26 por ciento de las unidades económicamente activa (INEGI, 2012). Otro dato a considerar y que merma el nivel de competitividad del sector comercio son los vendedores ambulantes y la piratería. La "Confederación de Cámaras Nacionales de Comercio, Servicio y Turismo" (2013) puntualiza que las ganancias por piratería en México alcanzan los 75 mil millones de dólares anuales, cifras que rebasan por mucho los ingresos obtenidos por la venta de petróleo. Por último, la "Cámara de Comercio Mexicana" reveló los resultados de una investigación en el 2012 en la cual identificaron que un 88 por ciento de los sujetos de estudio habían adquirido algún artículo pirata y sólo el 58 por ciento tenía una percepción negativa de la piratería. El panorama anterior establece que el sector comercio en Baja California se enfrenta a una estructura de mercado que exige estrategias de comercialización diferentes, ya que es evidente que las empleadas actualmente no logran mitigar las nuevas condiciones de mercado.

### **METODOLOGÍA**

Con la finalidad de revertir la situación actual del sector comercio en Baja California e identificar las oportunidades, se establecieron como objetivos específicos: Identificar y comparar las estrategias de comercialización empleada por el sector comercio en Tijuana, B.C. y San Diego, CA., del producto con mayor fuga de compradores, Definir qué elementos de las estrategias de comercialización son valoradas por el consumidor fronterizo. Por las características del estudio se requirió emplear diferente métodos de análisis a partir de los mismos.

La tabla uno muestra el método y modelo seleccionado para desarrollar el análisis comparativo entre los negocios del sector comercio de venta de ropa por ser el producto de mayor demanda por los consumidores fronterizos ubicado en San Ysidro, Chula Vista, Nacional City y San Diego California contra el sector comercio de Tijuana, México. En cuanto al estudio de mercado éste se enfocó en conocer los gustos y preferencias de los consumidores fronterizos de clase media que residen y trabajan en Tijuana y que tradicionalmente realizan sus compras en el Sur de California; este perfil permitió identificar que se tienen una población sujeta de estudio de 156 mil 800 personas y se decide trabajar con un nivel de confianza de 1.96, un margen de error de 5 por ciento y una probabilidad de 50; en cuanto al tipo de análisis se decidió seleccionar el descriptivo por la naturaleza del proyecto y fortalecerlo con la observación no participativa. Es necesario mencionar que se decide concentrar el proyecto en el municipio de Tijuana ya que este es el que muestra mayor movimiento de consumo en el estado y transitan anualmente alrededor 13 millones 600 mil autos y 24 millones de personas anualmente (Ibarra, 2013).

Tabla1: Metodología Empleada en el Estudio

Objetivo específico	Sujeto de estudio	Método	Modelo
Análisis comparativo de la competencia	Negocios del sector comercio de San Ysidro, Chula Vista, National City , San Diego, CA y Tijuana:	Evaluación de fuerza competitiva de Thompson A. Gamble J. & Peteral (Edición 10. 2012)	Modelo de las 4C's de Robert Lauterborn (1993) Variables para la hoja de verificación.
Estudio de mercado	segmento de interés: venta de ropa Consumidores fronterizos de clase media residentes de la Ciudad de Tijuana B.C con visa para ingresar a EUA y que acostumbren a comprar en el sur de California.	William G. Zikmund y Barry J. Badin. (N: 156,800) (Z: 1.96) (E: 5%) (P:50)	Modelo a) Descriptivo b) Observacional no participativo

*Esta tabla describe la metodología empleada en el proyecto y permite observar a partir del objetivo específico los sujetos de estudio a observar, el método y modelo empleado; destacando el nivel de confianza de 1.96 y un margen de error del 5 por ciento. Fuente: Elaboración propia.*

## RESULTADOS

Las estrategias de comercialización del sector comercio división “Ropa” fue el centro del análisis comparativo de la competencia, partiendo del hecho que este sector muestra un porcentaje mayor de fuga de consumidores fronterizos. Para lograrlo fue necesario identificar las tiendas y plazas más buscadas por los clientes en ambos lados de la frontera en este caso: Tijuana y San Diego. La tabla dos muestra las zonas y comercios que acostumbran visitar los sujetos de estudio en ambos lados de la frontera.

Tabla 2: Plazas y Tiendas Más Buscadas Por los Consumidores Tijuanaenses en Ambos Lados de la Frontera

Tipo	Tijuana, B.C.	San Ysidro, Chula Vista, National City & San Diego, CA.
Plaza comercial o sustitutos	Plaza Rio, Macro Plaza, Tianguis Siglo XXI Tianguis Mercado de todos, Tianguis las carpas.	Las Americas Premium Outlets Center (San Ysidro), Big Nazz 99 Cents Plus Store (Chula Vista end San Ysidro), Chula Vista Center “H” St. (Chula Vista), Plaza Bonita (Chula Vista), Fashion Valley Center ( San Diego), Horton Plaza (San Diego), Spring Valley Swap Meet (National City), San Ysidro Swap Meet (San Ysidro).
Tienda de ropa	SEARS, Wal Mart, Coppel C&A, Boutiques en diversos lugares , ventas independientes	Wal Mart, Ross Dress For Less, Macy's, Tj Market, Target, K Mart, Men's Fashion Depot (San Diego), 3 cuerdas de Boutiques en San Ysidro Boulevard.

*La tabla 2 observa los lugares más visitados por el consumidor fronterizo en el municipio de Tijuana y el en Condado de San Diego y sus alrededores, clasificados en dos grupos plazas comerciales y sustitutos en lo general y tiendas de ropa en lo particular. Fuente: elaboración propia.*

Al señalar las plazas y tiendas más visitadas por los consumidores fronterizos es importante mencionar que se identificó con claridad una diferencia de tamaño entre ellos y por consecuencia en su capacidad para implementar estrategias de comercialización, por tanto se vio en la necesidad de realizar un proceso de discriminación y garantizar de ese modo la equidad comparativa, así como el hecho de estudiar al segmento más vulnerable del sector comercio y quedar sólo con las tiendas Boutique dentro de las plazas, puestos en el swap meet o tianguis, boutique en avenidas y se eliminan las tiendas departamentales y personas que venden ropa en casa, estas últimas por no formar parte del segmento de estudio al ser clasificado como comercio informal.

Una vez realizado el análisis comparativo y el estudio de mercado (anexo 1) los resultados generales observados en la tabla tres son por demás desalentadores para la micro, pequeña y mediana empresa del sector comercio en Tijuana y Baja California y quedan al descubierto los elementos más sensibles de la estrategia de comercialización empleada actualmente en comparación a la implementada por los pequeños

negocios del sector comercio en San Diego, CA y sus alrededores. El resultado corrobora las afirmaciones del Lic. Karim Chalita (2013) presidente de la "Cámara Nacional de Comercio" en Tijuana al asegurar que el sector comercio no cuenta con armas para enfrentar la fuga de consumidores al Estado de California. Con una capacidad para competir limitada, con apenas un 23.3 por ciento de las características de acuerdo a la ponderación trabajada, el sector comercio no podría recuperar el mercado perdido en los últimos años y enfrentar las nuevas condiciones de mercado.

Tabla: 3: Resultados Generales del Análisis Comparativo de la Competencia Desde la Perspectiva del Consumidor Fronterizo

Variable	Elementos Observados	Elementos Desfavorables Para El Comerciante Tijuaneño (Detalles Anexo1)	Capacidad Para Competir Por Variable
1. Cliente	18	13	27.2%
2. Costo	6	6	0%
3. Conveniencia	3	1	66%
4. Comunicación	3	3	0%
Capacidad total para competir	30	23	23.3%

La tabla encuadra los resultados generales identificados en el análisis comparativo entre los sujetos de estudio de Tijuana y San Diego. Se observaron 30 elementos, de los cuales el sector comercio de Tijuana salió por debajo en 23 de ellos lo que implica un nivel de competencia general de 23.3 por ciento en una escala de 100. Fuente: Elaboración propia

## CONCLUSIONES

### Oportunidades del Sector Comercio en Baja California

El sector comercio en Baja California tiene mucho camino por recorrer y luchas por ganar antes de pensar en remontar las posiciones perdidas, de hecho se recomienda que aprenda del pasado y de vuelta a la página para escribir un capítulo con acciones distintas. La nueva estrategia de comercialización deberá contemplar la innovación como eje rector e iniciar un proceso interno de reflexión y apertura a nuevas ideas, que si bien ya existen en el mercado, son un área de oportunidad para la micro, pequeña y mediana empresa del sector comercio. En este sentido y como respuesta al objetivo general se identificaron tres áreas de oportunidad visualizadas bajo un esquema de innovación que permitirán mejorar su nivel de competencia: La primera de ellas se observa en un plano estructural y de comportamiento, entre las que destacan:

- Disponibilidad para formar parte de una asociación o grupo empresarial (participación en las Cámaras)
- Llevar a un nivel de colaboración la relación con proveedores y fabricantes (mercadotecnia vertical).
- Hacer de la capacitación un soporte para enfrentar los nuevos retos (Capital Humano)
- Aprender a escuchar al consumidor (Administración de la relación con los clientes)
- Buscar la mejora continua (filosofía de calidad)
- Aprender a definir, transmitir y medir los resultados (definición y evaluación de objetivos)

La segunda área de oportunidad se presenta en un plano funcional y se debe innovar en los siguientes rubros:

- Ampliar los servicios de apoyo: servicios de crédito, de atención al cliente, de información y consulta, así como los servicios para la comodidad de los clientes en sus compras (competir con productos aumentados)
- Trabajar en mejorar la relación costo y calidad (Análisis de proveedores)
- Planear la temporada alta para ganar en ventas al volumen (redes de colaboración)

### Administración de compras y manejo de inventarios (Satisfacción de necesidades).

La tercera área de oportunidad está relacionada con la estructura de mercado de consumo de Baja California el cual se caracteriza por su relación histórica con los condados del Sur de California y su fuerte influencia en los hábitos y patrones de consumo, sobre todo entre las familias de mayor antigüedad en la región, las cuales han replicado el modelo de consumo por generaciones. En este sentido, se identificó que alrededor del 62 por ciento (Secretaría de Relaciones Exteriores, 2013) de la población de Tijuana no cuenta con visa para ingresar a los Estados Unidos, lo que sugiere que el mercado de consumo interno es mayor al consumo fronterizo, por tanto la micro, pequeña y mediana empresa del sector comercio debe aprovechar la oportunidad que tiene y voltear a ver al comercio del Sur de California como un aliado para posicionarse en el mercado interno y aprender el concepto de servicio y formación de redes de colaboración para enfrentar con audacia a las tiendas departamentales situadas en la región y mitigar el impacto del comercio informal.

### Retos Que el Sector Comercio en Baja California Debe Enfrentar

El sector comercio en Baja California se encuentra inmerso en una demanda histórica para México, ya que busca por la vía legal derogar la homologación del impuesto al valor agregado en la zona fronteriza y dejar en claro que las decisiones tomadas sin tomar en cuenta las características propias de la zona inhiben el desarrollo regional. Sin embargo, este desafío no es el único que el sector comercio debe afrontar, ya que se identificó en el análisis comparativo que la calidad y el precio son los elementos de mayor influencia y que la estrategia de comercialización empleada en California está diseñada bajo un enfoque de mercadotecnia vertical y que existe una cultura empresarial que favorece la relación entre las partes involucradas (fabricantes, distribuidores mayoristas, minoristas e instituciones bancarias), de tal forma que el sector comercio ha desarrollado un modelo de negocio centrado en la estimulación del consumo y no en la obtención de la mayor rentabilidad por venta.

Este último modelo es el que predomina en el sector comercio de Baja California, por lo tanto, las nuevas condiciones de mercado estimulan a modificarlo de lo contrario su futuro no se deslumbra alentador. Finalmente se identificó que las estrategias de comercialización que valoran los consumidores fronterizos están centrados en el servicio, específicamente los orientados a facilitar las compras, elemento que el sector comercio en Baja California debe valorar e implementar estrategias sin afectar las finanzas de la empresa, en este sentido el reto se localiza en que se debe considerar la importancia de generar información financiera para la toma de decisiones sin importar el tamaño de la empresa.

## ANEXO

### Resultados Detallados del Análisis Comparativo de la Competencia y el Estudio de Mercado

El anexo 1 muestra a detalle el análisis comparativo de la competencia y el resultado del estudio de mercado, lo anterior con la finalidad de cruzar ambos indicadores e identificar aquellos elementos de la estrategia de comercialización que deben ser replanteados en forma innovadora.

## Anexo 1: Resultados del Análisis Comparativo de la Competencia y del Estudio de Mercado

Análisis Comparativo de la Competencia

## RESUMEN

*El presente estudio establece como objetivo principal analizar en instituciones gubernamentales el clima organizacional y su relación con la calidad en el servicio de acuerdo a la carta iberoamericana de calidad en la gestión pública. Se pretenden estudiar las Secretarías del Gobierno del Estado de Durango ubicadas en el municipio de Durango. Las variables fueron operacionalizadas en base a las diferentes teorías del clima organizacional y la carta iberoamericana de la calidad en la gestión pública, donde surgieron 14 dimensiones: estructura, comunicación, capacitación y desarrollo, trabajo en equipo, ambiente físico y cultural, identidad liderazgo, dirección estratégica y ciclo de mejora, gestión por procesos, mejora de la normatividad, gobierno electrónico, gestión del conocimiento y aportación de los funcionarios. Por otra parte se realizó un proceso de validación por expertos a través de un Panel de Expertos y de acuerdo a la revisión de la literatura se confirman las dimensiones propuestas, el instrumento es de escala tipo likert, cuenta con 62 ítems los cuales evalúan las variables objeto de estudio.*

**PALABRAS CLAVE:** Clima Organizacional, Calidad en el Servicio, Sector Gubernamental, Instrumento de Medición

## DEVELOPMENT OF AN INSTRUMENT TO MEASURE ORGANIZATIONAL CLIMATE, IN TERMS OF THE QUALITY OF SERVICE IN THE GOVERNMENT SECTOR

### ABSTRACT

*The main objective of this study is to analyze the organizational climate in government institutions, and its relationship to service quality according to the Latin American letter of quality in public administration. The aim is to study the Government Secretaries of the State of Durango located in Durango city. The variables based on different theories of organizational climate and the Ibero-American letter quality in public administration were operated, where 14 dimensions emerged : structure , communication, training and development, teamwork, physical and cultural environment , identity, leadership, strategic direction and improvement cycle , adoption of a model of excellence, process management , improved regulations , e-government , knowledge management and contribution of staff . Moreover, a validation process through a panel of experts was conducted and according to the literature review the proposed dimensions are confirmed, the instrument is in scale, Likert type, has 62 items, which assess the variables object of study.*

## INTRODUCCIÓN

El clima organizacional es un fenómeno de importancia para la mayoría de las organizaciones, ya que mediante su análisis y medición, se busca mejorar el ambiente de trabajo que en ellas predomina, para incidir sobre la eficiencia de su operación y el aumento de su productividad (INE, 2008). El presente trabajo se establece desde dos perspectivas: la primera en relacionar el clima organizacional en función de la calidad en el servicio en instituciones gubernamentales, estas variables han sido vinculadas con la literatura organizacional en el contexto nacional e internacional; por otra parte se pretende desde el punto de vista metodológico, validar un instrumento de medición que considere las variables del clima organizacional y de calidad en el servicio, tomando en cuenta la confiabilidad, validez y las dimensiones evaluadas. Se tomó en cuenta la Carta Iberoamericana de la Calidad en la Gestión Pública (CLAD, 2008) emitida por este organismo y en base a la carta se adaptaron dimensiones del clima organizacional de acuerdo a las diferentes teorías existentes sobre el tema como: Litwin y Stringer 1968, Valenzuela 2003 y 2007 Chiang, et. AL Y Marín 2002 para asociar estos constructos conceptualmente. El resto de esta investigación se organiza de la siguiente manera: se inicia con la revisión de literatura relacionada con el clima organizacional sus autores y algunas de sus dimensiones, posteriormente se presenta la Carta Iberoamericana de la Calidad en la Gestión Pública emitida por el CLAD (2008), después, en la sección de metodología se incluye, la operacionalización de las variables para elaborar el instrumento de medición así como la confiabilidad del instrumento. Finalmente se presentan las conclusiones.

## REVISIÓN LITERARIA

### Clima Organizacional

La investigación sobre clima organizacional comenzó en los finales de los 1960, y por lo tanto, más de 40 años de investigación han acumulado ahora un tema. Mucho se ha avanzado en ese tiempo. Destaca que se consideran cinco de los logros más significativos 1) el desarrollo de estrategias y los focos del proceso de investigación, 2) la distinción de un clima de satisfacción en el trabajo, 3) las resoluciones de los niveles de problemas de análisis 4) el estudio del acuerdo sobre el clima dentro de las unidades de trabajo y 5) el aumento de la complejidad conceptual del clima como una variable potencial, mediador y asesor. (Neal M. Ashkanasy, Celeste P.M. Wilderom, Mark F. Peterson , 2011)

El clima organizacional es un fenómeno socialmente construido, que se deriva de las interacciones individuo-grupo-condiciones de trabajo, dando como resultado un significado a las expectativas individuales y grupales (Perez de Maldonado, 1997). El desarrollo de bases de teóricas de la administración pública, clima organizacional, dimensiones del clima organizacional, ha permitido la comprensión y desarrollo de este tema, sin dejar de mencionar las múltiples investigaciones realizadas sobre el mismo que han sido muy útiles dentro de las organizaciones ya sean públicas como el gobierno o una escuela de educación superior o privadas como cualquier tipo de empresa.

Otro enfoque menciona que el clima es un elemento fundamental de las percepciones que el trabajador tiene de las estructuras y procesos que ocurren en un medio laboral. Al referirse a las estructuras y procesos de la organización es hablar de su estructura orgánica prácticamente y de cada uno de los procesos que se llevan a cabo en la misma con el fin de cumplir con los objetivos planteados. (Goncalves , 1997) Existe una polémica bastante grande respecto a la definición al concepto de clima organizacional (Brunet, 2002) el clima de una organización puede ser sentido por un individuo sin que esté consciente del papel y de la existencia de los factores que lo componen; de esta forma resulta difícil de medir el clima, porque no se sabe bien si empleado lo evalúa en función de sus opiniones personales o de las características verdaderas de la organización.

### Dimensiones del Clima Organizacional

En cuanto a la operacionalización del clima organizacional, podemos decir que existen insuficientes mediciones validadas del constructo (Neal M. Ashkanasy, Celeste P.M. Wilderom, Mark F. Peterson, 2011). A través de los años, las dimensiones que han sido identificadas como componentes de esta compleja variable han sido distintas, por lo que diversas visiones emanaron, conduciendo a una confusión y un lento progreso teórico (Brunet, 2002). Por lo anteriormente mencionado algunas de las dimensiones que evalúa el clima organizacional y sus diferentes autores se presentan enseguida; (Litwin & Stringer, 1968), resaltan que el clima organizacional depende de nueve dimensiones: estructura, responsabilidad, recompensas, riesgos, relaciones, estándares de desempeño, identidad, cooperación y conflicto. (Valenzuela, 2003), diseñó un cuestionario de 80 preguntas de respuesta cerrada, tipo Likert agrupadas en 10 categorías: trabajo personal, supervisión, trabajo en equipo, administración, comunicación, ambiente físico, capacitación y desarrollo, promoción y carrera, sueldos y prestaciones y orgullo de pertenencia. (Díaz, Galván, & Ocampo, 2008) se basó en el trabajo de Likert enfatizando en las dimensiones de: instalaciones de la empresa, herramientas de trabajo y equipo, seguridad y equipo de protección, estructura, compensaciones, ambiente de trabajo, relación entre compañeros, dirección y liderazgo, comunicación, trabajo en equipo, capacitación y desarrollo, mejora continua y relación empresa-familia-amigos. (Hernandez, 2005), hizo una revisión de literatura de los estudios más comunes de clima organizacional en México y el extranjero quedando las siguientes dimensiones: moral, dirección, innovación, percepción de la empresa, percepción del desempeño, motivación intrínseca, satisfacción general, liderazgo, visión y recompensas. Después de la revisión de la literatura, para el presente documento se seleccionaron como dimensiones del clima organizacional las siguientes: estructura, comunicación, capacitación y desarrollo, trabajo en equipo, ambiente físico y cultural, identidad y liderazgo.

### La Calidad en el Servicio

La filosofía de calidad de servicio está fundamentada en un enfoque corporativo en el cliente, cultura y sistema de direcciones. El enfoque presenta todo un proceso que incluye desde la preparación y mejoramiento de la organización y del proceso hasta las estrategias, para que además del servicio base, se presten servicios a través de una comprensión total de las necesidades y expectativas del cliente (Colunga, 2006). Por tanto para entender mejor este concepto debemos conocer primero que es un servicio, el cual es una actividad o conjunto de actividades de naturaleza casi siempre intangible que se realiza a través de la interacción entre el cliente y el empleado y/o instalaciones físicas de servicio, con el objeto de satisfacerle un deseo o necesidad. Los servicios ofrecidos dependen en gran medida de la calidad del factor humano que labora en la empresa. Se deben afinar y fortalecer los procesos de integración y dirección del personal para obtener los niveles de calidad ya señalados, reiteradamente, en los puntos anteriores. El área responsable de la administración de factor humano jugará un papel central en las estrategias competitivas que se diseñen, ya que aportará sus procesos para atraer y retener talento en la organización. La profesionalización de: planes de factor humano, reclutamiento, selección, contratación, orientación, capacitación, desarrollo, remuneraciones, comunicación interna, higiene, seguridad y las relaciones laborales contribuirán significativamente en la construcción de ventajas competitivas ancladas en el personal sus conocimientos, sus experiencias, su lealtad, su integridad, su compromiso con los clientes la empresa y sus colegas.

Se requiere de un sistema que gestione la calidad de los servicios, aquí es pertinente establecer el ciclo del servicio para identificar los momentos de verdad y conocer los niveles de desempeño en cada punto de contacto con el cliente (Díaz & Pons, 2003). La gestión de calidad se fundamenta en la retroalimentación al cliente sobre la satisfacción o frustración de los momentos de verdad propios del ciclo de servicio. En los casos de deficiencias en la calidad, son críticas las acciones para recuperar la confianza y resarcir los perjuicios ocasionados por los fallos. El prestigio y la imagen de la organización se mantendrán debido al

correcto y eficaz seguimiento que se haga de los posibles fallos que se den en el servicio, hasta cerciorarse de la plena satisfacción del cliente afectado. Inclusive debe intervenir forzosamente la dirección general para evitar cualquier suspicacia del cliente. Esto inspirará confianza en los clientes y servirá de ejemplo a todo el personal para demostrar la importancia que tiene la calidad en todo lo que hacemos. Dentro de los organismos que evalúan la calidad en el servicio, podemos encontrar entre muchos en el siguiente cuadro algunos de los aspectos considerables para evaluar esta variable, dichos aspectos son importantes dentro de las organizaciones que prestan servicios, y por consecuencia es factible que en las instituciones públicas tomen en cuenta lo anteriormente mencionado ya que el objetivo de las mismas es la prestación de servicios.

### Carta Iberoamericana de la Calidad en la Gestión Pública

Al final de los años setenta del Siglo XX, la crisis económica mundial dificultó la viabilidad del modelo de Estado de bienestar construido por los países industrializados y post-industrializados después de la segunda guerra mundial. Frente a dicha crisis, surgió una propuesta de corte neoliberal-conservador que perseguía restablecer el equilibrio fiscal y de la balanza de pagos de los países en crisis. Para ello se promovió la reducción del tamaño del Estado y su sustitución por el mercado como instrumento predominante del desarrollo. Contrario a lo que se afirmó, años después de la aplicación de las medidas neoliberales, los problemas de desarrollo se agudizaron en la región, los mercados nacionales se debilitaron, no hubo crecimiento económico, la pobreza se expandió, la gobernabilidad decayó y el Estado que había sido desmantelado perdió su capacidad de respuesta a los nuevos desafíos.

En consideración a lo anterior, el Consejo Directivo del CLAD, reunido el 14 de octubre de 1998, aprobó el documento doctrinario *Una Nueva Gestión Pública para América Latina*, en el que se declara la necesidad de reconstruir el Estado para enfrentar los nuevos desafíos de la sociedad post-industrial, un Estado para el siglo XXI, que además de garantizar el cumplimiento de los contratos económicos, debe ser lo suficientemente fuerte como para asegurar los derechos sociales y la competitividad de cada país en el escenario internacional. Con ello, se reconoce que el Estado es un instrumento indispensable para el desarrollo económico, político y social de cualquier país, y que en la región tiene que orientarse a la atención de tres grandes problemas: la consolidación de la democracia, la necesidad de retomar el crecimiento económico y la reducción de la desigualdad social, garantizando la inclusión social. Para abordar dichos desafíos, los Estados iberoamericanos deben adecuar su organización y funcionamiento a las nuevas realidades, aprendiendo de los errores y aciertos de las diversas experiencias recientes y adoptando un nuevo modelo de gestión pública que recupere la capacidad de las Administraciones Públicas iberoamericanas como instrumentos útiles y efectivos al servicio del bien común o interés general de sus respectivas sociedades.

Bajo dicho mandato, y continuando con el esfuerzo sostenido en esta área por la Comunidad Iberoamericana, se elabora la presente “Carta Iberoamericana de Calidad en la Gestión Pública”, que se inscribe en la propuesta de adecuar el funcionamiento de las Administraciones Públicas iberoamericanas para garantizar que sean instrumentos útiles, efectivos y confiables al servicio de sus respectivas sociedades. En tal sentido, la presente Carta Iberoamericana vincula la calidad en la gestión pública con dos propósitos fundamentales de un buen gobierno democrático: 1. toda gestión pública debe estar referenciada a la satisfacción del ciudadano, ya sea como usuario o beneficiario de servicios y programas públicos, o como legítimo participante en el proceso formulación, ejecución y control de las políticas públicas bajo el principio de corresponsabilidad social; 2. la gestión pública tiene que orientarse para resultados, por lo que debe sujetarse a diversos controles sobre sus acciones, suponiendo entre otras modalidades la responsabilización del ejercicio de la autoridad pública por medio del control social y rendición periódica de cuentas. La Carta Iberoamericana de Calidad en la Gestión Pública persigue los objetivos siguientes:

Promover un enfoque común en Iberoamérica sobre la calidad y la excelencia en la gestión pública, que integre las distintas perspectivas políticas y técnicas que se encuentran presentes en los diversos niveles y sectores de las Administraciones Públicas de la región.

Conformar un cuerpo de principios y orientaciones que sirvan de referencia a las diferentes Administraciones Públicas de los Estados iberoamericanos en la formulación de políticas, planes, modelos y mecanismos que permitan la mejora continua de la calidad de su gestión pública.

Proponer la adopción de instrumentos que incentiven la mejora de la calidad en la gestión pública, que sean flexibles y adaptables a los diferentes entornos de las Administraciones Públicas iberoamericanas y a sus diversas formas organizativas.

Servir como guía para el diseño, regulación, implantación, desarrollo, mejora y consolidación de planes de calidad y excelencia en la gestión pública, que le permitan a las diferentes Administraciones Públicas de los Estados iberoamericanos potenciar sus capacidades y utilizarlas plenamente para acometer los retos y desafíos del desarrollo integral de sus respectivas sociedades y lograr el bienestar de sus ciudadanos.

#### Acciones E Instrumentos Para la Calidad en la Gestión Pública de Acuerdo a la Carta

Los Estados Iberoamericanos promoverán el desarrollo normativo que facilite la aplicación de acciones, técnicas e instrumentos para la calidad en la gestión pública de las diferentes Administraciones, órganos, entes y unidades administrativas. En la carta se recomiendan algunas acciones, técnicas e instrumentos básicos de calidad, en los que los órganos y entes públicos pueden apoyarse para la implementación de la calidad en la gestión pública, donde se toman en cuenta las siguientes dimensiones: dirección estratégica y ciclo de mejora, gestión por procesos, los equipos y proyectos de mejora, la mejora de la normatividad, el gobierno electrónico, la gestión del conocimiento, aportaciones y sugerencias de los funcionarios públicos.

### **METODOLOGÍA**

Se efectúa una revisión de literatura de los principales autores sobre el clima organizacional y la Carta Iberoamericana de la Calidad en la Gestión Pública 2008. La presente investigación es de modalidad descriptiva y responde por sus características a la metodología cuantitativa. Se llevó a cabo un proceso de validación mediante un panel de expertos por 5 académicos y 5 ex-servidores públicos, y de acuerdo a la revisión de literatura y la evidencia de validez cara a cara se eligieron 7 dimensiones del clima organizacional para enmarcarlas dentro de las dimensiones que presenta la Carta Iberoamericana de la Calidad en la Gestión Pública 2008. El instrumento de medición busca recoger información de las dimensiones seleccionadas sobre las variables de clima organizacional y calidad en el servicio, las cuales son estructura, comunicación, capacitación y desarrollo, trabajo en equipo, ambiente físico y cultural, identidad, liderazgo, dirección estratégica y ciclo de mejora, gestión por procesos, los equipos y proyectos de mejora, la mejora de la normatividad, el gobierno electrónico, la gestión del conocimiento, aportaciones y sugerencias de los funcionarios públicos, a través de una serie de preguntas que pretenden identificar la percepción de los actores hacia el clima organizacional y la calidad en el servicio.

El cuestionario quedó diseñado de la siguiente manera: Una primera sección que corresponde a la dimensión estructura, está compuesta por un total de 6 reactivos; la siguiente sección que es la dimensión de comunicación, por 5 reactivos; la sección de capacitación y desarrollo tiene 5 reactivos, la sección de ambiente físico y cultural se muestra con 6 reactivos la dimensión de identidad está integrada por 4 reactivos por último sobre las dimensiones del clima organizacional está la de liderazgo con 6 reactivos. Sobre la variable de calidad en el servicio el instrumento evalúa las siguientes dimensiones: la primera es la de dirección estratégica y ciclo de mejora con 5 reactivos, la dimensión de gestión por procesos con 7 reactivos,

la dimensión de mejora de la normatividad con 2 reactivos, la siguiente dimensión que trata sobre el gobierno electrónico contiene 4 reactivos, la dimensión de gestión de conocimiento también con 4 reactivos y por último la dimensión de aportación de los funcionarios con 1 reactivo siendo en total 62 reactivos en el cuestionario. Con la finalidad de analizar los datos, se utilizó la escala tipo Likert y a cada posible respuesta de cada reactivo se le asignó un valor numérico, para Muy De Acuerdo= 1, De Acuerdo= 2, En Desacuerdo= 3 y Muy En Desacuerdo=4.

## RESULTADOS

El instrumento fue sometido a una prueba piloto 40 cuestionarios y en base a la misma se determinó el criterio de confiabilidad del instrumento, por el coeficiente de Alfa Cronbach, desarrollado por J. L. Cronbach, requiere de una sola administración del instrumento de medición y toma valores entre 0 y 1 que sirve para comprobar si el instrumento que se está evaluando recopila información defectuosa y por tanto nos llevaría a conclusiones equivocadas o si se trata de un instrumento fiable que hace mediciones estables y consistentes. Alfa de Cronbach es por tanto un coeficiente de correlación al cuadrado que, a grandes rasgos, mide la homogeneidad de las preguntas promediando todas las correlaciones entre todos los ítems para ver que, efectivamente, se parecen. Su interpretación será que, cuanto más se acerque el índice al extremo 1, mejor es la fiabilidad, considerando una fiabilidad respetable a partir de 0,80 (Hernandez S. R., 2006). El coeficiente de alfa de Cronbach obtuvo una confiabilidad = 0.954

Tabla 1: Coeficiente Alfa de Cronbach de la Variable de Clima Organizacional y Calidad en el Servicio

		No. Casos	No. Ítems	Coeficiente Alfa de Cronbach
Variable	Clima organizacional	40	37	0.919
	Dimensión			
	Estructura	40	6	
	Comunicación	40	5	
	Capacitación y desarrollo	40	5	
	Trabajo en equipo	40	5	
	Ambiente físico y cultural	40	6	
	Identidad	40	4	
Variable	Liderazgo	40	6	0.941
	Calidad en el servicio	40	23	
	Dimensión			
	Dirección estratégica y ciclo de mejora	40	5	
	Gestión por procesos	40	7	
	Mejora de la normatividad	40	2	
	Gobierno electrónico	40	4	
	Gestión del conocimiento	40	4	
	Aportaciones de los funcionarios	40	1	

*Determinación del coeficiente alfa de cronbach donde la dimensión del clima organizacional obtiene un coeficiente de 0.919 que es un coeficiente alto y la variable de calidad en el servicio obtiene un alfa de conbach con valor de 0.941*

## CONCLUSIONES

En relación al objetivo de la presente investigación se concluye que se cumple con relacionar conceptualmente al clima organizacional con la calidad en el servicio de acuerdo a la carta iberoamericana de la calidad en la gestión pública, además se adaptó y valido un instrumento para medir el clima organizacional en función de la calidad en el servicio. El instrumento pretende medir las dimensiones de estructura, comunicación, capacitación y desarrollo, trabajo en equipo, ambiente físico y cultural, identidad y liderazgo que pertenecen a algunas teorías del clima organizacional y las dimensiones de dirección estratégica y ciclo de mejora, gestión por procesos, los equipos y proyectos de mejora, la mejora de la normatividad, el gobierno electrónico, la gestión del conocimiento, aportaciones y sugerencias de los funcionarios públicos de la calidad en el servicio. Después de la validación cara a cara por el panel de expertos la prueba piloto se realizó a 40 servidores públicos del municipio de Durango donde el coeficiente alfa de cronbach resulto de 0.954 lo que indica un alto índice de fiabilidad, así mismo se calculó el

coeficiente para las dos variables donde el clima organizacional obtuvo una fiabilidad de 0.919 y la variable de calidad en el servicio un 0.941. Por último se pretende realizar una investigación en el sector gubernamental dentro del estado de Durango donde se tomen en cuenta los diferentes niveles organizacionales en las Secretarías de Gobierno y se puedan presentar algunas recomendaciones para la mejora de las variables ya que son aspectos de los cuales los directivos pueden tomar decisiones que mejoren el ambiente dentro de las organizaciones y a su vez este impacte en la calidad del servicio que se presta.

## ANEXOS

Presentación Este cuestionario tiene como objetivo principal obtener información que apoye en la evaluación del clima organizacional y la calidad en el servicio en el sector público. Este cuestionario tiene una naturaleza confidencial. Se le solicita cordialmente dar su opinión sobre la veracidad de los siguientes enunciados según su experiencia en esta institución. Le agradecemos su colaboración.

<b>Pregunta</b>					
<p> Muy De Acuerdo  de Acuerdo  en Desacuerd o  Muy En </p>					
<p> Considero que es necesario el establecimiento de reglas  Considero que mis funciones y responsabilidades están claramente definidas  Las normas de disciplina de la institución me parecen adecuadas  Los procedimientos ayudan a la realización de mis tareas  La cantidad de registros son necesarios para apoyar la realización de mis tareas  Es importante la información plasmada y recabada en los registros para la institución  La comunicación entre las áreas trabajo de esta dependencia es clara completa y permanente  En esta institución existe buena comunicación entre subordinados y jefes  En esta institución existe buena comunicación entre jefes y subordinados  Tengo confianza con mis compañeros de trabajo  Nos reunimos para analizar si el trabajo se está llevando conforme los objetivos establecidos  La capacitación que la institución ofrece va de acuerdo con la misión y los objetivos de la misma  La institución me pregunta mis intereses y necesidades de capacitación  La capacitación que se ofrece al personal es obsoleta  Mis responsabilidades me impiden recibir la capacitación que yo necesito para mi desempeño  La institución solo ofrece cursos de capacitación básica.  En mi departamento existe trabajo en equipo con mis compañeros  En mi trabajo todos nos llevamos bien  En esta institución tratamos de hacer bien el trabajo de equipo  Se reconocer cuando existen fallas y errores en el departamento.  En esta institución existe espíritu de trabajo en equipo  Las instalaciones en mi departamento son adecuadas para desarrollar mis actividades.  El espacio para desempeñarme es el adecuado  La limpieza en mi área de trabajo es frecuente  Cuento con los materiales suficientes para realizar mis actividades  Considero que el equipo existente en mi departamento es el adecuado para el desarrollo de mis funciones  Considero que el mobiliario de mi departamento es apto para realizar mis actividades  Siento orgullo de pertenecer a esta organización  Considero que soy miembro de un equipo que se desempeña bien  Considero que hay lealtad por parte del personal hacia la organización  En esta organización cada cual se preocupa por sus propios intereses  El superior se preocupa porque entendamos bien nuestro trabajo  A nuestro superior solo le podemos decir lo que quiere escuchar  Mi jefe inmediato tiene la capacidad para ayudar, motivar y dirigir proyectos de personas  Mi jefe es claro en la asignación de tareas  Mi jefe muestra interés en el resultado de mis tareas  Mi jefe toma en cuenta mis aportaciones  Las políticas del departamento apoyan a los servicios que se prestan en esta institución  Las estrategias de mi departamento son adecuadas para el servicio que se brinda  Considero que los objetivos de mi departamento se cumplen conforme a lo planeado  La normatividad vigente facilita mi desempeño  Los planes de mi departamento ayudan a la realización de mis tareas  Los requerimientos de las prestaciones de servicios en esta institución son adecuados  Los procesos para la prestación de servicios públicos en esta dependencia son adecuados  Los objetivos de los procesos ayudan a mejorar la calidad en el servicio  Considero que las actividades de los procesos son adecuadas para brindar el servicio a los usuarios  Considero que son suficientes las actividades de los procesos de mi departamento  Las obligaciones de las autoridades y directivos van de acuerdo a las funciones de esta dependencia  En esta dependencia los indicadores para evaluar los procesos están bien definidos </p>					

Existen necesidades de mejora de la calidad en el servicio en mi departamento  
La normatividad vigente facilita las funciones para el servicio que se presta  
Considero importantes los trámites electrónicos en esta secretaría  
La digitalización dentro de mi departamento ayuda a prestar un mejor servicio  
En este departamento los trámites electrónicos facilitan el servicio al usuario  
Existen procesos sistemáticos para el servicio al ciudadano  
Se realiza una evaluación periódica sobre los procesos realizados en su departamento  
Se intercambian experiencias de su departamento con otro departamento  
Considero que mis procedimientos están bien definidos para prestar un buen servicio  
El manual de organización de mi departamento es claro y especifica mis funciones  
Recibo sugerencias y aportaciones para mejorar el servicio por parte de los funcionarios  
Conozco algún modelo de calidad en el servicio  
Conozco algún premio de la calidad en el servicio  
Agradecemos su participación y sinceridad para contestar este cuestionario. Si tiene algún comentario adicional favor de plasmarlo enseguida.

## RESUMEN

*Hoy en día la participación de las mujeres se ha ido incrementando en los distintos ámbitos de la sociedad, gran parte de las mujeres no son sólo amas de casa, sino ahora participan como trabajadoras aportando económicamente al sustento familiar y algunas de ellas son dueñas de su propio negocio, o en otros casos ocupando altos mandos en diversas organizaciones, como lo confirma un estudio publicado por CONCYTEG (Rojas, Salazar, & Batres, 2007). Existen innumerables investigaciones sobre la mujer y su entorno, pero la mayoría enfatizan la violencia familiar o a la mujer en una posición inferior al hombre, entre otros factores que abarcan una serie de variables sobre las mujeres, pero no existen estudios de género enfocados a la mujer empresaria y el entorno laboral en el que se desenvuelven. El presente estudio tiene como objetivo profundizar en los aspectos del perfil de la mujer empresaria coahuilense que conciernen con los motivos para emprender, la conciliación entre la vida familiar y laboral, discriminación y sus percepciones cualitativas en torno a estos aspectos. La metodología tiene un enfoque mixto cuantitativo, aplicando dos instrumentos, validados por FAEDPYME, y por la ESADE, España. El estudio de campo abarcó una muestra de 103 mujeres empresarias de mypes en los sectores de servicio, comercio e industria del estado de Coahuila. Los datos fueron procesados mediante técnicas estadísticas descriptivas. Los resultados muestran a una mujer coahuilense en edad promedio entre 40 y 55 años, madres de familia con nivel de estudios universitarios en más de la mitad de ellas, decidida a empoderarse cada día más en el desarrollo económico del estado, mostrando microempresas en su mayoría familiares con visión de consolidación y crecimiento, percibiéndose como mujeres activas, capacitadas, independientes y autosuficientes, innovadora, con determinación y actitud para enfrentar los retos y las diferencias con las que día a día luchan para demostrar sus capacidades, habilidades y conocimientos que aún muchos hombres no reconocen. Esta información servirá de base para una propuesta de acciones para las políticas públicas en apoyo a la mujer emprendedora del estado.*

## BUSINESSWOMAN PROFILE WOMAN IN COAHUILA: AN EMPIRICAL STUDY

### ABSTRACT

*Today the participation of women has been increasing in various areas of society, many of the women are not just housewives, but now participate as workers financially contributing to family support and some of them own their business itself, or in other cases holding senior managers in various organizations, as confirmed by a study published by CONCYTEG (Rojas, Salazar, & Batres, 2007). There are countless research on women and the environment, but most emphasize domestic violence or women in an inferior position to man, among other factors, covering a number of variables on women, but there are no studies of gender focused women businesswoman and working environment in which they operate. The present*

*study aims to describe the profile of women entrepreneurs Coahuila . The methodology has a mixed quantitative and qualitative approach , using 2 instruments , validated by FAEDPYME , and the ESADE , Spain . The field study covered a sample of 103 women entrepreneurs of MSMEs in the service sectors , trade and industry of the state of Coahuila. The data were processed using descriptive statistical techniques. The results show a woman coahuilense average age between 40 and 55, mothers with college level in more than half of them , determined to empower more and more in the economic development of the state , showing mostly micro family thinking of consolidation and growth , perceived as active women , trained , independent and self-sufficient, with determination and innovative attitude to face the challenges and differences that daily struggle to demonstrate their abilities , skills and knowledge that many men still not recognized. This information will form the basis for a proposed action for public policies to support women entrepreneurs in the state.*

## INTRODUCCIÓN

En la actualidad en México existen varias asociaciones, grupos y fundaciones creadas para el apoyo de las mujeres, enfocándose principalmente en el combate hacia la violencia, pero no se ha profundizado hacia el ámbito empresarial. Aunque existe la Asociación Mexicana de Mujeres Empresarias (AMMJE), la Red de Mujeres Empresarias (RME), así como también la Secretaría de Economía lanza el Fondo de Micro financiamiento a Mujeres Rurales (FOMMUR) para el apoyo a proyectos, y el Programa “Impulso Productivo para la Mujer” del Fondo Nacional para la Empresa Social; en Coahuila no se ha realizado un estudio que muestre a profundidad el perfil y características de la mujer emprendedora coahuilense en sus múltiples facetas. En el marco de un proyecto de investigación sobre Autonomía y Empoderamiento económico de las mujeres en el Estado de Coahuila, de la Facultad de Contaduría y Administración, Unidad Torreón, de la Universidad Autónoma de Coahuila se han realizado dos estudios para ir conformando el perfil de la mujer emprendedora en la ciudad de Torreón y su comparación con el que resulta en la ciudad de Saltillo.

(Guerrero Ramos, Canibe Cruz, Armenteros Acosta, Lopez Chavarria, & Reyna Garcia, 2013) (Guerrero Ramos, Gomez Gutierrez, & Armenteros Acosta, Mujeres emprendedoras: Similitudes y diferencias entre las ciudades de Torreon y Saltillo, Coahuila., 2014) Esta investigación es continuidad de las anteriores y pretende: contrastar el perfil de la mujer empresaria coahuilense, identificar rasgos peculiares de las empresas dirigidas por mujeres, profundizar en motivaciones para emprender y los obstáculos que han tenido estas mujeres en su trayectoria como empresarias, así como analizar la conciliación entre la vida familiar y laboral; y las percepciones que de ellas mismas y de otras mujeres tienen, en este contexto.

## REVISIÓN LITERARIA

El Sistema Económico de Latino América y del Caribe (SELA) en su reporte titulado “Desarrollando Mujeres Empresarias: La Necesidad de Replantear Políticas y Programas de Género en el Desarrollo de PYMES”, aborda el perfil de la mujer empresaria latinoamericana, por lo que da a conocer entre otros, los siguientes aspectos: El motor detrás de la empresa de mujeres, como regla general, está en la necesidad económica más que en la identificación de una oportunidad o en un deseo de desarrollar una idea innovadora. Las mujeres son dueñas de empresas más pequeñas que las empresas de los hombres. El nivel de educación de las mujeres empresarias en América Latina y el Caribe (ALC) en general es más bajo que el de los hombres. Las empresas de mujeres en ALC operan de manera predominante en el sector servicios

y están mejor posicionadas para atender nichos de mercado. Las mujeres empresarias enfrentan dificultades estructurales para acceder a crédito y capital limitado, lo que impide que sus empresas crezcan al tiempo que carecen de acceso a educación financiera, y también luchan contra los estereotipos negativos sobre su capacidad para establecer y desarrollar una empresa. La conciliación entre vida familiar y empleo muchas veces se resuelve a través de una empresa pero hace difícil el desarrollar la empresa. (SELA, 2010). La CEPAL por su parte, en uno de sus estudios publicó por medio de la revista *Mujer y Desarrollo*, la investigación realizada por Lidia Heller donde menciona que, frecuentemente las emprendedoras comienzan la actividad por el deseo de poner en práctica alguna idea innovadora, cubrir un nicho específico del mercado o la necesidad de generar sus propios ingresos.

En algunos casos —sobre todo las profesionales— deciden por esta alternativa ante la imposibilidad de ascender en sus carreras laborales dentro de una organización o encontrar un trabajo acorde con sus habilidades y contar además con mayor flexibilidad horaria que les posibilite compatibilizar trabajo y familia, así como ganar mayor independencia. (Heller, 2010) En lo referido al perfil de la mujer emprendedora en México, Gina Zabludovzky muestra en su estudio publicado en 1998 por la UNAM una serie de características de la empresa de la mujer mexicana: Son más pequeñas que las de los hombres y tienen un menor desarrollo, la empresaria se caracteriza por tener un estrecho contacto personal con todo su lugar de trabajo y sus trabajadores(as), tienen menor antigüedad que la de los hombres, las empresarias, en su mayoría, fundan e inician su empresa con recursos propios.

Para financiar sus empresas la mayoría de ellas recurre a sus ahorros personales y a la reinversión de sus ganancias, la mayoría de las empresarias se insertan de manera gradual en las actividades empresariales, muchas empiezan sin concebirse a sí mismas como empresarias, las situaciones más comunes que precipitan el inicio de la actividad empresarial en las mujeres son la pérdida de empleo y la enfermedad o muerte de un familiar, las mujeres tienen menos posibilidades de obtener créditos bancarios, más aún, la mitad de las mujeres empresarias ni siquiera ha intentado obtener alguno. Para la mayoría de las empresarias, su empresa es la única fuente de ingreso económico y se concentra en el mercado interno, no exportan ni importan ningún producto o servicio. El machismo y la corresponsabilidad entre distintos roles (el profesional con el doméstico) son los obstáculos más comunes que afrontan. Las empresarias tienden a ser más jóvenes que los empresarios. Al preguntarle a empresarias de distintas regiones del país por qué se decidieron a crear sus propias empresas, tanto en el estudio de Gina Zabludovsky, que data de 1998, como en el Diagnóstico sobre la situación de las empresarias mexicanas del INMUJERES, realizado diez años después, se han obtenido coincidencia en relación a los resultados. (Zabludovski, 1998) (INMUJERES, 2003) (Zabludovsky, Hacia un perfil de la mujer empresaria en México, 1993)

## METODOLOGÍA

La presente investigación tiene en principio un enfoque exploratorio ya que analiza documentalmente experiencias previas de investigaciones sobre el perfil de mujeres emprendedoras, y en uno de los cuestionarios aplicados se agregan preguntas cualitativas para entrevista a profundidad. En lo referido al enfoque cuantitativo estuvo basado en estadística descriptiva con tablas de frecuencia que utilizan porcentajes, tomados como base para la comparación. Se aplicaron dos instrumentos; el primero desarrollado y validado por FAEDPYMES. (FAEDPYME. Fundación para el Análisis Estratégico y Desarrollo de la Pequeña y Mediana Empresa), y el segundo fue adaptado de la Escuela Superior de Administración y Dirección de Empresas, de Barcelona España. Los instrumentos se aplicaron de manera presencial a 704 empresarios o directivos de micros, pequeñas y medianas empresas del estado de Coahuila; dicha información se estructuró y capturó en el programa SPSS versión 19, mismo que arroja resultados estadísticos de acuerdo a la información introducida a la base de datos creada para su análisis e interpretación. Una vez capturada la información en la base de datos con el programa estadístico SPSS versión 19, se filtró la misma por la variable de sexo del directivo, con el fin de analizar de manera

independiente las empresas dirigidas por mujeres. La base de datos de Mujeres quedó con 103 registros y la de Hombres con 601. El segundo instrumento se aplicó solamente a las 103 mujeres resultantes de la recogida de datos analizando así los resultados arrojados y relacionando variables con el fin de interpretar tanto el perfil como los motivos que impulsaron a la mujer coahuilense a emprender, entre otros factores que el instrumento incluye.

## RESULTADOS

El 14.6% de las empresas de Coahuila están dirigidas por mujeres, mientras que los hombres manejan el 85.4%, esto nos revela que en este Estado aún existe un gran dominio empresarial por los hombres, se sabe que el índice de mujeres económicamente activas aumenta con gran velocidad, pero desgraciadamente no pasa lo mismo cuando hablamos de puestos ejecutivos o directivos, pues hay una gran brecha entre hombres y mujeres empresarios, como lo confirma el estudio de Cerna donde "se analiza la situación de las mujeres que perciben ingresos provenientes de la propiedad y administración de empresas, dado que se ha documentado ampliamente que existe desigualdad en términos de acceso y control de recursos productivos. En México, el 81.1% de los empleadores son hombres, y el 18.9% restante son mujeres". (Cerna, 2008) La CEPAL menciona que la proporción de empleadores/as es de 74% varones y 26% de mujeres en zonas urbanas de diferentes países de América Latina y el Caribe.

(Heller, 2010). No obstante la participación de las mujeres como empresarias es un fenómeno que afortunadamente crece y merece estudio. En el análisis de los motivos para emprender el primero resultado ser la Superación con un 36 %, seguido de la Necesidad con un 30 %, siendo la diferencia entre uno y otro de solo 6 %, observándose una conjunción de estos dos motivos. Estos resultados son, en general coincidentes con el estudio que se presentan (Guerrero Ramos, Canibe Cruz, Armenteros Acosta, Lopez Chavarria, & Reyna Garcia, 2013) se muestra también una combinación de motivos en Necesidad y Oportunidad, y el análisis por separado es mayor en un 5 %, (27 %) el Motivo Necesidad que el de Oportunidad (23%). Según Antón los motivos son varios pero predominan el deseo de tener un negocio propio (29.6%), la necesidad económica (15.5%), oportunidad o negocio familiar (14.5), la flexibilidad de horario (11%) y la pérdida del empleo previo (4.4%). (Antón, 2009)

### Conciliación Entre la Vida Laboral y Familiar

El 91% de las mujeres encuestadas afirman que su trabajo no afectó o interfirió en la decisión de tener hijos, mientras que el 9% opina lo contrario. El 62% menciona que su carrera se vio afectada al ser madre, el 23% afirma que un poco y el 15% opina que su carrera no se vio afectada al tener hijos. "El trabajo no remunerado que realizan las mujeres empresarias en cuanto a atender las labores domésticas y cuidar a su familia puede influir en el esfuerzo y el tiempo que pueden dedicar al negocio. De hecho, se trata de dos factores interrelacionados, ya que las mujeres pueden tomar la decisión de emprender algún tipo de negocio que permita compatibilizar sus responsabilidades laborales y familiares" (Banco, Mundial Banco Internacional de Reconstrucción y Fomento /, 2010) El 55% de las mujeres cuentan con hijos menores que dependen económicamente de ellas, el 13% con hijos mayores de 18 años, el 8% de las mujeres sostienen a sus padres, el 5% a sus esposos, el 2% a otros no especificados y el 17% no tienen a ningún dependiente económico. El estudio en Torreón Coahuila revela que el 77 % de las mujeres emprendedoras tienen dependientes económicos. (Hijos o familiares). (Guerrero Ramos, Canibe Cruz, Armenteros Acosta, Lopez Chavarria, & Reyna Garcia, 2013)

### Percepciones

En el instrumento se integraron dos preguntas cualitativas, de estructura abierta donde se les da la oportunidad de que expongan su percepción; la primera se les pide describir a la mujer actual, a lo que

respondieron: "La mujer actual es dedicada al trabajo y decidida en su familia", "Es más independiente y trabajadora capaz de hacer igual o mejor el trabajo de los hombres", "Está demostrando lo que es ser emprendedora y dinámica", "Hay más mujeres que se desarrollan profesionalmente", "Es innovadora, perseverante y positiva", "Como personas independientes y trabajadoras pueden lograr lo que se propongan", "Capaz de salir adelante", "Libres, honestas, extremadamente fieles al trabajo y la familia", "Luchista", "Con muchas ganas de triunfar y sobresalir, de tener éxito en todos los aspectos de la vida", "Con hambre de superación y triunfo", "Con muchos sueños por alcanzar, mucho más preparada y comprometida", "Emprendedora, capaz de manejar su vida laboral y familiar", "Autónoma", "Actualmente la mujer tiene mayor oportunidad en el ámbito del negocio, cuenta con mucho apoyo de todo tipo y es más activa", "Capacitada para cualquier trabajo",

"Un ser que poco a poco logra su independencia y estabilidad económica y emocional", "Mas liberal, con más expectativas para laborar y ser más independiente, perseverante y capaz de asumir cualquier puesto importante dentro de una empresa", "Cada vez son más las mujeres que ocupan altos puestos o son dueñas de empresas, con derecho a toma de decisiones", "Empresarias responsables y decididas", "Capaz de lograr muchas cosas con metas fijas y ganas de seguir triunfando", "Estudiosas, capacitadas y deseosas de sobresalir", "Valientes con potencial amplio, luchando por una transformación individual y colectiva", "Seguras de sí mismas, atrevidas, decididas y preparadas con ganas de salir adelante con muchas metas por cumplir y con ganas de aportar siempre algo mejor", "Sin miedo, aventadas y soñadoras", "Segura, firme y emprendedora con ganas de mejorar para el bien de la familia", "Participando en el desarrollo del país, de mente amplia ante cualquier situación", "Tiene más oportunidad de tener cargos más relevantes en las empresas", "Inteligente, profesional y capaz, con deseos de crecer",

"Con muchos obstáculos para desarrollarse, con ganas de tener un mejor porvenir, guerrera y motivada", "Mucho más independiente, menos sumisa, en proceso de asimilamiento y acoplamiento a los cambios para alcanzar un balance saludable", "Independiente en cuestiones desde educativas, económicas, personales hasta afectivas, multifacética, organizada y con mayor capacidad que el hombre", "Productivas por necesidad", "Trabajadoras por necesidad", "Tiene mayor facilidad de decidir el rumbo de su profesión", "Hay mujeres muy capaces pero su rol de madre y esposa las limita, pero la hace una mujer más plena y puede ser más creativa" También algunas mujeres manifiestan perspectivas poco admirables:

"Mucho más trabajadoras pero con más pérdida de valores", "Todavía en la actualidad hay mujeres que tienen miedo y no se atreven a poner un negocio", "La mujer activa antepone su profesión a su hogar e hijos", "A la mujer actual le falta preparación, apoyo familiar y decisión".

## CONCLUSIONES

Podemos concluir que en la actualidad en el estado de Coahuila sólo el 14.6% de las mipymes son dirigidas por mujeres siendo en su mayoría microempresas familiares enfocadas a los sectores de servicios. Son mujeres preparadas con un perfil académico en economía o negocios (57%) y un nivel de licenciatura (56%) y posgrado (11%), mientras que sus parejas, el 56% cuentan con licenciatura y el 9% con posgrado demostrando que tienen la misma preparación académica que ellos, y en ocasiones los superan. Las empresarias en su mayoría son mujeres casadas (71%), madres (87%) con un promedio de 2 ó 3 hijos de todas las edades lo que nos demuestra que las edades de los hijos no tienen relevancia entre las actividades y la profesión de las empresarias. Son mujeres que sostienen tanto a hijos, padres y algunas a sus parejas, solamente el 17% no tiene ningún dependiente económico.

Los principales motivos por el cual decidieron emprender su negocio fue la Superacion personal y la independencia seguida de la necesidad, dejando como tercer plano el gusto o la pasión por lo que hacen además de las oportunidades que se les presentaron, situando la ambición y el poder como últimos

motivadores. En cuanto a la conciliación entre la vida familiar y laboral las empresarias del estado ha sabido combinar sus distintos roles pues afirman que su trabajo no afectó o interfirió en la decisión de tener hijos, aunque al ser madres más de la mitad de ellas confiesan que su carrera sí se vio afectada, sólo el 15% menciona lo contrario.

A grandes rasgos la empresaria coahuilense se percibe como una mujer dinámica, independiente, innovadora, trabajadora, autosuficiente, con sueños y metas por cumplir, preparada para enfrentar obstáculos y vencerlos, capacitada y sin miedos. Perseverante y con iniciativa, libre y decidida a superarse, dispuesta a asumir distintos roles para lograr atender a su familia y a su negocio apoyando a su pareja y familiares económicamente y en muchos casos siendo el sostén de su hogar.

# CRECIMIENTO ECONÓMICO Y ROTACIÓN LABORAL: EL CASO DE LA IME EN MEXICALI, BAJA CALIFORNIA

Luis Ramón Moreno Moreno, Universidad Autónoma de Baja California  
Virginia Guadalupe López Torres, Universidad Autónoma de Baja California  
Ma. Enselmina Marín Vargas, Universidad Autónoma de Baja California

## RESUMEN

*En el presente trabajo, se realiza un análisis de los procesos de rotación laboral en un grupo de empresas maquiladoras asentadas en el municipio de Mexicali, industria de gran relevancia por el número de plazas laborales que genera. El estudio es de corte longitudinal y cubre el periodo 2009-2013. Se utiliza información de una encuesta que permita obtener los datos para caracterizar los índices de rotación laboral. Los resultados muestran que la rotación laboral está vinculada con el dinamismo de la economía, cuya tendencia se correlaciona directamente con la del Producto Interno Bruto (PIB) e inversamente con el desempleo. Los sectores con mayores tasas de rotación están representados por el de electrónica, vidrio y médico, mientras que los menores valores de rotación se observan en el de mecánica.*

**PALABRAS CLAVE:** rotación laboral, industria maquiladora, desempleo, Mexicali.

## INTRODUCCIÓN

La maquila es una forma de organización diseminada por diversas regiones en el mundo que genera un importante número de plazas de trabajo, particularmente de tipo obrero. Esta estrategia productiva, ha sido la puerta de entrada hacia la industrialización para muchos países en desarrollo y representa, en teoría, un elemento del modelo económico neoliberal donde ganan los países que cuentan con abundante mano de obra y las maquiladoras ante la presencia de una fuerza laboral relativamente joven, educada y con costos competitivos. En términos económicos, la maquila representa una actividad donde el propietario de la materia prima hace las veces de empresario que contrata al dueño del bien de capital y a su fuerza de trabajo para elaborar un producto o proveer un servicio; mientras que el pago es un porcentaje fijo del valor del bien (Buitelaar et.al., 1999, citado por López, 2009). En la actualidad, hablar de maquila implica distinguir una parte del proceso productivo global dentro de la reorganización capitalista, dedicada a actividades de ensamble de las partes de un producto cuya materia prima y sub-ensambles provienen de otras regiones del mundo. De la misma forma, se considera que la maquila representa una actividad que emplea mano de obra contratada temporalmente a destajo y donde el capital inicial proviene de inversiones extranjeras o transnacionales, y cuya producción se destina mayormente hacia los mercados internacionales.

## REVISIÓN DE LA LITERATURA

La temática de rotación laboral ha sido una de las tópicos más estudiados en las últimas cuatro décadas en la literatura psicológica, empresarial, sociológica y económico-administrativa. Este es un tema bastante recurrente en los análisis asociados al sector empresarial, dado que tiene importantes consecuencias en el desempeño de las organizaciones; asimismo, y de acuerdo a Adler (2001) este elemento seguirá estando en la mesa de discusión dado que a medida que el mundo empresarial se mueve hacia una estructura económica basada en el conocimiento, la renuncia –voluntaria e involuntaria- de un trabajador implicará la pérdida de habilidades y conocimiento específico de ese empleado y el riesgo de transferencia de conocimiento hacia otras organizaciones.

En ese marco, para March y Simon (1958) el término de rotación laboral hace referencia a la partida de un empleado de la organización formalmente definida. Mientras que para Abassi y Hollman (2000), es el proceso de rotación de los trabajadores alrededor del mercado laboral, ya sea entre empresas y empleos, así como también entre una situación de ocupación y desocupación. De acuerdo a Price (1977), el concepto no es otra cosa más que la razón del número de trabajadores de una empresa que han renunciado voluntariamente o han sido despedidos en un periodo de tiempo, dividido entre la cantidad de empleados promedio en esa organización para el mismo periodo de tiempo.

Como se comentaba previamente, el tránsito hacia una economía basada en el conocimiento que va de la mano de un proceso de globalización, hace que las organizaciones realicen considerables inversiones en los empleados en términos de inducción, entrenamiento, desarrollo, mantenimiento y retención. De la misma forma, las empresas se enfrentan a una creciente competencia ante la reducción de las barreras comerciales, y es el capital humano quienes deben de continuar con el desarrollo de productos tangibles y la provisión de servicios que estén basados en estrategias creadas por ellos mismos. Por ello, estos se convierten en un elemento crucial al interior de las organizaciones dado que el valor que incorporan a tales estrategias es esencialmente intangible y no fácilmente replicable (Stovel y Bontis, 2002).

En buena medida los análisis revisados hasta ahora sobre los procesos de rotación laboral, permiten documentar que mayormente éstos son el resultado de dos factores (Ongori, 2007), i) aquellos relacionados con el empleo y ii) los organizacionales; en el primero, se encuentran variables asociadas al estrés asociado al trabajo, a la falta de compromiso para con la organización y a la no satisfacción con el empleo. Destaca además, el hecho de que dentro de las personas que renuncian a una organización, buena parte lo hacen por razones económicas, como son las condiciones generales del mercado de trabajo (tasa de desempleo), las posibilidades de ascenso y un mayor salario si se encuentran empleados en grandes empresas (Rainayee, 2012). Además, también son de reconocer los elementos asociados a la información insuficiente acerca de cómo desempeñar el trabajo de una forma adecuada, expectativas poco claras respecto a sus pares y supervisores, ambigüedad en los métodos de evaluación del desempeño, extensa presión laboral y falta de consenso en las funciones o deberes (Tor, 1997).

En lo que respecta a factores organizacionales, se observa que los procesos de inestabilidad organizacional además de empresas con altos grados de ineficiencia han mostrado tener un impacto elevado en los indicadores de rotación laboral (Rainayee, 2012). Lo anterior en buena medida se explica por el hecho de que en empresas estables los trabajadores pueden predecir las posibilidades de ascenso en las mismas. Siguiendo a Labov (1997), las organizaciones con sistemas de comunicación formales y robustos, tienden a presentar menores niveles de rotación laboral, mientras que para Magner et.al (1996), los empleados permanecen en organizaciones donde se sienten cómodos y en posiciones que encierran algún nivel en el proceso de toma de decisiones, es decir, los empleados deben entender completamente acerca de los aspectos que afectan su atmósfera laboral. Para Abassi y Hollman (2000), la rotación laboral se ve agravada cuando las compañías cuentan con procesos de contratación deficientes, falta de reconocimiento a los empleados, ausencia de compensación competitiva, oportunidades de ascenso poco claras, así como un mal ambiente de trabajo.

#### Rotación Laboral en la Industria Maquiladora en Mexicali, Baja California

En ese marco, el presente apartado está construido con base en la información de una encuesta mensual que aplica el grupo Sada y Asociados, S.C., a un conjunto de empresas maquiladoras de la ciudad, con énfasis particular en aquellas organizaciones asentadas en algunos de los parques industriales que pertenecen al grupo PIMSA. En términos globales, se obtuvo información de la tasa de rotación laboral desde enero de 2004 hasta julio de 2013, lo que implica una serie de 115 valores mensuales. De la misma forma, el número de empresas encuestadas en el periodo de análisis ha sido en promedio de 25 establecimientos, que emplean

una población de alrededor de 23,000 trabajadores. A manera de resumen, el Tabla siguiente contiene información de los valores obtenidos a través de esta encuesta.

Tabla 1: Valores Estadísticos de las Empresas Encuestadas, 2009 - 2013

	Tasa de Rotación	Empresas	Empleados
Media	4.0	26.9	22,335.7
Desviación Estándar	1.5	1.7	1,790.5
Mínimo	1.9	23	19,106
Máximo	8.3	31	25,697

Fuente: Elaboración propia.

La importancia de este conjunto de empresas, radica en el hecho de que en promedio durante los años de 2010 y 2011, contribuyeron con el 10.3% y 10.2% de los trabajadores empleados en la industria manufacturera de Baja California. Habría que agregar que al último mes del cual se tiene información, correspondiente a julio de 2013, 21 de 26 empresas de la muestra (80.7%), están registradas como empresas IMMEX. La tabla siguiente documenta las características generales de las empresas a las que se les aplica la encuesta para determinar los índices de rotación laboral; de la misma forma, se observan los valores de las organizaciones de la entidad que se encuentran dentro del programa IMMEX y la cantidad de empleo que generan.

Tabla 2: Características Generales de las Empresas Encuestadas

Categoría/Año	2010	2011	2012	2013
	IMMEX en Baja California			
Empresas	985	927	898	918
Empleo	225,354	226,189	230,396	245,712
	Empresas Entrevistadas			
Total Empresas	25	28	28	26
Empresas IMMEX	20	22	22	21
Empleo	20,293	22,170	23,623	25,097

Fuente: Elaboración propia con base a Sada y Asociados e Información de la Secretaría de Economía

Por otro lado, de acuerdo a datos de la Secretaría de Economía (2013), el número de establecimientos que en Mexicali están registrados dentro del Programa IMMEX ascendió a 204 de las 1,135 que existían a septiembre de 2013 en el estado de Baja California; en ese marco, en el caso de las firmas encuestadas, estas representan el 10.3% de del total de organizaciones registradas en este programa, respecto al total existente en el municipio. Habría que agregar que en promedio, alrededor de un 10% anual del total de empleos de la manufactura en Baja California, es generado por las compañías que se encuentran dentro de la muestra a las que se aplica el cuestionario mensual de rotación laboral.

En ese marco, la gráfica previa muestra la evolución de la tasa asociada a los valores de rotación laboral en las empresas encuestadas. Para el cálculo de los datos trimestrales y anuales, se tomaron promedios simples; como puede verse en el gráfico previo, los indicadores mensuales presentan importantes variaciones. En los valores anuales, se observa lo que se comentaba en el párrafo previo referido a una tendencia descendente de la tasa de rotación laboral, que puede haber sido el resultado de una menor tasa de actividad económica. Cabe destacar que una tasa de rotación laboral a la baja impacta de forma *positiva* en la organización, dado que un menor número de trabajadores está renunciando voluntariamente, y con ello, por ejemplo, no se incurre en mayores gastos de capacitación. Sin embargo, este bajo valor, también es un indicador del menor dinamismo de la economía en su conjunto medido por la tasa de crecimiento del Producto Interno Bruto (PIB). En ese marco, la gráfica siguiente muestra que a partir del proceso de desaceleración económica que inicia en el 2006, la tasa de rotación de igual forma presenta una tendencia a la baja similar a lo que ocurre en evolución del PIB, que parece estabilizarse en los últimos dos años. En contraste, y como es de esperarse, se observa una relación inversa entre los valores de rotación y desempleo en Baja California; así pues, en el caso del primero se observa una tendencia descendente a partir del año 2006, mientras que el segundo empieza a incrementarse a partir del año 2005, alcanzado su valor más alto en 2009 con una tasa de 6.59%.

En periodos de bajas tasas de crecimiento en la economía, medido por la evolución del PIB, la demanda de bienes y servicios para las empresas es menor, lo que implica menores tasas de contratación y en un buen número de casos, despido de una parte de los trabajadores. Esta situación, hace que los trabajadores decidan mantenerse en sus respectivas posiciones hasta que la economía retome la senda de crecimiento y con ello, se amplíen las oportunidades laborales en otras organizaciones o sectores económicos. En términos del sector de actividad, los datos obtenidos documentan el grueso de las empresas entrevistadas son clasificadas

dentro del sector electrónico y mecánico, que de forma conjunta participan con alrededor del 70%. De la misma forma, en lo que respecta a los valores de empleo generado, el sector mecánico participa con un 40% del total, seguido por el sector de electrónica con alrededor de 35%.

Desde una perspectiva del sector en el que se desempeñan los establecimientos analizados, se observa que los mayores valores de rotación aparecen en aquellas organizaciones que se inscriben dentro del sector de electrónica, vidrio, médica y otras con valores promedio de alrededor de 3.5% mientras que en contraste, las empresas de la actividad mecánica presentan la tasa de rotación más baja para el periodo analizado (1.6%); con una tasa intermedia de rotación (alrededor de 2%) se encuentran las empresas que se inscriben dentro del sector de alimentos y bebidas.

Tabla 3: Tasa de Rotación Promedio Por Sector de Actividad Económica

Año	Electrónica	Mecánica	Vidrio	Alimentos Y Bebidas	Medica	Otras
2009	2.98%	2.15%	4.18%	2.14%	3.28%	2.18%
2010	3.80%	1.68%	3.65%	2.28%	2.67%	3.28%
2011	3.20%	1.47%	2.80%	2.22%	3.61%	3.79%
2012	3.68%	1.38%	3.40%	2.28%	3.64%	4.25%
2013	3.87%	1.49%	3.10%	1.92%	3.63%	3.53%
2009 -2013	3.51%	1.63%	3.43%	2.17%	3.36%	3.41%

Fuente: Elaboración propia con base a datos de Sada y Asociados, S.C.

De acuerdo a la información más reciente (julio de 2013), de la muestra de 26 empresas maquiladores, siete cuentan con una plantilla laboral superior a los 1,000 empleados; once de las mismas, documentan una plantilla de entre 500 y 999 trabajadores; cuatro se registran en el rango de 300 a 499 empleados y las restantes, presentan una plantilla inferior a 300 empleados. En lo que concierne al tamaño de las organizaciones –medido por la cantidad de trabajadores empleados, las mayores tasas de rotación se observan en aquellas que se encuentran en la mitad de la distribución; en ese sentido, las compañías que cuentan con una plantilla de entre 500-999 y de 300-499, presentan los mayores valores de rotación, si se observa el periodo 2009-2012 donde se cuenta con información completa.

El siguiente Tabla documenta los valores de la correlación bivariada, que ya era posible visualizar en la gráfica 4. En esta se observa que la variación en la tasa de rotación laboral de la muestra de empresas es explicada en un 40% por la variación en la tasa de crecimiento del PIB de Baja California; valor similar, corresponde al obtenido de la tasa de crecimiento en la entidad del sector secundario; cabe destacar que estos dos valores se asocian a una correlación positiva, lo que indicaría que en caso de que el PIB estatal y del sector secundario, aumentaran de igual forma habría de esperarse un incremento en la cantidad de renuncias voluntarias. Por otro lado, y como era de esperarse, la tasa de desempleo esta asociada negativamente con la tasa de rotación, y presenta un valor considerable (-0.91); en ese marco, cuando existe una mayor tasa de desempleo, la tasa de rotación tiende a ser menor y viceversa. De forma global, puede verse que todos los valores son significativos.

Tabla 4: Correlaciones Bivariadas

	Tasa De Rotación Laboral		
	Correlación de Pearson (dos colas)	t-student	significancia
PIB BC	0.42	2.808	0.008
PIB BC Sector Secundario	0.44	2.913	0.006
Tasa de Desempleo	-0.91	-13.079	0.000

Fuente: Fuente: Elaboración propia con base a datos de Sada y Asociados, S.C.

### Consideraciones Finales

De acuerdo a lo revisado en este breve trabajo, se observa que el fenómeno de rotación laboral tiene importantes implicaciones no solo para los trabajadores y para las empresas, sino también para la economía en su conjunto. En ese sentido, es de destacar el hecho de que un trabajador puede entrar en esta categoría ya sea de forma voluntaria (cuando cambia de empleo) e involuntaria (cuando es despedido); en el caso de esta última variable y siguiendo lo comentado en la revisión de la literatura, las implicaciones negativas residen en los costos asociados a la contratación y capacitación del nuevo trabajador y en la moral del empleado despedido y de sus compañeros, que permanecen en la organización y que los conlleva a ser menos productivos ante la amenaza de nuevos despidos. De la misma forma, en el caso específico de la empresa, una implicación importante está dada por el hecho de que el obrero despedido terminará en organizaciones competidoras, a las que puede proveer de conocimiento y habilidades obtenidos en su puesto previo.

Asimismo, se observa en base al análisis que la fortaleza de la economía impacta directamente en las estadísticas de rotación laboral. Así por ejemplo, cuando la economía presenta una senda de crecimiento positiva, la tasa de rotación es más elevada ante la posibilidad de encontrar trabajo en empresas que recontratan o en los nuevos establecimientos que inician operaciones; en contraste, cuando la economía presenta una fase de desaceleración, los índices de rotación laboral disminuyen, dada la escasez de vacantes en el mercado o los procesos de despidos en empresas que experimentan menores niveles de demanda de sus bienes y/o servicios. En estos casos, los empleados buscan la seguridad del empleo mientras dure la dificultad económica y por lo tanto, disminuyen sus demandas laborales e incrementan sus niveles de productividad, con lo que esperan no formar parte de la lista de despidos. En ese marco, adquiere importancia el papel de los procesos de contratación empresarial, dado que son las organizaciones quienes absorben la mayor parte del costo económico de la ausencia de un empleado, y es de vital importancia, documentar el nivel de compromiso de los trabajadores para con la empresa, además de proveerles los beneficios económico o elementos de soporte que le permitan formar parte de un entorno un clima laboral que los motive a quedarse.

## RESUMEN

*México es un país clasificado como megadiverso, dada la riqueza en recursos naturales de flora y fauna, sin dejar de lado, la belleza geográfica de muchas regiones. En ese marco, estos elementos han sido aprovechados por las comunidades locales, así como los gobiernos de los tres niveles para incentivar la actividad turística como motor de crecimiento económico. El sector turismo no solo impacta positivamente a nivel de poblaciones en términos de la generación de empleo y producción, sino que también ayuda a mantener estabilidad macroeconómica (ingreso de divisas, balanza de pagos). Teniendo como corolario lo anterior, se espera que el calentamiento global impacte en el clima mundial, lo que dará como resultado una mayor cantidad de desastres naturales, motivado por los posibles incrementos en temperatura y precipitación. En ese marco, el presente trabajo busca determinar los posibles efectos que el calentamiento global, tiene en la actividad turística: para ello, se utiliza una función de demanda típica para el sector turismo, donde la variable dependiente está representada por la llegada de turistas internacionales. Se encuentra que el volumen de precipitación pluvial incide negativamente en el número de turistas que arriban a México, mientras que la temperatura tiene un efecto positivo, lo que implica que a medida que esta aumente de uno a tres grados centígrados como se estima para el presente siglo, se mantendrá la tendencia creciente en el número de turistas.*

## INTRODUCCIÓN

El turismo en México no solo representa una actividad económica importante en términos de su aportación al Producto Interno Bruto (PIB) del país, sino también en términos del nivel de empleo que genera y del impacto que tiene en otros sectores fuera del mismo, como lo es el sector de la construcción, la producción de bienes agrícolas y pecuarios, y el rubro de servicios educativos, por ejemplo. Habría que agregar de la misma forma, que el sector es una fuente importante de divisas lo que contribuye a mantener cierta estabilidad en el tipo de cambio y efectos positivos en la balanza de pagos. Es de destacar además, que en el caso de algunas poblaciones la actividad participa mayormente en la actividad local, lo que las deja en franca desventaja ante impactos económicos y sociales, tanto internos como externos, así como también ante la presencia de fenómenos naturales adversos. En este último punto, de forma más o menos reciente los científicos que estudian el clima han estado alertando del aumento de la contaminación antropogénica, y particularmente, la emisión de gases de efecto invernadero (GHG). De acuerdo a ello, esta contaminación hará que se modifique la temperatura del planeta, lo que implicará que se modifiquen los patrones de precipitación pluvial en muchas zonas del globo, con los consiguientes efectos negativos en las actividades económicas, además de un aumento en el nivel del mar que inundará una cantidad considerable de costas en el planeta.

## REVISIÓN DE LA LITERATURA

De acuerdo a Braun et.al. (1999), los factores ambientales representan uno de los elementos clave cuando los turistas seleccionan un lugar para vacacionar. Para Ivanova (2011), el clima determina la estacionalidad de la demanda turística e influye en los costos de operación como calefacción o enfriamiento, riego, suministro de agua y alimentos, etc. Así los cambios de las temporadas turísticas dependientes del clima

(mar y playa o deportes de invierno) pueden tener implicaciones importantes en la competitividad de los destinos y en las ganancias de los establecimientos turísticos. Como resultado, el posicionamiento competitivo de ciertos destinos turísticos famosos puede declinar, mientras que otros pueden volverse más atractivos. En ese marco, existe evidencia de que el clima seguirá cambiando durante el presente siglo; cabe destacar que las variaciones futuras en la temperatura y algunos otros elementos asociados con el cambio climático, tendrán efectos diferenciados en distintas regiones a nivel mundial. En ese marco, y siguiendo a Ivanova (2011) existe una compleja e importante relación entre los impactos del cambio climático y las medidas necesarias para la adaptación y la mitigación.

Debido a su dependencia del medio ambiente, el sector turismo se caracteriza por una alta sensibilidad climática. Recientemente, en los análisis referidos al turismo los investigadores han empezado a incluir variables climáticas, y en algunos casos, un índice de turismo climático (Mieczkowski, 1985; Amelung and Viener (2006). Una completa revisión de la literatura respecto a las variables de turismo y cambio climático puede encontrarse en Polovitz, Becerra y Zumstein (2011), quienes analizan poco más de doscientos artículos al respecto. De igual forma, destacan los trabajos de Ramasamy Swamy (2012) y Kajána Saarinenab (2012). De forma específica y acorde al presente trabajo, uno de los primeros análisis referidos a cambio climático y demanda de turismo que emplea la variable de temperatura es el de Koenig y Abegg (1997), quienes predecían como cambios en la temperatura afectarían el turismo de ski resorts en Suiza. En términos de las funciones de demanda turística, Agnew y Palutikof (2001), en su análisis de seis países europeos encuentran que la variable de temperatura es uno de los elementos de mayor influencia en el turismo internacional. Estos autores, determinan que la temperatura que atrae a los turistas es de alrededor de 21°C, y que en años calurosos, los turistas de playa prefieren hacer viajes en el país de origen en detrimento de los destinos tradicionales en el exterior.

Wietze y Tol (2002) en su análisis de la evolución de turistas en y desde los países de la OECD, con énfasis particular en los turistas daneses, encuentran de igual forma que la temperatura media ideal para la mayoría de turistas es de 21°C, por lo que argumentan que el cambio climático tendrá un efecto robusto en la demanda del sector. Concluyen también, que el problema no es tanto para los turistas, sino para los prestadores de servicios turísticos quienes sustituirán un destino por otro o una fecha por otra. Evidentemente, esto concuerda con lo comentado en la introducción en el sentido de que los proveedores de servicios turísticos locales presentan un menor grado de adaptación y serán quienes experimenten en mayor medida los impactos negativos de las variaciones en el clima, debido a las pocas alternativas disponibles y a una cultura de inmovilidad. En el caso específico de México, se ha abordado la perspectiva del cambio climático y sus posibles impactos a nivel macroeconómico, además de aquellos elementos del clima que afectan directamente el entorno social; esto último es importante, porque como ya comentábamos previamente para el caso del turismo, serán las pequeñas comunidades locales altamente dependientes de la actividad las que sufrirán los mayores estragos. En este respecto pueden revisarse los documentos de Moreno y Urbina (2008) y Delgado et.al (2010). En base a la revisión realizada, en nuestro país no existen trabajos que hayan documentado los posibles impactos de variables climáticas (particularmente temperatura y precipitación) en el sector turismo como el que pretendemos hacer con el presente.

## DATOS Y MÉTODO

De acuerdo a la literatura revisada específicamente sobre demanda turística, en buena parte de la misma, se observa que los flujos de turistas entre los países de origen y destino pueden ser explicados a través de una función de demanda. Habría que agregar, de igual forma que en estos trabajos se utiliza el número de llegadas de turistas o la cantidad de gasto erogada en el país de destino como variable dependiente. Crouch y Shaw (1992), por ejemplo documentan que en alrededor del 70% de los trabajos analizados que estiman funciones de demanda turística utilizan como variable dependiente la llegada de turistas, lo que justifica la utilización de la misma en el presente trabajo. Por otro lado, la revisión realizada respecto a la demanda

turística sugiere distintas variables que pueden utilizarse para como explicativas. Para efectos del presente trabajo se utilizan como variables independientes las siguientes: el Producto Interno Bruto Percápita (PIBPPD) del país de destino (en miles de dólares constantes de 2005), el Producto Interno Bruto de los países de origen (PIBPO; Estados Unidos y Canadá específicamente) en millones de dólares constantes de 2005, el Índice de Precios al Consumidor (IPC) del país de destino, los precios internacionales del petróleo (PP; en dólares estadounidenses), la temperatura anual promedio (TC) en grados centígrados y la precipitación media anual (PP) en milímetros. Cabe destacar que las series representan valores anuales y cubren el periodo de 1980 al 2012. La relación entre la llegada de turistas, así como las variables económicas y medio ambientales documentadas previamente, pueden representarse por ejemplo en el siguiente modelo multivariado:

$$TA_t = \alpha_0 + \beta_1 PIBPO_{it} + \beta_2 PIBPPD_t + \beta_3 IPC_t + \beta_4 OP_t + \beta_5 TC_t + \beta_6 PP_t + \varepsilon_t$$

Dónde:

$TA_t$  = Llegada de turistas del país i en el periodo t hacia México.

$PIBPO_{it}$  = es el Producto Interno Bruto del país de origen (Estados Unidos y Canadá).

$PIBPPD_t$  = Es el PIB per cápita en el país de origen (México)

$IPC_t$  = es el índice de precios al consumidor en el país de destino (México).

$OP_t$  = Representa los precios internacionales del petróleo en el periodo t.

$TC_t$  = es la temperatura media anual en grados centígrados en el país de destino.

$PP_t$  = es la precipitación media anual en milímetros en el país de destino.

Teniendo en cuenta el conjunto de datos obtenidos, se plantea la elaboración de análisis de series de tiempo. Para ello, se aplican las técnicas de cointegración a través de vectores autorregresivos (Greene (2000) y Wooldridge (2002), en el caso de las variables económicas que permitan documentar la presencia o no de una relación de largo plazo entre las series. De la misma forma, el análisis permitirá hacer predicciones del arribo de turistas a México, modificando las variables de temperatura y precipitación, que permita documentar como el calentamiento global, impactará en el sector para el caso mexicano.

## RESULTADOS

Se aplican las pruebas de raíces unitarias mediante los estadísticos de Dicky-Fuller Aumentada, Phillips-Perron y Kwiatkowski-Phillips-Schmidt-Shin (KPSS) sobre los logaritmos de las variables en niveles, así como en primeras diferencias. Todas las pruebas aplicadas documentan de forma consistente la presencia de raíces unitarias en las variables analizadas. Una vez que se ha determinado que todas las series cuentan con el mismo orden de integración, el paso siguiente es documentar la presencia o no de una relación de cointegración entre las variables y con ello, la posibilidad de verificar la presencia de una relación de largo plazo entre las mismas; para probar lo anterior, se utiliza la prueba de Johansen (1995). Los resultados de la misma, documentan la presencia de al menos 2 relaciones de cointegración entre las variables, cuando se utiliza el Producto Interno Bruto de Canadá y de Estados Unidos respectivamente.

Con base en el análisis de vectores autorregresivos (VAR), el cuadro siguiente documenta solo aquellas variables estadísticamente significativas en los análisis de regresión realizados. En ese marco, de acuerdo a los valores obtenidos la llegada de turistas canadienses a México medido por los datos del arribo de turistas tomado de los informes presidenciales (AT1), depende del arribo de turistas del año previo, lo que en cierta medida pudiera indicar el hecho de que estos son visitantes internacionales recurrentes; como es de esperarse, ha medida que aumenta el Producto Interno Bruto del país de origen (en este caso Canadá),

se observa un mayor volumen de turistas al país; de la misma forma, el volumen de precipitación pluvial presenta un signo negativo, lo que indicaría que a medida que la cantidad de lluvia aumentara en los sitios de destino, se tendría un menor arribo de turistas; en el resto de las variables, los coeficientes son estadísticamente no significativos.

Cuadro 1: Vectores Autorregresivos Para Turistas Canadienses

*Fuente:* Elaboración propia

En el caso de la segunda regresión, si se utilizan los valores del arribo de turistas del Instituto Nacional de Estadística Geografía e Informática (INEGI), se observan ligeros cambios. En ese marco, al igual que en la primera ecuación, el arribo de turistas a México provenientes de Canadá depende de los turistas del año previo, de la evolución económica de este país (medido por el PIB), de la temperatura y de los precios internacionales del petróleo. En este último caso, el signo es esperado es el correcto, lo que implicaría que a medida que aumentan los precios del petróleo, el costo de transporte aéreo y terrestre aumentaría, lo que disminuye la cantidad de turistas. En lo que respecta a la temperatura, si esta aumenta uno o dos grados como se tiene previsto para el fin del presente siglo, implicará que la temperatura media alcance un valor promedio en México de entre 22°C y 23°C, que es lo que se ha encontrado como la temperatura óptima para el grueso de viajeros internacionales con fines vacacionales. En un segundo caso, se aplica la metodología de vectores autorregresivos, pero ahora teniendo en cuenta a los turistas provenientes de Estados Unidos. Los resultados obtenidos son los que aparecen en el siguiente cuadro.

Cuadro 2. Vectores Autorregresivos Para Turistas Estadounidenses

Variable	<i>L</i> <sub>AT1</sub>	<i>L</i> <sub>AT2</sub>
Constante	-0.8999 (3.8536)	-6.066* (2.9745)

R <sup>2</sup>	0.9764	0.9432
R <sup>2</sup> ajustado	0.9707	0.9296
Suma de residuos al cuadrado	0.1051	0.0784
DW	2.199	2.429

*Nota:* Con base en los criterios de AIC, BIC y HQC, el número de rezagos óptimos fue de uno; \*, \*\* y \*\*\*, hacen referencia a un nivel de significancia de 10%, 5% y 1% respectivamente. Errores estándar entre paréntesis.

*Fuente:* Elaboración propia

Al igual que en el caso previo, cuando se utiliza la primer serie (AT1) asociada al arribo de turistas con información de los informes presidenciales, esta depende del número de turistas que arribaron el periodo previo, de la actividad económica en el país de origen de estos turistas (en este caso, Estados Unidos), del

PIB per cápita en México (significativo al 10%), y del volumen de precipitación pluvial; en el caso contrario, cuando se utiliza la variable de arribo de turistas internacionales a México de INEGI, la totalidad de las variables son estadísticamente significativas al 5%, con excepción del PIB per cápita de México.

## CONCLUSIONES

El turismo es una actividad económica que presenta efectos considerables en las regiones donde se asienta. Por un lado, esta representa una fuente de ingreso y empleo para los pobladores locales, así como una actividad que contribuye a las finanzas municipales, estatales y federales vía impuestos. De la misma forma, con el desarrollo del sector se genera una presión de los recursos naturales locales, que termina generando un encarecimiento de los mismos para los habitantes locales, además de considerable daño ambiental. Teniendo en cuenta lo anterior, aquellos sitios de destino donde se vean incrementados los grados de temperatura, la cantidad (y días de lluvia), una mayor presencia de tormentas y un aumento en el nivel del mar, experimentarán un menor arribo de turistas, lo que tendrá importantes efectos económicos para los habitantes que dependen de esta actividad. En contraste, con el aumento de la temperatura, se espera que los turistas viajen a destinos nacionales en detrimento de destinos al exterior, y que asimismo, se visiten sitios que actualmente son considerados fríos.

En ese marco, poco puede hacer México en términos de modificación en los patrones mundiales de emisiones de gases de efecto invernadero que pudieran revertir estos posibles impactos en el turismo, y no solo a nivel país, sino también en el ámbito internacional. Siguiendo a Hamilton y Lau (2004), estos impactos no implicarán un problema para los turistas quienes modificarán los destinos, no así sus preferencias. Se plantea entonces, que los tomadores de decisiones empiecen a tomar cartas en el asunto en términos de identificación de alternativas de desarrollo económico para estas áreas, además de incentivar una mayor participación del turismo nacional. Cabe destacar de igual forma, que estos cambios en los patrones del clima se harán evidentes durante el presente siglo y que ante una política pública de corto y mediano plazo, las acciones que se tomen en la actualidad no vislumbren la gravedad del problema.

# ANÁLISIS DE LA INFLUENCIA FAMILIAR EN LOS TALLERES ARTESANALES DE MÉXICO

Luis Ángel Correa García, Universidad Autónoma de Aguascalientes

Roberto González Acolt, Universidad Autónoma de Aguascalientes

Bogar García Martínez, Universidad Autónoma de Aguascalientes

## RESUMEN

*Los artesanos productores de objetos de identidad cultural y portadores de tradición transmitida de generación en generación, realizan sus piezas de artesanías en su mayoría por mano de obra integrada por miembros de la misma familia; característica la cual consideramos importante analizar desde la perspectiva de las ciencias económicas-administrativas, debido a su importancia en la operación de los talleres. El objetivo de este trabajo es comprender como la familia influye dentro de los talleres artesanales de México compuestos por una muestra de 48 unidades pertenecientes a cinco estados de la República Mexicana dentro los que se encuentran: Aguascalientes, Chihuahua, Coahuila, San Luis Potosí y Zacatecas. Es de gran importancia estudiar la familia en las pequeñas empresas ya que puede llegar a ser un aspecto clave para lograr la producción o mantenerse en el mercado local. La “influencia familiar” se midió a través de la sub escala “cultura” compuesta por 12 preguntas tomadas del instrumento Familia - Poder, Experiencia y Cultura. Los resultados muestran que la lealtad, los valores de la familia y el apoyo hacia la empresa explican el 63.997% de la varianza extraída. Se concluye que en los talleres artesanales de los estados analizados, la lealtad y los valores de la familia tienen influencia en el negocio según la percepción de los propietarios de los talleres.*

**PALABRAS CLAVE:** Familia, Artesanía y Taller Artesanal

## INFLUENCE ANALYSIS OF FAMILY CRAFT WORKSHOPS IN MEXICO

### ABSRTACT

*The craftsmen producing objects of cultural identity and carriers transmitted from generation to generation tradition, they made their handicrafts mostly for labor comprises members of the same family; characteristic considered analyzing from the perspective of science economic- administrative, due to its importance in the operation of the workshops. The objective of this work is to understand how the family influences within Mexico craft workshops consist of a sample of 48 units from five states in Mexico which are: Aguascalientes, Chihuahua, Coahuila, San Luis Potosi and Zacatecas. It is very important to study the family in small businesses because it can become a key to the production or stay in the local market aspect. The "family influence" was measured through the sub -scale "culture" consists of 12 questions taken from the instrument Family- Power, Experience and Culture. The results show that the loyalty family, values and support for the company explained the 63,997% of the extracted variance. We conclude that in the craft workshops of the analyzed states, the loyalty and the family values influence the business according to the perception of the owners of the workshops.*

**KEYWORDS:** Family, Handicrafts And Crafts Workshop

## INTRODUCCIÓN

Es importante investigar sobre los talleres artesanales ya que México es un país con una enorme riqueza cultural así mismo se caracteriza por la producción de artesanías a lo largo y ancho de la República Mexicana, sin embargo la situación actual de los artesanos es una paradoja, ya que con el transcurso de los años se encuentran cada vez más distanciados de los beneficios de las políticas públicas (Burciaga, 2010), los talleres artesanales son símbolo de la riqueza cultural, la producción de sus objetos imprime un sello personal a diferencia de los fabricados en serie. Los talleres compuestos en su mayoría por fuerza de trabajo familiar son considerados como empresas de subsistencia (Toledo, 2012; Hernández et al., 2010; Toledo et al., 2012), debido a que dentro del mercado local existe una gran cantidad de negocios de varias ramas de artesanías que operan con bajos niveles de rentabilidad.

El artesano es capaz de producir objetos artísticos pero por lo general no puede producirlos en serie, lo que conlleva que los volúmenes de producción sean reducidos (Hernández, Domínguez y Caballero, 2007), la mayoría de los talleres por un lado enfrentan serias dificultades en el desarrollo de habilidades para administrar, no poseen tecnología, es un sector que no tiene control sobre su mercado pues depende del arribo de turistas (Domínguez, Hernández y Toledo 2004). Por otro lado se encuentran alejados de los programas de capitalización ya que carecen de alguna garantía que respalden el crédito. Por el contrario sus principales ventajas competitivas es el alto sentido de compromiso de los empleados, sus productos con sus características particulares, su arraigo en la cultura popular representado por los conocimientos heredados de padres a hijos junto con su valor primordial denominado autenticidad, la cultura familiar es parte esencial del éxito de las empresas familiares (Esparza y García, 2011) así como el refuerzo social y los valores culturales (Toledo et al., 2012).

Conocer la influencia familiar en los talleres artesanales es importante para el estudio de las unidades de análisis ya que la familia representa la más antigua de las instituciones sociales humanas, un pilar fundamental de la sociedad, grupo primario fundador de la especie humana, encargada de funciones muy concretas en todos los sistemas económicos (De la Rosa et al., 2009), la familia elemento intrínseco de la vida humana; y columna vertebral de la cultura popular en México. El aspecto familiar dentro de una empresa es un factor relevante para la continuidad, viabilidad, evolución y crecimiento de los talleres artesanales (De la Rosa, Lozano y Ramírez, 2009), es un factor clave para el éxito de las empresas (Esparza y García, 2011) es por eso que el propósito de este trabajo es dar a conocer cuál es la influencia de la familia en los talleres artesanales de México. Por último se presentan los resultados y conclusiones para conocer el grado de la influencia en los talleres artesanales de los estados de Aguascalientes, Chihuahua, Coahuila, San Luis Potosí y Zacatecas.

## REVISIÓN DE LITERATURA

### Los Talleres Artesanales Como Empresas Familiares

En México el tema de las empresas familiares ha sido poco estudiado, los primeros estudios datan de la década de los 60's (Garza et al., 2011), el análisis de las empresas familiares de acuerdo con Astrachan et al., (2002) es difícil de precisar ya que en un contexto internacional donde las culturas y familias son diferentes a través de los límites geográficos. Por su parte Longenecker et al., (2007) define una empresa familiar como una sociedad en la que son propietarios, operan juntos o en sucesión dos o más miembros de la misma familia, donde la participación es variable ya que pueden trabajar tiempo completo o medio tiempo con la característica principal de que una empresa familiar es heredada de generación en generación debido a que cada miembro aporta conocimientos, habilidades, capacidades y pretende conservar su producción tradicional (Hernández, Domínguez y Caballero, 2007). Garza et al., (2011) intentan definir a la empresa familiar como una organización en la que la cultura es trascendente y compleja debido a que combina

atributos de la familia propietaria y de la empresa, De la Rosa et al., (2009) la definen como la unión de dos espacios de socialización distintos: empresa y familia. Y por último Esparza y García (2011), la conceptualizan como aquella donde la propiedad y el control recaen en el grupo familiar y la dirección es realizada por los miembros de la familia y hay continuidad en el negocio. En México los talleres artesanales son empresas familiares su estudio es relevante pues la mayoría están compuestos por miembros de la misma familia (Jaspe, 2009), contribuyen al ingreso de los individuos y por su incursión en la comunidad (Toledo et al., 2012). En general los estudios de las empresas familiares se centran en la mejora de su desempeño económico y productivo con base en postulados de la teoría económica o de las ciencias administrativas (De la Rosa et al., 2009), dejando de lado el aspecto de los valores y la lealtad hacia el negocio familiar.

En este contexto teórico se ha encontrado que la problemática para analizar las empresas familiares es que el término es difuso e impreciso (De la Rosa, 2009; Garza, 2011), existe una carencia de consenso sobre la definición de las empresas con estas características (Esparza y García, 2011), por su parte Martínez (2010) señala que desde el punto de vista de las industrias fragmentadas se pone la ambigüedad más que la claridad y es una perspectiva difícil de articular debido a que es difícil de conceptualizar. En este trabajo de investigación nos limitamos a definir los talleres artesanales como una organización tradicional compuesta en su mayoría por miembros de la misma familia productoras de piezas únicas con un distintivo denominado autenticidad, cuya tradición es heredada de generación en generación de padres a hijos como modo de vida. Los talleres artesanales por su potencial cultural es una alternativa para reducir la pobreza y lograr el desarrollo económico en zonas rurales de los estados, donde existe desempleo y marginación, por ende consideramos necesario estudiar la influencia familiar en los talleres artesanales ya que según Turok (1988) las artesanías en México se están perdiendo a medida en que artesanos dejan de producir para buscar un empleo formal o migrar hacia los Estados Unidos de América.

De lo anterior podemos argumentar que estudiar la influencia familiar en los talleres artesanales es importante para conocer cómo los miembros de la familia comparten valores similares, comprender el grado de lealtad de los miembros hacia el negocio familiar. Estudiar la cultura de las empresas familiares es un factor clave para el éxito de las empresas (Esparza y García, 2011). Los talleres artesanales no están considerados como una actividad económica capaz de formar parte de los censos económicos nacionales es por ello que no existen estadísticas oficiales (Garza et al, 2011; Correa et al., 2008). Los talleres representan importancia histórica y cultural como unidades de producción familiar que elaboran piezas en su totalidad hechas a mano, tienen características rurales, comportamiento individualista, producen con herramientas simples y trabajo humano (Toledo, 2012). Longenecker et al., (2007) mencionan que la educación del artesano está limitada a una enseñanza técnica, tienen experiencia en puestos técnicos, suelen carecer de buenas habilidades de comunicación y capacitación administrativa.

Los talleres artesanales con sus rasgos descritos difieren de otros tipos de pequeñas empresas ya que la toma de decisiones puede ser más compleja puesto que lleva una mezcla de valores e intereses familiares y de negocios. Por ejemplo, los intereses de la familia es el cuidado y cultivo de sus miembros, el objetivo es que cada miembro se desarrolle al máximo así como proveer oportunidades; en tanto los intereses de la empresa es la producción de los bienes o servicios, las metas son la rentabilidad y la supervivencia. Por su parte Subiñas (2011) describe la cultura familiar como tradicional y explica que se basa en una división sexual del trabajo que refleja la visión tradicional del trabajo sobre los roles apropiados para hombres y para mujeres, donde el estatus alto es el masculino y bajo tradicionalmente el femenino de los puestos de trabajo. Siguiendo a De la Rosa et al., (2009) mencionan que antes de analizar las empresas familiares se debe profundizar en la dimensión de la familia de la pequeña empresa ya que este término es un elemento que permite explicar la complejidad organizacional. El crecimiento de las empresas familiares depende de que se reconozca la necesidad de una administración profesional, de que los intereses familiares deben

de pasar a un segundo plano. La supervivencia de una empresa requiere de un equilibrio entre los intereses de la empresa y la familia.

### La Actividad Artesanal en México

La producción de artesanías se distingue en toda la República por sus formas, aplicaciones y en sus usos, así como en su decorado, (Alt, 1980). En México es imposible presentar una descripción de la infinita variedad de objetos manufacturados en las diferentes latitudes de la República Mexicana. La distribución territorial de la actividad artesanal está presente en los 32 estados de la República Mexicana en donde se registra producción. Pero son los estados de Michoacán, Jalisco, y Guanajuato los mayores productores de artesanías, mientras que Michoacán, Oaxaca, Estado de México, Hidalgo y Puebla concentran la mayor cantidad de localidades productoras (Correa et al., 2008). Por ejemplo, En el Estado de Oaxaca para Hernández et al., (1998) estiman que existen 20,000 artesanos, y para Toledo (2012) aproximadamente 28 mil personas que dependen de la producción de artesanías. En México el Fondo Nacional para el Fomento de las Artesanías (FONART) es la institución encargada de promover y fomentar la actividad artesanal del país para contribuir a elevar el ingreso familiar, su desarrollo humano y social de los artesanos. Las actividades artesanales en México se encuentran divididas en 17 ramas artesanales de acuerdo al FONART (2014) se encuentran la alfarería y cerámica, textiles, madera, cerería, metalistería, orfebrería, joyería, fibras vegetales, cartonería y papel, talabartería y peletería, maque y laca, lapidaria y cantería, arte huichol, hueso y cuerno, concha y caracol, vidrio, plumaria.

### Importancia de los Talleres Artesanales

En México, las micro, pequeñas y medianas empresas (mipyme) representan el 99.8% de total de las empresas y aportan un 52% del PIB, el 65% son empresas familiares (Esparza y García, 2011), por su parte Toledo et al., (2012) señalan que representan el 95% del total de empresas registradas, y contribuyen con el 75% de los empleos. La familia vista como una unidad económica a través de los años ha sido un importante pilar desde el siglo XIX, ya que expresa la relación entre el trabajo y capital dentro del taller artesanal (De la Rosa, 2009). Las actividades artesanales son consideradas relevantes ya que refuerzan los valores sociales y culturales, económicamente producen empleos contribuyendo con el desarrollo de los individuos y la comunidad. La artesanía tiene gran trascendencia que va más allá de la aportación económica, por su parte Toledo et al., (2010) señala que son relevantes para la economía de la región, porque atraen al turismo nacional e internacional.

Los talleres artesanales son fortaleza de los lazos familiares, ya que existe una motivación porque es una empresa familiar y algunas empresas utilizan este tema para diferenciarse de la competencia, de acuerdo con Alt (1980) en México las artesanías satisfacen vitales necesidades sociales. En el actual modelo familiar la descendencia se traza de manera unilineal por vía masculina lo que se conoce como patrilinealidad (Moctezuma, 2011), el linaje que proporciona a sus miembros un sentido de identidad familiar y social grupal. El principio agnático juega un papel importante en el aprendizaje y generación de un taller artesanal, este principio opera desde tiempos prehispánicos, se sustenta en el parentesco que se teje entre varones emparentados de manera consanguínea. Este principio juega un papel muy importante en la capacidad de un artesano para generar y consolidar un taller. Los estados con riqueza artesanal presentan una gran opulencia cultural, pero tienen una gran dependencia del mercado, por lo que muchas familias artesanas viven en condiciones de subsistencia (Toledo, 2012; Toledo et al., 2012) debido a que permanecen sin cambios por generaciones, con pocos incrementos en las ventas, tecnología rudimentaria, generalmente no tratan de participar en los mercados internacionales.

## METODOLOGÍA

### Muestra

La muestra se seleccionó por conveniencia, es decir no sigue ninguna fórmula estadística, debido a que la encuesta se aplicó a los propietarios de los talleres artesanales invitador por el FONART a participar en un foro de consulta el día 30 y 31 de Enero del 2014 en la Ciudad de Zacatecas, donde se entrevistó a 47 artesanos de los estados de Aguascalientes, Chihuahua, Coahuila, San Luis Potosí y Zacatecas. Para conocer la influencia de la familia en los talleres artesanales, el estudio de datos se realizara por medio de un análisis de factorial, procesado en el paquete SPSS V20.

En La Tabla 1 y 2 Se Describe la Distribución de la Muestra

**Tabla 1: Distribución Muestral Por Estado**

Estado	Frecuencia	Porcentaje	Acumulativo
Aguascalientes	4	8.5	8.5
Chihuahua	8	17	25.5
Coahuila	1	2.1	27.6
San Luis Potosí	2	4.3	31.9
Zacatecas	32	68.1	100

*En esta tabla se describe la distribución muestral por entidad federativa donde Zacatecas representa la mayoría de talleres con 68.1%. Fuente: elaboración propia.*

**Tabla 2: Distribución Muestral Por Rama Artesanal**

Rama artesanal	Frecuencia	Porcentaje	Acumulativo
Alfarería y cerámica	15	31.9	31.9
Textiles	13	27.7	59.6
Madera	3	6.5	66.1
Joyería	2	4.2	70.3
Fibras vegetales	2	4.2	74.5
Cartonería y papel	3	6.5	81
Talabartería	4	8.4	89.4
Lapidaria y cantería	2	4.2	93.6
Arte huichol	3	6.4	100

*La tabla 2 describe la distribución muestral por rama artesanal donde se observa que la alfarería y cerámica es la rama que mayor artesanos fueron entrevistados con 31.9%. Fuente elaboración propia.*

### Medidas

Este estudio analiza la influencia de la familia en el negocio, dicha variable fue medida a través de la escala F-PEC propuesta por Astrachan et al., (2002). Escala propuesta por Astrachan, Kein y Smyrniotis (2002) para medir la influencia de la familia en la empresa a través de tres dimensiones: el poder, la experiencia y la cultura. Utilizando únicamente la sub escala de Cultura, medida a través de una escala tipo likert de 5 ítems donde: 1=Nunca, 2= Rara vez, 3= Algunas veces, 4= Casi siempre y 5= Siempre.

<b>tabla 3: sub escala cultura</b>	<b>nunca</b>	<b>rara vez</b>	<b>algunas veces</b>	<b>casi siempre</b>	<b>siempre</b>
v1 ¿su familia tiene influencia en su negocio?	1	2	3	4	5
v2 los miembros de su familia ¿comparten valores similares?	1	2	3	4	5
v3 ¿su familia y negocio comparten valores similares?	1	2	3	4	5
por favor califique el grado en que está de acuerdo con las siguientes oraciones	totalmente en desacuerdo	en desacuerdo	ni de acuerdo ni en desacuerdo	de acuerdo	totalmente de acuerdo
v4 los miembros de la familia ¿están dispuestos a poner un gran esfuerzo más allá de lo esperado normalmente con el fin de ayudar a que la empresa familiar tenga éxito?	1	2	3	4	5
v5 ¿apoyamos a la empresa familiar en discusiones con amigos, empleados y otros miembros de la familia?	1	2	3	4	5
v6 ¿sentimos lealtad hacia el negocio familiar?	1	2	3	4	5
v7 ¿encontramos que nuestros valores son compatibles con los de la empresa?	1	2	3	4	5
v8 ¿estamos orgullosos de decir que somos parte de la empresa familiar?	1	2	3	4	5
v9 ¿hay mucho que ganar a largo plazo al participar con el negocio familiar?	1	2	3	4	5
v10 ¿estamos de acuerdo con los objetivos, planes y políticas del negocio familiar?	1	2	3	4	5
v11 ¿la decisión de participar en el negocio familiar tiene una influencia positiva en mi vida?	1	2	3	4	5
v12 ¿entiendo y apoyo a las decisiones de mi familia con respecto al futuro de la empresa familiar?	1	2	3	4	5

La tabla 3 describe las preguntas de la sub escala cultura tomada de la scale F-PEC (Poder, Experiencia y Cultura), medidas en escala tipo likert: Fuente elaboración propia con base en Astrachan et al., (2002).

## RESULTADOS

Aplicando la metodología descrita, la tabla 4 muestra las pruebas de esfericidad de Bartlett la cual contrasta la hipótesis nula de que la matriz de correlaciones es una matriz de identidad, en cuyo caso existen correlaciones significativas entre las variables y el modelo de análisis factorial es pertinente y la medida de adecuación muestral (KMO) Kaiser-Meyer-Olkin contrasta si las correlaciones principales entre las variables son significativamente pequeñas, este estadístico varía entre 0 y 1, como podemos apreciar si es factible el análisis factorial.

Tabla 4: KMO y Prueba de Bartlett

<b>Medida de Adecuación Muestral de Kaiser-Meyer-Olkin.</b>		<b>.735</b>
Prueba de esfericidad de Bartlett	Chi-cuadrado aproximado	211.148
	Gl	66
	Sig.	.000

La tabla 4 describe el test de Bartlett donde  $p$  es inferior a los niveles críticos 0.05 y 0.01 y el test de Kaiser-Meyer-Olkin su valor es superior a 0.05, por lo tanto los datos se adecuan para realizar el análisis factorial.

La tabla 5 ofrece un listado de auto-valores que expresan la cantidad de la varianza total que esta explicada por cada factor; y los porcentajes de la varianza explicada asociados a cada factor que se obtienen dividiendo su correspondiente auto-valor por la suma de los auto-valores (coincide con el número de variables). Por ende se extraen tanto factores como auto-valores mayores a 1 que tiene la matriz analizada.

En nuestro análisis existen 3 auto-valores mayor que 1, por lo que el procedimiento extrae 3 factores que consiguen explicar el 63.99% de la varianza de los datos originales.

Tabla 5: Varianza Total Explicada

Componente	Autovalores Iniciales			Sumas de las Saturaciones al Cuadrado de la Extracción			Suma de las Saturaciones al Cuadrado de la Rotación		
	Total	% de la varianza	% acumulado	Total	% de la varianza	% acumulado	Total	% de la varianza	% acumulado
1	4.598	38.313	38.313	4.598	38.313	38.313	3.645	30.373	30.373
2	1.873	15.611	53.924	1.873	15.611	53.924	2.225	18.538	48.910
3	1.209	10.072	63.997	1.209	10.072	63.997	1.810	15.086	63.997
4	.940	7.831	71.827						
5	.742	6.182	78.009						
6	.665	5.545	83.554						
7	.634	5.283	88.837						
8	.497	4.145	92.982						
9	.291	2.425	95.407						
10	.238	1.983	97.390						
11	.190	1.583	98.973						
12	.123	1.027	100.000						

*Método de extracción: Análisis de Componentes principales. Atendiendo el criterio de la varianza explicada, se puede observar que tres factores explican casi el 64% de la varianza, por lo que la solución de tres factores parece razonable. Fuente: datos analizados en SPSS.*

La tabla 6 presenta la solución rotada mediante el procedimiento varimax, el cual es un método de rotación ortogonal que minimiza el número de variables que tienen saturaciones altas en cada factor. Simplifica la interpretación de los factores optimizando la información en cada columna, para interpretar los factores, es necesario identificar, mediante las cargas factoriales, que variables utilizar. Debido a que todas las cargas en mayor o menos medida sobre todos los factores el criterio que utilizaremos para explicar cada factor aquellas variables con una carga factorial superior a 0.75 (Aldás y Maldonado, 2013) esto debido al tamaño de nuestra muestra.

Tabla 6: Matriz de Componentes Rotados

Variable	Componente		
	1	2	3
Los miembros de su familia comparten valores similares	.280	<b>.805</b>	-.147
Su familia y negocio comparten valores similares	.277	<b>.843</b>	-.078
Apoyamos a la empresa familiar en discusiones con amigos, empleados y otros miembros de la familia.	.103	.071	<b>.744</b>
Sentimos lealtad hacia el negocio familiar	<b>.871</b>	.053	.208
Encontramos que nuestros valores son compatibles con los de la empresa	<b>.757</b>	-.064	.137

*Método de extracción: Análisis de componentes principales. Método de rotación: Normalización Varimax con Kaiser*

De la tabla 6 analizando las saturaciones relativas de cada variable en cada uno de los tres factores podemos observar que el factor 1 está compuesto por las variables: *lealtad hacia el negocio familiar, encontramos que nuestros valores son compatibles con los de la empresa*. Todas estas variables saturan en un único factor por que componen un grupo diferenciado de variables; este factor lo podemos interpretar como lealtad hacia el negocio. El factor 2 viene explicado por las variables: *los miembros de su familia comparten valores similares y Su familia y negocio comparten valores similares*, lo que podemos interpretar como valores de la familia y empresa. Por último el tercer 3 está formado por sólo una variable: *apoyamos a la empresa familiar en discusiones con amigos, empleados y otros miembros de la familia* o lo podemos interpretar como apoyo hacia el taller que es independiente de la lealtad hacia el negocio y de los valores de la familia. Esto debido a que los factores son independientes entre sí y la variable no satura en los otros dos factores.

## CONCLUSIONES

Para este estudio aplicado a los propietarios de los talleres artesanales de los estados de Aguascalientes, Chihuahua, Coahuila, San Luis Potosí y Zacatecas tomando la escala F-PEC propuesta por Astrachan et al., (2002) para conocer la influencia de la familia en los talleres artesanales con el análisis factorial podemos concluir que atendiendo al criterio de la varianza explicada, tres factores explican casi el 64% de la varianza extraída, dado que cada factor es una combinación lineal de diversas variables lo que significa que gran parte de la varianza está recogida en los factores seleccionados mayores a .75, de esta forma el factor 1, al que podemos interpretar como lealtad hacia el taller artesanal viene explicado por las variables: sentimientos hacia la empresa y encontramos que nuestros valores son compatibles con los de la empresa. El factor 2 lo podemos interpretar como valores de la familia y el taller viene explicado por las variables: los miembros de la familia comparten valores similares y su familia y negocio comparten valores similares, y por último el tercer factor interpretado como apoyo hacia el taller artesanal viene explicado por la variable apoyamos a la empresa familiar en discusiones con amigos, empleados y otros miembros de la familia. Por lo tanto se concluye que los propietarios de los talleres artesanales perciben lealtad de los miembros de la familia hacia el negocio, así mismo, la familia y el negocio comparten valores similares, y existe un apoyo hacia la empresa ante las dificultades. Los aportes de este estudio contribuyen al enriquecimiento de los talleres artesanales, así mismo son de utilidad para personas interesadas en el estudio de empresas familiares.

Dentro de las limitaciones de esta investigación se puede mencionar el tamaño de la muestra, la dificultad para precisar el concepto de empresa familiar, la complejidad de los talleres artesanales, en futuros trabajos de investigación se recomienda ampliar la muestra a otras ramas artesanales, hacer el estudio sobre sólo una rama y en diversos estados de la república mexicana. Los resultados aquí presentados sobre la influencia familiar representada por los valores, la lealtad de la empresa y el apoyo hacia la empresa son factores que influyen en los talleres artesanales, resultados los cuales son consistentes con los hallazgos de Toledo et al., (2012), donde los valores familiares están presentes en los talleres artesanales y que es un factor clave para el éxito. Contrastando con los hallazgos reportados por Avedano et al., (2009) donde reportan que la familia no es un predictor sólido en los negocios familiares.

# LA IMPORTANCIA Y LA INFLUENCIA DE LAS MAQUILADORAS EN EL DESARROLLO ECONÓMICO DE MÉXICO

Mónica Fernanda Aranibar Gutiérrez, Universidad Autónoma de Baja California

## RESUMEN

*Las maquiladoras en México han jugado un papel estratégico para el desarrollo económico ya que se han constituido en generadoras de exportaciones y de divisas; han contribuido a elevar la competitividad de la industria nacional; han sido una fuente generadora de empleo, de capacitación y adiestramiento de la mano de obra; así como un sector importante para transmitir y generar tecnología.*

*En la actualidad, las maquiladoras han perdido aliento, debido a múltiples causas tanto internas como externas. En general se han enfrentado a los nuevos retos que plantean la globalización y la competitividad. Esta ponencia se centra en el sector industrial denominado maquiladoras de exportación, estableciendo su importancia e influencia para el desarrollo económico de México, en específico para el desarrollo de sus fronteras. Conoceremos sus antecedentes desde que se implantaron en México, cómo se han desarrollado, cómo han cambiado y cuál es el momento en que se encuentran.*

**PALABRAS CLAVES:** Desarrollo Económico, Maquiladoras, Evolución, Frontera

## THE IMPORTANCE AND THE INFLUENCE OF THE ASSEMBLY PLANTS IN THE ECONOMIC DEVELOPMENT OF MEXICO

### ABSTRACT

*The maquiladoras in Mexico have played a strategic role in the economic development already that have been formed in generating exports and foreign exchange; have contributed to raise the competitiveness of domestic industry; they have been a source of employment, education and training of the workforce; as well as an important sector for transmit and generate technology. Actually, the maquiladoras have lost breath, due to multiple internal and external causes. In general have faced the new challenges posed by globalization and competitiveness. This paper focuses on the industrial sector called maquiladora export, establishing their importance and influence to the economic development of Mexico, specifically for the development of its borders. We will know his background since they were introduced into Mexico, as have been developed, as have changed and what is the time in which they are located.*

**JEL:** L00, L6, L60,

**KEYWORDS:** Performance Appraisal, Impact, Staff Remuneration, Maquiladoras

## INTRODUCCIÓN

Las maquiladoras desde su nacimiento han sufrido una serie de transformaciones que les han permitido evolucionar, desarrollarse, y transitar por tener etapas que permiten observar la importancia y la influencia que han tenido en el desarrollo económico. En este sentido han jugado un papel estratégico para el desarrollo de México, ya que se constituyó en un gran generador de exportaciones y de divisas; contribuyó a elevar la

competitividad de la industria nacional; fue una importante fuente generadora de empleo sobre todo en los años noventa; de capacitación y adiestramiento de la mano de obra, así como un sector importante para transmitir y generar tecnología. Desde el año 2001 hasta la actualidad, las maquiladoras han perdido aliento, debido a múltiples causas tanto internas como externas. En general se ha enfrentado a los nuevos retos que plantean la globalización y la competitividad, por lo que las empresas maquiladoras están preocupadas por encontrar nuevos esquemas que les permitan mejorar su productividad, alcanzar los objetivos y las metas que se han planteado, en definitiva a seguir operando con éxito.

## REVISIÓN DE LA LITERATURA

### Antecedentes: las Maquiladoras en un Contexto de Sustitución de Importaciones y Apertura Económica

En la industria maquiladora de exportación se pueden identificar dos etapas: una donde las maquiladoras se pusieron en marcha bajo el modelo de sustitución de importación que se puede ubicar en el tiempo de 1965 a 1982 y la otra bajo un modelo de apertura comercial y desregulación económica, que es un modelo que puede ubicarse desde 1983 hasta 2000 (Turner, 2006) y que se extiende hasta la actualidad. Desarrollo económico e industrialización (maquiladoras). Después de la Segunda Guerra Mundial se desarrolló en México (1946-1952), el proyecto *industrializador* que pretendió construir la sociedad industrial, salir del subdesarrollo y consolidar al México independiente (Aguilar & Meyer, 1989 p. 198.). La nueva planta industrial fue financiada con las divisas de las exportaciones agrícolas y mineras tradicionales, con los envíos de divisas de los trabajadores mexicanos en EE.UU., con el aumento del turismo y del ingreso de capital extranjero que venía a participar del auge. Al lado de la industria surgió un poderoso sector bancario en el cual se cobijaron importantes grupos manufactureros y comerciales.

El deseado desarrollo económico se logró, sobre todo, con el llamado ‘milagro mexicano’, en el cual se pueden identificar dos etapas: El crecimiento con inflación (1935-1956) y el crecimiento con estabilidad (1956-1972) (Medina, 1995 p. 128)

A principios de los años setenta se mostraron ya los límites del desarrollo estabilizador. El gobierno de Luis Echeverría (1970-1976) intentó superar esta etapa para ubicarse en una nueva, la del llamado “desarrollo compartido”. Esto sólo fue parte de su discurso y a la vez se convirtió en una autocrítica a la desigualdad económica y a la concentración de la riqueza. El desarrollo compartido desembocó en una grave crisis económica en 1976, que tendría su réplica en 1982 al final del gobierno de José López Portillo. Al mismo tiempo, los EE.UU. decidieron poner fin en 1964 al Acuerdo Internacional sobre Trabajadores Migratorios (AITM) firmado entre México y Estados Unidos en 1942. Comúnmente conocido como el Programa Bracero. El fin de este programa tuvo como consecuencia un elevado flujo de trabajadores migrantes hacia la frontera de México que provocaron el aumento de la población y el desempleo de más de 200,000 trabajadores en las ciudades fronterizas mexicanas.

En respuesta del gobierno mexicano a la cancelación por parte de Estados Unidos, en diciembre de 1964, del AITM (Programa Bracero), y debido a la presión de los sindicatos del norte del país, se estableció el Programa de Industrialización de la Frontera (PIF), en mayo de 1965 y formalmente instituido en octubre de 1966. Siendo aquí donde la industria maquiladora tuvo su verdadero comienzo. Crisis económica en los setenta y ochenta: Reforma estructural. A finales de la década de los setenta y principios de los ochenta, hubo una desaceleración de la económica a nivel mundial. El crecimiento de la economía de los países más industrializados de Europa y EE.UU. fue negativo. En América Latina, la crisis iniciada en 1982 se prolongó durante toda la década motivada por dos factores fundamentales: el peso de la deuda externa y la reducción drástica de nuevos financiamientos y, sin duda como consecuencias de los errores de política locales, incluyendo la corrupción.

En este contexto de crisis se dio el *cambio estructural*. Los cambios hechos en los niveles micro y macro económicos, se retroalimentan de manera que el cambio estructural fue en mayor o menor medida el principal sustento de la estabilidad (Rebolledo, 1994, p. 126).

La reforma estructural estuvo fundamentada en: 1) la apertura comercial, 2) la desregulación, la inversión extranjera y, 3) las desincorporaciones.

#### Análisis de la Industria Maquiladora de Exportación (IME)

La Industria Maquiladora de Exportación (IME), según, Carrillo, Hualde & Quinterio, (2005) está formada por un conjunto de actividades productivas heterogéneas inscritas en un régimen arancelario específico, las cuales contienen características similares entre sí, diferenciándose en su interior por el tipo de sindicatos, procesos de ascensión, etc. La Industria Maquiladora de Exportación tiene cuatro etapas: Primera etapa 1965-1982: La IME en esta primera etapa juega un papel de integración complementaria de economías (*production sharing*). Segunda Etapa: 1983-1994 Las teorías de la flexibilidad (tecnológica, organizacional y laboral) y su relación con la competitividad así como la globalización se hacen presentes en esta etapa. Tercera Etapa: 1995-2000: "En esta etapa, el debate se centra en preguntarse si con el TLCAN se beneficia de manera significativa a la maquila y a sus trabajadores o por el contrario los perjudica. Cuarta Etapa: 2001- 2004. Con los cambios en las condiciones en el entorno nacional e internacional y la pérdida de ventajas comparativas, a partir del 2001 la IME sufre una profunda desaceleración. Por lo que en esta etapa habría que considerar las dimensiones del problema y las causas que lo provoca. Desde octubre del 2000 hasta 2004 las plantas maquiladoras perdieron alrededor de 300,000 empleos y 890 plantas.

Como puede observarse, en estas etapas se dieron en las maquiladoras altibajos que pueden resumirse, siguiendo a Turner, (2006) de la siguiente manera: "desde su origen hasta 1976 la industria maquiladora tuvo un crecimiento acelerado durante 12 años, experimentando, en el periodo 1976-1982, una sensible baja en los ritmos de actividad e incluso años de contracciones. De 1983 a 1992, la industria maquiladora vuelve a crecer con rapidez estimulada por las devaluaciones y la apertura económica, a pesar de la crisis económica y el estancamiento productivo de esos años, (Ver Tabla 1). El número de empresas se incrementó de 600 hasta sobrepasar las dos mil empresas, pero durante el par de años siguientes permaneció estancado. A partir de 1994, con la firma del TLCAN, vuelve a incrementarse alcanzando las 3 500 en el 2000." (p. 13)

Tabla1: Establecimientos, en la IME Por Entidad Federativa, 1980-2000

Año	Baja California	Sonora	Chihuahua	Coahuila	Nuevo Leon	Tamaulipas	Otros	Total
1980	230	81	121	31	-	81	76	620
1985	307	73	168	42	-	77	93	760
1990	640	155	311	133	65	225	174	1,703
1995	729	176	322	184	84	281	354	2,130
2000	1,218	284	446	280	156	375	831	3,590

Fuente: INEGI: (1998) (2001)

En el periodo 1980-2000, son tres los estados fronterizos predominantes en lo que se refiere al establecimiento de maquiladoras: Baja California, Chihuahua y Tamaulipas; los cuales representaron más de las dos terceras partes hasta 1993, siendo Baja California el que absorbió alrededor del 40%. En general en los seis estados fronterizos se localizaron 85% de los establecimientos de la industria maquiladora hasta 1993 (Turner, 2006, p.14). En lo referente a la evolución del empleo en la IME en el periodo de 1980 al 2000. En la década de los ochenta, de 1982 a 1986, crece rápidamente hasta duplicarse; después, cada seis años se dobló la cifra, hasta llegar al millón de empleos en 1998 y a un millón doscientos ochenta y cinco mil en el año 2000. (Ver Tabla 2). Por estados es Chihuahua, donde recibieron empleo la tercera parte de

los trabajadores de esta industria, de 1980 a 1993 y la cuarta parte, de 1998 al 2000 a pesar de que Baja California tenía mayor número de establecimientos. Baja California ha proporcionado la quinta parte del empleo de la industria. En términos porcentuales su participación se incrementó de 17%, en 1980, a 21%, en 1995, porcentaje que se mantuvo hasta el año 2000. (Turner, 2006, p.14).

Tabla 2: Empleo en la IME: 1980 2000 (Miles De Trabajadores)

Año	Baja California	Sonora	Chihuahua	Coahuila	Nuevo Leon	Tamaulipas	Otros	Total
1980	20	18	39	5	-	23	15	120
1985	39	20	78	11	-	37	27	212
1990	89	39	164	31	14	81	28	446
1995	133	54	185	56	27	117	76	648
2000	275	105	319	114	68	181	223	1 285

Fuente: INEGI (1998) (2001).

Con el (TLCAN) y de conformidad con el Acuerdo para la Desregulación de la Actividad Empresarial, también se afirma la imperiosa necesidad de adecuar el marco jurídico de la industria maquiladora y al mismo tiempo abatir los costos de las empresas maquiladoras de exportación, todo esto con el objeto de mejorar la competitividad y la necesidad de fortalecer a la industria maquiladora de exportación y de mejorar el acceso de las empresas medianas y pequeñas a los programas de maquila. Sin embargo, desde noviembre del 2000 la Maquila dejó de crecer, las causas de esta crisis, según Bendesky; De la Garza; Melgoza & Salas, Carlos. (2004). han sido atribuidas a varios factores:

*Estados unidos dejo de demandar productos de la maquila mexicana debido a la recesión económica La falta de competitividad con otros países como China y América Central que pagan salarios más bajos a sus trabajadores que los que se pagan en México. La reducción de las ganancias en las maquiladoras debido al incremento de los salarios de la Maquila en México en los últimos años. El peso sobrevaluado que encarece las exportaciones mexicanas. (p. 283) En términos generales se desprende tácitamente que la Maquila se basa en bajos salarios de lo contrario tiende a salir del país o cierra los establecimientos.*

A pesar de la disminución en el número de plantas y en el empleo ocasionada por la crisis que inició en 2001, a mediados del 2004 había en México un total de 2,800 establecimientos y más de 1,100 000 personas ocupadas (INEGI, 2004) este ejemplo nos indica que las maquiladoras se han visto envueltas en crisis económicas, recesiones, desaceleración y disminución de la economía. Respecto de crisis económicas destaca la que comenzó en 2008 que provocó que en Estado Unidos se perdieran una gran cantidad de empleos y del cierre de empresas, lo que lógicamente impactó directamente en la economía mexicana, la cual tiene como principal país exportador los EE.UU. la crisis que se extendió a Europa y a la mayoría de los países de otros continentes no ha terminado a la fecha de 2013.

#### Fomento de la Industria Manufacturera, Maquiladora y de Servicios de Exportación (IMMEX).

Para enfrentar la intensa competencia de los mercados globales, el gobierno mexicano público en el Diario Oficial de la Federación, el 1 de noviembre de 2006, el Decreto para el Fomento de la Industria Manufacturera, Maquiladora y de Servicios de Exportación (IMMEX), con el cual se integraba en uno solo, los programas para el Fomento y Operación de la Industria Maquiladora de Exportación (Maquila) y el Programa de Importación Temporal para Producir Artículos de Exportación (PITEX). Este programa se implementó como un mecanismo que permita a las empresas mexicanas competir con éxito posicionando sus mercancías y sus servicios en el comercio internacional.

Las lecciones de la EMIME. Con el paso del tiempo el Programa PITEX adquirió importancia en los procesos productivos por cuenta ajena, de tal manera que la maquila de exportación no se asociaba solamente a un programa de fomento al comercio exterior. Debido a la *relevancia del Programa IMMEX*

como una importante fuente de empleos y divisas para el país, se decidió iniciar en 2007 con la recolección de información estadística de las unidades beneficiarias de este Programa, principalmente de aquéllas con actividad manufacturera y en 2009 se inicia con la captación de información de establecimientos del segmento No manufacturero como actividades de agricultura, minería, comercio y servicios, principalmente.

Programa de la Industria Manufacturera, Maquiladora y de Servicios de Exportación (IMMEX) (Julio de 2013).

La Estadística Mensual sobre Establecimientos con Programa de la Industria Manufacturera, Maquiladora y de Servicios de Exportación (IMMEX) “muestra las características y evolución de los establecimientos manufactureros y no manufactureros (número de establecimientos en activo, personal ocupado, horas trabajadas, remuneraciones e ingresos, entre otras variables) registrados en este programa.” La estadística mensual que se genera del IMMEX, advierte el INEGI (2013) “no es comparable con la Estadística de la Industria Maquiladora de Exportación que generó y publicó el INEGI hasta diciembre de 2006, ya que si bien ambas se basan en programas de fomento al comercio exterior de la Secretaría de Economía, la referente a la Industria Maquiladora de Exportación se centraba exclusivamente en la producción por cuenta ajena destinada al extranjero” (INEGI, 2013) A julio de 2013, los Establecimientos adscritos al Programa IMMEX a nivel nacional fueron 6,283, esto significó una caída de (-) 0.3% a tasa anual. De estos establecimientos el 81.3% corresponde a manufactureros y el 18.7% a establecimientos no manufactureros (que realizan actividades que tienen que ver con la agricultura, pesca, comercio y a los servicios). En la figura siguiente se presenta la participación del total de los establecimientos en las distintas entidades federativas del país.

El personal ocupado se incrementó 5.8% en el séptimo mes de 2013 respecto a julio de un año antes. Según el tipo de establecimiento en el que labora, en los manufactureros avanzó 5.7% y en los no manufactureros 6.7 por ciento. El 89.8% de los trabajadores efectúan actividades del sector manufacturero y el 10.2% actividades de otros sectores. La distribución del personal ocupado por entidades federativas para julio de 2013, se dio de la siguiente manera:

Encabezados por Chihuahua que representó el 13.1%, Baja California 12.4%, Nuevo León 10.6%, Coahuila 9.7%, Tamaulipas 8.4%, Sonora 6.3%, Jalisco 5.8% y el estado de México 5.6%, que en conjunto contribuyeron con el 71.9% del personal ocupado total.

Figura 1: Distribución Por Entidad Federativa de los Establecimientos Con Programa Immex Durante Julio de 2013 (Estructura Porcentual)

### Las Maquiladoras en Baja California

Gran parte de las maquiladoras en Baja California se ha concentrado en Tijuana, específicamente la industria electrónica que también tiene una gran presencia en Ciudad Juárez. Por lo tanto en la ciudad de Tijuana, la electrónica ha desempeñado un papel muy importante en el crecimiento de la IME como lo demuestran los datos de 1997, cuando Baja California ocupó el primer lugar nacional en materia de empleo, y el sexto en número de establecimientos. La industria representó el 7 por ciento del PIB estatal manufacturero y

participó con alrededor del 1.5 por ciento del PIB de la industria electrónica del país sobre el PIB manufacturero nacional”. (López, 2008, p. 65) Como se ha dicho la industria maquiladora ha perdido dinámica los últimos años y esto ha afectado a los establecimientos en los estados fronterizos. El caso de Baja California, según las cifras del INEGI de abril de 2012, en Tijuana se perdieron 86 plantas durante abril de 2012 comparado con las de noviembre de 2007.

Según datos oficiales, durante abril de 2012 en Tijuana el número de establecimientos de la industria maquiladora registro una pérdida de 86 plantas en comparación con datos de noviembre de 2007. Se pasó de un total de 624 en 2007 a una cifra de 538 en 2012. En Mexicali, en el mismo periodo de tiempo se registró la pérdida de 12 empresas maquiladoras ya que se pasó de 168 en 2007 a 156 establecimientos en 2012. Por lo que respecta a Tecate había un registro en 2007 de 137 maquiladoras y para abril de 2012 se contaba con 124, lo que significa que hubo una pérdida de 13 establecimientos. En el caso de Ensenada se perdieron 12 plantas ya que se pasó de 105 en noviembre de 2007 a 93 en abril de 2012. Con estos datos el número total de establecimientos de maquiladoras en Baja California se perdieron 123 plantas ya que se pasó de 1,034 en noviembre de 2007 a 911 en abril de 2012.

Esto nos indica que la crisis económica tuvo su impacto en la industria maquiladora y en el número de empleo. Las maquiladoras han sido un factor importante porque se han constituido como una variable en el desarrollo económico de allí su importancia. Como hemos apuntado anteriormente, por lo que respecta a su estudio, las maquiladoras, durante las últimas décadas han sido abordadas desde diferentes aristas, desde aquellas que estudian su evolución tecnológica y organizativa, con incidencias importantes en la calidad del empleo y en las condiciones de trabajo como el caso de los estudios de (Carrillo y Hualde, 1998; Lara, 1998; Contreras, 2000) hasta aquellos que plantean las condiciones precarias de trabajo y que los cambios tecnológicos no han representado una mejoría en la calidad del empleo (Kopinak, 1996; De la O, 1999; Cravey, 1998). De los estudios de las maquiladoras en Baja California sobre todo aquellos relacionados directamente con el tema de interés de esta investigación, destacan aquellos los que se refieren con las maquiladora y la rotación de personal, (Morales, 2011) (Carrillo, 2001, Carrillo y Santibáñez, 1993), (Morales, 2011; Gutiérrez, 2012), esta última se enfoca en la rotación del personal obrero en la industria maquiladora de exportación en Tijuana, Baja California. Otros estudios se enfocan al tema de las mujeres fronterizas en la industria maquiladora, (Carrillo y Hernández, 1989).

Sobre la evaluación del desempeño en las industrias maquiladoras hay muy pocos estudios sobre todo para la ciudad de Mexicali. Ciertamente la mayoría de los estudios se centran en la ciudad de Tijuana debido a que allí están el mayor número de establecimientos. En esta investigación nos enfocamos en los empleados de las maquiladoras, en el personal y de modo específico en la estrategia que utilizan en los departamentos de RR.HH. para evaluar el desempeño. Se pretende vincular los resultados de la evaluación sistemática o formal que se implementa en las industrias maquiladoras para retribuir a sus empleados, para incentivarlos. Asimismo el impacto que tiene en la rotación de personal. El estudio se restringe a la Ciudad de Mexicali de un universo de alrededor de 200 empresas maquiladoras que se encuentran activas.

# FACTORES CONDICIONANTES QUE IMPULSAN A LAS PYMES EXPORTADORAS DEL SECTOR AGROINDUSTRIAL DEL ESTADO DE COLIMA A PARTICIPAR EN UNA FERIA NACIONAL E INTERNACIONAL

Manuel Rubio Maldonado, Universidad de Colima  
Oscar Bernardo Reyes Real, Universidad de Colima  
Aurelio Déniz Guizar, Universidad de Colima

## RESUMEN

*El estado de Colima cuenta con una importante posición estratégica portuaria, específicamente situada en el municipio de Manzanillo, Colima. Aunado a ello, se tiene una riqueza agropecuaria con gran potencial en cuanto a recursos naturales, lo que hace idóneo al estado para crear producción agroindustrial. Esto impulsa un compromiso para que las pequeñas y medianas empresas del estado sean competitivas ante las empresas del resto del país y contribuyan a las exportaciones del mismo. Para ello, cabe mencionar que utilizan diferentes medios para dar a conocer sus productos y servicios, uno de estos, son las ferias nacionales e internacionales. La importancia de las ferias nacionales e internacionales en los últimos años, han sido una herramienta de promoción y difusión para dar a conocer sus bienes y servicios. Con este medio de comunicación se ha incrementado el nivel de ventas. Esto ha dado a las PYMES un punto de referencia para buscar clientes potenciales. El escenario desarrollado en estos eventos también ha posicionado la marca de sus productos y elevado los pedidos de las firmas. En ese sentido, las ferias o exposiciones son una excelente vitrina para mostrar las mercancías, servicios y cualidades ofrecidos de la empresa. Y así, derivado de un incremento sustancial en su producción por la promoción y difusión de sus productos y servicios en las ferias, aprovechen la posición estratégica del estado, esto por tener un polo de desarrollo logístico con influencia comercial hacia el mercado estadounidense, canadiense y hacia los países asiáticos de la Cuenca del Pacífico.*

**PALABRAS CLAVE:** Empresas PYMES, Empresa Exportadora, Feria Nacional O Internacional

## CONDITIONING FACTORS DRIVING THE SME SECTOR EXPORT AGRO COLIMA STATE TO PARTICIPATE IN A NATIONAL AND INTERNATIONAL FAIR

### ABSTRACT

*The state of Colima has a major port strategic position, specifically in the town of Manzanillo, Colima. Added to this, there is a high potential agricultural wealth in natural resources, which makes it suitable to the state to create agro-industrial production. This drives a commitment to small and medium state enterprises to be competitive the rest of the country and contribute to exports thereof. To do this, include using different media to publicize their products and services, one of these are national and international fairs. The importance of national and international in recent years, fairs have been a tool of promotion and dissemination to publicize their goods and services. With this media has increased the level of sales. This has given SMEs a reference point to find potential customers. The scenario developed in these events has also positioned the brand of your products and orders large firms. In that sense, fairs and exhibitions*

*are a great showcase for goods , services and qualities offered by the company. And so, derived from a substantial increase in production for the promotion and dissemination of its products and services at trade shows, I seize the strategic position of the state , this by having a pole of logistics development with commercial influence to the U.S. , Canadian market and to Asian countries of the Pacific Rim .*

**JEL:** F23

**KEYWORDS:** SME companies, export company, national or international fair

## INTRODUCCIÓN

El Estado de Colima cuenta sin duda con una posición estratégica de gran potencial en cuestión de servicios portuarios y recursos naturales, lo que lo hace apto para la producción agropecuaria. La actividad portuaria para la exportación de la producción agroindustrial al mercado internacional se centra en el puerto de Manzanillo. Esto les proporciona una ventaja competitiva a las Pequeñas y Medianas Empresas del Estado respecto a las demás empresas del país. Cabe mencionar que el sector al que fue enfocado este proyecto es el sector primario, específicamente a la agroindustria, en los 10 municipios del estado donde se ubicaron estas empresas. El sector exportador en Colima ha enfrentado transformaciones profundas durante las dos últimas décadas, el continuo proceso de urbanización, las tendencias del mercado mundial, han influido de manera decisiva en la estructura del sector exportador.

La producción adquiere un carácter mucho más comercial, donde la competencia impone estándares de calidad y servicio, obligando a las unidades productoras a una continua modernización en sus procesos productivos, así como a la diversificación de productos y nichos de mercado. Esto tiene importancia en su utilización para el desarrollo económico, fortalecimiento nacional y posicionamiento internacional de las empresas. Ello obliga a las PYMES colimenses a consolidar su mercado doméstico y a realizar una cantidad de exportaciones para que lleguen a tener un renombre respecto a otras empresas que no tienen esta ventaja competitiva, y no solo eso, sino también de ello depende la estabilidad económica del Estado de Colima. Mediante esta investigación, se busca tener un amplio conocimiento de las diversas empresas que han incursionado en la participación en ferias nacionales e internacionales con la finalidad de consolidarse en el sector exportador, así como identificar los factores condicionantes que han influido en la participación en estos eventos de cada una de las firmas.

También se pretende que la información recabada pueda lograr mayor interés en las empresas que no han incursionado en las ferias y se fomente su participación por cuenta propia y no a través de terceros. Se considera que esta información es de gran importancia porque en la actualidad las empresas buscan ser más competitivas, y estos factores puestos en práctica por estas empresas exitosas, pueden servir como herramienta básica para que logren sus objetivos. Al realizar esta investigación se espera encontrar la realidad de lo que son los factores estratégicos con los cuales éstas empresas se han apoyado para lograr un crecimiento sostenido a través de esta herramienta, con la que han dado a conocer sus productos, hacer alianzas estratégicas, trabajar a consignación, conseguir insumos; derivado de esto han fortalecido su mercado doméstico e internacional.

Este fenómeno ha alcanzado a una gran cantidad de países, aun cuando se observa que en general a Latinoamérica le hace falta una mayor internacionalización de sus empresas, (Wilska y Tourunen, 2001), por lo que es de suma importancia realizar investigaciones para referirse a cuáles han sido los elementos determinantes que han fortalecido su participación en el mercado doméstico, porque en él se tiene la misma competencia que en el escenario internacional, (Sánchez Díez, 2002). Aunado a lo anterior, investigadores postulan que en el siglo XXI, el éxito o fracaso de la PYMES dependerá de su desempeño en los mercados globales. Esta afirmación supone la vigencia de un nuevo paradigma, según el cual, las empresas son

creadas y actúan en mercados crecientemente interconectados, en donde las barreras nacionales tienden a diluirse. Dentro de esta lógica, las empresas verían al mundo como un gran mercado y sus estrategias y decisiones de negocio se formularían bajo esta premisa de fortalecer el mercado nacional e internacional, basados en instrumentos de promoción que consoliden su mercado nacional e internacional. Ahora bien, cabe preguntar si nuestras Pequeñas y Medianas Empresas están preparadas, y, sí su evolución responderá a esta lógica. Dado que los resultados competitivos de las PyMES no son neutros para las sociedades de pertenencia, su éxito competitivo tiende a traducirse en generación de mayor empleo y riqueza, incorporación de nuevos conocimientos y desarrollo de talento local. De modo que el desempeño competitivo tendrá impacto sobre la evolución económica, social, institucional y cultural de las sociedades que las albergan, razón para dedicar este artículo al entendimiento de los procesos de la promoción de sus productos mediante su participación en ferias nacionales e internacionales, que fortalezcan ambos escenarios con el fin de identificar los factores que determinan e impulsan su participación con este instrumento de marketin para consolidarse en ambos mercados.

*Objetivo general:* Determinar los “factores y condiciones que impulsan a las PyMES del Estado de Colima a incursionar en ferias nacionales e internacionales”.

*Hipótesis de investigación:* Si los factores para reaccionar de una empresa PYME del sector agroindustrial exportador dependen de las tendencias del consumidor como gustos, opiniones, creencias, valores y hábitos en general de sus clientes potenciales, entonces estos influyen para que las PYMES participen en una feria nacional e internacional que consolide su mercado interno y exportador.

## REVISIÓN LITERARIA

Desde hace dos décadas las pequeñas empresas exportadoras del Estado de Colima se encuentran en un proceso de apertura creciente al mercado exportador. Es de recordar que en México las PYMES representan un 97% del tejido empresarial, ocupan más del 50% de la población económicamente activa y generan una cuarta parte del Producto Interno Bruto, (Morales. 2006, p21). La falta de capacitación, innovación tecnológica y financiamiento, entre otros aspectos, ha generado que estas empresas enfrenten múltiples obstáculos para participar competitivamente en los mercados internos y externos, (Montero & Muñoz 2007). Para lograr incursionar y mantenerse en las esferas de la economía global, estas Firmas deben considerar la productividad y la competitividad como parte de sus objetivos estratégicos, (Charruca, E. J. Barrutia & J. Landeta 1995). La productividad es el empleo eficiente de los recursos técnicos, materiales y humanos para producir bienes y servicios de calidad, (Sánchez, 2008), representando la relación entre cantidad y calidad del producto o servicio. La calidad es la ausencia de deficiencias y constituye el cúmulo de características que satisfacen al cliente, (Juran, 1990). El sector exportador representa un factor económico muy importante, tanto para los colimenses como para el país. Por lo tanto, para obtener un mejor desarrollo y crecimiento económico a través del sector exportador, es importante resaltar las ventajas competitivas con las que cuenta el estado de Colima, (Porter, 2004).

Se cuenta con variedad de productos, como coco, limón, melón, sandía, piña, aceites de coco y limón, la cercanía a uno de los puertos más importantes del país y apoyos gubernamentales a la exportación necesarios; sin embargo, en los últimos años no sólo su potencialidad productiva ha venido en decremento, sino también su capacidad para mejorar el bienestar de calidad de vida de los trabajadores. Así, en esta investigación se considera importante determinar los factores que impulsan a las PyMES a incursionar y participar en ferias nacionales e internacionales y conocer de primera mano que tanto limitan o impulsan la participación en el mercado doméstico y el internacional. Derivado de lo anterior, determinar la efectividad de estas estrategias con las cuales han logrado un crecimiento sostenido en el escenario nacional y si ello les ha permitido consolidar su internacionalización La internacionalización tradicional es la que por lo común siguen las trasnacionales. Esta internacionalización tradicional supone un proceso a través del cual,

en un primer momento, la empresa instala fuera de sus fronteras aquellas actividades más próximas al cliente final —ventas a través de la exportación— para progresar en su internacionalización, asumiendo un mayor grado de compromiso —como pueden ser las inversiones directas. Las etapas que generalmente suelen seguir las empresas, son: exportación ocasional, exportación regular directa e indirecta, establecimiento de filiales de venta en el extranjero y creando subsidiarias de producción en el extranjero, (Sáez y Cabanelas, 1997:26). Venderle al mundo es hoy una posibilidad. Se puede hacer en forma individual o en grupo. Es clave la asistencia a ferias: el refrán “la unión hace la fuerza”, es cada vez más popular en el mundo PYME. Si bien hay actividades que parecen restringidas a las grandes empresas, el límite desaparece si de exportar se trata. Con estrategias propias o formando parte de una asociación las Pymes colimenses han ganado espacios en mercados extranjeros. Así, los factores que impulsan a una PYME a participar en una feria nacional o internacional son la buena calidad y los buenos precios. Los reportes sobre las Pequeñas y Medianas Empresas (PYMES) se pueden clasificar en dos tipos, los reportes sobre estadísticas y los reportes sobre Política Industrial.

En ambos reportes se reconoce que las PYMES son importantes para la economía y para el desarrollo del país, por el número de empleos que representan y por su contribución a la derrama económica en el mercado, (SBA, 2010). Por otra parte, se comenta la importancia de que no desaparezcan y crezcan para aumentar el impacto positivo en la economía. Sin embargo, las publicaciones disponibles no analizan de manera formal la gestión de las PYMES en México, lo que existe son los comentarios y argumentos de profesionales y proveedores de servicios, basados principalmente en experiencias pasadas, que expresan en los medios de comunicación las áreas de oportunidad en las PYMES, por ejemplo: el desarrollo de una estrategia de negocio, realizar benchmarking, estudios de mercado, capacitación para la exportación, apoyos de financiamiento para el crecimiento, cursos de administración y de las operaciones del negocio, capacitación del recurso humano en todas las áreas y desarrollo de sistemas informáticos internos y de e-commerce, (Barceló y Pérez, 2003). En este contexto, consideramos dos enfoques desarrollados por Nacional Financiera (NAFIN), denominados enfoques internos y externos.

El enfoque externo se caracteriza por problemas que afectan a las PYMES, pero que son más bien del tipo macroeconómico y en donde las PYMES no tienen influencia en su solución (o no es su razón de ser); mientras que el enfoque interno, en cambio, se caracteriza por problemas derivados de la gestión propia del negocio y del sector económico al que pertenecen y, donde las PYMES son responsable de su solución y mejora. Como primer ejemplo tenemos el caso de la "Encuesta a la industria mediana y pequeña" de NAFIN (1985), donde se analizó una muestra de 20,923 empresas y que, de los nueve factores identificados como "problemas", solo cinco factores pueden ser asociados a la gestión interna del negocio (ver tabla 1): carencia de organización, retraso tecnológico, falta de capacitación del personal, problemas en la colocación de productos, y carencia de registros contables. Otro estudio de interés es "La industria por escala productiva", realizado por SECOFI (1987). Abarcando 35,000 empresas que representaron el 40% de la industria nacional, y que identifica seis factores en la "problemática" de la micro y pequeña empresa, de los cuales solo dos pueden ser asociados a la gestión interna del negocio: altos costos de operación y liquidez financiera. Así, el estudio de Sánchez, (2003) menciona un estudio de NAFIN, que reporta los "motivos o causas internas por las cuales mueren las PYMES", entre las cuales se mencionan: problemas administrativos (43%), problemas fiscales (16%) incapacidad de cumplir requisitos (15%), deficiencia en comercialización (11 %), por errores en insumos y producción (8%) y debido a la falta de financiamiento (7%). Con excepción de los puntos "problemas fiscales" y "falta de financiamiento", el resto son puntos que se pueden asociar a la Gestión Interna del Negocio.

Sin embargo, no se reporta la referencia del estudio, por lo que debe ser tomado solamente como un comentario. En relación a un estudio más reciente realizado en el período del 2001-2002, se aplicó una encuesta a 1,034 PYMES (CIPI, 2003a) donde las principales conclusiones del reporte preliminar son: primero, se reconoce que los programas para las PYMES no deben ser los mismos que para las Micro y

para las grandes empresas; segundo, los indicadores de eficiencia utilizados en los programas públicos, cuando se basan en el número de empresas atendidas, provoca que la atención sea sobre las Micro empresas que representan más del 90% de las empresas. Así, reporte preliminar, se orientan a recomendaciones para mejores apoyos públicos, definidos específicamente como política industrial para el segmento de las PYMES, más que en mejoras de la gestión interna de las PYMES y solo reconoce dos problemas de la gestión interna de las PYMES: falta de certificación en calidad y de metodologías orientadas a la mejora en calidad y productividad. Sin embargo, en las publicaciones revisadas de las PYMES, nada se menciona sobre los procesos de gestión sobre promoción de sus productos y cuales herramientas serían las adecuadas para desarrollar una técnica para ofertar sus productos, los cuales son independientes a tener una estructura organizacional compleja o a tener que documentar la calidad del producto. Los procesos de gestión pueden dividirse en dos tipos: procesos operativos y procesos de apoyo (APQC, 2004)", y, la literatura sobre los temas de gestión que soportan los procesos de gestión son: administración general, administración de operaciones, control de piso y calidad, administración de la productividad, y planeación estratégica.

## METODOLOGÍA

En la última década del siglo pasado y en la década reciente de este siglo en donde la participación de México en el sector exportador ha sido productiva, obliga a conocer cuáles han sido esos factores que impulsan a las pymes a promocionar sus productos en el mercado nacional e internacional. Así, esta dinámica muy propia del medio exportador, obligó a encuentros con empresarios y fue llevando a profundizar aspectos referidos a la capacitación de sus cuadros técnicos y operativos, así como a preguntarles acerca de la contribución que realiza el mundo del conocimiento (universidades, escuelas de negocios, laboratorios, etc.) a favor de sus aspiraciones de consolidar el mercado nacional y con ello fortalecer el internacional. La presente investigación se enmarca en la búsqueda y acopio de datos de fuentes primarias ya que se obtuvo a través de investigaciones específicas, principalmente por el instrumento de encuestas y la entrevista en profundidad. Además se utilizó la fuente secundaria, consultando a las oficinas de Fomento Económico de los gobiernos municipales y a la delegación de la Secretaría de Economía del estado de Colima, publicaciones oficiales de la Secretaría de Economía, del portal de Proméxico, oficinas de Fomento Económico de los 10 municipios del estado de Colima.

La propia dinámica de los encuentros con empresarios nos fue llevando a profundizar aspectos referidos a la capacitación de sus cuadros técnicos y operativos, así como a preguntarles acerca de la contribución que realiza el mundo del conocimiento (universidades, escuelas de negocios, laboratorios, etc.) a favor de sus aspiraciones de internacionalización. Para procesar la información se utilizaron métodos cuantitativos de los resultados obtenidos de las encuestas. Se analizaron bajo métodos estadísticos y hechos observables con la finalidad de controlar las variables y medir los resultados. Soto y Dolan, (2004), señalan que la PYME tiene características que le permiten desenvolverse de manera más eficiente que las grandes empresas, éstas son: su elevado grado de flexibilidad, su acceso a nuevas formas de distribución, operar contractualmente con agentes, distribuidores, empresas comerciales, utilizar asociaciones sectoriales junto con otras empresas, fomentar alianzas con empresas extranjeras a fin de comercializar en sus mercados, la motivación e ingenio que son capaces de desarrollar ante la competencia.

De acuerdo a la SE (2013), SAGARPA (2013), FOMENTO ECONOMICO (2013). De un total de 560 empresas PYMES solo 33 participan en el sector exportador y ello ha sido factor para asistir a ferias nacionales e internacionales con la finalidad de dar a conocer sus productos y contar con clientes potenciales. Este trabajo se auxiliará del método deductivo, ya que parte de lo general a lo particular, que se aplica a la realidad de la actividad exportadora de las empresas colimenses, (Hernández s. r. & Fernández c. c. 2009).

*Técnicas a utilizar en la investigación:* Visitas domiciliadas a las empresas seleccionadas del padrón de la de las instituciones públicas antes mencionadas aplicando la encuesta y observación directa al empresario respecto a los factores que los impulsaron a incursionar en las ferias nacionales e internacionales.

*Valor metodológico:* basada en “dos enfoques desarrollados por NAFIN, denominados enfoques internos y externos. El enfoque externo se caracteriza por problemas que afectan a las PYMES, pero que son más bien del tipo macroeconómico y en donde las PYMES no tienen influencia en su solución (o no es su razón de ser); mientras que el enfoque interno, en cambio, se caracteriza por problemas derivados de la gestión propia del negocio y del sector económico al que pertenecen, y donde la PYME es responsable de su solución y mejora. En relación a estos enfoques se determinaron las características que engloban las factores internos y externos utilizados por las PYMES exportadoras del área agroindustrial del estado de Colima durante el período de 2010-2013.

*Valor práctico:* Se encara principalmente a la participación y opinión de las empresas que están exportando sus productos agroindustriales en función de los dos enfoques antes mencionados. Esto deja el antecedente para que en una futura investigación proponer estrategias para su mejora continua.

*Fortaleza de infraestructura colimense:* A nivel internacional, la ubicación geográfica del Estado, sus condiciones climatológicas y el contar con el puerto más importante del pacífico mexicano, representan ventajas estratégicas para las empresas exportadoras. “El puerto de Manzanillo es un puerto de transbordo –puerto Hub- ideal para los países de Centro y Sudamérica, así como para la costa oeste de los Estados Unidos de Norteamérica y Canadá (Gobierno del estado libre y soberano de Colima, 2010)”. Cuenta con un recinto portuario de 437 hectáreas en total, dividido en dos polígonos, que comprende zona de agua, más de 5,000 metros de muelles en 30 posiciones de atraque; 2.6 hectáreas de zonas de almacenamiento techado; 43 hectáreas de patios de usos múltiples; con terminal de hidrocarburos, pesquera y turística, así como un moderno centro de emergencias. Para el desalojo adecuado y seguro de las mercancías se encuentra equipado con 17.1 kilómetros de vías férreas con servicio de tren de doble estiba y 6.2 kilómetros de vialidades. El movimiento interno de cargas se realiza a través de quince terminales e instalaciones especializadas, las cuales son operadas por inversionistas nacionales y extranjeros con recursos tecnológicos de punta. La capacidad dinámica de carga del puerto es de 18.2 millones de toneladas para el manejo y almacenamiento de diversos productos, en 2013 registró un movimiento anual de 2,000,000 Teu's. Para el año 2018 se espera un crecimiento exponencial a un ritmo anual superior a 19%. *Ventajas competitivas del puerto*

“Ubicación geográfica estratégica que le facilita desplazar mercancías a los principales centros comerciales e industriales de la región centro occidente, del Bajío y Centro de México.

Cercanía con los países situados en la región de la Cuenca del Pacífico que promueve el desarrollo de un servicio marítimo frecuente entre México y Asia.

Apoyo a los puertos estadounidenses de Los Ángeles y Long Beach, que presentan problemas logísticos por congestionamiento.

Más de 130 hectáreas de superficie de reserva para el desarrollo de nuevas instalaciones y terminales en la zona norte, proyecto ya terminado en 2013, (API 2013).

Autopistas y red ferroviaria en condiciones excelentes que conectan directamente con importantes puntos nacionales e internacionales, simplificando la creación de corredores terrestres y hermanamientos con puertos interiores.

Servicio de ferrocarril de doble estiba en ruta fija, único en México, brindando mayor seguridad en el transporte de carga contenerizada.

Aduana y recintos fiscales modernos que contribuyen a la fluida circulación de la mercancía que ingresa al puerto.

Condiciones climáticas favorables para la navegación que le permiten operar las 24 horas del día los 365 días del año.

Apertura e incentivos por parte del Gobierno del Estado de Colima para la inversión nacional y extranjera.

Tecnología de punta en sus instalaciones y terminales que erigen al puerto por sexto año consecutivo como el líder nacional en manejo de carga.

En la entidad operan dos centrales termoeléctricas con una capacidad efectiva de generación de 1,900 Mw, las cuales producen el 70 por ciento del total de energía generada por la división occidente.

La red eléctrica estatal tiene una longitud de 6,337 Km. La red de alta tensión en 115 KV y 69 KV en el Estado tiene una longitud de 702 Km. La red que corresponde a las líneas de mediana tensión en 34.5 KV, 23 KV y 13.8 KV mide 3,696 Km y las líneas de baja tensión tienen una longitud de 1,939 Km (API, 2012).

*Proyectos en desarrollo:* “Actualmente en Colima se están invirtiendo grandes capitales en el desarrollo de importantes proyectos, en el sector energético para almacenamiento y transporte de gas LP y gas natural, así como en la generación de energía eléctrica, que beneficiarán a más de 10 estados de la región centro-occidente e impulsarán la competitividad para el desarrollo del país. Desarrollo del segundo puerto denominado Cuyutlán, con el doble de capacidad del puerto de Manzanillo, (Gobierno del estado de Colima, 2013).

## RESULTADOS

*Desde la perspectiva del enfoque interno, se encontró lo siguiente:* Al realizar un análisis de los datos recopilados a través de la aplicación de las encuestas a las Pequeñas y Medianas Empresas de los municipios del estado de Colima nos percatamos que el 100% de estas empresas tienen conocimiento de que representan una gran importancia para su Estado y País. Las PyMES, además de tener conocimiento de la importancia que juegan en el país, el 93% de estas están exportando sus productos a otro país, obteniendo grandes beneficios de ello, diversificando su mercado y alargando el ciclo de vida de algún producto, mientras que el 7% restante no quiere arriesgar su patrimonio llevando a cabo dicha actividad.

El 57% de las PyMES que están exportando, al momento de llevar a cabo dicha actividad, realizan previamente una investigación de mercado para poder conocer cómo se comporta el mercado en relación a la competencia y a las necesidades de los posibles consumidores, en relación a las razones por las que el 43% de las PyMES encuestadas no hacen una investigación de mercados es porque ellos sólo exportan a empresas para que otros la vendan con su propia marca o sencillamente porque no requieren investigar el mercado para poder vender su producto. Una vez hecha la investigación de mercados el 100% de estas Pequeñas y Medianas Empresas tienen la capacidad de satisfacer estos mercados gracias a la calidad de sus productos. Gracias a la calidad de sus productos y al resultado de las encuestas aplicadas en las pequeñas y medianas empresas de los municipios del Estado de Colima: Armería, Colima, Cómala, Coquimatlán, Cuauhtémoc, Ixtlahuacán, Manzanillo, Minatitlán, Tecmán y Villa de Álvarez, se corroboró que el 92% de las empresas encuestadas dentro de estos municipios, consideran necesaria su participación en las ferias nacionales e internacionales. Así se constató que estas, consideran importante la participación en dichas ferias para poder obtener mayores clientes y diversificar su mercado.

Del total de PYMES exportadoras del sector agroindustrial del Estado Colima, el 64% de esas empresas ha participado en ferias nacionales e internacionales, de estas firmas participantes en ferias o exposiciones, el 50% de PYMES ha participado de 1 a 4 ocasiones, el 31% de 1 a 5 y el 19% tiene una participación mayor a 8 veces. En relación a los beneficios, el 44% de estas consideran que la participación en las ferias nacionales e internacionales les ha traído beneficios económicos, mientras el 32% menciona que obtuvieron beneficios tecnológicos y el 24% restante opino que ambos beneficios. De la participación de tipo

específico por las características del evento en ferias o exposiciones nacionales e internacionales, el 37% de estas PYMES han participado en ferias nacionales o internacionales, 25% ha asistido a ferias nacionales y de sector o producto, 19% participa en ferias nacionales, regionales y en ferias generales o multisectoriales, el 13% ha participado en ferias regionales y en ferias de sector o de producto y tan solo el 6% mencionó solo haber participado en ferias regionales o locales.

Respecto al precio que se paga por estos eventos, el 75% de estas empresas consideran que los precios para participar en ferias nacionales e internacionales son justos y ello les ha enriquecido con aportaciones que les sugieren los futuros clientes. Mientras que el 25% restante contestó que los costos para participar en estas ferias son excesivos. Respecto a volver a participar, el 100% están dispuestos a participar nuevamente en ferias nacionales e internacionales. Así se comprobó que el 96% tiene confianza en las ferias y de los beneficios que las mismas tienen y en relación al costo del evento el 72% tiene conocimiento de los costos para poder participar en las exposiciones de tales ferias. En relación a los apoyos gubernamentales, el 64% opinó que han sido oportunos y buenos, mientras que el 28% de las mismas nunca se han visto beneficiados, el resto contestó que son malos o que nunca se han visto beneficiados por ellos. Una vez que éstas realizan la investigación de mercado y logran cubrir la demanda de sus consumidores y darse cuenta de que su producto es de alta calidad, el 93% de las PyMES tienen la capacidad de crear su propia marca y competir con las marcas ya conocidas en el extranjero, mientras que el otro 7% no tiene la capacidad de competencia con marcas reconocidas por lo que se ven en la necesidad de invertir en la creación de una marca propia o de mejorarla.

Ya realizada la venta del producto en el extranjero de las Pequeñas y Medianas Empresas de Colima, éstas dieron un resultado positivo del 86% de la totalidad de las empresas que con la exportación pueden diversificar su riesgo de invertir en un solo mercado, esto realizando un plan de marketing, siendo el 64% las que aplican este plan. Para poder darse a conocer en otros mercados es necesario la publicidad en el mismo país destino, siendo el 36% de las empresas encuestadas las que cuentan con campañas publicitarias, mientras que el otro 64% no cuenta con ellas, puesto que sus productos se venden muy fácilmente debido a los diferentes aspectos que los caracterizan como el precio y la calidad, por mencionar algunos. Como resultado de la investigación realizada, el 92% de las empresas del sector agroindustrial del Estado de Colima, considera de manera importante la participación en ferias, aun así, que ya exporten su producto. Así mismo consideran que las ferias nacionales e internacionales traen un cambio en la forma de pensar y los obliga a mantener la mejora continua en sus productos por la exigencia del mercado, llámese nacional o internacional. Aunado a lo anterior, posicionan sus productos en estos mercados. Mientras que el 8% de las empresas no sienten la necesidad de llevar a cabo dicha actividad y formar parte de ese gran número de empresas con precedencia consolidada en el mercado doméstico y complementado su actividad con el mercado internacional.

## CONCLUSIÓN

El objetivo principal de esta investigación fue determinar a través de una investigación de campo, los factores condicionantes tanto internos como externos que determinan la participación de las PYMES en las ferias nacionales e internacionales de los 10 municipios el Estado de Colima en el periodo 2011-2013. De acuerdo a información proporcionada por parte de la Secretaría de Economía, las Pequeñas y Medianas Empresas siempre han sido de gran importancia para el país. Cabe mencionar que a partir de los años 80's el sector agroindustrial comenzó a tener un gran auge y un crecimiento económico en el Estado de Colima; sin embargo, fue hasta los años 90's que comenzó a explotarse dicho sector, y es así como las empresas emprendieron la actividad agroindustrial, citando las exportaciones de diferentes productos colimenses como es el limón, el coco y sus derivados, el café, melón, sandía y plátano, por mencionar algunos; tratando así de sobresalir y dándole la importancia económica al Estado de Colima. Ello obligó a buscar mecanismos para promocionar sus productos a través de las ferias nacionales e internacionales.

Tomando en consideración la ubicación estratégica del puerto número uno a nivel nacional y reconocido internacionalmente en el movimiento de carga contenerizada, como lo es el Puerto de Manzanillo. Y derivado de lo anterior, se cuenta con la logística adecuada para el movimiento de mercancías producidas en el Estado de Colima, lo cual es de gran beneficio para que las Pequeñas y Medianas Empresas consoliden su actividad comercial a través de la promoción de sus productos en ferias. Esto es debido al incremento que se ha tenido en sus ventas y así aprovechar el potencial logístico para su actividad en el mercado internacional. Como se pudo observar, en esta investigación de campo se corrobora la hipótesis planteada en la que se analizó específicamente los factores internos que impulsan a las PYMES del estado de Colima a participar en las ferias nacionales e internacionales. No se consideró el análisis de los factores externos por falta de información proporcionada por las empresas.

## ABSTRACTO

*La sífilis congénita es un grave problema de salud pública a pesar de ser una infección probable de prevención. Este trabajo objetiva evaluar las condiciones de funcionamiento de las unidades de atención primaria de la salud en una ciudad en el noreste de Brasil, para cumplir con las recomendaciones para el control de la sífilis congénita. La investigación evaluativa que se recogieron los datos de julio a octubre de 2011. Se utilizó métodos multivariados del análisis factorial e aglomerados para determinar los factores representativos de cada dimensión e identificar los perfiles de atendimento.*

# OPERATING CONDITIONS OF THE UNITS OF PRIMARY HEALTH CARE IN A CITY IN NORTHEASTERN BRAZIL FOR THE CONTROL OF CONGENITAL SYPHILIS

## ABSTRACT

*Congenital syphilis is a serious public health problem despite being a likely infection prevention. This work aims to evaluate the operating conditions of the units of primary health care in a city in northeastern Brazil, to meet the recommendations for the control of congenital syphilis. Evaluation research data were collected July to October 2011. Multivariate methods like Factor Analysis and Cluster Analysis are used to determine the factors representing each dimension and identify attendance profiles.*

**JEL :** I180

**KEYWORDS:** Congenital Syphilis, Serodiagnosis of Syphilis, Health Evaluation, Primary Health Care

## INTRODUCCIÓN

Los estudios que evalúan los programas y servicios de salud muestran que la estructura y organización de dichas funciones interfieren en la calidad de la atención prestada (Costa et al, 2009). Entonces surge la pregunta: ¿cómo son las condiciones de funcionamiento de las unidades de atención primaria de salud (UPS) en Fortaleza - ubicado en el estado de Ceará, al noreste de Brasil - para cumplir con las recomendaciones establecidas por el gobierno para el control de la sífilis congénita (SC) ? Esta investigación tuvo como objetivo evaluar con imparcialidad e independencia, las condiciones de

funcionamiento de las unidades de atención primaria (UPS) de la ciudad de Fortaleza, en relación con las recomendaciones del gobierno para la prevención y el control de SC, buscando identificar los aspectos más relevantes de infraestructura física, la disponibilidad de recursos humanos y materiales, así como el rendimiento de los procesos de trabajo.

## REVISIÓN DE LA LITERATURA

La evaluación de la salud en la atención primaria se ha defendido en los últimos años y tiene como objetivo identificar los aspectos que pueden contribuir a la mejora de la calidad de los servicios. Últimamente, se argumenta que la evaluación de los servicios de salud debe ser sistemática y comprometer a los participantes en todas las etapas del proceso. Una revisión sistemática es una herramienta de gestión importante, ya que puede proporcionar información a los encargados de formular políticas para aumentar la eficiencia y eficacia de los recursos invertidos en programas sociales (Costa y Castanhar, 2003). Estudio sobre la frecuencia de las enfermedades de transmisión sexual que se celebró en seis capitales brasileñas encontró que la prevalencia de sífilis en mujeres embarazadas se encuentra muy por encima de las expectativas de la OMS, que son 0.5 casos por cada mil nacidos vivos (Brasil, 2010). En Fortaleza, los casos de sífilis gestacional en el período 2001-2009, mostró que el 68.7 % de las madres asistieron la atención prenatal, el 46.3 % fueron diagnosticados con sífilis en el embarazo y sólo 15.0 % tienen a parejas sexuales tratado. Los indicadores anteriores reflejan la mala calidad de la atención prenatal y poca importancia que los profesionales de la salud han dado al diagnóstico y al tratamiento, sobre todo durante el embarazo, lo que refuerza la necesidad de adoptar medidas encaminadas a la eliminación de la sífilis congénita, principalmente a través de acciones preventivas en la asistencia a la prenatal, crucial para la prevención de la enfermedad ahora.

### De Datos y Método

Estudio de evaluación llevado a cabo en la ciudad de Fortaleza, capital del estado de Ceará, que tiene la densidad demográfica más alta de Brasil, con 7,815.7 habitantes/km<sup>2</sup>. Administrativamente está dividida en seis regiones, denominadas Secretarías Regionales (SER) que funcionan para ejecutar las políticas y los objetivos sectoriales establecidos como prioritarios para cada grupo de población a través de los servicios articulados en una red de seguridad social. La recolección de datos se llevó a cabo de julio a octubre de 2011 hasta la observación directa en 89 unidades de atención primaria del municipio. La definición de las variables y atributos observados en el estudio se basó en los documentos publicados por el Ministerio de Salud, que considera cuatro dimensiones: *Estructura Física* (EF), *Recursos Materiales* (RM), *Recursos Humanos* (RH) y *Estructura Organizacional* (EO). Los indicadores de evaluación consistió en 35 ítems, tales como: existencia de salas para la atención prenatal y la administración de medicamentos, farmacias, equipos de médicos y enfermeras con entrenamiento en la sífilis y la anafilaxis, la atención prenatal, la realización de actividades educativas para la sífilis en las mujeres embarazadas y la sífilis congénita. Para cada variable se aplica una escala de 1 a 5, donde los valores más altos indican una condición más favorable. El alfa de Cronbach (Hair, Anderson, Tatham y Black, 2005) de 0.79, indica buena adecuación de la escala adoptada.

Fue creado un índice de clasificación de las unidades para cada dimensión, mediante la aplicación del *Factor Analysis* (FA), que sustituyó al grupo original por un menor, llamado *factores* o *componentes*, que han absorbido la mayor parte de la variación mostrada por los valores originales (Corrar, Paulo y Dias Filho, 2007). Celebró las habituales pruebas de validación de la FA, como el Kaiser-Meyer-Olkin, lo que resultó en una cantidad apropiada de 0.62 y de esfericidad de Bartlett, con significación estadística inferior a 0.001. Se obtuvieron las puntuaciones factoriales, tanto considerados para cada dimensión ( $IC_j$ ) en cuanto a los cuatro juntos (IC). Este último se creó mediante la aplicación de una función lineal de la  $IC_j$ , mediante la multiplicación de *eigenvalues* de cada factor por las puntuaciones factoriales.

La clasificación de UPS se basó en la estandarización de IC, lo que les deja con media cero e desviación estándar igual a 1, lo que permite establecer los siguientes criterios:

Tabla 1: Clasificación de UPS Basado en IC

Situación	Característica	Designación
$IC \leq -1$	Pobre clasificación	<i>Insuficiente</i>
$-1 < IC \leq 0$	Ligeramente por debajo de la media	<i>Regular</i>
$0 < IC \leq +1$	Ligeramente por encima de la media	<i>Bueno</i>
$IC > +1$	Alta clasificación	<i>Excelente</i>

Por último, hemos utilizado la primera componente de cada dimensión, obtenida por FA para formar grupos (Hair, Anderson, Tatham y Black, 2005). Inicialmente se realizó un análisis jerárquico y el gráfico resultante (*dendrogram*) mostró la formación de 4 grupos, lo que nos permitió distinguir las diversas formas de asistencia dadas por las UPS.

## RESULTADOS

Tabla 2 presenta cada dimensión evaluado y su grado de explicación de las variables relevantes. En EF dimensión, por ejemplo, tener espacio de oficinas para la atención médica y para administrar medicamentos fueron capaces de explicar el 60,1% del comportamiento de las variables originales.

Tabla 2: Presentación de las Dimensiones EF, RM, RH Y EO Con Sus Variables Relevantes

Dimensión	Explicación (%)	Variables Relevantes
<b>Estructura Física (EF)</b>	60.1	La posesión de oficina y sala de medicamentos
<b>Recursos Materiales (RM)</b>	59.8	Ser propietario de kit para anafilaxis
<b>Recursos Humanos (RH)</b>	55.5	Profesionales capacitados en la sífilis y la reacción anafiláctica
<b>Estructura Organizacional (EO)</b>	46.3	Realizar acciones para la prevención de la sífilis

*Las variables relevantes fueron extraídos de sus cargas factoriales con el programa SPSS v.20*

La siguiente tabla muestra el número de unidades enmarcadas en cada segmento, en base a los índices de clasificación parciales ( $IC_j$ ) y global (IC). A nivel general, como se muestra en la última fila, fueron juzgados *Insuficientes* 22.5% de las UPS, 24.7% *Regulares*, 33.7% *Buenas* y 19.1% *Excelentes*.

Tabla 3: Clasificación Global de las Unidades Básicas de Salud de Acuerdo Con Las Dimensiones

Dimensión	Insuficiente		Regular		Bueno		Excelente	
	n	%	n	%	n	%	n	%
Estructura Física (EF)	11	12.4	34	38,2	35	39,3	09	10,1
Recursos Materiales (RM)	20	22,5	18	20,2	39	43,8	12	13,5
Recursos Humanos (RH)	12	13,5	33	37,1	37	41,6	07	7,9
Estructura Organizacional (EO)	25	28,1	23	25,8	28	31,5	13	14,6
Clasificación global	20	22,5	22	24,7	30	33,7	17	19,1

Como se describió anteriormente, la atención primaria de salud en Fortaleza se logra a través de las Secretarías Regionales (SER) y en la siguiente figura se muestra la distribución geográfica.

Figura 1: Clasificación de las Unidades de Acuerdo a las Secretarías Regionales (SER)

Puede ser visto que mientras que las SER 2, 4, 5 y 6 tienen alrededor del 50% de las unidades clasificadas como *Excelente*, as SER 1 y 3 tienen una alta incidencia clasificadas por *Insuficientes*.

Por último, la agrupación basada en el componente principal de cada dimensión permitió descubrir diferentes niveles de rendimiento y la siguiente tabla muestra los valores obtenidos (*centroids*), que identifican los diferentes perfiles de llamada de la sífilis :

Tabla 5: Perfiles de Rendimiento de UPS Basados en los *Centroids* Obtenidos

	CLUSTER			
	1	2	3	4
Estructura Física (EF)	0.80	-0.83	-0.25	0.00
Recursos Materiales (RM)	0.03	-1.13	0.86	0.17
Recursos Humanos (RH)	-0.36	-0.45	-0.40	1.84
Estructura Organizacional (EO)	0.69	-0.20	-1.11	0.62

Los valores se obtuvieron mediante el análisis de conglomerados (*Cluster Analysis*) con el programa SPSS v.20

Se pueden distinguir los siguientes cuatro tipos de atención: (*Grupo 1*) compuesto por 29 unidades, que consiste en aquellos con estructura física y organizativa razonable, bajo nivel de utilización de los recursos materiales y el pobre desempeño de los recursos humanos; (*Grupo 2*) formado por 21 unidades, presenta la ineficacia en todos los aspectos evaluados; (*Grupo 3*) compuesto por 23 unidades, cuenta con los recursos materiales adecuados, pero es deficiente en todos los otros aspectos de la atención; (*Grupo 4*) formado por 16 unidades, presenta equipos eficaces, que opera con bajo nivel de estructura y recursos materiales.

## CONCLUSIÓN

Se cree que la aplicación de la metodología de valoración imparcial se puede señalar a los organismos responsables los aspectos que deben ser abordados como una prioridad para fortalecer la acción del gobierno para la prevención de la transmisión vertical de la sífilis, especialmente la marcada heterogeneidad en el cuidado de UPS.

# **LAS CAPACIDADES DE PERSONALIZACIÓN Y DE RECONFIGURACIÓN Y SU RELACIÓN CON EL DESEMPEÑO OPERATIVO EN GRANDES EMPRESAS MANUFACTURERAS DE LA REGIÓN CENTRO DE COAHUILA, MÉXICO**

Elvira Velarde López, Universidad Autónoma de Coahuila  
Ma. Zóchitl Araiza Garza, Universidad Autónoma de Coahuila  
Laura Ramos Martínez, Universidad Autónoma de Coahuila

## **RESUMEN**

*En la literatura sobre el tema, los autores se refieren a las capacidades operacionales como factores que inciden en el desempeño operativo de las firmas, lo cual las convierte en una fuente potencial para su ventaja competitiva. Debido a la importancia de estas capacidades se realizó el presente estudio, el cual específicamente analiza la relación que existe entre las capacidades operacionales de personalización y de reconfiguración y el desempeño operativo que han desarrollado las grandes empresas del sector manufacturero de la región centro del estado de Coahuila, México. La metodología empleada consistió en obtener información cuantitativa mediante un cuestionario estructurado aplicado a 253 trabajadores de nivel medio/superior de cinco grandes empresas del sector manufacturero de la región; los datos obtenidos fueron procesados posteriormente con el software estadístico SPSS aplicando el Coeficiente de Correlación de Spearman. Entre los resultados más relevantes destaca el hecho de que las capacidades operacionales de personalización y de reconfiguración se relacionan con el desempeño operativo percibido en las empresas en estudio.*

**PALABRAS CLAVE:** Capacidades de Personalización, Capacidades de Reconfiguración, Desempeño Operativo Percibido

## **CUSTOMIZATION AND RECONFIGURATION CAPABILITIES AND THEIR RELATIONSHIP WITH OPERATING PERFORMANCE IN MANUFACTURING BIG FIRMS IN CENTRAL REGION OF COAHUILA, MEXICO**

## **ABSTRACT**

*In the literature, the authors refer to operational capabilities as factors that affect the operating performance of the firms, which makes them a potential source of competitive advantage. Because of the importance of these capabilities we decided to make the present study, which examines the relationship between operational capabilities, specifically customization and reconfiguration capabilities with the operating performance developed by large manufacturing firms in the central region of the state of Coahuila, Mexico. The methodology employed was to obtain quantitative information using a structured questionnaire administered to 253 workers in middle/upper level of five large firms belonging to the manufacturing sector in the region; the data were subsequently processed with the SPSS statistical software using the Spearman correlation coefficient. Among the most relevant results, there was the fact that the*

*operational capabilities of customization and reconfiguration are related to perceived operational performance in these firms.*

**JEL:** C38, L29, M10

**KEYWORDS:** Mass Customization Capabilities, Reconfiguration Capabilities, Perceived Operational Performance

## INTRODUCCIÓN

Según Flynn, Wu and Melnyk (2010), las capacidades operacionales son el ingrediente secreto que no se ve a simple vista, ya que no son tan obvias y tan tangibles como los recursos y prácticas operacionales; los mencionados autores comparan las capacidades operacionales con el amor, ya que se conocen cuando se ven pero no siempre es posible articular en una forma precisa lo que son realmente, por lo cual se torna difícil desarrollar y fomentar estas capacidades en las firmas y hace necesaria la realización de estudios sobre el tema. En el Municipio de Monclova, principal localidad de la región centro del Estado de Coahuila, se ubica Altos Hornos de México, S.A. de C.V. (AHMSA), la fundidora de acero más importante del país junto con algunas empresas grandes del sector manufacturero que se han ido ubicando alrededor y que representan el motor del desarrollo económico de la región.

Se han efectuado varios estudios (Rueda y Simón 2001; Simón y Rueda, 2004) en esta región sobre los cambios en la industria mexicana del acero, en los cuales las empresas más grandes pudieron soportar esta situación estableciendo alianzas estratégicas y acuerdos de inversión principalmente con compañías extranjeras (Simón y Rueda, 2004). Esta ventaja de las grandes empresas genera la inquietud de realizar estudios sobre la manera que éstas se adaptan a las necesidades que se presentan a través de aprovechar sus recursos y capacidades y cómo les permite permanecer en el mercado. De lo anterior se deriva la siguiente pregunta en relación a las cinco empresas manufactureras en estudio: ¿Cuál es la relación que existe entre las capacidades de personalización y las capacidades de reconfiguración y el desempeño operativo en las empresas en estudio? Con los resultados de esta investigación se obtendrá información que será de mucha utilidad para los empresarios no solamente de empresas grandes, sino también de pequeñas y medianas empresas para establecer estrategias que fomenten y continúen desarrollando sus capacidades operacionales que incidan en el desempeño operativo de las mismas y les permita ser más competitivas.

## REVISIÓN LITERARIA

El presente estudio se encuentra sustentado con la teoría de recursos y capacidades (Penrose, 1959; Wernerfelt, 1984; Barney, 1991; Peteraf, 1993), que asume que las firmas pueden adquirir una ventaja competitiva sostenible a través de utilizar adecuadamente sus recursos y capacidades; Barney (1991) menciona que, de acuerdo con esta teoría, los recursos estratégicos que controlan las firmas dentro de una industria o grupo pueden ser únicos, heterogéneos y que son fortalezas que pueden ser muy útiles para diseñar e implementar estrategias con el fin de mejorar su eficiencia y efectividad, lo cual les hará más competitivas (Wu, Melnyk y Flynn, 2010). Siguiendo a Wu et al. (2010), las capacidades operacionales son el conjunto de habilidades, procesos y rutinas específicos a la firma, desarrollados dentro del sistema de administración de operaciones y que regularmente son utilizadas en la solución de problemas a través de la configuración de sus recursos operativos. En Flynn, et al. (2010) y Wu et al. (2010) se propone una taxonomía de capacidades operativas que incluyen: capacidad de mejora, de innovación, de personalización, de cooperación, de sensibilidad y de reconfiguración.

### Capacidades de Personalización

De acuerdo con Flynn et al. (2010), las capacidades de personalización son las habilidades, procesos y rutinas distintivas para la creación de conocimiento a través de extender y personalizar los procesos y sistemas operativos. Tu, Vonderembse y Ragu-Nathan (2001) desarrollaron una medida directa de las capacidades de personalización masiva compuesta de tres indicadores: i) personalización del costo beneficio, que se refiere a la habilidad para personalizar productos sin incrementar los costos de producción; ii) personalización de la eficacia del volumen, que es la habilidad para añadir variedad de productos sin sacrificar el volumen de producción; y iii) personalización de la capacidad de respuesta, refiriéndose a la habilidad de reorganizar los procesos de producción rápidamente en respuesta a los requerimientos individuales del cliente. Máynez, Cavazos, Torres y Escobedo (2013) utilizan cinco indicadores para medir las capacidades de personalización: i) identificar claramente las necesidades de los clientes, ii) producir exactamente lo que los clientes desean, iii) producir a gran escala, de acuerdo a las necesidades individuales identificadas en los clientes, iv) ampliar la variedad de productos, sin tener que incrementar costos y v) incrementar la variedad de productos, sin sacrificar volúmenes de producción. Este estudio utiliza los cinco indicadores de las capacidades de personalización propuestos por Máynez et al. (2013).

*Capacidades de reconfiguración:* Flynn et al. (2010) se refieren a la reconfiguración operaciones como las habilidades, procesos y rutinas distintivas para complementar las transformaciones necesarias para restablecer el enlace entre las estrategias de operación y el ambiente de mercado, cuando ha sufrido un desequilibrio. La reconfiguración operativa es importante en esos ambientes de negocios cambiantes, donde las empresas se enfrentan a nuevas innovaciones, crisis económica, pérdidas en la producción, eventos políticos y otros más, de tal manera que la habilidad para consensar y negociar con el cambio llega a ser una manera de vida (Wu et al. 2010). Los indicadores utilizados por Máynez et al. (2013) para medir las capacidades de reconfiguración son: i) producir distintos tipos de productos sin necesidad de realizar grandes cambios, ii) construir productos diferentes, en la misma planta y al mismo tiempo, iii) manufacturar artículos de forma simultánea o periódica, en una forma productiva estable, iv) cambiar la combinación de productos, de un período a otro y v) cambiar muy rápidamente la producción de un artículo a otro. El presente estudio utiliza los cinco indicadores de las capacidades de reconfiguración propuestos por Máynez et al. (2013).

*El Desempeño Operativo:* El enfoque predominante en la literatura para medir el desempeño operativo, de acuerdo con Wu, et al. (2010), es utilizar como dimensiones: el costo, la calidad, la entrega y la flexibilidad; estas dimensiones fueron utilizadas en sus estudios por los mencionados autores para relacionar el desempeño operativo con las capacidades operacionales: para medir el costo utilizaron los indicadores: costo unitario de manufactura, costos generales de manufactura, total del costo; para medir la calidad: cumplimiento de la calidad del producto, durabilidad del producto, calidad total del producto, confiabilidad del producto, características del producto; para la entrega: precisión en la entrega, confianza en la entrega, calidad en la entrega; finalmente, para la flexibilidad utilizan: la habilidad para ajustarse al volumen del producto y la habilidad para producir un rango de productos. Por otro lado, Máynez et al. (2013) utilizaron los siguientes indicadores para medir el desempeño operativo: cumplimiento a las especificaciones de calidad del producto, desempeño del tiempo de entrega, flexibilidad para cambiar la mezcla de productos, flexibilidad para cambiar el volumen de producción y velocidad en la producción para la introducción de nuevos productos. En el presente trabajo se utilizarán los indicadores de Máynez, et al. (2013). Estos indicadores para el desempeño operativo percibido de Máynez et al. (2013) se utilizarán en la presente investigación.

*Las capacidades operacionales y el desempeño operativo:* Según Máynez et al (2013), no es posible definir una capacidad sin considerar al desempeño, ya que las capacidades permiten que la empresa pueda desarrollar una actividad de forma repetida y confiable. Máynez y Cavazos (2012) y Wu, et al (2010), se muestran conformes al afirmar que las capacidades operacionales son una fuente importante de desempeño superior, debido a que los resultados obtenidos en el trabajo de estas autoras confirman que el desempeño operativo percibido es impactado por las capacidades personalización y reconfiguración. En estudios

realizados por Máñez et al (2013) se obtuvo evidencia que confirma que las capacidades de personalización masiva y reconfiguración impactan la variabilidad del desempeño operativo. Sin embargo, mencionan los mencionados autores: “si el propósito es exceder el desempeño de los competidores, es necesario que dichas capacidades se desplieguen de forma superior (Day, 1994) a fin de generar una ventaja competitiva”.

## METODOLOGÍA

En el presente estudio se plantean las siguientes hipótesis:

Las capacidades de personalización se relacionan directa, positiva y significativamente con el desempeño operativo percibido en las grandes empresas manufactureras en la región centro del estado de Coahuila.

Las capacidades de reconfiguración se relacionan directa, positiva y significativamente con el desempeño operativo percibido en las grandes empresas manufactureras en la región centro del estado de Coahuila.

La estrategia metodológica se basó en un estudio cuantitativo, para lo cual se utilizó el método de encuesta, aplicada mediante un cuestionario estructurado (adaptado de Máñez et al. (2013), auto administrado a 253 empleados de nivel mando medio y superior en 5 grandes empresas manufactureras de la región centro del estado de Coahuila. Los datos obtenidos en el año 2013 se procesaron a través del paquete estadístico SPSS para medir las variables en estudio y establecer las relaciones buscadas. La medición de las tres variables se hizo a través de los indicadores de Máñez et al. (2013), cada uno de estos indicadores se midió con una escala de Likert de 1-5, en donde 1= totalmente en desacuerdo, 2=en desacuerdo, 3=ni de acuerdo ni en desacuerdo, 4= de acuerdo y 5= totalmente de acuerdo. Se utilizó la técnica del coeficiente *Rho de Spearman*, ya que los indicadores fueron establecidos en escala ordinal estableciendo categorías, pero de menor a mayor.

## RESULTADOS

El resultado de la técnica *Rho de Spearman* permite aceptar la  $H_1$ , ya que el análisis estadístico arroja una correlación positiva (.251\*\*) y significativa a un nivel de confianza del 99% entre la variable capacidades de personalización y la variable desempeño operativo percibido. De igual manera, para todos los indicadores de cada uno de estos constructos, se presenta una correlación significativa en algunos casos a un nivel de confianza del 99% y en otros del 95%, a excepción del indicador de capacidades de personalización: ampliar nuestra variedad de productos, sin tener que incrementar costos, ya que no presenta una relación significativa el indicador de desempeño operativo: cumplimiento de las especificaciones de calidad del producto.

El resultado de la aplicación de la técnica *Rho de Spearman* permite aceptar parcialmente la  $H_2$ , ya que el análisis estadístico arroja una correlación positiva (.314\*\*) y significativa a un nivel de confianza del 99% entre la variable capacidades de reconfiguración y la variable desempeño operativo percibido. De igual manera, para todos los indicadores de cada uno de estos constructos, se presenta una correlación significativa en algunos casos a un nivel de confianza del 99% y en otros del 95%, a excepción de un indicador del desempeño operativo: Velocidad en la producción para la introducción de nuevos productos el cual no presentó resultados significativos al cruzarse con cuatro indicadores de capacidades de reconfiguración: i) construir productos diferentes, en la misma planta y al mismo tiempo, ii) manufacturar artículos de forma simultánea o periódica, en una forma productiva estable, iii) cambiar nuestra combinación de productos, de un período a otro, y iv) cambiar muy rápidamente la producción, de un

artículo a otro. Los resultados de estas correlaciones, concuerdan con los estudios de Wu, et al (2010), Máynez et al (2013), Máynez y Cavazos (2012), Day (1994), Hegde, et al. (2005), en el sentido de que las capacidades operacionales, específicamente las de personalización y reconfiguración inciden directa y positivamente en el desempeño operativo de las empresas manufactureras.

## CONCLUSIONES

El presente trabajo de investigación tuvo como objetivo analizar la relación entre las capacidades de personalización y de reconfiguración con el desempeño operativo en una muestra por conveniencia de cinco grandes empresas manufactureras de la región centro del estado de Coahuila, por tanto los resultados encontrados, se limitan a las empresas antes mencionadas, sin considerar las posibles discrepancias entre los diferentes sectores económicos. Entre los principales hallazgos está la confirmación de que las capacidades de personalización inciden directa y positivamente en el desempeño operativo de las firmas, además de que todos los indicadores de estos dos constructos presentan relación positiva y significativa entre ellos, a excepción de *la ampliación de la variedad de productos, sin tener que incrementar costos* que no tiene relación significativa con el *cumplimiento de las especificaciones de calidad del producto*. Por otro lado, las capacidades de reconfiguración también arrojaron una correlación significativa en el cruce con el desempeño operativo; pero el indicador *Velocidad en la producción para la introducción de nuevos productos*, no presentó resultados significativos de una correlación con los indicadores de capacidades de reconfiguración: la construcción productos diferentes, en la misma planta y al mismo tiempo, la manufactura de artículos de forma simultánea o periódica, en una forma productiva estable, el cambio en la combinación de productos, de un período a otro, y el cambio muy rápido de la producción, de un artículo a otro. Entre las futuras líneas de investigación que se generaron con los resultados encontrados en este trabajo, se recomienda cruzar el resto de las capacidades operacionales propuestas por Flynn et al. (2010) con el desempeño operativo; posteriormente se contempla realizar estudios sobre la incidencia de las mencionadas capacidades y el desempeño operativo en la ventaja competitiva de grandes empresas manufactureras.

# EL VALOR ECONÓMICO DEL CONOCIMIENTO

Tadeo Armando Barrón López, Universidad del Valle de México

## RESUMEN

*Se detectará, identificará y conocerá las perspectivas de los directores generales de tres empresas familiares mexicanas, con el fin de ver el valor del conocimiento en cada una de estas empresas, dando como resultado un conocimiento del área para el mejor desempeño del capital humano y el reconocimiento de sus líderes al compromiso, por tanto darle el verdadero valor a su empleo dentro de su organización. Se analizan dos grandes grupos de creadores de conocimiento dentro de una organización, el trabajador operativo y el trabajador de confianza, de tal suerte que los directores de las áreas dan valor a él conocimiento que ejercen o crean en las organizaciones, entendiendo el valor de uso, valor de cambio y en referencia al valor creativo y valor económico.*

**PALABRAS CLAVE:** Conocimiento, Valor, Creación

## ECONOMIC VALUE OF KNOWLEGDE

## ABSTRACT

*The following text will detect , identify and learn about the perspectives of the CEOs of three Mexican family businesses, in order to see the value of knowledge in each of these companies, resulting in a knowledge of the area for the best performance human capital and recognition of their leaders to compromise, thus giving real value to your job within your organization .Two groups of creators of knowledge within an organization, the worker and the worker operating trust , are analyzed in such a way that the directors of the areas they value him exercising or create knowledge in organizations , understanding the value in use exchange value and referring to the creative and economic value .The results are interpreted to see the true value that gives the organization the knowledge that operating personnel , as they trusted the staff through their day to day work to narrow or activity in their daily work.*

**JEL:** M00

**KEYWORDS:** Knowledge, Value, Creation

## INTRODUCCIÓN

En el siguiente texto se detectará, identificará y conocerá las perspectivas de los directores generales de tres empresas familiares mexicanas, con el fin de ver el valor del conocimiento en cada una de estas empresas, dando como resultado un conocimiento del área para el mejor desempeño del capital humano y el reconocimiento de sus líderes al compromiso, por tanto darle el verdadero valor a su empleo dentro de su organización. Se analizan dos grandes grupos de creadores de conocimiento dentro de una organización, el trabajador operativo y el trabajador de confianza, de tal suerte que los directores de las áreas dan valor a él conocimiento que ejercen o crean en las organizaciones, entendiendo el valor de uso, valor de cambio y en referencia al valor creativo y valor económico.

Se interpreta los resultados para ver el verdadero valor que le da la organización al conocimiento que el personal operativo, como el personal de confianza dan, a través de su día a día, para concretar un trabajo o alguna actividad dentro de su labor cotidiana. Entenderemos, en términos de medición de resultados y no

en términos de justicia, el valor real del conocimiento, intrínsecamente ligado al valor económico, al reconocimiento y en un sentido de autorrealización del individuo, que ayuda a motivar al grupo y/u organización a esforzarse, ya que ve recompensada su labor. Principalmente saber ¿Qué es el conocimiento?: es la adquisición de experiencias, vivencias, educación, comprensión, conciencia de los hechos e información para entender una realidad. Sin embargo, la falta de entendimiento del conocimiento a diversificado el concepto como capital intelectual, recurso humano entre otros conceptos integrados a darle significado al valor del conocimiento.

*Generación del Conocimiento. Es un conjunto de actividades realizadas por los empleados de una organización para incrementar el conocimiento organizacional. Se ha identificado dos categorías de atributos: adquisición externa del conocimiento y creación interna del conocimiento.* (Miguel H. Mejía Puente, 2007) Podemos entender que el conocimiento como concepto se puede influenciar por diferentes entornos (el aprendizaje), entonces valorizar el conocimiento para una organización se enfoca en términos reales en la rentabilidad de la organización. *El proceso de aprendizaje es uno de los fenómenos más relevantes en la especie humana. Producto del aprendizaje de las personas, en el transcurso de su existencia, cambian considerablemente sus conductas, actitudes, habilidades y capacidades producto de lo que aprenden en diferentes instancias de la vida.* (Cristian Sandoval Yáñez, 2013) Entender en primera instancia que el conocimiento, es la base de toda organización, se le daría mayor valor a la creatividad e innovación, ya que son eje para la producción de conocimiento, a su vez entender que si el conocimiento tiene valor en la organización, la rentabilidad viene junta. En la recopilación de información visualizada en las empresas de muestra, se implemento un cuestionario que revela la intención de detectar y describir el valor del conocimiento en la dinámica de importancia para cada una de las organizaciones, entendiendo, no solo la importancia que lleva, sino el uso de tal conocimiento para el buen desempeño de la organización. ¿Se puede medir el conocimiento?

Me enfocaré en una persona, al nacer no tiene conocimiento, por tanto desde que nacemos, no tendríamos ningún valor de uso, ni valor monetario, sin embargo, entendamos que desde la educación de nuestros padres, empieza una carrera de traslado de información a darle vivencias y experiencias a los hijos, que determinan su desempeño a largo plazo, es decir, que la educación de nuestros padres se determinan por el ejemplo de sus valores y experiencias, creando un sentido de vida y camino que determinará el comportamiento de nuestros hijos. Intentando responder a la pregunta si es posible medir el conocimiento a través de los valores intrínsecos, donde la actitud y aptitudes adquiridas son dadas desde el entorno familiar, son buscadas por empresarios, para la dirección y gestión de sus empresas, dándole más importancia a gente con valores como: responsabilidad, lealtad, seguridad, entre otros valores.

En la entrevista con la empresa CEDAPSA, S.A. de C.V. se detecto que si es posible medir el conocimiento ya que el giro simplifica, el valor del conocimiento en el contexto de la resolución de problemas, ellos le llaman ingeniería, contextualizando, es una empresa de metal mecánica que se dedica a resolver problemas de otras empresas en el sentido de mueblería industrial y de merchandising. Creando con base en las ideas del cliente, transforman la idea en realidad y solucionando una problemática comercial y rentable para el uso del conocimiento, transformado en metal. En el caso de REDUREX, empresa que se dedica a la industria de la salud, productora y comercializadora de productos para bajar de peso, su principal medición del conocimiento es la patente, la formula que se inventó, sigue dando riqueza en el contexto que la comercialización, interactuando con un Eureka el sentido del valor del conocimiento, por ultimo Perfiles Comerciales, S.A. de C.V. empresa comercializadora de insumos metálicos, como tubo, perfiles, lamina, etc. Empresa que tiene como medición del conocimiento, sus procesos de compra-venta, siendo este conocimiento el responsable de tener a esta organización bien posicionada en el mercado ¿Cuál es el valor del conocimiento en el trabajo?

Entendiendo el comportamiento de las organizaciones, El principal objetivo sigue siendo la rentabilidad y crecimiento en el mercado, se entiende que el personal que este en una situación optima de enriquecer a un empresario tendría valor, por tal, se ha enfocado a darle significado económico a todas las habilidades, competencias y actitudes, encaminadas a un sentido de valor de uso y de cambio. El problema principal entonces no radica en dar valor de uso y valor monetario a un trabajo, si no a la significación del valor del trabajo mismo, entendamos que el trabajo puede ser físico o mental, donde recae una sensibilidad de resultados, enfocados ciertamente en su totalidad en un bien económico.

*La única fuente de conocimiento es la experiencia todo lo demás es solo información:* (Albert Einstein). En las empresas indagué sobre la medición del conocimiento, en el caso de CEDAPSA, S.A. de C.V. se mide a través de las soluciones que pueden ser vendidas, simplificando la solución en un producto que resuelve las necesidades de sus clientes en la creación de conocimiento que genera valor en todo sentido, por otro lado en el caso de REDUREX, se mide el conocimiento por el grado cronológico, es decir, la vigencia de la fórmula para atacar una necesidad de resolver el sobrepeso y obesidad y por ultimo en el caso de Perfiles Comerciales, S.A. de C.V. en la eficiencia del proceso de venta que siga generando riqueza, a través de un proceso en constante mejora para generar riqueza, en las entrevistas con los dueños de las empresas mencionadas enfatizan el acumulamiento de riqueza como eje para medir el buen desempeño del uso del conocimiento, sin embargo no es notorio el contexto real, de la valoración del conocimiento, simplemente se basan en un salario o sueldo y las soluciones de los diferentes empleados no son resaltados, ni recompensados. En las empresas mexicanas antes mencionadas, no se fomenta la medición del desempeño y mucho menos de indicadores, solo la rentabilidad de la empresa y es medible solo por los altos mandos en contextos de utilidad (rentabilidad), sin embargo no es una cuestión de desinterés, es más una cuestión de ignorancia de la aplicación de controles donde se pueda gestionar mejor la medición del conocimiento. ¿Se puede gestionar el conocimiento?

Se podría medir en tres enfoques dependiendo el sistema donde se analiza, lo contextualizó en tres vertientes: la familiar, la empresa y la sociedad. Donde la principal dentro de un proceso cronológico y secuencial esencial de la vida un individuo, determina la gestión de su propio conocimiento, encaminado primeramente a una adaptación familiar y social. Partiendo de la estructura familiar como medula del conocimiento primario y la escuela como formación cultural y profesional determinando y consolidando el conocimiento productivo, por darle un adjetivo, permite medir su conocimiento, a través de habilidades, capacidades y actitudes, donde la empresa demanda específicamente ciertos conocimientos, adaptando conciencia de la gestión del conocimiento, independientemente del sentido que le de la empresa. *Según Bueno (1998) la gestión del conocimiento es el conjunto de procesos que permiten utilizar el conocimiento como factor clave para añadir y generar valor. Para Garvin (1998), la gestión del conocimiento obtiene y comparte bienes intelectuales con el objetivo de conseguir resultados óptimos en términos de productividad y capacidad de innovación de las empresas.*

*Es un proceso que genera, recoge, asimila y aprovecha el conocimiento con el fin de crear una empresa más inteligente y competitiva. Honeycutt (2013) dice que la filosofía de la gestión del conocimiento es "entregar la información precisa para la persona apropiada en el instante oportuno, proporcionando herramientas para el análisis de esa información y la capacidad de responder a las ideas que se obtienen a partir de esa información". Schmelkes realiza una reflexión sobre el traspaso de la gestión del conocimiento que se debería realizar desde las organizaciones productivas a las instituciones de educación superior. (2012) En la entrevista con los empresarios de las empresas mexicanas mencionadas, se logra entender que no hay indicadores y medición formal del conocimiento, se altera en un sentido autócrata y visto desde una metodología empresarial en una dirección reactiva, donde es prioridad la solución correctiva y no preventiva, visto esto como una gran abismo, entre gestionar el conocimiento y creer gestionar el conocimiento, sin embargo, se pueden generar estos indicadores y controles donde la gestión se hace más*

dinámica para el gestor para poder tomar decisiones más acertadas y con mejores resultados para la generación de riqueza.

## CONCLUSIONES

En el contexto de detección del conocimiento de las 3 empresas mexicanas, se logra percibir la versatilidad de la medición, gestión y control del conocimiento, sin embargo se vislumbra que el conocimiento es valorado pero de diferente manera, dependiendo el giro de la empresa le dan mayor sentido al conocimiento. Teniendo en cuenta diferentes factores para detectar el conocimiento y el tipo de empresa generadora de valor, el conocimiento, se identifica principalmente con la rentabilidad de la organización, sin embargo, dentro del estudio de las empresas, se ha detectado el principal conocimiento que genera valor y las personas que lo crean, podemos identificar, el origen del proceso generador del conocimiento y el valor que le da la organización para ser rentable, después del descubrimiento del proceso generador del conocimiento, los empresarios tienen una gran herramienta para tomar decisiones e integrar más fácil los objetivos de la empresa.

Al finalizar las entrevistas, los empresarios que dieron permiso al estudio, escépticos de los resultados, se dieron cuenta de la visión externa y enfocada a la ayuda de la organización, logra concebir la acción como algo valioso, para la integración de los resultados para un cambio estructurado y útil para cada empresario. Al darles el resultado donde se identifica la creación del conocimiento dentro de su organización, dos de tres empresarios sabían que generaban rentabilidad a través de ese conocimiento, pero estaban consientes en darle valor en todos sentidos, fomentar la creación, innovación, creatividad y fomentar la creación del conocimiento ya que entendieron que a mayor creación de conocimiento, mayor rentabilidad de la organización.

# POTENCIAL ECONÓMICO DEL AVITURISMO EN LOS CABOS

José Emer García de la Puente Orozco, Universidad Autónoma de Baja California Sur  
Plácido Roberto Cruz Chávez, Universidad Autónoma de Baja California Sur

## RESUMEN

*Una de las actividades ecoturísticas más importantes a nivel mundial es la observación de aves. México tiene un gran potencial en aves (tiene más de 10% de especies a nivel mundial) y su cercanía con Estados Unidos el mayor emisor de avituristas (82,000 avituristas), han dejado una derrama de casi 36,000 millones de dólares. No obstante, esta actividad es poco aprovechada, en parte por falta de conocimientos, capacitación y apoyo tanto gubernamental como privado. Baja California Sur tiene aproximadamente 434 especies. Sin embargo no existen empresas locales dedicadas al aviturismo. En este sentido, el objetivo del trabajo fue analizar el potencial turístico de aviturismo en Los Cabos, destacando sus características y la elaboración de recomendaciones para este destino turístico.*

**PALABRAS CLAVE:** Turismo Sustentable, Observación De Aves

## ECONOMIC POTENTIAL OF BIRDING IN LOS CABOS

### ABSTRACT

*One of the most important ecotourism activities worldwide is birding. Mexico has great potential in birds (having more than 10% of species in the world) and its proximity to the United States, the largest emitter of birdwatchers (82,000 birdwatchers), have left a spill of nearly 36,000 million. However, this activity is largely untapped, partly because of lack of knowledge, training and support both government and private. Baja California Sur has about 434 species. However there are no local companies dedicated to birdwatching. In this sense, the objective was to analyze the tourist potential of birding in Los Cabos, highlighting its features and the development of recommendations for this tourist destination.*

**JEL:** O11, O14, O44, O50.

**KEYWORDS:** Sustainable Tourism, Bird Watching

### INTRODUCCION

El ecoturismo es una actividad que combina el gusto de viajar con la preocupación por el ambiente, tiene como objetivos la sostenibilidad, la conservación y el involucramiento de las comunidades humanas locales donde se desarrolle (Zamorano, 2002). Las actividades turísticas que tienen como objetivo el cuidado y protección del ambiente son una alternativa económica viable para las comunidades que viven en lugares con atractivos y riquezas naturales, tales actividades pueden coadyuvar al cumplimiento de las metas del desarrollo sustentable, en regiones que presenten un potencial para el ecoturismo (Luque, 2009). Actividades que van desde aquéllas de carácter general como el senderismo interpretativo, safari fotográfico, observación de flora y/o fauna o las más especializadas, como la observación de aves, avistamiento de ballenas, participación en programas de rescate, como es el caso de los campamentos tortugueros, entre otras (SECTUR, 2005).

Una de las actividades especializadas del ecoturismo con más afluencia turística a nivel mundial es el avistamiento de aves, denominado actualmente como “aviturismo”; el cual se trata de una actividad especializada en observar (avistar) aves, lo cual involucra llevar a visitantes aficionados a la observación de las aves (birders en inglés) a sitios propicios para encontrar diferentes especies. Estas personas están dispuestas a pagar por el servicio de un guía conocedor de las aves del sitio, y demás servicios relacionados (hospedaje, alimentación y transporte, entre otros). El típico birder es una persona de estrato económico medio o alto y de nivel educativo regularmente elevado (Cantú et al., 2011). Respecto a la nacionalidad predominan turistas estadounidenses, canadienses e ingleses. Por ello, el objetivo del trabajo fue analizar el potencial turístico del aviturismo en Los Cabos y valorar la existencia de infraestructura turística adecuada la recepción de los visitantes nacionales e internacionales. Para esto, se procederá a la investigación y elaboración de un listado de especies, destacando cuales son de particular interés para el turista. A su vez, la investigación de la oferta turística, demostrando así que el aviturismo es un nicho que debe de ser aprovechado responsablemente con un integración comunitaria para el correcto desarrollo de esta actividad.

## REVISION DE LITERATURA

La observación de aves en México, como actividad económica es reciente; es hasta mediados de 1950 cuando se publicaron las primeras guías de identificación de las aves de México (Gómez de Silva *et al.*, 2010), lo cual impulsó el interés por parte de extranjeros y mexicanos de conocer a las aves en su ambiente natural. Se estima que fue hasta finales de la década de 1960 que empezaron a llegar *tours* de observadores de aves a nuestro país (Gómez de Silva *et al.*, 2010). En 2006 se realizó la primera investigación sobre la cantidad de observadores de aves extranjeros y mexicanos, así como la derrama económica que deja esta actividad (Gómez de Silva, 2008). Pese a que la observación de aves es aún incipiente, su derrama económica fue de poco menos de 24 millones de dólares. Tomando en cuenta que en el 2006 la derrama anual por captura de aves fue de 442 mil dólares (CONABIO 2006), se resalta que la observación de aves reditúa 54 veces más que la captura de éstas.

En Mexico el aviturismo no se ha logrado explotar de manera adecuada por falta de conocimientos, capacitación y apoyo, tanto gubernamental como de la iniciativa privada. Los observadores de aves que visitan México gastan dinero en transporte, alojamiento, alimentos, propinas, recuerdos y en ocasiones en choferes y guías. También gastan en equipo (como cámaras, binoculares, telescopios, guías de viajes, etc.), pero la mayor parte del equipo lo adquieren fuera de México. Aún los mexicanos comúnmente adquieren sus equipos fuera del país. La alta biodiversidad de México y su proximidad con los Estados Unidos proveen una excelente oportunidad para captar los beneficios económicos relacionados a la observación de aves (Gómez de Silva, 2011).

En Baja California Sur se han registrado 423 especies de aves de las 1109 que existen registradas en México, es decir cerca del 40% del total de las especies observables en el país (Howell 1995) utiliza la porción sur de la península. Además en el estado se encuentran cuatro especies endémicas: la Mascarita Peninsular (*Geothlypis beldingi*), el Cuitlacoche Peninsular (*Toxostoma cinereum*), el Colibrí de Xantus (*Hylocharis xantusii*) y la Gaviota de Patas Amarillas (*Larus livens*), especies particularmente llamativas para los ecoturistas (Erickson & Howell 2001). Baja California Sur (BCS) cuenta con una amplia diversidad de ambientes, que incluyen una prolongada franja marítimo-terrestre, que presenta diferentes puntos clave en la ruta migratoria de diversas especies acuáticas. Algunos sitios sobresalientes para el avistamiento en el estado son: la salina de Guerrero Negro, las lagunas Guerrero Negro, Ojo de Liebre y San Ignacio, el Estero San José, la Reserva de la Biosfera Sierra de la Laguna, los Sistemas de Oasis de Baja California Sur y otros puntos, aledaños a la ciudad de La Paz, como las lagunas Chametla y la planicie lodosa ubicada frente a los poblados Chametla y El Centenario (Galindo, 2003).

Dentro del Estado de BCS, destaca el municipio de Los Cabos particularmente como un punto idóneo para la implementación del aviturismo no solo por su riqueza ornitológica si no también por la integralidad de sus atractivos por contar con la oferta de sol y playa, pinturas rupestres, diversos atractivos culturales y contar con 4 Áreas Naturales Protegidas (ANP's) (Reserva de la Biosfera Sierra de la Laguna, Área de protección a la Flora y Fauna Cabo San Lucas, Parque Nacional Cabo Pulmo y Estero San José del Cabo) (García de la Puente, 2011). Es además reconocido como uno de los puntos con más afluencia turística del país. Debido a lo anterior de la región está dotado con la infraestructura necesaria para atender las necesidades del turista y cuenta con flujo constante de los mismo, Y en cuanto respecta a la avifauna, dentro del municipio se pueden encontrar las 4 especies endémicas del estado así como mas de 30 sub especies endémicas dentro de las cuales se encuentran el Búho enano del Cabo (*Glaucidium gnoma hoskinsii*) el Junco de Bairdi (*Junco phaenotus bairdi*) y la Primavera de San Lucas (*Turdus migratorius confinus*) (Rodríguez- Estrella, 1988) las cuales son de particular interés para el aviturista.

## METODOLOGIA

Los métodos utilizados para la investigación son la investigación documental y el trabajo de campo como medio de verificación. Para la elaboración del listado se llevó a cabo una compilación por diversos medios los cuales incluyeron paginas en la red electrónica como Ebird (<http://ebird.org/content/ebird/>), búsqueda bibliográfica y petición directa observadores de aves con experiencia en la zona. El listado se integró de todos los reportes seleccionados. Para la selección de especies de interés se destacaron las especies en base a distintas características como lo son: (1) su temporalidad (migratorias, residentes y transeúntes, basado en la clasificación propuesta por Howell y Webb 1995);(2) su probabilidad cualitativa de observación muy común, común, rara y ocasional, (Howell y Webb 1995);(3) La inclusión de especies en listas prioritarias estadounidenses (e. g. lista de aves prioritarias para Estados Unidos de Partners in Flight); (4) su estatus de conservación (en peligro de extinción, amenazada, sujeta a protección especial y endémica, SEMARTAT 2010). Por otro lado, se procedió a investigar el tipo de infraestructura hotelera, resturatera, vías de comunicación y servicios complementarios que pueden ser necesarios para la recepción de avituristas. Lo anterior, sirve para valorar si existen las condiciones propicias para brindar todo lo necesario en la práctica del aviturismo.

## RESULTADOS

El Municipio de Los Cabos es sin lugar a dudas el sitio con mayor potencial para el desarrollo del aviturismo dentro del estado de Baja California Sur, ya que es el principal destino turístico del Estado y cuenta con un flujo constante de turistas y gracias su gran diversidad de ambientes y por el contar dentro de su territorio con la “Reserva de la Biosfera de Sierra de La Laguna” y con el “Esteros de San José” el listado obtenido suma un total de 332 especies de aves destacando la presencia de 4 especies endémicas y mas de 30 subespecies endémicas y un total de por lo menos 33 especies de particular interés para el aviturista. El listado total de especies obtenidas sumo un total de 332 especies de aves esto se puede deber principalmente a su gran diversidad de ambientes y cabe destacar que la mayoría de los registros de especies son pertenecientes a las inmediaciones de dos ANP's (Sierra de la Laguna y Esteros San José) donde se encuentran emplazamientos rurales los cuales ya participan en actividades de turismo rural por lo cual de llevarse a cabo la actividad colocaría a los lugareños como los beneficiados principales del aviturismo.

### Listado de Aves Con Potencial Aviturstico en la Región del Cabo

Codorniz California, California Quail (*Callipepla californica*)

Colimbo del Pacifico, Pacific Loon (*Gavia pacifica*)

Zambullidor menor, Least Grebe (*Tachybaptus dominicus*)

Pardela pati rosa, Pink-footed Shearwater (*Puffinus creatopus*)

Pardela del pacifico, Wedge-tailed Shearwater (*Puffinus pacificus*)  
 Pardela sombría, Sooty Shearwater (*Puffinus griseus*)  
 Pardela culinegra Black-vented Shearwater (*Puffinus opisthomelas*)  
 Paño de las galapagos, Wedge-rumped Storm-Petrel (*Oceanodroma tethys*)  
 Paño negro, Black Storm-Petrel (*Oceanodroma melania*)  
 Paño menor, Least Storm-Petrel (*Oceanodroma microsoma*)  
 Bobo de patas azules, Blue-footed Booby (*Sula nebouxii*)  
 Bobo de patas rojas, Red-footed Booby (*Sula sula*)  
 Cormorán peninsular, Brandt's Cormorant (*Phalacrocorax penicillatus*)  
 Gaviota de Heerman, Heermann's Gull (*Larus heermanni*)  
 Gaviota Occidental, Western Gull (*Larus occidentalis*)  
 Gaviota de patas amarillas, Yellow-footed Gull (*Larus livens*) (Endemica)  
 Gaviota de California, California Gull (*Larus californicus*)  
 Charran elegante, Elegant Tern (*Thalasseus elegans*)  
 Paloma de collar, Band-tailed Pigeon (*Patagioenas fasciata*) (subespecie)  
 Tortolita, Ruddy Ground-Dove (*Columbina talpacoti*)  
 Búho enano del Cabo, Northern Pygmy-Owl (*Glaucidium gnoma*) (subespecie)  
 Tecolote enano, Elf Owl (*Micrathene whitneyi*)  
 Colibrí cabeza violeta, Costa's Hummingbird (*Calypte costae*)  
 Zafiro de xantus, Xantus's Hummingbird (*Hylocharis xantusii*) (Endemica)  
 Carpintero bellotero, Acorn Woodpecker (*Melanerpes formicivorus*) (subespecie)  
 Carpintero de California, Gilded Flicker (*Colaptes chrysoides*)  
 Vireo de Cassin, Cassin's Vireo (*Vireo cassinii*) (subespecie)  
 Perlita Californiana, California Gnatcatcher (*Poliophtila californica*)  
 Mirlo primavera, merican Robin (*Turdus migratorius*) (subespecie)  
 Cuitlacoche peninsular, Gray Thrasher (*Toxostoma cinereum*)  
 Mascarita peninsular, Belding's Yellowthroat (*Geothlypis beldingi*)  
 rascador californiano, California Towhee (*Melozone crissalis*)  
 Junco de Bairdi, Yellow-eyed Junco (*Junco phaeonotus*) (subespecie)

Tomando como referente de que el estado cuenta con 423 especies, dentro del municipio se pueden encontrar mas del 80% del total de estas y todas las especies endémicas del Estado aunadas a las subespecies endémicas. Los dos principales sitios para la observación de aves son de fácil acceso para el turista que se encuentra hospedado en la zonas hoteleras del municipio ya que el Estero San José se ubica dentro de la Zona Hotelera de San José del Cabo y la Reserva de la Biosfera de Sierra de la Laguna dista a no más 30 minutos traslado en auto y es también de destacar que su extensa franja costera le da al turista la posibilidad de observación de aves pelágicas.

### Infraestructura Turística

Los Cabos cuenta con infraestructura suficiente para la recepción de observadores de aves, ya que en número de hoteles según INEGI (2013), había 121, de los cuales la mayoría están clasificados en cinco estrellas, con 48 establecimientos (Tabla 1). De cuatro estrellas hay 15, de tres 13, de dos estrellas 9, una estrella 11 y 25 sin clasificación. Lo cual demuestra que realmente existe una oferta diversa para cualquier tipo de estrato económico. También encontramos que la mayor parte de los cuartos están ubicados en cinco y cuatro estrellas, con 11,605 y 1,489 respectivamente. Contabilizando en total de cuartos hasta el año 2012, 14,753 (Tabla 1).

Es importante resaltar, que también la oferta complementaria turística es importante para la recepción de los visitantes, por ello, en la Tabla 2, podemos apreciar algunos de estos establecimientos. Por ejemplo, al

año 2012, el número de restaurantes en Los Cabos se registra en 92, 4 cafeterías, 9 centros nocturnos, 11 bares y 27 agencias de viajes. Este último es básico para la orientación y contratación de algunos servicios de los observadores de aves. Incluso posteriores a su visita en los centros de avistamiento, pueden contratar otro tipo de servicios para conocer el destino turístico.

Por otro lado, otro tipo de infraestructura básica para los visitantes son los espacios marítimos, para lo cual según la Tabla 2, refleja la existencia de 4 marinas y 860 muelles de atraque, los cuales son complementarios para el observatorio de las aves en otros espacios naturales. Así mismo, están disponibles transportadoras turísticas que son 25, necesarias para los traslados de visitantes que no requieran el uso de arrendamiento de autos por optimizar el recurso. La Tabla 2 muestra la existencia de espacios de golf que son 11, y son catalogados como campos en el Top Mundial, y por ese reconocimiento ha tenido mucha aceptación por un segmento de mercado turístico alto. Y por último, existen centros de enseñanza turística y centros de convenciones que pueden servir para adaptar ciertos espacios para un mayor conocimiento de las aves en el Estado y el destino de Los Cabos.

Tabla 1: Infraestructura Hotelera y de Cuartos en los Cabos, 2012

Tipo De Hotel	Hoteles	Cuartos
Cinco estrellas	48	11 605
Cuatro estrellas	15	1 489
Tres estrellas	13	601
Dos estrellas	9	223
Una estrella	11	288
Sin categoría	25	547
Total	121	14753

La Tabla muestra la disponibilidad de infraestructura hotelera tanto de número de hoteles por categoría y número de habitaciones. En los cuales podemos constatar que la mayor parte de esta oferta es de nivel alto, por tener hoteles en su mayoría de cuatro y cinco estrellas. Fuente: Elaboración basado en INEGI, 2013.

Tabla 2: Infraestructura Complementaria Turística en los Cabos, 2012

Restaurantes	Cafeterías	Discotecas y Centros Nocturnos	Bares	Agencias de Viajes	Empresas Arrendadoras de Autos
92	4	9	11	27	21
Campos de golf	Centros de convenciones	Centros de enseñanza turística	Marinas turísticas	Muelles de atraque	Transportadoras turísticas especializadas
11	1	1	4	860	25

La Tabla muestra la composición de infraestructura complementaria en Los Cabos, desde la cantidad de restaurantes, bares, cafeterías, centros nocturnos y de diversión, la disponibilidad de viajes y arrendadoras de autos. Los cuales son necesarios para el traslado y necesidades básicas de los observadores de aves. También muestra la existencia de infraestructura marítima y espacios de esparcimiento únicos en Los Cabos. Fuente: Elaboración basado en INEGI, 2013.

Cabe destacar que el gasto promedio diario de un aviturista va de los 80 a 200 dólares, el cual de poder captarse adecuadamente dejaría una derrama económica directa para las comunidades Cabeñas. Por todo lo anterior el Municipio de los Cabos cuenta con las características idóneas para la ejecución del aviturismo y al encontrarse los sitios con potencial dentro o en las inmediaciones de comunidades rurales lo transforman en el compañero perfecto para el turismo rural o como un atractivo principal por si solo es por esto que puede y debe ser aprovechado como una herramienta que propicie desarrollo sustentable con una considerable derrama económica para la región. Este destino turístico, cuenta con la infraestructura adecuada para la recepción de los observadores de aves y hacer placentera su estancia, así mismo, tiene la oportunidad de conocer otros tipo de espacios naturales de la región. Es importante señalar que las condiciones para ofrecer este servicio son buenas, hay recursos naturales, infraestructura, solo falta

formalizar este tipo de servicios y motivar a otros establecimientos a ofertar este tipo de actividades a los visitantes.

## CONCLUSIONES

La investigación realizada muestra evidencia suficiente de la existencia de un potencial natural de especies de aves en Los Cabos, disponibles para el avistamiento. El cual puede ser aprovechado por el sector turístico para una mayor captación en afluencia de visitantes. Este destino cuenta dentro de su territorio con cuatro ANP's, donde destaca la reserva de la biosfera de Sierra de la Laguna con presencia de tres especies endémicas y más de 40 subespecies endémicas de las cuales 11 solamente se reproducen en el área del bosque de pino encino. Así mismo, existe una infraestructura suficiente para la recepción de los diversos segmentos de turistas y ser partícipes de la observación de aves. Dicha infraestructura es variada y se puede adaptar a diferentes niveles económicos. Por ello, el aviturismo es una actividad turística con gran potencial en Los Cabos.

### RESUMEN

*El objetivo de este artículo es mostrar el diagnóstico que se efectuó al proceso de dirección estratégica en la Facultad de Economía, Contaduría y Administración (FECA) a inicios del año 2012, el estudio de documentos: fue uno de los métodos empleados para recopilar información acerca del campo de acción utilizando el Plan de Desarrollo Institucional de la Universidad Juárez del Estado de Durango (UJED) 2011-2016 y el Plan de Desarrollo Institucional de la FECA, además el cuestionario elaborado por la Cátedra de la UNESCO en Dirección Universitaria, el cual se adaptará a la realidad local en el tema de educación superior. El cuestionario consta de 37 ítems, clasificados en 4 ejes, a saber: formulación de la estrategia, despliegue y alineamiento, seguimiento y retroalimentación y aprendizaje; éste servirá como guía orientadora para realizar una entrevista semi-estructurada, que se aplicará en forma presencial a los responsables de la planeación institucional, para después mostrar las fortalezas y debilidades detectadas del proceso.*

**PALABRAS CLAVE:** Planeación Estratégica, Diagnóstico, Educación Superior

## THE PROCESS OF STRATEGIC MANAGEMENT, STRENGTHS AND WEAKNESSES IN FECA UJED

### ABSTRACT

*The aim of this paper is to show the diagnosis, which was made to the process of strategic management at the School of Economics, Accounting and Business Administration (FECA), in early 2012, the study of documents, such as the Institutional Development Plan of Juárez University of Durango State (UJED) 2011-2016 and the Institutional Development Plan of FECA, in addition to the questionnaire prepared by the UNESCO Chair on Higher Education Management, which will be adapted to the local reality in the field of higher education, was one of the methods used to gather information about the field. The questionnaire consists of 37 items, classified in 4-axis, namely: strategy formulation, deployment and alignment, monitoring, feedback and learning; it will be considered as a guide to make a semi-structured interview, which will be applied face to face to those responsible for institutional planning, and then show the strengths and weaknesses in the process to be identified.*

**JEL:** M10

**KEYWORDS:** Strategic Planning, Diagnosis, Higher Education

## INTRODUCCIÓN

La Universidad Juárez del Estado de Durango (UJED) está afiliada a la Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES) en México, por lo tanto cumple con una serie de requisitos establecidos por sus estatutos los cuales señalan, entre otros, que deberán realizar un ejercicio de autoevaluación a partir de los indicadores, cualitativos y cuantitativos en diez grandes apartados entre los que destacan la Naturaleza y la Misión de la Institución, la Normatividad Institucional y el de la Planeación (Los diez apartados son: la naturaleza y la misión de la institución, Normatividad institucional, Planeación, Infraestructura académica, Planes de estudio, Evaluación, Profesores, Estudiantes, Recursos Financieros, Difusión Cultural).

Por otro lado la FECA está acreditada por el Consejo de Acreditación en la Enseñanza de la Contaduría y Administración, A.C., (CACECA), se creó bajo la tutela de la Asociación Nacional de Facultades y Escuelas de Contaduría y Administración, (ANFECA), en 1996; a partir de 2002 se consolidó como asociación civil y en 2003 fue reconocido por el Consejo para la Acreditación de la Educación Superior, (COPAES), como el único organismo acreditador para los programas de contaduría, administración y afines en el país, evaluando con estándares e índices que engloban tres aspectos: alumnado, docencia y administración. CACECA ha acreditado más de seiscientos programas académicos de nivel superior. De acuerdo con la mejora de la educación continua, ofrece talleres mensuales de formación de pares evaluadores, así como espacios de aprendizaje para el desarrollo de competencias educativas y administrativas en docentes y directivos, de forma presencial y a distancia.

Conforme a la importancia de la educación en la globalización, CACECA ha expandido sus actividades hacia instituciones educativas de Latinoamérica, con enfoques de evaluación y de formación docente. Entre los países en los que tiene presencia se encuentran Guatemala, Perú, Bolivia, Chile, Cuba, Ecuador, El Salvador, Nicaragua, Colombia, Argentina, Puerto Rico y Paraguay. Además la FECA tiene una participación importante dentro del Programa Integral de Fortalecimiento Institucional (PIFI), estrategia de la Secretaría de Educación Pública (SEP) para apoyar a las Instituciones de Educación Superior (IES) a lograr mejores niveles de calidad en sus programas educativos y servicios que ofrecen. A través de este programa, las instituciones reciben recursos en respuesta a las prioridades derivadas de un ejercicio de planeación estratégica participativa.

Lo anterior nos muestra la importancia de la Dirección Estratégica en las Instituciones de Educación Superior de México, en particular la FECA de la UJED ya que es un vía para el crecimiento y consolidación de las universidades, además relacionada con la obtención de calidad y no menos importante recursos económicos extraordinarios del Gobierno Federal para su crecimiento y consolidación, pero debemos preguntarnos qué fortalezas y debilidades tenemos en este proceso? Responder esta interrogante es el objetivo de este artículo. El artículo está organizado en cuatro apartados. En el primero la sección de revisión literaria se presenta lo más relevante sobre la dirección estratégica, después tenemos la sección de metodología donde se describe cómo se llevó a cabo el estudio, en la sección de resultados se resume los datos más relevantes y el tipo de análisis realizado. Una vez presentados los resultados, en conclusiones se procede a evaluar e interpretar sus implicaciones.

## REVISIÓN LITERARIA

### Administración Estratégica E Innovación

David (2008), define a la administración estratégica como el arte y la ciencia de formular, implementar y evaluar las decisiones inter funcionales que permiten a la organización alcanzar sus objetivos. Asimismo, para Thompson y Strickland (2003), la administración estratégica es un proceso de evaluación sistemática

de la naturaleza de un negocio, definiendo los objetivos a largo plazo, identificando las metas y objetivos cuantitativos, desarrollando estrategias para alcanzar dichos objetivos y localizando recursos para llevar a cabo dichas estrategias. Para García (2007), el proceso de planeación estratégica implica la realización de actividades formalizadas y por escrito por parte de las empresas, encaminadas a identificar objetivos y metas, a analizar el ambiente externo y los recursos internos para identificar oportunidades y amenazas del entorno y determinar fortalezas y debilidades de la organización, lo que permitirá a la empresa formular estrategias adecuadas a sus objetivos en función de su situación interna y externa. Otras definiciones importantes son:

Hax y Majluf (1984:72), afirman que: "La dirección estratégica tiene, como objetivo último, el desarrollo de los valores corporativos, las capacidades directivas, las responsabilidades organizativas, y los sistemas administrativos que relacionan la toma de decisiones estratégica y operativa de todos los niveles jerárquicos, y de todas las líneas de autoridad de negocio y funcionales de una empresa". Para Hofer et al. (1984), el campo de la dirección estratégica está relacionado con dos grandes áreas. La primera estudia los procesos estratégicos de las organizaciones, tales como la formulación de objetivos, la formulación de estrategias y el diseño de estructuras y sistemas administrativos. La segunda implica el estudio de las diferentes funciones o responsabilidades de la alta dirección, lo que incluye actividades tan diversas como la coordinación e integración de las tareas realizadas en las diferentes áreas funcionales, la participación en las decisiones estratégicas y operativas clave, la negociación con colectivos externos y el ser portavoz de la organización. Teece (1990) define la dirección estratégica como la formulación, implementación y evaluación de las acciones directivas que permiten aumentar el valor de la empresa o maximizar la diferencia entre su valor de mercado y el capital aportado por los propietarios.

Para este autor, la cuestión clave consiste en saber cómo posicionar y dirigir la empresa de manera que genere, aumente y proteja las rentas económicas. Frente a otros autores que destacan la importancia del entorno, Teece (1990:46) considera que "Es importante reconocer [...] que las rentas se derivan fundamentalmente de algún activo único o idiosincrásico poseído o controlado por la empresa". De igual manera, Summer et al. (1990) centran el objetivo de la dirección estratégica en garantizarla supervivencia y el crecimiento de aquellas organizaciones que, en comparación con sus competidoras, alcanzan competencias distintivas en la obtención de outputs de utilidad para la sociedad.

## METODOLOGÍA

Durante el proceso de la investigación el aspecto central fue la realización de un diagnóstico que permitió detectar las fortalezas y debilidades en el proceso de dirección estratégica. Para la realización del mismo se tuvo en cuenta aplicar métodos que favorecieran la triangulación de la información, y que la misma fuera confiable. La triangulación de la información es un recurso muy importante de la investigación que permite relacionar y contrastar información que viene de diferentes fuentes y establecer regularidades que le dan unidad, integridad al proceso sobre el cual se está incidiendo, y en este caso fue de vital importancia poder integrar diferentes fuentes de las que se derivaron criterios muy similares. El principio básico de la triangulación consiste en recoger y analizar datos desde distintos ángulos para compararlos y contrastarlos entre sí. Denzin (1970) define la triangulación como "la combinación de metodologías en el estudio de un mismo fenómeno". Para Kemmis (1983) consiste en un control cruzado entre diferentes fuentes de datos: personas, instrumentos, documentos o la combinación de todos ellos.

Para la realización del diagnóstico se aplicaron los siguientes métodos: 1.- Estudio de documentos. 2.- Entrevista a directivos de la Facultad. Se identificaron las fortalezas y debilidades en el proceso de administración estratégica por medio del estudio de documentos, para recopilar información acerca del campo de acción utilizando el Plan de Desarrollo Institucional de la UJED 2011-2016 y el Plan de Desarrollo Institucional de la FECA 2006-2012, además el cuestionario elaborado por la Cátedra de la UNESCO en Dirección Universitaria, el cual se adaptó a la realidad local en el tema de educación superior. El cuestionario consta de 37 ítems, clasificados en 4 ejes, a saber: formulación de la estrategia, despliegue

y alineamiento, seguimiento y retroalimentación y aprendizaje; éste servirá como guía orientadora para realizar una entrevista semi-estructurada, que se aplicará en forma presencial a los responsables de la planeación institucional.

## RESULTADOS

Después de haber efectuado el diagnóstico al proceso de dirección estratégica en la FECA de la UJED y atendiendo a las sugerencias de académicos se ha llegado a las siguientes fortalezas y debilidades del proceso en la Tabla 1 y Tabla 2:

Tabla 1: Fortalezas Detectadas en el Proceso de Dirección Estratégica

Fortalezas	
1	Cuenta con un proyecto estratégico a partir de las políticas establecidas para tal efecto
2	La estrategia como “fruto de un proceso formal”
3	Mediante el subsidio extraordinario se asignan recursos a través de mecanismos como Programa Integral de Fortalecimiento Institucional (PIFI), estrategia que ha venido impulsando en los últimos 8 años el gobierno federal a través de la SEP, en las universidades públicas del Subsistema de Educación Superior, a través de procesos integrales de planeación participativa, para fomentar la mejora continua de la calidad de los programas educativos y servicios que ofrecen las IES, con el propósito de elevar la calidad de la educación superior.
4	Se tienen en cuenta en la estrategia, y se integran de forma estructurada y explícita, los elementos clave de la planeación estratégica, como Misión Valores y Visión
5	Cumplen con los principales elementos que esperados en la formulación de la estrategia. Así lo establece la ANUIES al determinar que en la función de planeación se debe comprobar la existencia de evidencias y mecanismos que permitan sustentar la toma de decisiones institucionales en un proceso de planeación que propicie el desarrollo y el logro de altos estándares de calidad.
6	Se hizo un proceso de planeación estratégica participativa ya que fueron incluidos un equipos de docentes especializados en la temática
7	Se consensuan y plantean medidas específicas para el seguimiento y evaluación antes de que se inicie el proceso
8	Se hace una comparación del progreso de la institución con el seguimiento de su proyecto estratégico
9	Se dispone de un sistema de indicadores, o Cuadro de Mando, diseñado específicamente para el seguimiento estratégico

*Principales fortalezas detectadas en el proceso de dirección estratégica.*

## CONCLUSIONES

Las instituciones de educación superior suelen incluir en sus planes estratégicos un listado de objetivos y acciones que se derivan de las oportunidades y amenazas detectadas durante el proceso de evaluación del entorno externo y del conjunto de fortalezas y debilidades encontradas en la fase de diagnóstico institucional. No obstante, sí es cierto que las universidades establecen estas directrices futuras recurriendo a diferentes niveles de detalle y concreción que, en última instancia, les permiten una implementación más eficaz de las acciones formuladas. Para unificar los conceptos empleados, podemos afirmar que, con carácter general, son tres los niveles de formulación con más frecuencia utilizados, a los que denominamos de la siguiente forma: (1) objetivos generales, o aquellos objetivos de naturaleza más bien cualitativa y bajo nivel de concreción; (2) objetivos específicos, o conjunto de objetivos más concretos derivados de los anteriores y cuya orientación es más cuantitativa; y (3) acciones estratégicas, o aquellas actividades que nos permiten poner en práctica, o implementar, los objetivos específicos.

Estos tres niveles de objetivos y estrategias afectan a los niveles institucionales, de departamentos, escuelas y facultades, siendo estos dos últimos los que, en última instancia, logran que el esfuerzo de elaboración de un plan estratégico acometido por la institución alcance una implementación exitosa. Los principales factores que inciden negativamente en la implantación de la estrategia son el compromiso, seguimiento escaso y la comunicación deficiente. La visión estratégica compartida, el despliegue y la integración son los principales elementos que inciden positivamente en la implantación de la Estrategia.

Tabla 2: Debilidades Detectadas en el Proceso de Dirección Estratégica

Debilidades	
1	La estrategia se plantea a través de "algunas ideas y líneas generales"
2	No se realiza el proceso de planeación considerando las tendencias del entorno internacional, nacional y regional; la evaluación que por norma deben hacer de planificaciones anteriores y sus resultados, así como de las restricciones presupuestales, signo de nuestro tiempo.
3	No se tienen en cuenta en la estrategia, y no se integran de forma estructurada y explícita, los elementos clave de la planeación estratégica, como FODA, Ejes/Objetivos estratégicos y Cuadros de Mando
4	Falta de Participación de una consultoría externa en el proceso de formulación de la estrategia.
5	Poca aplicación de las En cuanto a las metodologías y modelos que se utilizan en el proceso de formulación y planificación estratégica como Análisis FODA, Análisis de Mercado, Mapas Estratégico, Escenarios y Planes de Acción
6	Poca participación de la comunidad docente y administrativa de la facultad en el proceso de elaboración del plan estratégico
7	Falta de una convocatoria a la comunidad universitaria a participar en el proceso de consulta para la elaboración del plan de desarrollo institucional
8	No existe una previsión de actividades para asegurar el despliegue de la estrategia dentro de la facultad
9	Las funciones y responsabilidades de las personas dentro de la institución no están bien entendidas y asumidas, ya que se carece de un manual de funciones
10	Los objetivos estratégicos no son claros y fáciles de comunicar, cuantificables y alineados con la política y la estrategia
11	No existe un proceso eficaz de comunicación de doble vía que garantice la transmisión de la estrategia
12	Falta Comunicación formal con amplia difusión a toda la institución
13	No existe un proceso para valorar el nivel de entendimiento de la estrategia definida
14	No están alineados con la estrategia de la institución, de forma estructurada, los siguientes elementos Presupuesto anual, Política de personal, Política TIC, Sistema de información, Gestión por procesos, Sistemas de seguimiento, Gestión de la calidad, Responsabilidad social
15	Falta de aplicación de las metodologías que utilizan en el despliegue y alineamiento de la estrategia como la Dirección por Objetivos, Grupos de Mejora, Cuadros de mando, Mapas estratégicos y Cartas de Servicio
16	Principales factores que inciden negativamente en la implantación de la Estrategia: a) Visiones parciales de la estrategia b) Escaso despliegue c) Compromiso escaso d) Seguimiento escaso e) Alineamiento deficiente f) Comunicación deficiente g) Integración deficiente h) Mecanismos de información son tácticos y no estratégicos (se enfocan hacia la medición y no el aprendizaje)
17	Hay dinámica de seguimiento formal de la implantación de la estrategia definida
18	En el proceso de planificación y revisión de la política y estrategia se incluyen los resultados de los indicadores internos de rendimiento y de autoevaluación de la propia institución
19	Herramientas utilizadas para dar soporte al seguimiento y medición: a) Cuadros de mando b) Elaboración de memorias anuales c) Sistemas de indicadores de rendimiento
20	Existe una revisión periódica del plan estratégico en relación con su despliegue y los resultados dentro de sus unidades internas
21	Se aprovechan suficientemente las oportunidades de mejora y de adaptación identificadas

*Principales debilidades detectadas en el proceso de dirección estratégica.*

# INTERDEPENDENCIA SIGNIFICATIVA ENTRE RIESGOS FINANCIEROS EN MICROEMPRESAS COMERCIALES HIDALGUENSES

Suly Sendy Pérez Castañeda, Universidad Autónoma del Estado de Hidalgo

Dorie Cruz Ramírez, Universidad Autónoma del Estado de Hidalgo

Cuauhtémoc C. Campos Rangel, Universidad Autónoma del Tlaxcala

Beatriz Sauza Ávila, Instituto Superior del Oriente del Estado de Hidalgo

## RESUMEN

*El actual entorno empresarial, dinámico y altamente competitivo, ha visto numerosas debacles trayendo al estudio del riesgo a la luz y el desarrollo de diversos enfoques para su medición desde los más tradicionales, con visiones individualistas y netamente cuantitativos, hasta los enfoques integrales y cualitativos. Dada la carencia de herramientas para la evaluación de riesgos en las microempresas, el presente documento presenta un enfoque integral, el Enterprise Risk Management (ERM), como metodología viable para la evaluación de riesgos en este sector de la economía, considerando como premisa la existencia de interdependencia entre los riesgos identificados, que aunque en lo individual no presentan altos niveles de exposición, en su relación con otros se observa que potencialmente son riesgos que afectan el desempeño de la empresa. Los resultados se obtuvieron a través de un diseño cualitativo, transversal, no experimental, realizado a 265 microempresas del sector comercial del estado de Hidalgo, México. Los hallazgos muestran que la metodología ERM para la evaluación del riesgo es una herramienta sencilla, útil y aplicable para la medición de riesgos a partir de datos cualitativos en microempresas, evidenciando una relación altamente significativa entre los riesgos financieros evaluados.*

## SIGNIFICANT INTERDEPENDENCE AMONG FINANCIAL RISKS IN MICRO COMMERCIAL BUSINESS IN HIDALGO

### ABSTRACT

*The current business, dynamic and highly competitive environment, has seen numerous debacles bringing to light the study of risk and the development of various approaches to its measurement from the traditional, individualistic and purely quantitative visions until comprehensive and qualitative approaches. Because of the lack of tools to assess risks in micro business, this paper presents a comprehensive approach, the Enterprise Risk Management (ERM), as a viable methodology for assessing risks in this sector of the Mexican economy, considering its premise about the existence of interdependence among the risks identified, although not individually have high levels of exposure, as compared to other it shows that risks are potentially affecting the performance of the company. These results were obtained through a qualitative, cross-sectional, non-experimental design, performed at 265 micro business of the commercial sector in Hidalgo state, in Mexico. The findings show that the ERM methodology for risk assessment is a simple, useful and applicable tool for measuring risks qualitatively in very small business, showing a highly significant relationship among financial risks assessed.*

## INTRODUCCIÓN

Dada la reconocida importancia que las microempresas tienen en el ámbito económico nacional e internacional, por su contribución al empleo y por la generación de la riqueza, éstas se han constituido en uno de los objetos centrales de estudio de la teoría administrativa, llevando a gestores e inversionistas a prestar más atención a la gestión de los riesgos inherentes y emergentes en estos negocios. De ahí que se considere importante para las empresas tomar ventajas de sus decisiones sobre resultados inciertos, ya que las malas decisiones pueden provocar pérdidas y las decisiones acertadas pueden mejorarla rentabilidad en los casos de oportunidades. Al respecto, COSO (2004) afirma que “las incertidumbres presentan riesgos y oportunidades, con el potencial de erosionar o aumentar el valor” (p. 15), en donde se observa que las fuentes de estas incertidumbres están presentes en la complejidad y heterogeneidad de los mismos riesgos, es decir, están presentes en el ámbito interno y externo de los negocios.

Para medirlos se han usado comúnmente medidas estadísticas (Morales y Morales, 2009), así como distribuciones de probabilidad (Coss, 2003) que utilizan conceptos probabilísticos que suponen que los valores asignados a las probabilidades ya están dados o que se pueden asignar con cierta facilidad. Ante este panorama se aprecia que no es fácil desarrollar y emplear una metodología del riesgo de aplicación general y menos al contemplarse la situación que vive el pequeño inversionista en países en vías de desarrollo, por lo que no funcionan los enfoques tradicionales sobre el riesgo en estas entidades. Bajo este contexto, el presente trabajo presenta una propuesta de evaluación de riesgo a partir de la metodología del Enterprise Risk Management (ERM) que se basa en datos cualitativos, para que una vez medidos éstos sean correlacionados para identificar su nivel de interdependencia que los pueda hacer potencialmente peligrosos para el desempeño de las microempresas.

## REVISIÓN LITERARIA

### Enterprise Risk Management (Erm)

El interés de abordar el tema de riesgos se observa en estudios realizados a nivel internacional, en donde se destacan los principales a los que se enfrentan los negocios (E&Y, 2010; Aon Corp, 2009), con esto se observa que la forma de hacer negocios ha cambiado y los riesgos han cambiado, ante lo cual Milans (2012) afirma que desde inicios del siglo XXI estamos en la era de la gestión del riesgo, porque las amenazas que surgen en el ejercicio de toda actividad empresarial requieren ser manejadas adecuadamente para evitar consecuencias económicas no deseadas. De ahí que se considere un área de atención prioritaria para microempresarios, pues al nacer habitualmente de la pasión emprendedora, les hace falta identificar a lo que están expuestos para tomar mejores decisiones.

Bajo este contexto, se hizo indispensable poner más énfasis en la gestión de riesgos relacionados con todos los aspectos del negocio y una de las metodologías que aborda el riesgo de una manera integral se define en términos generales como Enterprise Risk Management (ERM), que describe el conjunto de actividades que las empresas deben realizar frente a los diversos riesgos que enfrentan, esto mediante un método holístico, estratégico e integrado. Uno de los riesgos de los que se ocupa esta metodología son los financieros, ya que considera que éstos tienen un impacto significativo en la rentabilidad, la eficacia, el crecimiento y la reputación de las empresas.

En este siglo XXI, existen varios aspectos que han impulsado considerablemente la necesidad de la gestión de riesgos en las empresas de cualquier tamaño, que hoy se identifican como las ventajas de la aplicación del ERM (Cueva, 2008; SOA, 2009; Beasley, Pagach y Warr, 2009; Marsh, 2012) en donde se demuestra que las empresas que han gestionado de manera eficiente los riesgos que amenazan su actividad, han sido

capaces de sobrevivir a las crisis económicas en mejores condiciones. De ahí la importancia de estudiar el riesgo en microempresas, al ser un sector de gran relevancia económica pero con altos índices de mortandad.

### Riesgo

La existencia de numerosas definiciones sobre riesgo hacen que no exista una concepción común; sin embargo, se observa que los conceptos son semejantes y se asocian con diferentes aspectos, entre los que se pueden mencionar la posibilidad de variaciones en los valores esperados, ausencia de conocimiento seguro de eventos futuros o próximos a confrontarse y condiciones inciertas. En consecuencia, el riesgo se puede entender como la posibilidad de que exista una variación en los resultados esperados, es decir, el riesgo es un resultado incierto que proviene de una decisión, acción o tarea: "una decisión que no implica riesgo, probablemente no es una decisión" (Druker, citado por Vedpuriswar, 2006) y añade que el riesgo no se puede evitar ni eliminar completamente, por lo que la gestión de riesgos es claro respecto a su reducción al mínimo con el objetivo de mantenerlo dentro de límites controlables, así como la aceptación del riesgo en sí para obtener la recompensa.

Monahan (2008) sostiene la idea de que el riesgo es la misma incertidumbre, entendiendo al riesgo como una distribución de varias probabilidades para diversos resultados; por su parte, COSO (2004) define la incertidumbre como la que presenta tanto riesgos como oportunidades, con un potencial de erosionar o aumentar el valor. El riesgo es la posibilidad de que la ocurrencia de un evento afecte negativamente el logro de los objetivos, y la oportunidad es la posibilidad de que un evento ocurra y afecte positivamente la consecución del objetivo.

### Interdependencia de Riesgos

Los defensores del ERM argumentan que integrando el estudio de todas las clases de riesgos en la empresa será posible identificar y entender los riesgos inherentes en las diversas actividades de los negocios (Meulbroek, 2002; Hoyt & Liebenberg, 2011). Aunque la gestión de riesgos individuales reduce la probabilidad de pérdidas, existen interdependencias potenciales entre los riesgos de las actividades que pueden no ser notados en el tradicional enfoque de gestión de riesgos; en contraste, el ERM proporciona una estructura que combina todos los riesgos de las actividades empresariales en un marco integrado que facilita la identificación de tales interdependencias (Hoyt & Liebenberg, 2011). Por definición y contraste, ERM es visto como el nuevo paradigma en la gestión de riesgos.

## **METODOLOGÍA**

El presente estudio tiene un diseño cualitativo, transversal, no experimental y correlacional. Cualitativo, ya que la medición del riesgo se hizo a partir de la percepción de los dueños de las microempresas; transversal, al realizarse la recolección de datos en un momento en el tiempo (mayo de 2013); no experimental, porque no hubo manipulación deliberada variables y correlacional, al determinar los niveles de relación entre los riesgos financieros de las microempresas. Para la medición del nivel de riesgos en las microempresas objeto de este estudio, se siguió el proceso establecido por el ERM, integrando los elementos metodológicos que la literatura establece como indispensables para la obtención de resultados científicamente válidos y confiables.

### Recolección de Datos

Para la medición de la correlación de los riesgos se tomó el instrumento IEREM (Pérez, Campos y García, 2013), que consta de 39 preguntas, distribuidas en 3 bloques: a) datos de identificación; b) crecimiento; c) riesgos financieros, evaluados en viabilidad e impacto. La población de estudio fueron las microempresas

comerciales al por menor, ubicadas en Ciudad Sahagún, estado de Hidalgo, México, que pertenecen a 8 de los 9 subsectores que comprende esta actividad empresarial (DENUE, 2012). A través del muestreo probabilístico simple y estratificado se determinó la muestra que consistió 265 microempresas, distribuidas en cada uno de los subsectores.

## RESULTADOS

### Medición de Riesgos

De acuerdo a la metodología del ERM, se determinan los promedios obtenidos a partir de la evaluación de riesgos financieros en cuanto a viabilidad e impacto, en donde la valoración mínima es 1 y la máxima es 5, obteniendo los resultados mostrados en la Tabla 1.

Tabla 1: Riesgos Financieros

Riesgos Financieros	Viabilidad	Impacto
Estructura de capital	1.5	1.7
Mercado	1.3	1.4
Crédito	1.5	1.4
Liquidez	1.8	1.9
Tesorería	1.5	1.4
Contabilidad	1.4	1.4

*Son los promedios obtenidos a partir de la evaluación de los riesgos financieros de las microempresas entrevistadas, en cuanto a viabilidad e impacto. Fuente: Elaboración propia con base en las entrevistas con microempresarios*

Como se observa, los riesgos financieros de las microempresas estudiadas se ubican con poca frecuencia (viabilidad) y no tienen un impacto significativo en los ingresos de las entidades.

### Ranking de Riesgos

Para realizar el ranking de riesgos, se transformaron los valores de viabilidad e impacto en porcentaje para valorarlos, que es el resultado de la multiplicación de la viabilidad (F) por el impacto (I), de donde se obtuvieron los resultados mostrados en la Tabla 2:

Tabla 2: Ranking de Riesgos Financieros

Riesgo Identificado	Viabilidad (F)	Impacto (I)	Valoración de Riesgo (F * I)	Clasificación
<b>Financieros</b>				
<b>Estructura de capital</b>	<b>3.0</b>	<b>3.4</b>	<b>10.20</b>	<b>2</b>
Mercado	2.6	2.8	7.28	5
Crédito	3.0	2.8	8.40	3
<b>Liquidez</b>	<b>3.6</b>	<b>3.8</b>	<b>13.68</b>	<b>1</b>
Tesorería	3.0	2.8	8.40	3
Contabilidad	2.8	2.8	7.84	4

*En este ranking de riesgos se identifican algunos que tienen un nivel diferenciado del total, como son la liquidez, con 13.68 y estructura de capital, con 10.20. Fuente: Elaboración propia con base en las valoraciones de los riesgos*

Aunque en general los riesgos financieros en las microempresas comerciales se reportan con un impacto poco significativo y poco frecuentes, se identifican algunos que tienen un nivel diferenciado del total, estos son la liquidez, con 13.68 y estructura de capital, con 10.20.

### Interdependencia de Riesgos

Retomando lo dicho por Hoyt & Liebenberg (2011), aunque la gestión de riesgos individuales reduce la probabilidad de pérdidas, existen interdependencias potenciales entre los riesgos de las actividades que pueden no ser notados en el tradicional enfoque de gestión de riesgos; en contraste, el ERM proporciona una estructura que facilita la identificación de tales interdependencias. Para identificar ese nivel de interdependencias se aplicó el coeficiente de correlación de Spearman, con un valor crítico de .1263, calculado con base en el número de microempresas entrevistadas, obteniendo los resultados mostrados en la Tabla 3.

Tabla 3: Correlación de Spearman Entre Riesgos Financieros

RIESGOS		FINANCIEROS					
		Estructura De Capital	Mercado	Crédito	Liquidez	Tesorería	Contabilidad
FINANCIEROS	Estructura de capital	1.000					
	Mercado	.860	1.000				
	Crédito	.732	.689	1.000			
	Liquidez	.646	.648	.675	1.000		
	Tesorería	.694	.732	.730	.709	1.000	
	Contabilidad	.599	.615	.706	.672	.738	1.000

*Para identificar ese nivel de interdependencias se aplicó el coeficiente de correlación de Spearman, con un valor crítico de .1263, calculado con base en el número de microempresas entrevistadas, obteniendo los resultados mostrados. Fuente: Elaboración propia con base en los datos obtenidos en la aplicación del instrumento.*

Con base en los resultados obtenidos y con base en el valor crítico calculado, se observa que todos los valores calculados superan el 0.1263 y se infiere que todos los riesgos financieros están estadísticamente relacionados, en una relación positiva y muy significativa (valores superiores a 0.600). La interdependencia más significativa la observamos entre el riesgo de mercado y la estructura de capital, con una correlación de .860.

### CONCLUSIONES

Respecto a la metodología ERM para la evaluación de riesgos en microempresas, esta es útil y aplicable a este sector de la economía, pues evalúa los riesgos a partir de información cualitativa y permite jerarquizarlos dentro del contexto integral de la empresa. A diferencia de las metodologías tradicionales que sólo utilizan datos cuantitativos y cálculos matemáticos y/o estadísticos robustos. Los resultados de las empresas estudiadas muestran que sus niveles de riesgos financieros se ubican con baja viabilidad y sin impacto significativo, jerarquizando los riesgos de mayor exposición al de liquidez y estructura de capital y respecto a la interdependencia los resultados muestran que existe una relación positiva muy significativa entre los riesgos financieros, con valores superiores a 0.6 y que alcanzan el .860 de correlación, lo que hace inferir que existen relaciones potenciales entre los riesgos empresariales que afectan el crecimiento empresarial cuando la exposición de alguno de estos riesgos eleva o disminuye su nivel, concluyendo que

el estudio de riesgos debe ser de manera integral, como los propone el ERM y no bajo las teorías tradicionales e individualistas.

# **EL MERCADO DE LA NOSTALGIA: UNA OPORTUNIDAD DE EXPORTACIÓN PARA LAS EMPRESAS FAMILIARES DEL MUNICIPIO DE HERMOSILLO, SONORA MEXICO**

Natalia Guadalupe Romero Vivar, Universidad Estatal de Sonora

María de los Ángeles Monterde Valenzuela, Universidad Estatal de Sonora

## **RESUMEN**

*La relevancia que ha tomado para México el crecimiento del mercado hispano en los Estados Unidos es muy significativa, el incremento continuo de migrantes connacionales representa un nicho de mercado que demanda constantemente productos de origen mexicano, a este segmento se le conoce como “Mercado de la nostalgia” este concepto es utilizado para designar los hábitos de consumo compartidos por quienes se aferran a sus raíces cuando están lejos de su país de origen y hacen todo lo posible por consumir los productos que conocieron en su infancia, este grupo de productos comprende alimentos, bebidas, artesanías y artículos de regalo entre otros. Este mercado de consumidores potenciales se encuentra conformado por toda la población hispana que radica en Estados Unidos. Dentro de territorio americano los estados con mayor índice de hispanos son: California, Texas, Florida, Arizona, Nuevo México, Nueva York, Nueva Jersey e Illinois, estos ocho estados contienen tres cuartas partes (74%) de la población latina de la nación. El mercado de la nostalgia representa para la Micro, Pequeña y Mediana Empresa Familiar la oportunidad de expandir su mercado, incrementar sus utilidades, diversificar riesgos y mercados. La concentración de hispanos en el estado de Arizona simboliza para la empresa familiar una oportunidad de negocio constante, ya que existen empresas que tienen la capacidad de abastecer el mercado en pequeñas cantidades.*

**PALABRAS CLAVE** Población, Hispanos, Mercado, Empresa, Exportación

## **THE MARKET OF “NOSTALGIA”: AN EXPORT OPPORTUNITY FOR FAMILY BUSINESS TOWNSHIP HERMOSILLO, SONORA MEXICO**

### **ABSTRACT**

*The relevance that the growth of the Hispanic market in the United States has taken in Mexico, is really significant; the continuous increase of Mexicans immigrants represents a niche market that is constantly demanding products of Mexican origin, we call this segment: "Nostalgic Market". This concept is used to describe drinking habits shared by those who cling to their roots when they are away from their home country and do everything possible to consume products that remind them of their childhood. This group of products includes: foods, drinks, crafts, gift items and more. This potential consumer market is made up of all Hispanics living in the United States. Within the American territory the states with the highest Hispanic population are: California, Texas, Florida, Arizona, New Mexico, New York, New Jersey and Illinois. These eight states contain three-quarters (74%) of the Latino population in the nation. The Nostalgic Market represent the opportunity to expand micro, small and medium family markets, increase their profits and diversify risks. The concentration of Hispanics symbolizes for the family enterprises, a chance of constant business in the state of Arizona, as there are companies that have the capacity of supplying the market in small quantities.*

## INTRODUCCION

La creación de empresas en Sonora y en México, surge como respuesta al desempleo tan alto registrado en los últimos años. Por ello es de suponer que en actitud desesperada y con mucha creatividad, las personas emprenden; a veces sin intención, estudios, factibilidad o recursos; y solo con la necesidad como motor que las impulsa a sortear todo tipo de pruebas. Inician comercializando o produciendo algo que saben hacer, con el recurso humano más barato y disponible: La Familia. Las Empresas Familiares en México, conforman aproximadamente el 95% del PIB; y están en todos los estratos: micro, pequeñas, medianas y grandes. Aproximadamente el 70% las empresas familiares tienden a desaparecer antes del primer cambio generacional; siendo su esperanza de vida promedio de 25 años, mientras que las empresas que tienen una gestión más institucionalizada es de 50 años en promedio.

Por lo tanto la operatividad de la empresa obliga a sus dueños a buscar otras alternativas de producción para subsistir o bien desarrollar y consolidar su actividad según el caso, es por ello que la producción constante y la participación de la empresa familiar en el sector exportador es un importante detonador de su actividad, ya que provee de oportunidades de expansión, mejores salarios, diversificación de los riesgos y los mercados. Los mexicanos que viven en el estado de Arizona en Estados Unidos, representan un mercado conocido como “El mercado de la Nostalgia”, éste simboliza para la empresa familiar una oportunidad de negocio, ya que la población perteneciente a este grupo selecto de consumidores “extraña” los productos típicos de su tierra, por lo que la demanda de éstos es constante y poco satisfecha, por las exportaciones incipientes de las empresas que tienen capacidad de producción; esta investigación tiene como propósito identificar a las empresas familiares del municipio de Hermosillo que tienen actividad exportadora, así como conocer el destino de sus exportaciones y en su caso saber cuántas de ellas no realizan actividad comercial al exterior. Al identificar estos aspectos se podrá sugerir a las empresas familiares que tipo de productos pueden abastecer en el mercado de la nostalgia. Este documento contiene información acerca de la caracterización del mercado de la nostalgia en el estado de Arizona, Estados Unidos, así como también un perfil de la empresa familiar, la aplicación del instrumento, los resultados y las conclusiones

## REVISIÓN DE LITERATURA

*Contextualización del mercado de la nostalgia en Estados Unidos* : La relevancia que ha tomado para México, el crecimiento del mercado hispano en los Estados Unidos es muy significativa, el incremento continuo de migrantes connacionales representa un nicho de mercado que demanda constantemente productos de origen mexicano, a este segmento se le conoce como “Mercado de la Nostalgia”, este concepto es utilizado para designar los hábitos de consumo compartidos por quienes se aferran a sus raíces cuando están lejos de su país de origen y hacen todo lo posible por consumir los productos que conocieron en su infancia, este grupo de productos comprende alimentos, bebidas, artesanías y artículos de regalo entre otros; este gran mercado incluye tanto a personas mayores de edad como a jóvenes, sobre todo aquellos que emigraron siendo niños. (Vargas, 2010). Los hispanos son el grupo minoritario más grande del país, U.S. Census Bureau (2013) muestra en un estadístico que la población hispana en el 2012 fue de 53 millones, lo que representa el 17% de los EE.UU. comparativamente la población de negros no hispanos, que son el segundo grupo minoritario más grande del país, representan el 12% de la población del país y en seguida el grupo de asiáticos no hispanos tercero con un 5%.

La Población Hispana Que Vive En El País Vecino, Sigue Ubicándose En Las Zonas De Asentamiento Tradicional, De Acuerdo A Un Análisis Del Pew Research Center, De EE.UU. Hoy En Día, Los 100

Condados más grandes de población hispana contienen el 71% de este tipo de población; el Condado de Los Angeles, CA solo contiene 4,9 millones de hispanos esto representa el 9% de la población hispana de la nación. Los estados con mayor índice de hispanos son: California, Texas, Florida, Arizona, Nuevo México, Nueva York, Nueva Jersey e Illinois, estos ocho estados contienen tres cuartas partes (74%) de la población latina de la nación. Los patrones de asentamiento geográfico se alinean por lo general a los diversos países de origen de la población hispana. Por ejemplo, las personas de origen mexicano son el grupo dominante en el área metropolitana de Los Angeles -Long Beach, que componen el 78% de así como también en los estados fronterizos de Arizona, California, Nuevo México y Texas. En el año 2011 la población de los inmigrantes mexicanos estaba compuesta por 53% hombres y 55% mujeres, considerablemente mayores (edad media de 38 frente a 29), el 41% de ellos con nivel de estudios de secundaria, cuenta con un ingreso promedio es de cerca de \$ 2.000 en las últimas dos décadas.

*Características de los consumidores hispanos en Arizona:* Los hispanos en Arizona son más de la tercera parte de la población y continua creciendo, consolidando su permanencia en la entidad, se ha proyectado que para el año 2030 los hispanos serán mayoría dentro del territorio en Arizona, los consumidores hispanos son el segmento de mercado más grande en la economía, con un cambio en el perfil de consumo adoptando los aspectos de la vida americana. (Cámara de Comercio de Arizona 2012) El poder de compra de los hispanos ha alcanzado los 43.3 billones de dólares en el 2013, se pronostica que el poder de compra en toda la unión americana de los hispanos para el 2015 será 1.5 trillones de dólares, equivalente a la 12va. Economía más grande del mundo. La población hispana tendrá un incremento cuatro veces más rápido que la población en general desde ahora hasta el año 2050, el promedio de edad de los hispanos que viven en Arizona es de 28 años, 10 años más joven que el promedio que es de 37 años, en Arizona, generan el 18% del total de las compras. En la Figura 1 podemos observar que el poder de compra de los hispanos asentados en Arizona tiene una tendencia a incrementarse muy considerablemente en el consumo de productos y servicios, este grupo de consumidores tendrá un poder de compra para el año 2017 de 1,676 billones de dólares.

Figura 1: Poder de Compra de los Hispanos

Fuente: Elaboración propia. A partir de USA Seiling Economic Growth 2012

En cuanto a la estructura de la población mexicana en el estado de Arizona, la Tabla 1 nos muestra que existen más consumidores hombres que mujeres y el grueso de la población tiene un rango de edad entre los 5 y 17 años, por lo que es un mercado eminentemente joven, sin embargo, el rango de edad entre los 18 y 29 años está conformado por personas con capacidad de trabajar y ser autosuficientes. Los rangos de edad entre los 30 a 39, 40 a 49 y 50 a 65 y más, representan un segmento de mercado que añora los productos elaborados en su tierra natal, por lo que son consumidores constantes de productos mexicanos.

Tabla 1: Composición de la Población Hispana en Arizona

<b>Hombres</b>	<b>982,00</b>
Mujeres	968,00
Rangos de Edad: 5-17	505,000
18-29	399,000
30-39	287,000
40-49	235,000

*Empresas familiares:* Las Micro, pequeñas y medianas empresas son fundamentales para el país porque son el principal generador de empleos, son el mejor distribuidor de ingresos entre la población y entre las regiones, son también indispensables para que las grandes empresas existan, y además un factor central para la cohesión social, y la movilidad económica de las personas. La creación de empresas en Sonora y en México, surge como respuesta al impulso de la economía regional, toda vez que implica satisfacer varias necesidades: 1) Autoempleo, 2) Seguridad familiar y 3) Aprovechamiento de Oportunidades de Mercado. Es entonces la Familia la incubadora natural y protagonista del progreso.

Las Empresas Familiares en México, conforman aproximadamente el 95% del PIB; y están en todos los estratos: micro, pequeñas, medianas y grandes. La Tabla 3 muestra datos relevantes de las Empresas Familiares, mostrando preocupante su tasa alta de mortalidad en ellas durante los primeros años de existencia, pues 7 de cada 10 empresas de reciente creación no duran más de 3 años, proporción similar que se da en las empresas familiares que tienden a desaparecer en el primer cambio generacional; siendo la esperanza de vida promedio de 25 años, mientras que las empresas que tienen una gestión más institucionalizada es de 50 años en promedio.

Tabla 3: Estadísticas de las Empresas Familiares en México

#### Información de Empresas Familiares en México

El 90% de empresas mexicanas son familiares - EU reporta más del 95%  
 Las Micro, Pequeñas y Medianas empresas generan el 52% del PIB en México  
 Más del 90% de emisoras en BMV tienen clara representación familiar  
 El 80% de los nuevos empleos en la última década han sido creados por Empresas Familiares  
 El 78.5% de los empleos en México los generan las Micro, Pequeñas y Medianas y son Empresas Familiares  
 70% de empresas de reciente creación no durarán más de 3 años.  
 Solo 13.9% de las empresas Mexicanas obtuvieron un crédito  
 7 de cada 10 empresas familiares desaparecen en primer cambio generacional  
 Esperanza de vida de empresa familiar es de 25 años – Contrario a gestión institucional que es de 50 años.

La Tabla 4 nos indica la clasificación que hace la Secretaría de Economía Mexicana, por estratos o tipo de empresa; en la cual se aprecian las características de cada uno en cuanto a número de trabajadores y monto de ventas anuales. En esta clasificación están incluidas Empresas Familiares en una proporción del 90% de este censo.

Tabla 4: Estratificación Empresarial en México

Estratificación en México. Secretaría de Economía 2009			
Tipo	Sector	Trabajadores	Ventas Anuales
Micro	Todos	hasta 10	Hasta 4 millones
Pequeña	Comercio	11 a 30	de 4 a 100 millones
	Industria/Servicios	11 a 50	
Mediana	Comercio	31 a 100	de 100 a 250 millones
	Servicios	51 a 100	
	Industria	51 a 250

Para efectos de esta investigación, el conocer cómo están distribuidas las empresas familiares, dentro de la economía, muestra una clara idea de la relevancia de atenderlas para conservarlas y desarrollarlas debido al fuerte aporte al Producto Interno Bruto Nacional. Según datos del Instituto Nacional de Estadística, Geografía e Informática (INEGI), el 95.2% de las empresas familiares están clasificadas como micro, y generan el 45.6% del empleo formal. Tabla 5.

Tabla 5: Datos Generales México INEGI 2009

<b>Datos Generales México Inegi 2009</b>				
<b>Tipo</b>	<b>% Total</b>	<b># Empresas</b>	<b>% Empleo</b>	<b>Empleos (millones)</b>
Micro	95.2	4,897,142	45.6	12.6

Mediana	0.3	15,432	9.1	2.5
Grande	0.2	10,288	21.5	6.0
Total	100%	5,144,056	100%	<b>27.7</b>

Fuente: KPMG. 2009. Estudio Sobre Empresas Familiares En México

La Tabla 5, también muestra que el tipo de Empresas Familiares Mediana y Grande son las que menos proporción representan; figurando con un 0.3 y 0.2% respectivamente, el 95% lo integra la microempresa y el 4.3% la pequeña, lo que hace suponer un gran reto para la administración de empresas en el sentido de desarrollarlas y conservarlas. Es importante subrayar que la economía de un país depende en gran medida de las empresas familiares; y que las familias, dependen de las empresas que funcionan en un país; por lo tanto, el bienestar económico y social estará en manos de las empresas.

Por la relevancia que significa su proporción y aportaciones, la Empresa Familiar en México empieza a ser objeto de intensos estudios. En ellos se busca determinar esquemas que expliquen su composición, estructuras y comportamientos. En la Figura 3 se aprecia uno de los más completos, el modelo de los Tres Círculos, de Davis y Tagiuri (1982), que explica la forma en que se sobreponen los sistemas de la Familia, la Empresa y la Propiedad, así como el lugar que ocupan cada uno de los miembros que pertenece a alguno de los siete sub-conjuntos que se forman en las áreas de sus intersecciones. El círculo Familia es aquel al cual pertenecen todos y cada uno de los miembros de un mismo grupo familiar. El círculo Empresa comprende el conjunto de individuos que laboran dentro de ella y que perciben un sueldo o beneficio económico directo, producto del trabajo que desempeñan y que le agrega valor a la compañía.

El círculo Propiedad determina quiénes son dueños de las acciones de la empresa, lo cual genera toda una serie de deberes y derechos sobre esta. Todas y cada una de las personas que de alguna forma u otra tienen relación con una Empresa Familiar, pueden ubicarse en alguno de estos círculos y subconjuntos. Por ejemplo: alguien que pertenezca a la familia pero que no sea empleado ni propietario, se encuentra ubicado en el área marcada con el número uno. Por otro lado, un empleado que no tenga relación con la familia ni con la propiedad de la empresa estaría en el círculo tres. Otro ejemplo lo constituye un socio que no trabaje en ella y no tenga vínculos familiares en el número dos. Los otros subconjuntos o intersecciones dan la condición para un propietario familiar no empleado (cuatro), propietario no familiar empleado (cinco), familiar no propietario empleado (seis) y el familiar propietario perteneciente a la empresa en el subconjunto siete.

Figura 3: El Modelo de los 3 Círculos de la Empresa Familiar, Davis y Tagiuri (1982)

*Ahora bien, dos de los grandes problemas que se identifican en este tipo de organizaciones son:* La dificultad para crecer: Efectivamente, mientras las empresas no familiares tienden a acelerar su crecimiento luego de algún tiempo las empresas familiares se inclinan al estancamiento y la consecuente parálisis en su crecimiento. Por lo que una opción para continuar con el crecimiento sostenido de la empresa es diversificar el mercado de destino de los productos que vende, de esta forma la producción podría tener una constante y los ingresos por las utilidades de la venta al extranjero serían más redituables al vender a un mercado con un poder de consumo más elevado y un nivel de ingreso sólido. La continuidad: Tal vez sea uno de los más graves problemas de largo plazo, puesto que la empresa en ocasiones está sujeta a los ciclos de la familia, o bien al grado de profesionalización que ésta tenga para garantizar rentabilidad que la sostenga en el mercado; y también a encontrar nuevos mercados que le abran posibilidades de crecimiento.

## METODOLOGIA

Para el desarrollo de la investigación se llevó a cabo un estudio exploratorio para conocer si la empresa familiar toma en cuenta la diversificación de su mercado (la exportación) como potencial de crecimiento, posteriormente se realizó un estudio descriptivo, el cual nos permitió medir la participación de la empresa familiar en actividades de exportación, definir qué productos son los que se están exportando y cuál es su destino o en su caso determinar si la participación en este tipo de actividad es nula, esto nos permitirá obtener un perfil comercial de su actividad.

### Muestra

Para delimitar la muestra de este estudio, se acudió a buscar primeramente un censo de empresas familiares de la región, y en ninguna de las fuentes consultadas (Instituto Nacional de Estadística, Geografía e Informática INEGI, Sistema de Información Empresarial Mexicano SIEM, Secretaría de Economía de Sonora) se obtuvieron datos precisos, debido a que no se clasificadas bajo esta denominación; por lo que la muestra, objeto de investigación, se estimó a partir del método Muestreo Probabilístico Aleatorio por Conglomerados, en donde la población está integrada en grupos específicos. En este caso el muestreo se hace seleccionando en forma aleatoria algunos conglomerados dentro del conjunto total y procediendo a analizar a la población a partir de aquellos elementos seleccionados: como son Total de Empresas de Sonora (INEGI, 2009) 497,521; de las cuales 66,729 son empresas locales, de las cuales 1098 se dedican a la producción y comercio a mayoreo de abarrotes, alimentos, bebidas, hielo y tabaco; elementos que nos llevaron a acotar y precisar aún más el tamaño de la muestra. A partir de aquí se tomaron datos de Cámara de Comercio del municipio de Hermosillo, en el Estado de Sonora, enfocando la investigación sólo a aquellas que tuvieran las cualidades de Empresa Familiar, que produzcan un bien deseado en el Mercado de la Nostalgia del Estado de Arizona, de tal forma que se determinó la muestra de 33 Micro, pequeñas y Medianas Empresas (Mipymes) Sonorenses que reunieron estas características. Se utilizó un cuestionario para entrevistar a directivos o dueños de las empresas familiares en cuestión y se validó que tuviera un 95% de confiabilidad y un .05% de margen de error.

$$n = \frac{Z^2 p \cdot q \cdot N}{Ne^2 + Z^2 p \cdot q}$$

$$n = \frac{(1.96)^2 (0.5) (1-0.50) (33)}{(33)(0.05)^2 + (1.96)^2 (0.50) (1-0.50)}$$

$$n = \frac{0.9604 (33)}{0.0825 + 0.9604} = \frac{31.693}{1.0429} = 30 \text{ Cuestionarios}$$

n = Tamaño de la muestra

e = error de estimación 05%

N= Universo

Z= Nivel de confianza 1.96 para una tabla de distribución normal para el 95% de confiabilidad

p= Probabilidad a favor 0.50

q= Probabilidad en contra 0.50

## RESULTADOS

Figura 4, La muestra seleccionada corresponde en 77% al sector comercial, lo cual nos confirma certeza y enfoque en la elección. En segundo sitio encontramos al sector agropecuario, tercer sitio agroindustrial, y la venta de servicios la última actividad a la que se dedican las empresas seleccionadas.

Figura 4: Clasificación de Actividades de las Empresas Familiares Objeto de Estudio

De acuerdo a la estratificación empresarial de la Secretaría de Economía el 45% de las empresas familiares encuestadas tienen de 6 a 10 empleados considerándose como pequeña y solo el 7% están calificadas como medianas; el promedio de vida de las Empresas objeto del estudio, es de 25 años. Además las Empresas Familiares en cuestión, resultaron tener estabilidad económica, muy probablemente por tener conocimiento de mercado local y contar con un proceso de producción de tipo artesanal. Los resultados muestran que el 48% de las empresas elaboran sus productos artesanalmente y el resto se comparte con una producción mixta y de tipo industrial con el 26% respectivamente, de cierta manera este tipo de producción es acorde a las características de los productos que consume el mercado de la nostalgia, ya que son artículos producidos con características únicas y originales del país de origen, además de que contienen un alto valor agregado por su elaboración artesanal ante los ojos del mercado de la nostalgia. Es importante recalcar que la oferta productiva (elaborada artesanalmente) de las empresas familiares son alimentos procesados (con un total del 59% de la muestra), la cual coincide con el tipo de bienes solicitados por el mercado la nostalgia, el cual añora este tipo de productos, la oferta de las empresas exportadoras son: Salas, coyotas (galletas), dulces típicos como Jamoncillo, Bacanora (bebida alcohólica) y aguas frescas (bebidas no alcohólicas)

Figura 5 Un dato curioso de la muestra objeto de estudio, indica que el 50% de las empresas están exportando, el destino principal de las exportaciones es el estado de Arizona, EUA. El 36% de la muestra

lo hace más de dos veces por año y el 23% una vez al año. El 46% de estas exportaciones se realizan a través de terceros (clientes, familiares, amigos), esto nos confirma la falta de planeación para el envío de mercancías al extranjero y refleja un desconocimiento de la importancia y viabilidad económica que tiene el mercado de la nostalgia para las empresas familiares que tienen capacidad de producción. La falta de planeación y estrategias para posicionarse en el mercado provocan un desconocimiento total del mismo.

Figura 5: Frecuencia Exportadora de las Empresas Familiares Objeto de Estudio

Cantidad de Exportaciones Anuales

El empresario o directivo de Empresa Familiar, reconoce que tiene la necesidad de Capacitación, considerando un (56%) en el tema de Plan de Negocios y un (22%) en Estrategias de Comercialización. Este dato coincide y confirma el tipo de exportaciones realizadas (sugerencias de terceros) y devela las oportunidades de participación de los agentes involucrados con este tipo de negocios y empresas. El 64% de las empresas tienen necesidad de financiamiento para innovación y equipamiento; y con ello mejorar capacidad productiva para estar en mejores condiciones operativas y ampliar su capacidad de atención a los mercados. El resto 36% de los encuestados, dijo tener necesidad de buscar nuevos mercados, pues también tienen la iniciativa de desarrollarse, pero la operación de la empresa los absorbe y les resta tiempo para realizar estas búsquedas y su correspondiente plan de acción.

## CONCLUSIONES

Concluimos que la mayoría de las Empresas Familiares dedicadas a la producción de artículos susceptibles a exportarse al mercado de la nostalgia, pertenecen a la clasificación de pequeñas empresas debido a que están conformadas con pocos empleados (de 6 a 10). Producen de manera artesanal sus artículos, lo cual le da un valor agregado idóneo para su aceptación en este mercado, ya que el consumidor busca productos con estas características, las cuales evocan el sentido de pertenencia a sus raíces. Los artículos que producen las Empresas Familiares sonorenses, en su mayoría son alimentos, cualidad destacada en el perfil de esta investigación que empata cabalmente con la demanda existente; ya que el consumidor del Mercado de la Nostalgia, prefiere este tipo de productos. De acuerdo al estudio de Global Insight Market Monitor (2013), los productos más demandados en este mercado son: Productos de Panadería, Bebidas Alcohólicas y No Alcohólicas, Dulces, y Alimentos para elaborar en el Hogar, Productos Cárnicos Regionales, y un mercado abierto de otros productos Alimenticios; según éste estudio el 24% de los Hispanos encuestados consideran la cocina el área más importante de su casa, lo cual nos afirma que tienen arraigo por sus costumbres.

Sin embargo el desconocimiento de la oportunidad de negocio en el Mercado de la Nostalgia, provoca inseguridad en el empresario para comenzar un proceso de exportación profesional y/o continua, dejando a un lado la opción de acceder a un prometedor mercado en crecimiento como éste. Esto se ve reflejado en el estudio, ya que la Empresa Familiar exporta por sugerencias de terceros, reaccionando a la solicitud de un amigo o familiar y no por una planeación estratégica previa que haya develado la oportunidad de negocio. Por lo tanto, es necesaria la capacitación en aspectos como Plan de Negocios, Comercialización y

Regulaciones Sanitarias, para que con ello encuentren nuevas oportunidades de negocio, diversifiquen su mercado e incrementen sus ventas al exterior. Aunque existen programas para apoyar el desarrollo y crecimiento de las pymes, los empresarios muestran un desencanto ante estos programas ofrecidos por los tres niveles de Gobierno. Es importante mencionar la principal problemática presentada al realizar esta investigación; pues al buscar la información actualizada relacionada con las empresas familiares, se encontró que ninguna dependencia de gobierno tiene listados con características empresariales de este tipo; y por otro lado el empresario tiene temor de otorgar información de su empresa; sin embargo, se insistió y se hizo una labor de convencimiento para obtenerla.

No obstante esta circunstancia, la investigación arrojó otras vertientes que mostraron inquietudes e interrogantes que en un futuro se pueden investigar, como por ejemplo las razones del desencanto que impera entre los empresarios para tramitar programas de apoyo para productores o exportadores, y así estar en condiciones de obtener beneficios que ofrecen los distintos niveles de gobierno en el Municipio de Hermosillo. Es importante señalar como contribución de esta investigación, la necesidad de diseñar un programa de seguimiento o acompañamiento para que la micro y pequeña empresa familiar, puedan consolidar su crecimiento a través de distintos apoyos así como asistencia técnica, para comenzar a exportar sus productos al Mercado de la Nostalgia de Arizona.

## EL EGRESADO DE LA LICENCIATURA EN CONTADURÍA EN EL ÁMBITO LABORAL

María Soledad Plazola Rivera, Universidad Autónoma de Baja California

Raquel Talavera Chávez, Universidad Autónoma de Baja California

Marianna Berrelleza Carrillo, Universidad Autónoma de Baja California

### RESUMEN

*La información en las organizaciones es un elemento de competitividad, al permitirles diseñar estrategias futuras para alcanzar la visión organizacional, es por ello que las instituciones educativas requieren mantenerse alertas de los acontecimientos del entorno, para identificar sus requerimientos y llevarlos al aula y favorecer el desarrollo del país y coadyuvar al bienestar de las personas, esto ha hecho que dentro de la Facultad de Contaduría en el 2013 se iniciara una investigación que tiene como objetivo generar información para identificar y cuantificar los propósitos del proceso enseñanza aprendizaje del Programa Educativo de la licenciatura de Contaduría del plan 2009-2, desde la perspectiva de los egresados, profesores, estudiantes y empleadores y su inserción en el mundo laboral. En este trabajo se presentan los resultados obtenidos de los alumnos potenciales a egresar en cuanto a su inserción al ámbito laboral.*

**PALABRAS CLAVES:** Egreso, Inserción Laboral

## THE IMPACT OF FORMER STUDENT OF ACCOUNTING INTO THE WORKPLACE

### ABSTRACT

*Information in organizations is a factor of competitiveness, that allows to design the future strategies to achieve the organizational vision, so for the educational institutions is necessary to maintain alerts of events in the environment to identify their needs and take them to the classroom and encourage the development of the country and contribute to the well-being of the people. The School of Accounting and Administration began an investigation that aims to generate information to identify and quantify the effects of the teaching learning process of the educational program of Bachelor's degree in accounting, from the perspective of the former students, professors, students and employers and their insertion in the world of work. This paper presents the results obtained from students who are finishing their studies in relation to its inclusion to the workplace.*

**JEL:** A22

**KEYWORDS:** Former Students, Workplace

### INTRODUCCIÓN

La Universidad Autónoma de Baja California (UABC) manifiesta su compromiso con su nivel de calidad a los servicios que brinda en sus funciones sustantivas, y en los procesos permanentes de planeación y evaluación, permitiéndole dar respuesta de forma creativa a los cambios que han motivado los paradigmas de los modelos de producción en serie hacia un modelo de redes flexibles (Martínez, 2006) y dar respuesta a las recomendaciones hechas por organismos internacionales, como el Banco Mundial, la Organización para la Cooperación y el Desarrollo Económico, la Comisión Económica para América Latina y la

Organización de las Naciones Unidas para la Educación, la Ciencia y la Cultura que manifiestan que las Instituciones de Educación Superior (IES), están llamadas a cumplir un papel de extrema importancia para favorecer el desarrollo del país y coadyuvar al bienestar de las personas. (ANUIES, 2006). Este empeño a la calidad y los servicios han llevado a la UABC a posicionarse como una universidad de calidad y ser reconocida por sexta ocasión por la Secretaría de Educación Pública (SEP) con programas de buena calidad acreditados o reconocidos a nivel nacional. ([www.uabc.mx/noticias/diciembre10/buena\\_calidad.htm](http://www.uabc.mx/noticias/diciembre10/buena_calidad.htm)).

El logro institucional de calidad ha requerido de sincronía de cada una de las partes que conforman la estructura de la UABC, en el 2012 los indicadores muestran un total de 75 programas educativos reconocidos por su buena calidad, de los cuales 87 son evaluables, representando el 86% del total, de los que se atiende al 89% de la matrícula de nivel licenciatura. (UABC, 2012). Considerando que la calidad en los programas de estudio representan la base en que descansa principalmente la formación del profesionista, de ahí su importancia de identificar los requerimientos del entorno, para que estos den respuesta a las necesidades del sector productivo y social y los avances en materia científico-tecnológica que le permitan a los egresados solucionar problemas de forma eficaz y eficiente ante la vida cotidiana de su entorno. (Guía metodológica para la creación y modificación de los programas educativos de la Universidad Autónoma de Baja California. 2010 p.8).

Lo que hace necesarios la identificación y cuantificación de los requerimientos que impactan en el programa educativo de la Licenciatura en Contaduría desde la perspectiva de los estudiantes potenciales a egresar de los periodos 2013-1 y 2013-2 de la Facultad de Contaduría y Administración del campus Tijuana correspondiente al plan 2009-2 y su inserción en el mundo el trabajo por lo que la investigación que aquí se describen los requerimientos que deben ser satisfechos y que deben ser incorporados en la curricular en la restructuración del nuevo plan de estudios.

## REVISION DE LITERATURA

El propósito esencial para la Secretaría de Educación Pública es crear condiciones que permitan asegurar el acceso de todas las mexicanas y mexicanos a una educación de calidad, en el nivel y modalidad que la requieran y en el lugar donde la demanden, para lograr un México con Educación de Calidad, establece estrategias y líneas de acción y una de ellas Desarrollar el Potencial Humano de los Mexicanos con Educación de Calidad y Garantizar la inclusión y la equidad en el sistema educativo a través de garantizar que los planes y programas de estudio sean pertinentes y contribuyan a que los estudiantes puedan avanzar exitosamente en su trayectoria educativa, al tiempo que desarrollen aprendizaje significativos y competencias que les sirvan a lo largo de la vida: Definir estándares curriculares que describan con claridad lo que deben aprender los alumnos del sistema educativo y que tomen en cuenta las diversas realidades del entorno escolar, incluyendo los derivados de la transición demográfica como reformar el esquema de evaluación y certificación de la calidad de los planes y programas educativos en educación media superior y superior en el Plan Nacional de Desarrollo 2013-2018.

Para alcanzar y desarrollar el potencial humano de los mexicanos con Educación de Calidad y Garantizar la inclusión como lo manifiesta la SEP, la UABC se ha transformado estructuralmente y colocando a “los estudiantes no son la razón de ser de la universidad, sino sus principales protagonistas”( Suárez Zozaya 2013) estableciendo políticas en la formación integral del alumno a través del fortalecimiento de la atención de éste como centro de los esfuerzos institucionales, el mantenimiento de la calidad de los programas educativos, para lo que se generó la iniciativa de la actualización o modificación de los planes de estudio y alcanzar una Educación de Calidad.

En los planes y programas de estudio descansa principalmente la formación del profesionista, de ahí su importancia del medio en que se dé, debe ser una de sus principales características para que dé respuesta

a las necesidades del sector productivo y social, así como a los avances en materia científico-tecnológica que le permitan a los egresados solucionar problemas de forma eficaz y eficiente ante la vida cotidiana de su entorno. (Guía metodológica para la creación y modificación de los programas educativos de la Universidad Autónoma de Baja California.2010).

Conocedora de la influencia que el contexto nacional e internacional tiene para el área curricular, se mantiene la UABC en un constante dinamismo en la actualización y modificación de sus planes de estudio, en ellos se integran concepciones del hombre, sociedad, ciencia, tecnología, arte, deporte, valores, aprendizaje y conocimiento, los cuales orientan el modelo curricular flexible, basado en competencias profesionales y centradas en el aprendizaje del alumno, como un esfuerzo sostenido. En este marco de dinamismo donde “Los cambios que de [...] se observan han generado renovadas demandas al sistema educativo en materia de formación profesional, marcadas por criterios o principios de reformar para innovar en la educación, y dan como un hecho que al insertarnos en estos procesos obtendremos niveles de calidad exigidos para la competitividad”. (Martínez, 2006).

## METODOLOGIA

La investigación tiene un diseño transeccional correlacional y el proceso metodológico se efectúa en cuatro etapas que se describe a continuación en la Tabla 1.

Tabla 1: Proceso Metodológico

Fases	Descripción	Actividades
I	Adquisición de herramientas conceptuales y contextuales	Revisión de la literatura
		Preparación para la entrada al campo
II	Identificación y focalización del fenómeno de estudio	Construcción del objeto de estudio
		Definición de los participantes
III	Aplicación del trabajo de campo	Elaboración de la guía de entrevista estructurada
		Entrevista con los participantes del estudio
		Registro de los datos
IV	Descripción de resultados	Tratamiento de la información
		Análisis e interpretación de los datos

En la Tabla 1 se describe el proceso metodológico de la investigación. Fuente: Elaboración Propia.

De acuerdo al proceso metodológico, se realizó una aproximación con los elementos teóricos y se procedió a un acercamiento que consistió en diversas reuniones y entrevistas con estudiantes de la carrera de Contaduría potenciales a egresar en los periodos 2013-1 y 2013-2 del plan de estudios 2009-2 de la Facultad de Contaduría y Administración del campus Tijuana. Las reuniones y las entrevistas realizadas a los potenciales a egresar han permitido adquirir herramientas contextuales generales. Para el trabajo de campo, se utiliza como técnica de recolección de datos una encuesta que está estructurada de cuatro apartados: Datos Generales; Experiencia profesional; Examen Ceneval, que corresponde a la evaluación de un organismo a externo y el Proceso de enseñanza aprendizaje, la cual se describe en la Tabla 2.

En particular para el trabajo se describe el avance de los estudiantes potenciales a egresar, y si bien la encuesta se conforma de cuatro apartados, se identifican los que trabajan en el área y el tiempo de inserción en el ámbito laboral como el puesto que ocupan en la empresa como la correlación que existe entre los que Trabajan en el Área y el Puesto que ocupan y los efectos que se tienen entre las categorías de los periodos 2013-1 y 2013-2.

Tabla 2: Encuesta A Potenciales A Egresar

Estructura de la Encuesta a Potenciales a Egresar			
<b>I. Datos generales</b>	1. Nombre	Identificación	
	2. Sexo		
	3. Estado Civil

	5. Correo electrónico		
<b>II. Experiencia profesional a la fecha</b>	1. ¿Trabaja usted actualmente?	Caracterización laboral	
	2. ¿Áreas de la profesión?		
	3. Nombre de la empresa/institución en que trabaja.		
	4. En este trabajo usted es:		
	5. El puesto que ocupa actualmente:		
	6. Antigüedad en el trabajo		
	7. ¿En qué medida coincide su actividad laboral con los estudios de licenciatura?		
	8. El sector económico (rama) de la empresa o institución en que trabaja es:		
<b>III. Examen CENEVAL</b>	9. La principal actividad que usted desempeña es	Áreas formativas	
	1. De las áreas formativas del Plan de Estudios, señala aquella en la que se te dificultó dar respuesta en el examen CENEVAL.		
	2. Señala las causas del porque se te dificultó el contestar el examen CENEVAL.		
<b>IV. Proceso de enseñanza-aprendizaje</b>	3. ¿Qué significa para ti el examen CENEVAL?	Sugerencias del proceso enseñanza-aprendizaje	
	1. ¿Qué sugerencias haría para mejorar el proceso de enseñanza-aprendizaje?		

La Tabla presenta el contenido de la encuesta que se aplicó a los estudiantes próximos a egresar en los periodos 2013-1-2013-2 donde se identifican, su caracterización laboral, áreas que conforman el plan de estudios y sugerencias del plan de estudios. Fuente: Elaboración Propia

## RESULTADOS

Como se planteó en la metodología para este trabajo se describen los resultados obtenidos de la encuesta aplicada a los potenciales a egresar correspondiente a los apartados de Datos generales y Experiencia profesional de las preguntas: El puesto que ocupa y La principal actividad que desempeña. Para ello se utilizó una muestra descrita en la en la Tabla 3, indicando la población encuestada de los estudiantes potenciales a egresar del plan de estudios 2009-2 de los periodos 2013-1 y 2013-2 en la Carrera de Licenciado en Contaduría. La caracterización de los encuestados se muestra en la Tabla 4 y se observa que en los periodos 2013-1 y 2013-2 una consistencia en cuanto a que la población mayor es femenina y en ambos sexos predominan el estado civil de solteros; el tiempo de Antigüedad en el Empleo para los periodos encuestados permanece la constante de un año de inserción laboral lo cual se observa en la Tabla 5; su posición dentro de la empresa de los próximo a Egresar permanece la categoría de empleado lo que se observa en la Tabla 6.

Tabla 3: Universo de Estudiantes Potenciales a Egresar

2013-1				2013-2

Tabla 5: Antigüedad en el Empleo

2013-1 antigüedad	totales	2013-2 antigüedad	totales
de un 1 a 12 meses	82	de un 1 a 12 meses	19
de 13 a 24 meses	23	de 13 a 24 meses	10
de 25 a 36 meses	8	de 25 a 36 meses	1
de 37 a 48 meses	17	de 37 a 48 meses	4
de más de 4 años	0	de más de 4 años	2
no empleados	39	no empleados	8

Se describe el tiempo de inserción laboral que tienen los estudiantes potenciales a egresar de los periodos 2013-1 y 2013-2 es de un año a doce meses. Fuente: Elaboración Propia.

Tabla 6: Posición del Potenciales a Egresar en el Ámbito Laboral

2013-1		2013-2	
	Totales		Totales
Propietario	2	Propietario	1
Trabajador Independiente	3	Trabajador Independiente	1
Empleado	126	Empleado	34
No Trabaja	38	No Trabaja	8

La posición que del estudiante potencial a egresar de los periodos 2013-1 y 2013-2 es de empleado. Fuente: Elaboración Propia.

Así mismo se llevo acabo la correlacion a cada uno de los periodos para determinar los estudiantes potenciales a egresar que Trabajan en el Area (TEAE) y el Puesto que Ocupan (PUEOC) en la empresa. Para el periodo 2013-1 corresponde la Figura 1 y para el periodo 2013-2 le corresponde la Figura 2. Al llevarse a cabo el análisis entre los periodos 2013-1 y 2013-2 de los estudiantes potenciales a egresar se concluye que los que Trabajan en el área y el Puesto que ocupando la categoría de auxiliares disminuyen del 51% a 33% y la categoría de asistentes aumentan de 15% a 25%.

Figura 1: Correlación de los Que Trabajan en el Área y el Puesto Que Ocupan del 2013-1

Se describe la correlación entre los estudiantes potenciales a egresar del periodo 2013-1 que Trabajan en el Área (TEAE) y el Puesto que Ocupan (PUEOC) categorías: 0 No empleado, 1. Director general, 2. Dueño o socio de., 4. Gerente/Director de área, 6. Jefe de departamento, 7. Ejecutivo de Cuenta, 8. Jefe de oficina/sección/área, 9. Empleado profesional, 10. Supervisor, 11. Analista especializado/técnico, 12. Vendedor en establecimiento, 13. Asistente, 14. Ayudante, profesional, 16. Empleado no profesional, 17. Auxiliar, 18. Promotor. Es observable que el puntaje más alto para los que Trabajan están en la categoría de Auxiliares y le precede el de Asistente Empleado Profesional Fuente: Elaboración Propia.

Figura 2: Correlación de los Que Trabajan en el Área y el Puesto Que Ocupan del 2013-2

Se describe la correlación entre los estudiantes potenciales a egresar del periodo 2013-2 que Trabajan en el Área (TEAE) y el Puesto que Ocupan (PUEOC) categorías: 0 No empleado, 1. Director general, 2. Dueño o socio de., 4. Gerente/Director de área, 6. Jefe de departamento, 7. Ejecutivo de Cuenta, 8. Jefe de oficina/sección/área, 9. Empleado profesional, 10. Supervisor, 11. Analista especializado/técnico, 12. Vendedor en establecimiento, 13. Asistente, 14. Ayudante, profesional, 16. Empleado no profesional, 17. Auxiliar, 18. Promotor. Es observable que el punto más alto corresponde a la categoría de Auxiliares, siguiéndole Empleados no Profesionales y Asistentes. Fuente: Elaboración Propia.

## CONCLUSIONES

En el análisis de los datos de la investigación el sujeto de estudio, los estudiantes potenciales a egresar de la carrera de Contaduría, en los periodos 2013-1 y 2013-2 están inmersos en campo laboral en el primer año y la principal actividad que desempeñan es administrativa; el Puesto que ocupan es la categoría de auxiliares disminuyendo del 51% a 33% de un periodo a otro, y la categoría de asistentes aumentan de 15% a 25%. El movimiento de las categorías y de los que trabajan en el área tuvieron cambios. Los

propósitos del plan de estudios del 2009-2 que se “caracteriza porque: Se sustenta en la lógica, objetivos y organización del trabajo del Licenciado en Contaduría en condiciones y contextos laborales y no sólo a partir de la lógica y objetivos del trabajo escolar y académico y la práctica constituye una parte fundamental [...] Todo lo cual identifica al modelo de competencias profesionales”, si bien no es el 100% de ellos que están trabajando si es significativo que algunos de los propósitos del plan de estudios se alcanzaron y están medibles.

# **RIESGOS TURÍSTICOS: UNA PERSPECTIVA DE VALORACIÓN DESDE LAS AGENCIAS DE VIAJES DE MEDELLÍN, COLOMBIA**

Juan Gabriel Vanegas, Fundación Universitaria Autónoma de las Américas  
Jorge Aníbal Restrepo Morales, Fundación Universitaria Autónoma de las Américas

## **RESUMEN**

*Este estudio identifica y valora los riesgos a los que se enfrentan los consumidores a la hora de adquirir un paquete turístico. El concepto de riesgo está asociado a la percepción intrínseca de éste por parte de expertos en todo el proceso de empaquetamiento de tours, por ello se recurre a la valoración de éstos desde la óptica de las agencias de viajes de la ciudad de Medellín, Colombia. La metodología utilizada es la técnica multicriterio de proceso de análisis jerárquico para encontrar los riesgos más importantes de acuerdo a los criterios de evaluación identificados, dada la incertidumbre y subjetividad existente inherente al proceso.*

**PALABRAS CLAVES:** Riesgo Percibido, Toma Decisiones, Turista, Paquetes Turísticos, Proceso de Análisis Jerárquico

## **TOURIST RISKS: A PERSPECTIVE OF VALUATION FROM TRAVEL AGENCIES OF MEDELLÍN, COLOMBIA**

### **ABSTRACT**

*This paper identifies and ranks the risks consumers face when buying a vacation package. The concept of risk is associated with the intrinsic perception of experts in the whole process of building a vacation package; therefore we use as qualitative information the assessment of travel agencies in the city of Medellin (Colombia). A multi-criteria analytic hierarchy process methodology is used in order to find the most important risks according to the identified valuation criteria, given the inherent uncertainty and subjectivity of the process.*

**JEL CLASSIFICATION:** A12, C44, C65, D81, L83, M1

**KEYWORDS:** Perceived Risk, Decision Making Process, Tourist, Package Tours, Analytic Hierarchy Process

## **INTRODUCCIÓN**

La industria de los viajes y el turismo corresponde a una actividad de enclave significativa en gran parte de los países del mundo, con incidencias directas e indirectas en el aparato productivo (WTTC, 2014a). Su contribución a la economía ha exhibido uno de los comportamientos más dinámicos con aportes significativos a la generación de empleo y riqueza. Este sector representó en Colombia en el último año USD6,3 billones, lo cual da cuenta del 5,3% del Producto Interno Bruto (PIB) y una generación total cercana a los 1.2 millones de empleos (WTTC, 2014b).

Ahora bien, las motivaciones de los turistas son claves a la hora de elegir un destino para vacacionar. En la teoría de las necesidades jerárquicas de Maslow (1943), se contempla que un individuo al cumplir con un

objetivo superior va presentar una necesidad superior por cumplir, pero ciertas restricciones, entre las que se puede mencionar las condiciones de seguridad y riqueza, impiden que éste pueda moverse hacia niveles cada vez mayores de necesidades. En este sentido, las percepciones asociadas al riesgo son factores claves para determinar la elección del destino de los turistas (Roehl y Fesenmaier, 1992; Sönmez y Graefe, 1998; Lepp y Gibson, 2008).

La literatura académica ha mostrado que dichas percepciones muestran una relación inversa en las intenciones de viaje, es decir cuando éstas son altas las intenciones se reducen (Pennington-Gray, Schroeder y Kaplanidou, 2011). En la misma dirección, se ha demostrado que la elección de un destino no se basa solamente en un conjunto de decisión que incluye precios e impresiones concebidas de un lugar, sino además que las percepciones que comprometen la integridad física y la salud de las personas, así como aquellas medidas preventivas que se adoptan para generar un clima de seguridad, son claves en la formación de expectativas de los potenciales turistas (Pizam, Tarlow y Bloom 1997).

Este trabajo valora los principales riesgos que enfrentan los potenciales turistas al momento de comprar un paquete de viajes. Pennington-Gray et al. (2011), señalan que no existe una jerarquización consistente de cuáles son los riesgos percibidos y en qué grado los son o cuáles son más riesgosos, dado que éstos dependen de una variedad tanto de factores externos como internos. Lo que resta del documento, aparte de esta introducción, presenta el proceso de toma de decisiones en turismo, las referencias teóricas alrededor de los riesgos turísticos y los estudios empíricos en este tema, la metodología de valoración que se siguió, el análisis y discusión de los resultados más relevantes y las conclusiones.

#### Proceso de Toma de Decisiones en Turismo

El comportamiento y las decisiones de consumo alrededor de bienes y servicios se ven influenciados por múltiples factores endógenos y exógenos. El consumo de servicios presenta ciertas particularidades que lo tornan más complejo que el acceso a bienes tangibles. Elementos como la intangibilidad, inseparabilidad del proceso de producción y consumo, heterogeneidad y conservabilidad, hacen parte de las características intrínsecas asociadas al acceso a bienes incorpóreos. Luego, al llevar estas propiedades al contexto de servicios de turismo, aspectos o rasgos distintivos aparecen en consideración. Moutinho (1987), sostiene que existen dos situaciones que explican la elección de un comprador: i) el proceso de adquisición tiene un fuerte componente emocional para los consumidores, y ii) el proceso de compra generalmente es la culminación de un largo proceso de planificación, selección, evaluación y valoración de alternativas por un gran número de personas.

Bajo estas condiciones, la incertidumbre y la percepción del riesgo aparecen como las restricciones del conjunto de maximización de la utilidad derivada de los servicios turísticos. A estas barreras, se le suman la completitud de la información que posee el consumidor para tomar la decisión, dado que previo a la compra de un servicio turístico, los consumidores adquieren una gran cantidad de información y anticipan el consumo, lo cual deriva en la creación de imágenes y expectativas. La decisión de compra del turista presenta algunos aspectos únicos: es una inversión tangible sin tasa de retorno, y la compra es a menudo preparada y planeada a través de ahorros realizados durante un período considerable de tiempo.

En la misma línea de argumentación, Abelson y Levi (1985, citado en Sirakaya y Woodside, 2004), señalan que la toma de decisiones se compone de tres elementos hilados al tiempo: decisiones estructuradas frente aquellas orientadas, decisiones sin riesgo frente contra modelos de elección arriesgada, y decisiones normativas versus modelos descriptivos. Luego, bajo esta perspectiva las decisiones libres de riesgo consideran las preferencias del individuo, mientras que aquellas arriesgadas consideran un conjunto de probabilidades. En este punto, existe un continuo de entornos de opciones bajo situaciones que van desde situaciones de elección bien definidas hasta mal definidas. Las primeras incluyen decisiones arriesgadas y

libres de riesgo, mientras que las segundas generalmente involucran decisiones arriesgadas debido a la incertidumbre del resultado. En los entornos de viajes es habitual que encontrar conjuntos de elección mal definidos con resultados que esconden probabilidades desconocidas, debido a la naturaleza inmaterial y experiencial del turismo.

Bajo esta óptica, Swarbrooke y Horner (2007) plantean que la elección de compra de un producto turístico, en comparación con un bien tangible, involucran restricciones adicionales que complejizan y dificultan el comportamiento de un eventual turista a la hora de elegir. Estos nuevos elementos acarrearán un alto riesgo al existir: i) situaciones de compromiso y participación elevadas tanto en la decisión de compra como de consumo; ii) altos niveles de inseguridad por las características intangibles del bien; iii) una gran carga de emotividad; iv) una influencia considerable de otros individuos; v) repercusiones en un horizonte temporal extenso; vi) situaciones que involucran un proceso dispendioso de recabar información; y vii) costos de oportunidad ocultos en los destinos a visitar.

### Determinación de los Riesgos Turísticos Desde la Teoría y Estudios Aplicados

Desde lo general a lo particular, la sección previa mostró que las decisiones turísticas no siempre se pueden predecir con exactitud y, además, la completitud y simetría de la información dista de evidenciarse en la práctica, razón por la cual los riesgos son inherentes a este proceso. En palabras de Moutinho (2000), el riesgo se concibe como una función que combina incertidumbre, características del lugar a visitar y el modo como fue realizada la compra, lo cual genera un conjunto de consumo que puede presentar condiciones no previstas. De igual forma, existen consecuencias desde un punto de vista financiero y psicosocial, así como percepciones por parte del tomador de decisiones que involucran cierto grado de subjetividad. Visto de esta forma, el grado de riesgo puede variar con los costos involucrados en la decisión y el grado de certeza que la decisión conduzca a la maximización de la utilidad.

En los escenarios de probabilidades y posibilidades de elección, las decisiones concernientes a las actividades turísticas, antes y después del proceso de compra, corresponden a un conjunto de elección que está sujeto a pérdidas y riesgos, dada la naturaleza incierta de éste. De acuerdo con la perspectiva encontrada en la literatura académica, las decisiones de compra traen asociadas consigo un riesgo percibido, que incluye factores de tipo objetivo y subjetivo. Moutinho (2000) y Solomon (2010) clasifican estos riesgos en cinco tipologías: i) monetarios, que implican la pérdida o desperdicio de dinero, ii) funcionales, cuando las expectativas no se materializan, iii) físicos, en el momento en que se compromete la salud del individuo, iv) sociales, en caso de estar pasado de moda o compromete el estatus personal, y v) psicológicos, cuando se producen situaciones que debilitan la autoestima o engendran culpabilidad. Schiffman and Kanuk (2000), aparte de los riesgos anteriores, añade un riesgo adicional, el temporal, que aparece cuando el producto final no reúne las expectativas formadas dado un tiempo invertido en el proceso de búsqueda.

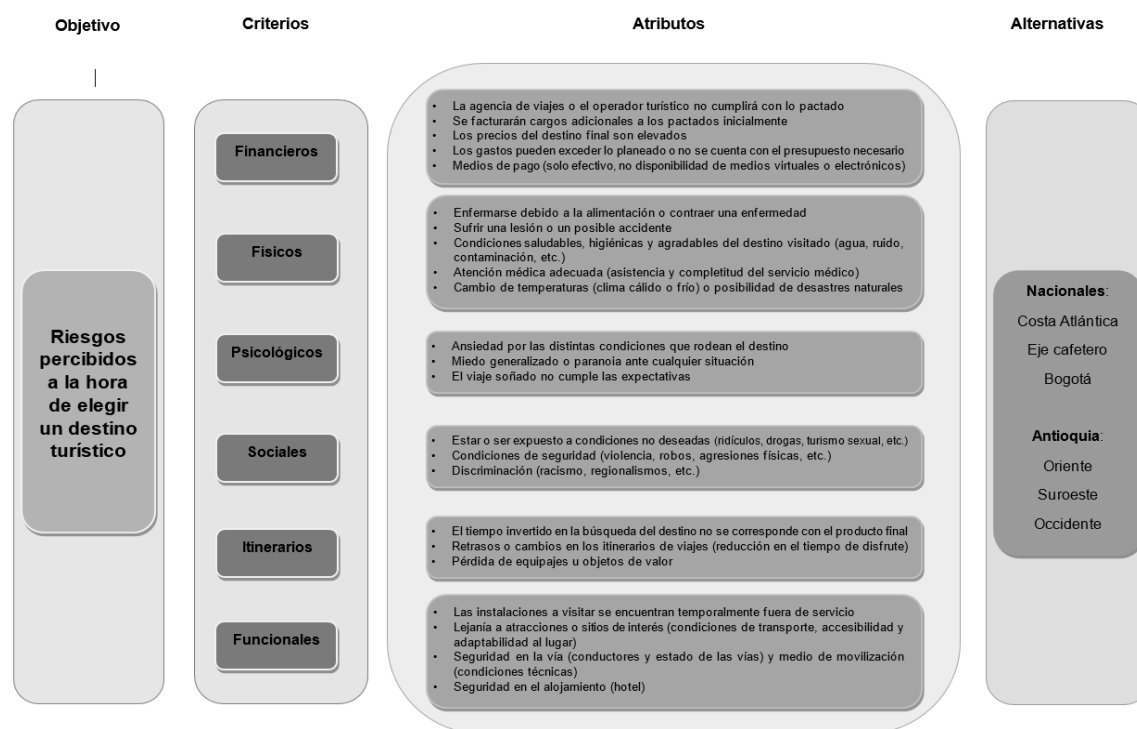

Ahora bien, existe un relacionamiento entre las categorías de riesgo descritas anteriormente. En primer lugar, existe un individuo como turista que se forma unas expectativas y que percibe el riesgo teniendo en cuenta: sus características internas, el proceso de aprendizaje experiencial desde el comportamiento vivido en viajes pasados, el conjunto de información y las fuentes que usó antes de tomar la decisión de viaje, y nivel de concientización que posee sobre el riesgo (Moutinho, 2000). Con base en ello, es posible visualizar el riesgo puede como un proceso en el cual éste tiende a ser minimizado; es decir, si bien el riesgo es inherente y puede existir, se utilizan métodos de reducción de riesgo hasta que llegue a un nivel que es tolerable para el individuo y consistente con los objetivos de compra. Luego, desde el concepto de aversión al riesgo y el perfil del turista, éste puede ser neutral, adverso o amante al riesgo (Moutinho, 2000). Empíricamente se ha demostrado que las percepciones de riesgo inciden directamente en las intenciones de compra de los turistas. En distintos escenarios y contextos han sido identificados riesgos asociados a la decisión de viajar que son de relevancia general y que brindan elementos acerca de la presencia o no de

riesgos en determinados destinos (Roehl y Fesenmaier, 1992; Tsaur, Tzeng, y Wang, 1997; Sönmez y Graefe, 1998; Wang, Jao, Chang, y Chung, 2010; Hsu y Lin, 2014).

### Modelación de los Riesgos Turísticos con Ahp

La perspectiva de valoración adoptada en este trabajo sigue los planteamientos de Tsaur et al. (1997), donde el riesgo turístico se concibe como aquel que es percibido por el turista durante el proceso de empaquetamiento de un tour o viaje. Con el fin de hacer operativa esta situación al momento de la valoración se recurre al juicio de expertos en el área, es decir, personal directivo o técnico de algunas agencias de viajes de la ciudad de Medellín, que en el día a día realizan el proceso de venta con el cliente, lo cual enfoca la valoración en la percepción de la oferta sobre los riesgos que se visualizan o evidencian. El siguiente paso consistió en la valoración de los riesgos mediante comparaciones pareadas por parte de los expertos de las agencias de viajes. El proceso de análisis jerárquico desarrollado por Saaty (1994) es una herramienta adecuada para el objetivo de este trabajo, al permitir desde una organización por categorías, descender a criterios y alternativas sucesivas, que a través de juicios da lugar a ponderaciones y priorización entre las alternativas. De esta forma, el objetivo global que persigue la estructura jerárquica del modelo AHP presentado en la Figura 1, es determinar el conjunto de riesgos en una ordenación lineal que más inciden a la hora del empaquetamiento de planes turísticos.

Figura 1: Niveles Jerárquicos de Valoración de Riesgos Turísticos

En esta figura se presenta la estructura jerárquica de modelación que se usará. Se presentan cuatro niveles: nivel uno, valoración de riesgos; nivel dos, clasificación de los riesgos (dimensiones generales); nivel tres, desagregación de los riesgos en subcategorías; y nivel cuatro, alternativas o destinos turísticos

## RESULTADOS PARCIALES

Con el fin de depurar los riesgos identificados se construyó un instrumento de recolección de información que se encuentra en evaluación con profesionales para validar los riesgos susceptibles de valorar. El trabajo de campo iniciará hacia finales de Abril de 2014 y el día de la presentación se tendrán resultados más consolidados.

## CONCLUSIÓN PARCIAL

En principio la compra de un bien de consumo diario y la compra de un producto turístico tienen en común la satisfacción de una necesidad. No obstante, con respecto a este último tipo de bienes existen diferencias notables debido a la complejidad y diversidad de la experiencia de consumo y costes que se acontecen, lo cual lleva a situaciones de alto riesgo, involucramiento y exposición para los turistas.

Este trabajo presentó una primera aproximación a la medición del riesgo en destinos nacionales y locales en Colombia. Dado que este tema presenta muchas aristas y la presentación tuvo en cuenta riesgos generales.

Fernando Castillo Gallegos, Universidad Autónoma de Tlaxcala

### RESUMEN

*El estrés es una sensación que se produce por estar sometido a diversas presiones en el trabajo, el cual si se sostiene de forma continua se convierte en crónico, conocido como Síndrome de Burnout, Esta patología laboral, puede tener repercusiones psicosomáticas, conductuales, emocionales, familiares, sociales, entre otros factores, afectando la inteligencia emocional de un profesional de la enseñanza educativa y generando impacto en el proceso enseñanza-aprendizaje. La presente investigación está dirigida al estudio de este constructo a 110 maestros que integran 3 planteles escolares del nivel media superior de Hidalgo. La investigación es descriptiva, correlacional, transversal y no experimental. Se utilizó como instrumento de medición el MBI (Maslach Burnout Inventory) de Maslach y Jackson. Los resultados muestran que el Burnout se encuentra presente en un 50% de los maestros, con un nivel que va de medio a alto, teniendo su mayor presencia en la dimensión Agotamiento Emocional, así mismo existen algunas variables socio-demográficas, como el género, edad y antigüedad del maestro, que se relacionan de manera distintiva con cada una de las dimensiones del modelo MBI.*

**PALABRAS CLAVE:** Síndrome de Burnout, Agotamiento Emocional, Despersonalización, Baja Realización Personal, Estrés

### DIAGNOSTIC STUDY OF BURNOUT SYNDROME IN TEACHERS MIDDLE SCHOOL CAMPUS LEVEL HIGHER

### ABSTRACT

*Stress is a feeling that comes from being subjected to various pressures at work, which if held continuously becomes chronic, known as burnout syndrome, disease This work may have psychosomatic, behavioral, emotional impact, family, social and other factors affecting the emotional intelligence of a professional education teaching and generating impact on the teaching-learning process . This research is directed to the study of this construct 110 teachers comprising three campuses of higher average level of Hidalgo. The research is descriptive, correlational , not experimental cross . Was used as the measuring instrument MBI (Maslach Burnout Inventory) of Maslach and Jackson. The results show that Burnout is present in 50% of teachers with a level ranging from medium to high, having its largest presence in the Emotional Exhaustion dimension, also there are some socio -demographic variables such as gender, age and seniority of the teacher that relate distinctly to each of the dimensions of the MBI model*

**JEL:** L29

**KEY WORDS:** Burnout Syndrome, Emotional Exhaustion, Depersonalization, Personal Accomplishment Lower Stress

## INTRODUCCIÓN

El trabajo es un elemento indispensable en el desarrollo del ser humano, ya que le permite realizarse en su vida personal y social, denotando en muchos casos su posición en la sociedad y la consideración con sus prójimos. Al estudiar los efectos del trabajo y su ámbito sobre los trabajadores, la psicología describe que existen unos positivos, capaces de generar bienestar, autorrealización y solidaridad, y otros que producen efectos negativos como la depresión y el distrés (estrés desagradable). La Organización Mundial de la Salud, OMS (como se cita en Stavroula, et. al, 2004), define al estrés laboral como “la reacción que puede tener el individuo ante exigencias y presiones laborales que no se ajustan a sus conocimientos y capacidades y que ponen a prueba su capacidad para afrontar situaciones”. Es importante mencionar que el estrés no necesariamente es perjudicial. En realidad, es benéfico porque nos mantiene motivados. El eustrés es el estrés positivo que estimula el comportamiento hacia las actividades (laborales, por ejemplo). Sin embargo, el estrés acumulado y por largo periodo, puede afectar nuestro bienestar físico y mental. El húngaro Hans Selye (1956) publicó que únicamente cuando la ocasión desborda la capacidad de control del individuo se producen consecuencias negativas o también denominado distrés.

A este último se le considera como preocupante para quienes analizan el modo conductual de las personas, ya que por lo menos uno de cinco profesionales padecen de algún problema de estrés. En relación a una encuesta llevada a cabo en 14 países por la empresa Regus y el Instituto Mexicano del Seguro Social (IMSS), México es el país con mayor porcentaje de casos de estrés vinculados con las actividades laborales (Morante, 2012). De entre los problemas de estrés laboral, destaca el Síndrome de Burnout, el cual se utiliza para describir las manifestaciones de tensión, fatiga, agotamiento, entre otras, asociados a profesiones de servicios (de cara con el cliente y/o usuario), como el personal médico, que tienen como objeto de labor, atender a otras personas. El Síndrome Burnout, acuñado originalmente por el psiquiatra y psicoanalista norteamericano Herbert Freudenberger (1974); lo explica como el desgaste y la sensación que se produce por una exhaustiva actividad laboral, principalmente en los individuos que mantienen contacto directo con otras personas a las cuales se les brinda una atención personalizada. Sin embargo, fue Christina Maslach (1978) quien desarrolló este término describiendo tres dimensiones: agotamiento emocional, despersonalización y falta de realización personal.

Para el caso particular de los profesionales de la enseñanza, la educación es un elemento fundamental para el desarrollo y crecimiento de cualquier país, por lo que la calidad educativa está estrechamente vinculada con el desempeño de los docentes, lo cual permite que las organizaciones puedan ser competitivas. En la actualidad, los maestros de los diferentes niveles educativos están expuestos a una gran variedad de factores de riesgo entre los que destacan los de tipo psicosocial, los cuales dan como resultado la patología denominada Síndrome de Burnout, que se produce por la exposición continua y prolongada a estresores laborales lo cual repercute en su salud.

En la actualidad, en las instituciones educativas, los docentes están presentado un incremento de las incapacidades médicas debido a diferentes enfermedades, ausentismo, conflictos interpersonales de estos profesionales con los alumnos y padres de familia, una baja productividad, entre otras cosas; las cuales pudieran estar relacionados con la prevalencia del Síndrome de Burnout, afectando la calidad del servicio que brindan éstos profesionales de la enseñanza, repercutiendo en la imagen de la institución, así como a la misma sociedad por el papel que las instituciones educativas desempeñan (Sánchez, 2012). La presente investigación se realizó en tres instituciones educativas del nivel medio superior, mismas que pertenecen a un mismo dueño, pero que se encuentran establecidas en distintos municipios del estado de Hidalgo. El propósito consistió en conocer los niveles de Burnout que prevalecen en los profesores por asignatura y la dimensión en donde más se acentúa, de acuerdo al modelo MBI (Maslach Burnout Inventory), así como correlacionar este constructo con algunas variables socio-demográficas para identificar en donde existe un mayor reflejo de este padecimiento.

## REVISIÓN DE LA LITERATURA

Primeramente es importante entender que el Síndrome de Burnout, es un padecimiento que se deriva del estrés, mismo que Lazarus y Folkman (1986) refieren que el término fue utilizado a partir del siglo XIV para aludir a experiencias adversas como, dificultades y tensión. No obstante, se ha hecho evidente su imprecisión dentro del glosario científico, pues tiene diferentes significados para distintas personas en razón de que existen definiciones y conceptos basadas en los estímulos, en la respuesta y en el concepto estímulo-respuesta (Ivancevich y Matteson, 1992). Según Stora (2000), tiempo después, en el siglo XVII la palabra estrés se empleó para expresar problemas, sufrimiento, privación y adversidad, resultado en suma de una vida hostil, manifestada en una sola palabra. Sin embargo, ocurrió una evolución semántica desde el punto de vista material, puesto que se pasa del efecto emocional que acarrea el estrés al motivo de su origen; es decir la fuerza o la presión que produce una tensión y a cierto plazo, una deformación en un objeto. Actualmente, el individuo vive más apresurado, carece de proyecciones a largo plazo y la inestabilidad es la característica del mundo actual. Con esta perspectiva las personas están expuestas a una serie de elementos que perturban no solo su salud, sino su ámbito emocional, a este respecto se ha descubierto un factor silencioso que ataca al individuo, este factor es tomado en cuenta por ciertos especialistas como enfermedad, por otros a manera de un estímulo.

De acuerdo con Cano (2009), quien es investigador y Presidente de la Sociedad Española para el Estudio de la Ansiedad y el Estrés, el estrés es catalogado como la enfermedad del siglo XXI, menciona que «el término estrés proviene de la física y la arquitectura y se refiere a la fuerza que se aplica a un objeto, que puede deformarlo o romperlo». Con base a lo anterior, podemos definir al estrés como la reacción fisiológica y psicológica del organismo a las demandas hechas sobre él Papalia (1988), pero para la presente investigación se seleccionó la definición formulada por la OMS (2008), la cual define al estrés desde el ámbito laboral como las: «reacciones que ocurren cuando los trabajadores confrontan exigencias ocupacionales que no corresponden a su conocimiento, destrezas o habilidades y que retan su habilidad para hacer frente a la situación». En México, en el ámbito laboral, el estrés es un fenómeno cada vez más frecuente que está aumentando en nuestra sociedad principalmente dado que los tipos y cargas de trabajo han ido cambiando en las últimas décadas (Ussher, 2007). Este constructo, afecta al bienestar físico y psicológico del trabajador y puede deteriorar el clima organizacional (Almirall, 1996). Según Frías (2002) los estresores o factores generadores de estrés en el ámbito laboral son los siguientes:

Ambigüedad y conflicto de Rol. Sucede cuando existen diferencias entre lo que espera el trabajador y la realidad de lo que le exige la organización. Puede haber conflictos, tales como, recibir órdenes contradictorias de un superior o cuando los objetivos no se corresponden con lo que realmente estamos haciendo. Cuando no se tiene claro lo que se tiene que hacer, las metas del trabajo y la responsabilidad inherente que conlleva, puede ser un factor de estrés importante; Sobrecarga de trabajo. Genera un desgaste físico y mental e impide al trabajador acatar eficientemente las situaciones estresantes. Una jornada excesiva resulta agobiante, mientras que por el contrario, una insuficiente al puesto, aburrida. Por otra parte, la jornada diurna puede ser más larga que una matutina o vespertina y por tanto al final de la jornada, el individuo se sentirá más agotado y su capacidad física y mental podrán verse disminuidas; Juegos de poder. Esta situación se puede transformar en un elemento importante de baja motivación. Asimismo, dar comienzo a la competitividad, en la que prevalecen las influencias o relaciones personales sobre la formación y capacitación del trabajador; y Inadecuación de Status. Estar en un lugar en la organización que se encuentre por debajo o por encima de la capacidad y formación del individuo, puede generar una profunda frustración apareciendo el estrés.

Retomando lo comentado al inicio de este apartado, Cuando el estrés se presenta de manera crónica en un individuo, provoca trastornos psicosomáticos —de la mente— y comportamientos que en esos momentos resultan preocupantes. El Síndrome de Burnout entendido como estrés crónico, es una señal de alerta sobre

esta situación. De acuerdo con Perea (2004) el Burnout es un término inglés que se traduce como quemadura o Síndrome de quemarse por el trabajo (Gil-Monte, 2005). Su empleo al español ha sido para denotar casos de desgaste profesional, estrés laboral, estrés emocional, principalmente. En este sentido, es importante reconocer que el Burnout continua siendo un fenómeno que afecta severamente a las personas en sus instituciones; sin embargo, a pesar de los esfuerzos en investigaciones desarrolladas estas no han sido suficientes para considerar al Síndrome como factor a prevenir. Asimismo, el aumento progresivo de este, permitió reconocer su existencia en más individuos. En 1974, Freudenberger conceptualizó al Síndrome de Burnout como la sensación de agotamiento, decepción y pérdida de interés por la actividad laboral, que se manifiesta especialmente en aquellos que se dedican a profesiones asistenciales como consecuencia del contacto diario con su trabajo. A partir de este año se fueron desarrollando diversas teorías explicativas y modelos de medición sobre este constructo, hasta que en 1981, Christina Maslach y Susan Jackson desarrollaron un modelo de medición conocido como MBI (Maslach Burnout Inventory), el cual es considerado actualmente el mejor instrumento de medición del Burnout (Garcés, López y García, 1997; Ortega y López, 2003; y Hernández et al, 2007).

Para la presente investigación se utilizó precisamente el modelo MBI, el cual está formado por 22 ítems en escala tipo Likert acerca de las sensaciones y actitudes del profesional en su trabajo y hacia los usuarios/clientes. Valora tres dimensiones: agotamiento emocional, despersonalización y baja realización personal en el trabajo. Al Síndrome de Burnout se le considera como una variable continua que se puede experimentar en diferentes etapas. Normalmente las puntuaciones del MBI se correlacionan con resultados obtenidos de otros instrumentos acerca de datos demográficos, características del trabajo, realización en el trabajo, información sobre la salud, principalmente, como de hecho se suelen plantear en las diversas investigaciones desarrolladas sobre el estudio de esta variable.

Los principales modelos explicativos del Síndrome de quemarse en el trabajo han considerado un conjunto importante de variables en su relación con las dimensiones del Síndrome, permitiendo estudiarlo desde diferentes aspectos y elaborando el desarrollo de distintas hipótesis. Desde estas perspectivas se han desarrollado diferentes modelos para su interpretación. 1) Modelos diseñados desde la teoría cognoscitiva del yo. Según esta teoría existen una serie de procesos de asociación mediante los que las representaciones simbólicas se traducen en acciones adecuadas. Se han considerado los siguientes modelos de Harrison; Charniss y el de Thompson, Page y Cooper. 2) Modelos elaborados desde las teorías del intercambio social. Estos modelos parten de la teoría de la seguridad y de la teoría de la conservación de recursos.

Proponen que el Síndrome de quemarse por el trabajo tiene su etiología en las percepciones de falta de equidad o de ganancia que desarrollan los sujetos como resultado del proceso de comparación social cuando establecen relaciones interpersonales. Cuando los sujetos perciben que aportan más que lo que reciben y no son capaces de resolver los problemas, desarrollarán sentimientos de quemarse por el trabajo. Los modelos elaborados desde este enfoque son: el modelo de comparación social de Buunk y Schaufeli y el de conservación de recursos de Hobfoll y Fredy. 3) Modelos diseñados desde la teoría organizacional. Todos estos modelos incluyen al Síndrome de quemarse por el trabajo como una respuesta al estrés laboral. Ponen énfasis en la importancia de los estresores del contexto de la organización (estructura organizacional, clima organizacional, disfunciones de rol, apoyo social percibido, etc.) y de las estrategias de afrontamiento empleadas ante la experiencia de quemarse.

Aquí encontramos principalmente los siguientes modelos: el modelo de Golembiewski, Munzenrider y Carter, de Cox, Kuk y Leiter, y Winnubst. Por otro lado, un requisito indispensable de cualquier investigación que se haga, es un instrumento de medida que determine de manera científica lo expuesto en dicha investigación. El Síndrome de Burnout no queda exento de dicho requisito, incluso dada su dificultad de comprensión muestra la necesidad de un instrumento de medición válido y fiable que pueda ser utilizado en diversos contextos laborales e idealmente en diferentes países, siendo así varios los instrumentos creados

para la evaluación del Síndrome. En La Tabla 1: Se Muestra un Listado de Instrumentos de Medida del Síndrome de Burnout:

Tabla 1: Instrumentos de Medición de Burnout

Instrumento De Medida	Autores
Staff Burnout Scale	Jones (1980)
Indicadores del Burnout	Gillespie (1980)
Emener – Luck Burnout Scale	Emener y Luck (1980)
Tedium Measure	Pines, Aronson y Kafry (1981)
Maslach Burnout Inventory	Maslach y Jackson (1981)
Burnout Scale	Kremer y Hofman (1985)
Teacher Burnout Scale	Seidman y Zager (1986)
Energy Depletion Index	Garden (1987)
Mattews Burnout Scale for Employees	Mattews (1990)
Efectos Psíquicos del Burnout	Carcía Izquierdo (1990)
Escala de Variables Predictoras del Burnout	Aveni y Albani (1992)
Cuestionario del Burnout del Profesorado	Moreno y Oliver (1993)
Holland Burnout Assessment Survey	Holland y Michael (1993)
Rome Burnout Inventory	Venturi, Dell'Erba y Rizzo (1994)
Escala de Burnout de Directores de Colegios	Friedman (1995)

Fuente: Garcés de los Fayos, López y García (1997)

Para la presente investigación se utilizará el MBI diseñado por Christina Maslach, el cual es considerado actualmente el mejor instrumento de medición del Burnout, siendo este el más utilizado para las investigaciones relacionadas con el Síndrome. En un estudio realizado por Galván, Aldrete, Preciado y Medina (2010), en una institución educativa de nivel preescolar, encontraron que el 88% de las docentes presentaban el Síndrome de Burnout en alguna de las tres dimensiones de acuerdo al instrumento Maslach Burnout Inventory (MBI). En una investigación realizada por Aldrete, González, Preciado y Pando (2009) encontraron que 8 de cada 10 docentes padecían Síndrome de Burnout en una o más dimensiones – agotamiento emocional, despersonalización y baja realización personal- que caracterizan a esta patología. Además, estos autores consideran que los docentes de primaria y secundaria son los individuos más expuestos a padecer Burnout principalmente a causa del ambiente estresante en el que se desempeñan. Aldrete, Vázquez, Aranda, Contreras y Oramas (2012), en un estudio realizado en una institución educativa de nivel medio superior –preparatoria- encontró que el 50.4% de los docentes presentaba la prevalencia del Síndrome de Burnout, debido principalmente a las condiciones de trabajo, carga de trabajo, condiciones y características de la tarea, exigencias laborales, interacción social y características organizacionales, la remuneración, por mencionar algunas. Por su parte Arquero, Donoso, Hassall y Joyce (2006), en un estudio realizado en docentes universitarios, encontraron que el 28% tenían prevalencia del Síndrome de Burnout en alguna de sus tres dimensiones – agotamiento emocional, despersonalización y baja realización personal.

## METODOLOGÍA

Es conveniente llevar a cabo el presente estudio diagnóstico sobre Síndrome de Burnout, toda vez que actualmente esta patología laboral se ha venido presentando de manera continua en instituciones educativas (Sánchez, 2012). En este sentido, es necesario realizar estudios que permitan determinar el nivel de presencia de este tipo de constructo, así como utilizar esta información para la realización de una serie de sugerencias y propuestas orientadas a la disminución y prevención de esta patología en los profesionales de la enseñanza de la institución. Considerando que hoy en día existe una buena apertura por parte de las organizaciones, para permitir el acceso a la información y la realización de este tipo de estudios, tal como lo demuestran los directivos (dueños) de los planteles educativos evaluados, el beneficio inmediato será para que se pueda poner en marcha un plan de intervención inmediato. Es por ello que se pretende alcanzar el siguiente objetivo: “Realizar un estudio diagnóstico del Síndrome de Burnout en docentes de escuelas

del nivel medio superior, con el propósito de reconocer su nivel de afectación y posibles estrategias de intervención”.

En la actualidad, millones de individuos están expuestos a numerosos peligros en el trabajo que ponen en riesgo su salud y su vida. De acuerdo con la Organización Mundial de la Salud (OMS) cada año, cerca de 800 mil personas mueren a causa de lesiones ocupacionales y 11 millones debido a enfermedades laborales. Así mismo, como consecuencia de las condiciones laborales se está presentando un incremento en accidentes, pérdidas auditivas, problemas musculo-esqueléticos y cardiovasculares; trastornos mentales, entre otros, lo cual implica un costo en servicios médicos de entre el 2% y el 14% del Producto Interno Bruto (PIB) para algunos países. Además, menciona que estudios recientes muestran más evidencias que relacionan al estrés laboral en países industrializados con enfermedades de depresión y coronarias (OMS, 2012). En los países desarrollados y en vías de serlo, existen millones de trabajadores expuestos a distintos tipos de riesgos ocupacionales como son físicos, químicos, ergonómicos, psicológicos, biológicos, entre otros. Sin embargo, en la actualidad se está presentando un importante incremento principalmente en los riesgos de tipo psicosocial. Una de las patologías que se presenta como consecuencia de los factores de riesgo de tipo psicosocial dentro de las organizaciones, principalmente en las de servicios, es el Síndrome de Burnout, la cual afecta la salud de los trabajadores de forma física, psicológica y emocional, además de repercutir en el desarrollo del trabajo, tanto en la productividad como en la calidad, así como en la competitividad de las organizaciones en las que laboran, pues ésta depende principalmente de la calidad de los servicios que brindan los trabajadores.

Esta patología de acuerdo con Schaufeli (2005) está teniendo una elevada prevalencia principalmente en enfermeras, docentes y doctores. De acuerdo con Moriana y Herruzo (2004), los docentes son los profesionales más afectados en comparación con otros como son enfermeras, médicos y trabajadores sociales. Los profesionales de la educación en todos los niveles educativos tienen la importante tarea de formar y preparar a los individuos, lo cual es fundamental para el desarrollo y crecimiento de cualquier país. Para el caso particular de los docentes del nivel medio superior, son los encargados de formar y capacitar por medio de procedimientos y/o métodos de enseñanza-aprendizaje, que permiten transmitir conocimientos, habilidades, valores, creencias, pensamientos, hábitos, normas, entre otras cosas; a los alumnos, ya sea para integrarse al sector productivo o para continuar con sus estudios a nivel profesional.

Por lo anterior la función que desempeñan los docentes es de suma importancia, tanto dentro de las instituciones educativas, como para el mismo país. Actualmente, muchos docentes están expuestos a una gran variedad de riesgos de tipo psicosocial los cuales afectan su salud de forma física, psicológica y emocional, ocasionando con ello un bajo rendimiento laboral, un incremento en las incapacidades médicas, ausentismo, baja productividad, baja calidad del servicio que brindan, entre otras cosas. Tal es el caso de las escuelas de educación media superior, objeto de este presente trabajo de investigación, quienes sus directivos han expresado que en los últimos tres semestres han tenido problemas con los docentes, ya que no son participativos en las reuniones académicas, hay conflictos y roces constantes entre ellos, continuamente piden permisos, entre otros aspectos. A pesar de que las tres instituciones educativas se ubican en distintos municipios del estado de Hidalgo, los dueños han detectado que los problemas son similares, por lo cual se decidió llevar al cabo un estudio diagnóstico para dar respuesta a las siguientes preguntas de investigación:

¿Existe la presencia de Síndrome de Burnout en los planteles educativos del nivel media superior?,  
¿En qué niveles de afectación se encuentra cada una de sus dimensiones, de acuerdo al modelo MBI?, y  
¿Algunas variables socio-demográficas se encuentran presentes de forma distintiva en relación con el Burnout? El estudio de campo se llevó a cabo en el periodo mayo – julio de 2013, con la participación de los maestros por horas y que aceptaron contestar la encuesta. Los directivos expresaron su interés por que se realizara un diagnóstico general y no se segmentara por escuela, ya que las estrategias a implementar las

desean manejar de manera objetiva, sin hacer señalamientos directos hacia un plantel educativo, de los tres que conforman la firma. Las hipótesis fueron las siguientes:

Existe la presencia de Síndrome de Burnout en los maestros de los planteles educativos del nivel media superior evaluados, en un nivel que va de medio a alto. Los maestros de los planteles educativos evaluados, presentan un mayor Síndrome de Burnout en la dimensión Baja Realización Personal, de acuerdo con el modelo de medición MBI. La antigüedad del maestro, es una de las variables socio-demográficas que se encuentran presentes de forma distintiva en relación con el Burnout. La presente investigación es deductiva, descriptiva, correlacional, observacional y transversal. La población total está compuesta de 110 maestros por horas, entre los tres planteles educativos evaluados, efectuándose un censo, como se puede apreciar en la Tabla 2.

Tabla 2: población

Plantel	No. Maestros (N)
1	45
2	30
3	35
Total	110

Fuente: elaboración propia.

Para la realización del estudio se utilizó el instrumento de medición MBI (Maslach Burnout Inventory) desarrollado por Christina Maslach y Susan Jackson en 1981, mismo que está formado por 22 ítems en escala tipo Likert. Valora tres dimensiones: agotamiento emocional, despersonalización y baja realización personal en el trabajo. Se aplicó una prueba piloto al 10% del total de los maestros, sometiendo de forma estadística una prueba de confiabilidad para comprobar la existencia de una alta coherencia interna entre los valores del instrumento de medición. Se utilizó el coeficiente Alpha de Cronbach, mismo que arrojó un valor de 0.85, lo cual reafirma la pertinencia y congruencia encontrada en la medición del MBI.

## RESULTADOS

En relación al Síndrome de Burnout, en la Tabla 3, se puede observar que en promedio el 54.7% de los trabajadores presentan un nivel bajo en las tres dimensiones del modelo MBI; no obstante, comienzan a detectarse algunos casos alarmantes en lo referente al Agotamiento Emocional, sumando los porcentajes de nivel medio con alto, se habla de un 50% de los maestros que presenta problemas. Asimismo, en la segunda y tercera dimensión, los niveles medio a alto, están por encima del 40%, lo cual es una señal de riesgo para que en el corto plazo se lleguen a incrementar los niveles de estrés.

Tabla 3: Nivel de Síndrome de Burnout Por Dimensión

	Agotamiento Emocional (AE)		Despersonalización (D)		Baja Realización Personal (BRP)	
	Frec.		Frec.		Frec.	
Nivel	#	%	#	%	#	%
Bajo	55	50%	65	59%	60	55%
Medio	38	35%	35	32%	35	32%
Alto	17	15%	10	9%	15	14%
Total	110	100%	110	100%	110	100%

Fuente: Elaboración propia.

En respuesta a la primera hipótesis de investigación ( $H_1$ ), se establece que en las dimensiones: Agotamiento Emocional, con un 50%; Despersonalización, con un 41%; y Baja Realización Personal, con un 46%, padecen Burnout que va de medio a alto. Es decir, la hipótesis de investigación “se acepta”.

Así mismo, en relación a la segunda hipótesis ( $H_2$ ), se establece que en la dimensión de Agotamiento Emocional es en la que se observa una mayor tendencia de Burnout de medio a alto, ya que así lo explica el 50% de los maestros encuestados (55 casos), con lo que dicha hipótesis “se rechaza”, ya que en segundo lugar se ubica la Baja Realización Personal con un 46% (50 casos) y en tercero la Despersonalización con un 41% (45 casos). En cuanto a la correlación de algunas variables sociodemográficas con el Burnout, se procedió a realizar diversos análisis bivariados, mostrando únicamente los resultados de las variables más significativas. En la Tabla 4 se observa que en la dimensión de Agotamiento Emocional existen diferencias significativas entre los maestros del género femenino y masculino. Los valores más altos en esta dimensión correspondieron a las mujeres encuestadas (media = 2.20,  $p = 0.035$ ). En las dimensiones de Despersonalización y Baja Realización Personal, no se identificaron diferencias significativas entre personal del género femenino y masculino.

Tabla 4: Puntuaciones Medias del MBI Por Género

Dimensiones del MBI/Género	Media	N	T-Student	P
Agotamiento Emocional			2.031	0.035
• Femenino	2.20	45		
• Masculino	1.32	65		
Despersonalización			0.248	0.702
• Femenino	1.21	45		
• Masculino	1.13	65		
Realización personal			-0.632	0.440
• Femenino	4.45	45		
• Masculino	4.73	65		

Fuente: Elaboración propia.

En la Tabla 5, se identificaron diferencias estadísticamente significativas con las dimensiones de Despersonalización y Baja Realización Personal. En la dimensión de Despersonalización las puntuaciones medias más altas correspondieron a los maestros que tienen entre 26 y 30 años de edad (media = 1.60;  $p = 0.000$ ) y en maestros de 30 a 40 años (media = 1.34;  $p = 0.000$ ). En lo referente a la dimensión de Baja Realización Personal, las puntuaciones medias más altas correspondieron a los maestros de más de 40 años (media = 4.78;  $p = 0.032$ ), contrariamente las puntuaciones medias más bajas en esta dimensión correspondieron al personal que tiene de 30 a 40 años de edad (media = 4.22;  $p = 0.032$ ).

Tabla 5: Puntuaciones Medias del MBI Con la Edad

Dimensiones del MBI/Edad	Media	N	Prueba F	P
Agotamiento Emocional			2.044	0.650
• De 18 a 25 años	1.25	12		
• 26 a 30 años	2.33	26		
• De 30 a 40 años	2.28	40		
• De más de 40 años	1.25	32		
Despersonalización			7.132	0.000
• De 18 a 25 años	1.12	12		
• 26 a 30 años	1.60	26		
• De 30 a 40 años	1.34	40		
• De más de 40 años	0.76	32		
Baja Realización Personal			2.470	0.032
• De 18 a 25 años	4.50	12		
• 26 a 30 años	4.23	26		
• De 30 a 40 años	4.22	40		
• De más de 40 años	4.78	32		

Fuente: Elaboración propia.

En la Tabla 6, Las puntuaciones medias más altas de la dimensión de Agotamiento Emocional correspondieron a los maestros que tiene de 6 a 10 años de antigüedad (media = 2.49;  $p = 0.03$ ) y al personal con 16 y 20 años de antigüedad (media = 2.42;  $p = 0.03$ ). En la dimensión de Despersonalización se identificaron puntuaciones medias más altas en los maestros que tiene de 1 a 5 años de antigüedad (media = 1.53;  $p = 0.000$ ), en cambio las puntuaciones medias más bajas de esta dimensión corresponden al personal con 21 años o más de antigüedad (media = 0.59;  $p = 0.000$ ). Finalmente, en la dimensión de Baja Realización Personal se identificaron puntuaciones medias más bajas en maestros que tienen de 21 años en adelante de antigüedad (media = 5.00;  $p = 0.000$ ).

Tabla 6: Puntuaciones Medias del MBI Con la Antigüedad

Dimensiones del MBI/Antigüedad	Media	N	Prueba F	P
Agotamiento Emocional			2.617	0.036
• De 1 a 5	2.17	30		
• De 6 a 10	2.49	23		
• De 11 a 15	2.11	18		
• De 16 a 20	2.42	21		
• De 21 en adelante	1.75	18		
Despersonalización			6.449	0.000
• De 1 a 5	1.53	30		
• De 6 a 10	1.39	23		
• De 11 a 15	1.35	18		
• De 16 a 20	1.15	21		
• De 21 en adelante	0.59	18		
Realización personal			6.560	0.000
• De 1 a 5	4.36	30		
• De 6 a 10	4.12	23		
• De 11 a 15	4.38	18		
• De 16 a 20	4.70	21		
• De 21 en adelante	5.00	18		

Fuente: Elaboración Propia.

En respuesta a la tercera hipótesis de investigación ( $H_3$ ), se observó que algunas de las variables socio-demográficas tienen una presencia distintiva en relación con el Síndrome de Burnout, en alguna de sus tres dimensiones evaluadas, por lo que se “acepta”, ya que al menos en la antigüedad, así se logró estadísticamente probar.

## CONCLUSIONES

A partir de los resultados obtenidos se identificó que en los 110 maestros encuestados, el 50% presenta niveles de Burnout, que van de medio a alto, en las dimensiones Agotamiento Emocional, 41% en Despersonalización y 46% en Baja Realización Personal. En relación a las variables socio-demográficas analizadas, se puede rescatar de manera general, que en lo referente al género, se encontró que el 41% de mujeres y el 59% de los hombres presentan Burnout en la dimensión Agotamiento Emocional. En cuanto a la edad se observa que los que tienen de 26 a 30 años su Burnout se relaciona con la Despersonalización. De acuerdo con la antigüedad, el Burnout se encuentra presente en todas las dimensiones, destacando los que tienen menos de 10 años.

## TIENDAS DE BARRIO: OTRA REALIDAD DE RESPONSABILIDAD SOCIAL, FUSAGASUGÁ, CUNDINAMARCA. COLOMBIA

Elizabeth Ann Escobar Cazal, Universidad de Cundinamarca

Gonzalo Escobar Reyes, Universidad de Cundinamarca

### RESUMEN

*El Proyecto: Organizaciones empresariales en Fusagasugá. Estudio multidimensional de sectores 2008 – 2012 se centró básicamente en los aspectos de empleabilidad y responsabilidad social. El propósito de la investigación fue realizar un diagnóstico de las organizaciones empresariales formales e informales vinculadas a los sectores servicio, comercio e industria, analizando el impacto socio-económico generado. Dentro del sector comercio y por su alto impacto socio-económico se analizaron las tiendas de barrio, consideradas organizaciones informales por no cumplir con requerimientos administrativos y económicos propios de la economía formal. Se determinó que el autoempleo constituye una alternativa productiva que permite a emprendedores y familias alcanzar condiciones básicas de vida (aseguramiento en el mediano y largo plazo de adquisición de vivienda, acceso a la educación y uso de servicios públicos).*

**PALABRAS CLAVES:** Microempresas, Economía Informal, Responsabilidad Social, Autoempleo

## NEIGHBORHOOD STORES. OTHER FACTS ABOUT SOCIAL RESPONSIBILITY, FUSAGASUGÁ, CUNDINAMARCA. COLOMBIA

### ABSTRACT

*The Project: Business organizations in Fusagasugá. Multidimensional sectors study 2008 – 2012, focused mainly on aspects of employability and social responsibility. The purpose of the research was to conduct an assessment of the formal and informal business organizations linked to the service sector, trade and industry, analyzing the socio-economic impact. Within the retail sector and its high socio-economic impact convenience stores analyzed, considered informal organizations for failing to comply with its own administrative and economic requirements of the formal economy. It was determined that self-employment is a productive alternative that allows entrepreneurs and families achieve basic living conditions (assurance in the medium and long-term acquisition of housing, access to education and public service use).*

**JEL:** M14

**KEYWORDS:** Microenterprises, Informal Economy, Social Responsibility, Self-Employment

### INTRODUCCIÓN

El grupo de Investigación ARADO adscrito al Programa Administración de Empresas de la Universidad de Cundinamarca, sede Fusagasugá, desarrolló una investigación longitudinal: *Organizaciones empresariales en Fusagasugá. Estudio multidimensional de sectores, 2008 - 2012*. En la investigación se realizaron estudios descriptivos y diagnósticos sobre las organizaciones formales e informales (mipymes) vinculadas a los sectores: servicio, comercio e industria, determinando a partir del diseño e implementación de estrategias metodológicas, la comprensión de la interrelación de actores (usuarios y público), la evaluación de procesos, la valoración del impacto socio-económico generado y la movilidad que sobre oferta y

demanda laboral presentó la dinámica. Dentro de la franja económica de informalidad se estableció, que factores como la insuficiencia de innovación tecnológica, la dependencia financiera y la escasa existencia de estudios para creación de empresas, configuran una constante extendida largamente en el tiempo. En tal sentido, en muchos municipios de mediana población, como en el caso de Fusagasugá, estos, junto a otras causas no menos importantes, han obstaculizado la creación y el establecimiento de grandes empresas. Tal condición determina que el índice de desempleo en el municipio se relacione con el aumento de microempresas, fenómeno que se presenta indicando, no una alternativa de desarrollo de sectores económicamente deprimidos, sino significando contrariamente, disminución de la capacidad económica de la clase media. Una consecuencia por ejemplo, ante la emergencia de estos eventos ha sido la transformación de barrios residenciales y espacios campestres en concentraciones de pequeños negocios. Así, las tiendas de barrio se han convertido en una alternativa laboral importante.

## REVISIÓN LITERARIA

De acuerdo a la Clasificación Industrial Internacional Uniforme CIIU (2012) el Sector comercio es el sector económico que engloba todas aquellas actividades económicas que se dedican a la compra y venta de bienes materiales que se ofrecen para satisfacer las necesidades de la población. La Clasificación Industrial Internacional Uniforme CIIU clasifica a las tiendas como comercio al por menor. Es decir, comercio de bienes propios de consumo final privado, nuevo o usado, sin transformación, dirigido a familias y hogares.

Tabla 1: Clasificación Industrial Internacional Uniforme CIIU. Comercio al Por Menor

Comercio al Por Menor	Código Ciiu
Comercio al por menor, en establecimientos no especializados, con surtido compuesto principalmente de alimentos (viveres en general), bebidas y tabaco	G521100
Comercio al por menor en tiendas pequeñas y graneros	G521101
Comercio al por menor de viveres y abarrotes en otros tipos de establecimientos no especializados	G521102
Comercio al por menor en supermercados y almacenes de cadena	G521103

*Fuente: Cámara de comercio de Bogotá. 2012. El Código CIIU tiene como propósito agrupar todas las actividades económicas similares por categorías, permitiendo que todos los empresarios puedan clasificarse dentro de actividades muy específicas que facilitan el manejo de información para el análisis estadístico y económico empresarial.*

El Departamento Administrativo Nacional de Estadística DANE es la entidad responsable de la planeación, levantamiento, procesamiento, análisis y difusión de las estadísticas oficiales de Colombia. Pertenece a la rama ejecutiva del Estado y ha adelantado numerosas investigaciones sobre economía, industria, productividad agropecuaria, población, etc.

## METODOLOGÍA

En esta investigación de tipo descriptiva y para desarrollar el proyecto, fueron vinculados 40 estudiantes auxiliares y 3 profesores investigadores principales. La participación de los alumnos validó su experiencia homologándose el desempeño y suficiencia investigativa alcanzada, como opción de grado. En relación a la metodología aplicada, debe mencionarse que las fuentes primarias se determinaron a través de la observación directa y estructurada, el uso de técnicas de recolección de información: encuestas aplicadas a empleadores, empleados, clientes y proveedores, entrevistas dirigidas a empresarios y directivos de las organizaciones. Este levantamiento se complementó con registro fotográfico y con observación personal y directa. Las fuentes secundarias se trabajaron desde el análisis documental y de textos.

Posteriormente se procedió a la tabulación y análisis estadístico de la información acopiada. Se diseñaron tablas de análisis y gráficas para promediar resultados. Un siguiente momento correspondió al desarrollo del ejercicio explicativo orientado a plantear relaciones de tipo teórico entre condiciones y datos observados, descritos y contrastados, definiendo niveles de interdependencia mediante la aplicación del análisis e Impactos socio-económicos. Para el desarrollo de este artículo se propuso analizar la empleabilidad y responsabilidad social generadas desde la dinámica económica de las tiendas de barrio. En total se aplicaron 462 encuestas a tenderos ubicados en todas las comunas de la zona urbana.

## RESULTADOS

Fusagasugá se ubica en el Suroccidente del Departamento de Cundinamarca. Es capital de la Provincia del Sumapáz conformada por 10 municipios. Su extensión es de 204 km<sup>2</sup>. Se encuentra a una distancia de 64 km de Bogotá (D.C. Colombia), integrada a una red vial que la comunica con el resto del país.

La población del municipio proyectada por el Departamento Administrativo Nacional de Estadística DANE para el año 2012 fue de 126.691 habitantes (DANE, 2009). De los cuales el 80% reside en la zona urbana. El perímetro urbano, con una extensión de 14 Km<sup>2</sup> (aprox.) se subdivide en 6 comunas: Centro, Norte, Oriental, Sur-Oriental, Occidental, Sur Occidental, conformadas aproximadamente por 42 barrios y 300 urbanizaciones. El municipio no cuenta con grandes industrias y fábricas, por el contrario su economía se apoya en el desarrollo de micro, pequeñas y medianas empresas mipymes

El término Mipyme comprende las micro, pequeñas y medianas empresas de carácter familiar. De acuerdo a Fedesarrollo 2007 cuanto más pequeña es la pyme, se aproxima más a la informalidad y por lo tanto la consecución de recursos (créditos) a través de entidades financieras, es tarea mayormente difícil.

Lo común en estas organizaciones es el carácter emprendedor que las distingue, su facultad para innovar y su proceso de toma de decisiones que debe garantizar en primera instancia la supervivencia de la organización y luego, su posterior crecimiento y desarrollo. (HURTADO BOLAÑOS, 2011)

El censo poblacional de 2005, reporta que las PYMES constituyen el 99% de las organizaciones nacionales y ocupan al 80% de los trabajadores colombianos, la información del DANE muestra que el 96.4% son microempresas y allí están trabajando la mayoría de los empleados. Estas empresas se ubican en las principales ciudades y departamentos de Colombia, en su orden, Bogotá, Medellín, Valle del Cauca, Cundinamarca, Santander y Atlántico. En Bogotá, el porcentaje de empresas grandes es mayor que el de PYMES (36.1% vs. 22.8%), mientras que en el resto de departamentos es casi la misma proporción de grandes empresas y PYMES. Las microempresas suelen ocupar menos de cinco empleados, operan en el comercio (47.3%), en el sector servicio (39.1%) y con una baja participación en la industria (11.1%).

Esta distribución explica los niveles de informalidad, el bajo nivel tecnológico, la escasa formación de su personal y las limitaciones para conseguir financiación en la banca formal. (HURTADO BOLAÑOS, 2011)

Localmente, según este mismo censo, Fusagasugá no cuenta con grandes empresas lo cual ha limitado posibilidades de empleo e inversión. El 98% del tejido empresarial corresponde a microempresas que generan principalmente autoempleo y hasta tres empleos directos, incidiendo con su producción en la economía regional. Por la oferta de empleabilidad se destacan los sectores de comercio y servicio.

La Ley 905 de 2004, define microempresa o famiempresa reconociendo como la mayoría de establecimientos que pertenecen al sector comercio, las tiendas de barrio. Estas tiendas son consideradas organizaciones informales, por no cumplir con requerimientos administrativos y económicos propios de la economía formal: - Régimen contributivo, Pago de salarios integrales, - Constitución jurídica, - Disponibilidad de recursos y planificación financiera, - Uso de tecnologías básicas (programas contables, software empresarial, etc.) y - Estructura organizacional. Tampoco cumplen con planes de saneamiento e infraestructura física adecuada. Generalmente estos negocios se establecen en viviendas propias y/o

arrendadas y los ingresos dependen de la dinámica socio-económica que se presenta en el lugar y respecto a los diversos comercios que entran en competencia. Igualmente, la propiedad del negocio o micro empresa es de una sola persona o grupo familiar. En este aspecto, el Departamento Administrativo Nacional de Estadística (DANE), define como vinculados al sector informal de la economía a los familiares ayudantes a los que no se les paga un salario, a las empleadas del servicio doméstico, a los trabajadores que se encuentran laborando por su propia cuenta en Actividades propias o familiares (excluyendo trabajadores y técnicos) y a los obreros y empleados asalariados del sector privado y patrones o empleadores vinculados a empresas con diez o menos personas ocupadas.

De acuerdo a los resultados de la investigación, en Fusagasugá para 2012 las entidades y actividades comerciales generadoras de empleo más importantes fueron: ventas por catálogo, centros comerciales, plaza de mercado y tiendas. Se identificaron 462 establecimientos destinados a tiendas ubicadas en todas las comunas de la zona urbana. Por el amplio número de negocios, esta actividad genera competencia entre propietarios, situación que beneficia a los clientes, quienes tienen la posibilidad de escoger, comparar precios, calidad de los productos y disponer de mejor atención.

Tabla 2: Encuestas Aplicadas a Tenderos Fusagasugá

Encuestas Aplicadas a Tenderos			
comuna sur oriental y occidental	comuna norte y centro	comuna oriental y sur occidental	total encuestas aplicadas
181	120	161	462

*Las 462 encuestas se aplicaron a tiendas ubicadas en la zona urbana de Fusagasugá, que se encuentra dividida políticamente en 6 comunas: en la Sur Oriental y Occidental se aplicaron 181, en la Norte y Centro 120, y en la Oriental y Sur Occidental 161 encuestas.*

Para Adela Cortina empresa es una organización o la base de la sociedad, es decir “tiene un tipo de entidad que se distiende en pasado, presente y futuro y que no se reduce a la suma de sus miembros; a su vez esa entidad ha de cumplir unas funciones y asumir claras responsabilidades sociales, es decir, ha de tomar decisiones morales” (CORTINA, 2008). Aclarando que la responsabilidad de los individuos no se debe diluir en los derroteros de la empresa, sino que además de existir la ética individual, hay una ética corporativa y comunitaria. La ética de las organizaciones se debe complementar con la ética individual.

“Una ética de las organizaciones es indispensable para reconstruir el tejido de una sociedad, para remoralizarla” (CORTINA, 2008) Los planteamientos de Cortina respecto a la toma de decisiones justas de la empresa, fundamentadas en valores, implica ser responsable con ella misma, con los consumidores, empleados o trabajadores, proveedores y sociedad en general. Por otra parte, Homero Martínez expresa que “La responsabilidad social de la empresa es el compromiso que tiene la empresa de contribuir con el desarrollo, el bienestar y el mejoramiento de la calidad de vida de los empleados, sus familias y la comunidad en general. Es la capacidad de valorar las consecuencias que tienen en la sociedad las acciones y decisiones que tomamos para lograr los objetivos y metas propias de nuestras organizaciones”. (MARTÍNEZ HERRERA, 2011) Más allá de estos planteamientos, nos permitimos hacer una reflexión de responsabilidad social empresarial en la relación empresa: tienda – actores involucrados, de otros indicadores que se registraron espontáneamente en los análisis de resultados de la investigación.

El posicionamiento del comercio tradicional detallista como importante canal de distribución frente a los mercados de gran tamaño o grandes superficies. En Colombia, la tienda de barrio sigue teniendo un lugar privilegiado en los hábitos de compra de los consumidores. Este comportamiento diferencia a los colombianos del resto de los latinoamericanos. Así lo demuestra un estudio divulgado por la compañía de investigación de mercados Nielsen, que indagó respecto a los hábitos de compra de alimentos frescos

(carne, leche, pan, frutas y verduras) a nivel global. Mientras el promedio de participación en las ventas de alimentos frescos en los supermercados o grandes superficies latinoamericanos es del 25 %, en Colombia la cifra llega apenas al 13 %. (Compañía de Investigación de Mercados Nielsen, 2013)

*En Fusagasugá se identifican 3 grandes cadenas de mercado:* el Éxito, Colsubsidio y Supermercados Cundinamarca, caracterizados entre otros aspectos, por ofertar variedad de productos dentro del mismo espacio, como artículos electrodomésticos, electrónicos, ropas y accesorios, juguetería, artículos de aseo, alimentos. El Éxito y Colsubsidio ofrecen además, artículos de marca propia a más bajo precio. Adicionalmente, prestan servicios crediticios a través de tarjetas y descuentos y promociones con manejo de tarjeta puntos. A su vez los Supermercados Cundinamarca manejan surtido básico de alta rotación y estrategias de mercadeo como premios, sorteos y rifas.

A pesar de la alta competencia, el mercado de tienda compite con las grandes superficies en la venta de alimentos. El director Económico de la Federación nacional de Comerciantes Fenalco considera que la venta de alimentos en las grandes superficies pierde terreno, mientras que las tiendas de barrio siguen siendo el canal que se lleva la mayor parte del mercado. Es importante tener en cuenta la entrada del nuevo formato de Tienda Express, de gran incidencia en la venta de alimentos en países como México, España y Portugal, entre otros, y que empieza a implementarse en Colombia a través de Éxito Express, Carrefour Express, Oxxo y en un futuro próximo, de Jerónimos Market, de Portugal. Igualmente anotó, que alrededor del mundo, en las grandes superficies, continúa la tendencia observada en los últimos años: las ventas de bienes perdurables van en aumento, mientras que las de alimentos han perdido representatividad, en favor del formato Express. (ESPAÑA, 2013)

La comodidad de adquirir productos básicos cerca del lugar de residencia sin necesidad de realizar grandes desplazamientos. Este servicio es fundamental, y las tiendas se identifican en todos los barrios y asentamientos de la zona urbana municipal y en su periferia. El autoempleo constituye una alternativa productiva que permite a emprendedores y familias alcanzar condiciones básicas de vida (aseguramiento en el mediano y largo plazo de adquisición de vivienda, acceso a la educación y uso de servicios públicos). Es la actividad laboral realizada por una persona para la creación de su propio empleo o puesto de trabajo convirtiéndola en emprendedora, para lo cual el trabajador utiliza su capital y esfuerzo generando empleo para él y limitadamente a otros. La Organización Internacional del Trabajo OIT define el trabajo por cuenta propia como “el sector integrado por todos aquellos que trabajan en unidades económicas de su propiedad que ellos mismos dirigen”. Se infiere la responsabilidad social de las tiendas al generar empleo e impactar socio-económicamente al municipio. Las tiendas además de generar empleos directos o autoempleo (462), también generan 171 empleos indirectos (proveedores, ayudantes o empleados).

Tabla 3: Tipos de Empleo

Sur Oriental y Occidental		Norte y Centro		Oriental y Sur Occidental	
DIRECTOS	INDIRECTOS	DIRECTOS	INDIRECTOS	DIRECTOS	INDIRECTOS
181	69	120	72	161	30

*En la Tabla se puede apreciar que en las Comuna Sur Oriental y Occidental se generan 181 empleos directos y 69 empleos indirectos, en las Comunas Norte y Centro se generan 120 empleos directos y 72 empleos indirectos y las Comunas Oriental y Sur Occidental generan 161 empleos directos y 30 empleos indirectos.*

De acuerdo a los resultados de las investigaciones es importante resaltar que las familias de los tenderos en un porcentaje alto la conforman de 1 a 3 integrantes.

La relación cercana del tendero con los actores involucrados, en este caso, el consumidor, es de confianza y credibilidad, si este se centra en la calidad de los productos, el servicio personalizado prestado y manejo

de precios justos. Se encontró además que la mayoría de tenderos brindan al consumidor el servicio de comprar a crédito o fiar. Cuando la tienda se establece en un lugar determinado: barrio, vereda, etc. por espacios de tiempo largos (de 1 a 50 años) generalmente proporciona y funciona con esta modalidad de pago. Es importante expresar que aunque en la mayoría de tiendas no hay cajas registradoras, los tenderos llevan sus cuadernos de “contabilidad” o libro de anotaciones donde identifican a sus clientes, la fecha de la compra y la lista de los productos que adquieren y acuerdan los pagos, que pueden ser semanales, quincenales o mensuales. Cabe anotar que la frecuencia de compras en el negocio, junto al conocimiento de residencia de los usuarios y vecinos, son factores que determinan grados de confianza entre las partes para hacer uso de la forma de crédito mencionada.

Figura 2: Tipos de Empleo

Fuente: (Escobar Cazal, 2011). La figura representa los tipos de empleo directos e indirectos generados por las tiendas de barrio. Se destacan las Comunas Sur Oriental y Occidental y la Oriental y Sur Occidental por promover empleos directos, las Comunas Norte y Centro y Sur Oriental y Occidental por generar empleos indirectos.

Tabla 4: Conformación de las Familias

Comuna Sur Occidental y Occidental		Comuna Norte y Centro		Comuna Oriental y Sur Occidental	
De 1 a 3	Igual o mayor de 4	De 1 a 3	Igual o mayor de 4	De 1 a 3	Igual o mayor de 4
92	71	97	27	99	62

En la Tabla se observa que el núcleo familiar de los tenderos lo conforman de 1 a 3 personas (sin incluir al tendero) y en menor cantidad se identificaron familias compuestas de cuatro o más miembros.

Figura 3: Conformación de las Familias

Fuente: (Escobar Cazal, 2011). La Figura representa la gráfica correspondiente a la conformación de las familias en las comunas del municipio. Se observa en todas las comunas que la tendencia de los grupos familiares es de 1 a 3 personas, y en menor cantidad se identificaron familias de 4 o más integrantes.

Tabla 5: Manejo de Crédito

Sur Oriental y Occidental		Norte y Centro		Oriental y Sur Occidental	
SI	NO	SI	NO	SI	NO
89	92	101	19	63	98

En la Tabla se aprecia que en las Comunas Norte y Centro 101 tenderos practican la modalidad de crédito mientras que 19 dijeron no estar de acuerdo con este tipo de financiación. En las Comunas Sur Oriental y Occidental 89 tenderos prestan este servicio, mientras que 92 no lo ejercen. 63 tenderos de las Comunas Oriental y Sur Occidental prestan este servicio y 98 de ellos no lo hacen.

Figura 4: Manejo de Crédito

Fuente: (Escobar Cazal, 2011) La Figura representa la modalidad de crédito que manejan los tenderos en escala de 0 a 120. Se puede apreciar que aún hoy sigue siendo un comportamiento tradicional.

Por lo general el horario de atención de las tiendas es de 6:00a.m. a 10:00 pm. No son negocios que prestan servicio las 24 horas. Sin embargo la mayoría de los tenderos atienden a sus clientes (vecinos) a cualquier hora. Casos de emergencia, como salud (venta de algún fármaco, venta de minutos), venta de alimentos, casos de esparcimiento y diversión (venta de bebidas alcohólicas), etc. El impacto que genera este servicio es de solidaridad, reconocimiento y respeto.

Tabla 6: Horario de Atención

Sur Oriental y Occidental		Norte y Centro		Oriental y Sur Occidental	
De 6:00 am a 10:00 pm	De 6:00 am a 12:00 y de 2:00 pm a 8:00 pm	De 6:00 am a 10:00 pm	De 6:00 am a 12:00 y de 2:00 pm a 8:00 pm	De 6:00 am a 10:00 pm	De 6:00 am a 12:00 y de 2:00 pm a 8:00 pm
173	8	117	3	19	142

La Tabla muestra que este tipo de negocio tiene un horario de atención bastante amplio. Entre las 6:00 a.m. y las 10:00 p.m. 173 tenderos de las Comunas Sur Oriental y Occidental laboran; 117 tenderos de las Comunas Norte y Centro y 19 tenderos de las Comunas Oriental y Sur Occidental disponen de esta jornada de trabajo. Y se destaca que en las Comunas Oriental y Sur Occidental 142 tenderos cierran sus negocios en horas de almuerzo.

La venta de productos al menudeo hace posible que los clientes compren productos en cantidades mínimas (una pastilla de chocolate, unidades en galletas y otros productos de paquete, unidades en productos de panadería y pastelería, cojines de shampoo, etc.). También, aunque no es una práctica tan frecuente entre los tenderos, se encontró un número importante de tiendas que prestan el servicio de venta de bolsitas (tipo papeleta) de aceite de cocina. Los tenderos atienden a pobladores desempleados o con niveles salariales bajos, cuyo presupuesto no alcanza para adquirir un producto completo (ejemplo: botella de aceite). La tienda se ha convertido en un espacio social vital para los residentes de los barrios y otros asentamientos. Allí en muchos casos se toman decisiones en beneficio de la comunidad. De otra parte, el tendero también

brinda el servicio de “comunicador de mensajes”. Hay familias que a través de ellos, dejan notas, dinero y hasta las llaves de la casa para entregar a otros integrantes del hogar. El conocimiento de la competencia, le genera seguridad al tendero, al conocer con quien compite. La existencia de otros micro-establecimientos dentro del barrio o asentamiento y la asistencia de casi siempre, los mismos proveedores establecen relaciones de respeto y reconocimiento y en ocasiones acuerdos para evitar la venta de cigarrillos y alcohol a menores de edad. Diversidad de servicios. Además de vender productos básicos de la canasta familiar, ofertan marcas no reconocidas de alta rotación a precios más bajos. También se pudo evidenciar que prestan otros servicios como la venta de minutos por celular y la comercialización de alimentos perecederos como lácteos, frutas y verduras fruer, cárnicos, huevos, productos de panadería, etc.

Tabla 7: Diversidad de Servicios

Sur Oriental y Occidental		Norte y Centro		Oriental y Sur Occidental	
SI	NO	SI	NO	SI	NO
85	96	85	35	27	134

En la tabla se aprecia que 85 tenderos de las Comunas Sur Oriental y Occidental, 85 tenderos de las Comunas Norte y Centro y 27 tenderos de las Comunas Oriental y Sur Occidental prestan otros servicios adicionales en la tienda, como la venta de minutos por celular, la venta de alimentos perecederos y panadería.

Figura 6: Diversidad de Servicios

Fuente: (Escobar Cazal, 2011) La Figura muestra la gráfica comparativa de la diversidad de servicios que se prestan en estos negocios. Se destaca que no prestan servicios adicionales 134 tiendas de las Comunas Oriental y Sur Occidental; 96 tiendas de las Comunas Sur Oriental y Occidental y 35 tiendas de las Comunas Norte y Centro.

## CONCLUSIONES

La expansiva existencia de las tiendas de barrio en Colombia constituye una nueva realidad sobre responsabilidad social, toda vez que estos negocios y/o mipymes han alcanzado credibilidad local al prestar servicios especiales como el microcrédito, la venta al detal y de pequeñas porciones (productos alimenticios) y al brindar a residentes del vecindario disposición permanente y solidaria de tiempo para atender servicios urgentes (llamadas, oferta de fármacos, etc.) El autoempleo se ha consolidado como alternativa laboral importante, contribuyendo al desarrollo socio – económico del municipio.

### RESUMEN

*En este trabajo se presentan los factores considerados para la estructura e implementación de un plan de gestión dinámica, para las Pymes situadas en la región de Orizaba, Veracruz, México. El estudio se basó en: el análisis y síntesis de diversos referentes bibliográficos como el macro ambiente, la industria o sector y la estructura organizacional; la información de diversos proyectos estratégicos implementados en las diferentes áreas funcionales de 23 empresas; así como el sistema desarrollado para el manejo de esta información, Sistema Integral de Gestión y Medición de Indicadores de Logro para Pequeñas y Medianas Empresas (SIGMIL). Como resultado, se integraron los fundamentos teóricos en el diseño inicial del plan de gestión dinámica con las experiencias en el campo de aplicación para generar un modelo acorde a las Pymes de la región.*

**PALABRAS CLAVE:** Gestión Dinámica, Proyectos Estratégicos, Pymes

## CONSIDERATIONS FOR THE IMPLEMENTATION OF A PLAN OF DYNAMIC MANAGEMENT

### ABSTRACT

*Are presented in this work the factors considered for the structure and implementation of a dynamic management plan for Pymes located in the region of Orizaba, Veracruz, Mexico. The study was based on: analysis and synthesis of various bibliographic references as the macro environment, industry sector and organizational structure, information of various strategic projects implemented in different functional areas of 23 companies, as well as the system developed for handling this information, Integral Management and Measurement of Indicators of Achievement for Small and Medium Enterprises (SIGMIL). As a result, the theoretical foundations were integrated into the initial design of dynamic management plan with experiences in the field of application to build a model according to Pymes in the region.*

**KEYWORDS:** Dynamic Management, Strategic Projects, Pymes

**JEL:** L10, M10

### INTRODUCCIÓN

En las exigencias del mundo actual hay retos tanto para las economías avanzadas como para las economías emergentes. En este devenir, México no es la excepción, y para lograr un crecimiento que permita avanzar a la altura de los países en desarrollo, deberá generar nuevos modelos de crecimiento con base al interior, incentivo relacionados con la sostenibilidad, la innovación y la sustentabilidad. Las MIPYMES son parte fundamental de la economía de los países. En América Latina, de acuerdo a investigaciones realizadas por la Fundación para el Desarrollo Sostenible-Formación y Consultoría (FUNDES) (FUNDES.ORG

promueve e impulsa el desarrollo competitivo de las micro, pequeña y mediana empresa en América Latina (<http://www.fundes.org/Paginas/Inicio.aspx>)), se ha determinado que las principales características de las MIPYME en estos países son:

La gran mayoría de este tipo de empresas nunca ha recibido formación o consultoría empresarial.

Hasta 90% de las MIPYMES son empresas familiares.

Las MIPYMES son actores importantes para preservar las economías y los empleos locales.

Estos negocios, dependen de los mercados internos (en promedio solo el 5% de ellas exporta).

Entre sus mayores obstáculos se encuentra la asimetría en su relación con grandes empresas, su falta de competitividad en volumen, calidad y precio, falta de información de mercados.

Respecto a México y de acuerdo al Observatorio PYME (OBSERVATORIOPYME.COM es el órgano del Instituto PYME a cargo de producir información actualizada sobre micro, pequeñas y medianas empresas (<http://www.observatoriopyme.com/encuestas-y-estudios/cifras-de-pymes/>), existen 4 millones 15 mil unidades empresariales, de estas el 99.8% son MIPYMES generando el 52% del Producto Interno Bruto (PIB) y 72% del empleo en el país, por lo que es necesario como parte estratégica de nuestro país, fortalecer a estas empresas para que sean más productivas y competitivas. Por otra parte, al igual que el resto de los países de América Latina, en México este tipo de empresas enfrentan problemas en su desarrollo, debido a cinco causas principales que frenan el desarrollo de las MIPYMES (Rodríguez Rubio, 2009):

El bajo poder adquisitivo,

La falta de planeación y administración,

La competencia con las grandes empresas transnacionales,

El aislamiento con el que trabajan ,

El comercio informal.

La región Córdoba-Orizaba, actualmente es considerada como uno de los corredores industriales más importantes del estado. Sin embargo, las empresas de la región como muchas otras del país, padecen los estragos de la situación económica actual, inclusive, en el peor de los escenarios, a su desaparición. La gran mayoría de los empresarios de las PYMES no comprenden la validez e importancia de prever el futuro, ya que tienen la idea que es muy complicado y solo funciona para las grandes empresas. “No es muy común hablar de planeación estratégica en la pequeña empresa y mucho menos escuchar algo formal acerca de ella cuando se trata de aplicarla” (Anzola Rojas, 2010). El Instituto Tecnológico de Orizaba, a través de la maestría en Ingeniería Administrativa, en los últimos años ha establecido relación con empresas de la región atendiendo necesidades específicas mediante proyectos profesionales o desarrollo de tesis, lo que ha propiciado una serie de actividades que, de acuerdo a los resultados particulares, es factible canalizarlos hacia un punto común para varias empresas.

## REVISIÓN LITERARIA

### Gestión y Administración

En términos generales los conceptos de administración, gerencia y gestión, se usan como sinónimos a pesar de los grandes esfuerzos y discusiones por diferenciarlos. Administración de acuerdo a Chiavenato (2006) es el proceso de planear, organizar, dirigir y controlar el uso de los recursos para lograr los objetivos organizacionales con lo que coincide Hitt, Black y Porter (2006) al referir a la administración como el proceso de estructurar y utilizar el conjunto de recursos orientados hacia el logro de metas para llevar a cabo las tareas en un entorno organizacional. Con una connotación más actualizada o gerencial la gestión es planteada como “una función institucional global e integradora de todas las fuerzas que conforman una organización”. En ese sentido la gestión hace énfasis en la dirección y en el ejercicio del liderazgo. Con lo

anterior se deja en claro que estos conceptos tienen una esencia común que no incluye la operación o ejecución. [http://ingenieria.udea.edu.co/producciones/guillermo\\_r/concepto.html](http://ingenieria.udea.edu.co/producciones/guillermo_r/concepto.html) Para Dolan S (2007), gestión es: Dirección, gobierno, administración, o aquel proceso que logra que las actividades sean realizadas con eficiencia y eficacia a través de otras personas. En tanto que José Albors (1999), define gestión como: proceso de fijación y posterior logro de objetivos de la empresa y sus fases y Miguel Udaondo (1992), como: acción que alude a dirección, gobierno y coordinación de actividades. Otra definición de Gestión es la que presenta Philippe Lorino (1993) “Es la medida y el análisis, visión y la comprensión, para la acción. La medida y el análisis son la base de la acción puesto que la acción se hace muy incierta si no se puede ver o no se puede comprender. Así, para que un proceso de gestión, de cualquiera tipo, sea completo, debe realizarse de tal manera que vincule los procesos de planear-realizar-controlar, ninguno de ellos de manera independiente.

[http://upcommons.upc.edu/revistes/bitstream/2099/1110/1/13\\_GestAmbientalRafaelMuriel\\_cast.pdf](http://upcommons.upc.edu/revistes/bitstream/2099/1110/1/13_GestAmbientalRafaelMuriel_cast.pdf)

### Gestión Empresarial

León (2007) en su libro refiere a la gestión empresarial como “la actividad empresarial que busca a través de personas mejorar la productividad y por ende la competitividad de las empresas o negocios. Este autor, considera que la gestión empresarial requiere el apoyo de la gestión Ambiental, de la Gestión Financiera, la Gestión Organizacional o Proceso Administrativo, Gestión de Recursos Humanos y desde luego la Gestión de la Tecnología de Información principalmente en las empresas medianas y grandes para aplicar los sistemas de información y comunicación intra y extra empresa a todas las áreas de la empresa, para tomar decisiones adecuadas en conjunto con el uso de internet. Coincide Calderón y Castaño (2005) al considerar a la gestión empresarial como conjunto de otros campos los cuales tienen que ver con la gestión organizacional, gestión de mercados, gestión del talento humano, gestión financiera y la gestión de procesos, producción y tecnología, dentro de esta última se considera a la gestión de calidad. La expresión 'Dynamic Case Management' o **Gestión Dinámica de Casos** se utiliza para definir procesos que se inician en un determinado momento y que tienen la particularidad de verse influidos por la aparición de nuevas informaciones que afectan y pueden hacer variar la prevista lógica así como el flujo y acciones a realizar dentro de los procesos mientras éstos se están ejecutando.

### Concepto de Administración Dinámica

Como sabemos el proceso administrativo se divide en dos fases la mecánica y dinámica; la fase mecánica se refiere a la estructura de la empresa la cual está conformada por: planeación y organización; mientras que la dinámica se refiere a la parte del proceso donde se realiza la ejecución de manera eficiente y eficaz donde a su vez se divide en: Integración, dirección y control.

## **METODOLOGIA**

Para este documento se empleó el análisis y síntesis de diversos referentes bibliográficos que lleven a conceptualizar la estructura de un modelo de gestión dinámica.

### Análisis del Macroambiente

Para situar el contexto en el cuál el modelo de gestión dinámica tendrá su desarrollo, es necesario tener un panorama claro de los entornos que dan una amplitud de la cosmovisión donde las empresas Pymes tienen desempeño. Así, el análisis del macro ambiente sitúa los entornos siguientes: Demográfico, Económico, Natural, Tecnológico, Político y Social, Cultural.

Figura 1: Entornos del Macroambiente

En la figura 1 se consideran diferentes entornos que de acuerdo a diversos autores, impactan el macroentorno en el cual se desempeñan las Pymes y que en mayor o menor medida afectan las actividades que en ella se realicen.

**Entorno Demográfico:** Kotler y Armstrong (2012), manifiestan que el entorno demográfico considera a las poblaciones humanas en términos de magnitud, densidad, ubicación, edad, género, raza, ocupación, migración, entre otros. Este entorno es de suma importancia para las empresas, ya que las personas conforman los mercados. Para Rivera y de Garcillán (2012) las variaciones demográficas en la población están relacionadas a cambios sociales, tales como la incorporación de las mujeres al trabajo, empleo temporal, aumento tasa de divorcio, retraso en la edad para contraer matrimonio, entre otros. Por otra parte, la relación entre población y empleo es una de las características que resaltan en la oferta de trabajo en las últimas décadas por la tendencia hacia la desaceleración de las tasas de crecimiento de la población en edad de trabajar y de la población económicamente activa. (Gallardo J. 2012)

**Entorno económico:** Integrado por factores financieros como el ingreso, costo de la vida, tasas de interés, el ahorro, y solicitud de crédito que influyen en el poder adquisitivo y los patrones de gasto de los consumidores. Algunos países tienen economías industrializadas que constituyen mercados ricos para distintas clases de bienes. En el otro extremo, se ubican las economías de subsistencia, las que consumen casi toda su producción agrícola e industrial, y ofrecen escasas oportunidades de mercado. En punto intermedio, se encuentran las economías en desarrollo, que pueden ofrecer oportunidades de negocio. (Kotler y Armstrong, 2012). Rivera y de Garcillán (2012) mencionan que las principales variables del entorno económico son el ciclo económico, tasa de interés, inflación, desempleo, tipo de cambio, balanza de pagos y carga fiscal. El análisis de este entorno permite determinar la capacidad de compra e influyen en las pautas de consumo de los mercados.

**Entorno natural:** Kotler y Armstrong (2012), mencionan que abarca los recursos naturales necesarios para la existencia de la vida del ser humano, y que además, proveen de insumos a la industria. Los intereses ambientales han crecido a un ritmo acelerado, ya que en la mayoría de las ciudades del mundo la contaminación del aire y del agua ha alcanzado niveles peligrosos. Existen algunas tendencias en el entorno natural; la primera de ellas es la escasez de materias primas. La contaminación del aire y la escasez del agua, recursos renovables y agotamiento de recursos no renovables. La segunda tendencia es el aumento de la contaminación. La industria daña la calidad del entorno natural. La eliminación de desechos químicos y nucleares, contaminantes químicos en suelos y en los alimentos, así como la saturación del medio ambiente con botellas, plásticos y otros materiales de empaque no biodegradables. La tercera tendencia es la intervención del gobierno en el manejo de los recursos naturales. La preocupación por el ambiente natural ha originado el denominado Movimiento Verde.

**Entorno tecnológico:** Cambia con rapidez, las nuevas tecnologías crean nuevos mercados y oportunidades de negocio; no obstante, cada nueva tecnología reemplaza a la anterior. Las empresas que no se actualizan, pronto encontrarán que sus productos son obsoletos y perderán nuevas oportunidades de productos y mercados. Conforme los productos y las tecnologías se vuelven más complejos, el público necesita

convencerse de que son seguros; las instituciones gubernamentales deben investigar y prohibir aquellos productos potencialmente inseguros. (Kotler y Armstrong, 2012). Rivera y de Garcillán (2012) manifiestan que la tecnología influye en los mercados de consumidores y en las propias actividades de las empresas. La tecnología modifica la producción y comercialización de productos, que repercute en una modificación del mercado: la aparición de industrias nuevas, modificación de industrias actuales o su desaparición.

*Entorno político y social:* Para Kotler y Armstrong (2012), el entorno político consiste en leyes, instituciones gubernamentales y grupos de presión que influyen y limitan a las organizaciones. El gobierno diseña la política pública para guiar al comercio, a través del establecimiento de leyes y regulaciones que limitan los negocios para el bienestar de la sociedad en su conjunto. Se promulgan leyes para regular los negocios por varias razones: la primera para proteger a las empresas entre sí; la segunda es para proteger a los consumidores, de productos de mala calidad, mentiras en la publicidad, engaños en precios y empaques; la tercera se refiere a proteger los intereses de la sociedad, asegurar que las empresas se responsabilicen de los costos sociales de la fabricación de sus productos.

*Entorno cultural:* Está conformado por instituciones y otras fuerzas que influyen en los valores, percepciones, preferencias y conductas de una sociedad. La gente crece en una sociedad específica que moldea sus creencias y sus valores básicos. Creencias y valores tienen un alto grado de persistencia, las creencias moldean actitudes y conductas cotidianas. (Kotler y Armstrong, 2012). Se deben considerar 6 aspectos: cómo se ve la gente a sí misma (conservador, hedonista, liberal), cómo ve la gente a los demás (preocupación por los demás), cómo ve la gente a las organizaciones (fidelidad, explotación, preocupación social y ambiental), cómo ve la gente a la sociedad (la defiende, dirige, aprovecha, cambia), cómo ve la gente a la naturaleza (conciencia de la fragilidad y limitación del medio ambiente) y cómo ve la gente al universo (misticismo, ocultismo, monoteísmo, politeísmo). Por otra parte, además de la generalidad del macroambiente, debe considerarse el sector o la industria a la que va dirigida la investigación, en este sentido, Michael Porter menciona que existen cinco fuerzas que determinan las consecuencias de rentabilidad a largo plazo de un mercado o de algún segmento de éste; por ello, la industria debe evaluar sus objetivos y recursos frente a estas fuerzas que rigen la competencia: proveedores, compradores, sustitutos y competidores.

### Análisis del Sector O la Industria

De acuerdo a Michael Porter existen cinco fuerzas que determinan las consecuencias de rentabilidad a largo plazo de un mercado o de algún segmento de éste. Por ello, la industria debe evaluar sus objetivos y recursos frente a estas fuerzas que rigen la competencia: proveedores, compradores, sustitutos y competidores.

Figura 2: Análisis de la Industria

En la figura 2 se indican las amenazas que de acuerdo a Michael Porter se presentan en el mercado competitivo de un sector o tipo de industria: el poder de negociación de los consumidores, el poder de negociación de los proveedores, la amenaza de los productos sustitutos, y la lucha por una posición en los mercados saturados.

### Competidores

Competidor es quien ofrece productos o servicios similares a los de otra empresa, que causan satisfacción y que pueden ser elegidos por usuarios o clientes de un mismo sistema económico empresarial. En este sentido las empresas de una misma industria compiten entre sí, y la rivalidad se incrementa conforme se vaya igualando la demanda y oferta o reduzcan los precios. Mediante la consideración de la competencia se pretende establecer las cosas o procesos que mejorarían sustancialmente lo que la competencia ofrece para la satisfacción del cliente. La Ley Federal de Competencia Económica (LFCE) no prohíbe ni castiga conductas de las empresas que resultan de manera natural del proceso de competencia y libre concurrencia, sino sólo aquellas que se consideran prácticas monopólicas que son conductas para restringir el proceso de competencia y libre concurrencia para proteger o extender posiciones en un mercado en perjuicio de otras empresas y el consumidor.

<http://www.cfc.gob.mx/index.php/transparencia/transparencia-focalizada/que-es-la-competencia-economica-y-libre-concurrencia>.

**Proveedores:** Proveedor es una persona física o moral encargada de abastecer o proporcionar cosas, materiales, materias primas, u otros que requiere una empresa. (Cruz, L. 2007). En el pasado la mayoría de los compradores pensó que la selección del proveedor correspondía al departamento de compras, actualmente la tendencia es incluir los recursos claves de la organización fuera y dentro del departamento (Leenders M., Fearon H., England W. 2005). Los posibles proveedores deben ser evaluados de acuerdo a los siguientes parámetros: situación financiera, perfil administrativo, capacidad técnica, sistemas de control de calidad, posición en el mercado y factores externos asociados y comportamiento anterior. Esta evaluación corresponde al departamento de compras realizarla para analizar los riesgos de suministro asociado a un proveedor. (Salvendy vol 6). Algunos de los atributos importantes a considerar para la selección de un proveedor que consideran Leenders M., Fearon H., y England (2005) son: Historial pasado, Instalaciones y fuerza técnica, nivel financiero, organización y administración, reputación, sistemas, conformidad con los procedimientos, comunicación, relaciones de trabajo y localización. Lo anterior depende de la naturaleza y cantidad a comprar.

**Productos Sustitutos:** Un producto sustituto es aquel que satisface las mismas necesidades que un producto en estudio. La entrada potencial de empresas que vendan productos sustitutos o alternativos a los de la industria constituye una amenaza en el mercado porque puede alterar la oferta y la demanda y más cuando estos productos se presentan con bajos precios, buen rendimiento y buena calidad. Los productos sustitutos son aquellos que el cliente puede consumir como alternativa, cuando cualquier sector baja la calidad de sus productos por el cual el cliente está dispuesto a pagar o sube el precio por arriba de este límite.

### Análisis de la Estructura Organizacional

Una estructura organizacional es un concepto fundamentalmente jerárquico de subordinación dentro de las entidades que colaboran y contribuyen a servir a un objetivo común. Una organización puede estructurarse de diferentes maneras y estilos, dependiendo de sus objetivos, el entorno y los medios disponibles. Para Hellriegel, (2002) la estructura organizacional es la representación formal de las relaciones laborales, en la que se define las tareas por puestos y unidad y señala como deben coordinarse para básicamente, cumplir con dos objetivos primarios: proporcionar una estructura de responsabilidades, relaciones de subordinación y los grupos, además de ofrecer mecanismos de vinculación y coordinación de todos los elementos organizacionales. La estructura organizacional de toda empresa sufre adecuaciones en sus componentes como consecuencia de cualquier efecto que provoque una toma de decisiones no importa en que nivel o factor se tome, dado su estructura sistémica (Senge, 2005) por esta razón, es necesario, para posicionar de forma general estos efectos, analizar de manera integral los efectos que pueden provocar dichas decisiones, pero sobre todo si se toman en cuenta los efectos directos y colaterales resultantes de cada acción. Para efectos de este trabajo se enfoca el esfuerzo al análisis solo de 5 factores básico: el ambiente

organizacional, la tecnología, los procesos, el servicio al cliente y las finanzas. La estructura debe estar diseñada para facilitar el empeño estratégico de una empresa por lo que sigue a la estrategia, sin una misión la estructura carece de sentido, no existe una estructura organizacional óptima para un tipo de organización, si bien las compañías de bienes de consumo tienden a emular la forma de organización de divisiones estructuradas por productos; las pequeñas tienden a estar estructuradas por funciones, las medianas en forma de divisiones (descentralizadas). Las empresas grandes tienden a usar la estructura de unidades estratégicas de negocios UEN o de estructura matricial. (Fred R David 2013).

En las grandes corporaciones Gallardo (2012), menciona que pueden reconocerse cuatro niveles organizacionales: nivel corporativo, nivel divisional, nivel unidad estratégica de negocios UEN y nivel funcional. En tanto que David Fred (2013) considera siete tipos básicos de estructuras organizativas por orden de: funciones, divisiones, por zona geográfica, divisiones de productos, divisiones de clientes, divisiones de procesos, unidades estratégicas de negocios (UEN) y matricial. Estructura funcional.- Agrupa las tareas y actividades por función de negocios: producción, marketing, finanzas, investigación y desarrollo, sistemas de administración de información Estructura divisional.- también conocida como descentralizada, puede adoptar las siguientes formas: por área o zona geográfica, por producto o servicio, por cliente o por proceso; con este tipo de estructura, las actividades funcionales se realizan de manera central o divisional. Estructura de la unidad estratégica de negocios.- estructura que agrupa divisiones similares en unidades estratégicas de negocios y delega la autoridad y responsabilidad de cada unidad a un ejecutivo senior quien reporta directamente al CEO. Estructura matricial.- este tipo es el más completo ya que depende de flujos verticales y horizontales tanto de autoridad como de comunicación, a diferencia de las estructuras divisionales y funcionales que dependen principalmente de flujos verticales. Así, independientemente del tipo de estructura, los factores considerados son finanzas, procesos, tecnología, ambiente organizacional, servicio al cliente.

## RESULTADOS

A partir de los referentes del marco teórico, y situados en la realidad de las empresas de la región de Orizaba, se concentró y analizó la información generada en 23 empresas en las cuales se han planteado al menos 5 proyectos estratégicos como parte de la vinculación con este sector, a partir de ello, se establecieron las áreas prioritarias. En la tabla 1 se presentan los diez primeros proyectos.

Tabla 1: Frecuencia de Proyectos Estratégicos

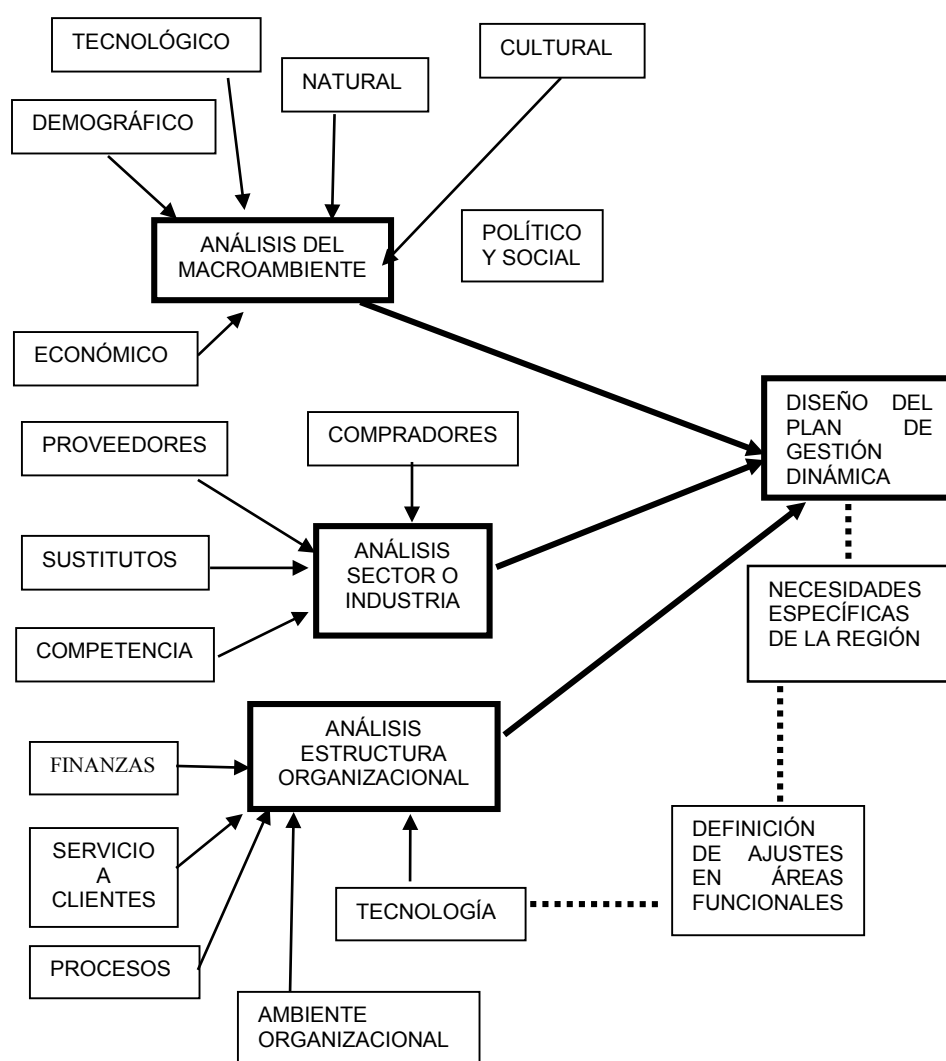

Proyectos Estratégicos	Frecuencia
organización y management	40
procesos productivos	38
desarrollo del personal	36
calidad, gestión y certificación	26
difusión y promoción	14
infraestructura	13
tecnología	12
sociedad	11
mercados y estrategias de mkt	11
economía y factores financieros	11

*En la tabla 1 se presentan las áreas temáticas en las cuales se desarrollaron proyectos estratégicos para empresas de la región de Orizaba, Veracruz, colocadas prioritariamente en función de la frecuencia manifestada en el seno de las organizaciones.*

De los resultados se pudo establecer que cerca del 50% de los proyectos estratégicos se centran en cuatro vertientes: Organización y Management (14%), Procesos Productivos (13%), Desarrollo del personal (13%) y Calidad, gestión y certificación (9%). El restante 50% se distribuye en 18 áreas temáticas, sin embargo, aquí los elementos económicos y financieros (incluyendo compra y venta de bienes y servicios) representan el 11% que representan un grupo fuerte a considerar como punto de atención. Derivado del desarrollo e implementación de proyectos estratégicos en empresas de la región, se está estructurando, en la maestría en

Ingeniería Administrativa, del Instituto Tecnológico de Orizaba, el Sistema Integral de Gestión y Medición de Indicadores de Logro para Pequeñas y Medianas Empresas (SIGMIL), que a través de diversas etapas, integra una serie de herramientas que conjuntadas y ordenadas sistemáticamente, potencien la realización metodológica de un plan integral de desarrollo empresarial. El objetivo es tener una herramienta con la cual pueda responderse al dinamismo empresarial en tiempo real. Considerando los elementos anteriormente descritos, se estructuró el modelo del diseño e implementación de gestión dinámica. En la figura 3 se presenta la primera parte del modelo y en la figura 4, la segunda que corresponde a las actividades de ejecución y control en el marco de la mejora continua e innovación. El concepto global de gestión dinámica para las pymes sugiere los ajustes que se realizan durante la ejecución y control de los planes integrales en el marco de la innovación y mejora continua.

Figura 3: Diseño Inicial de Modelo de Gestión Dinámica

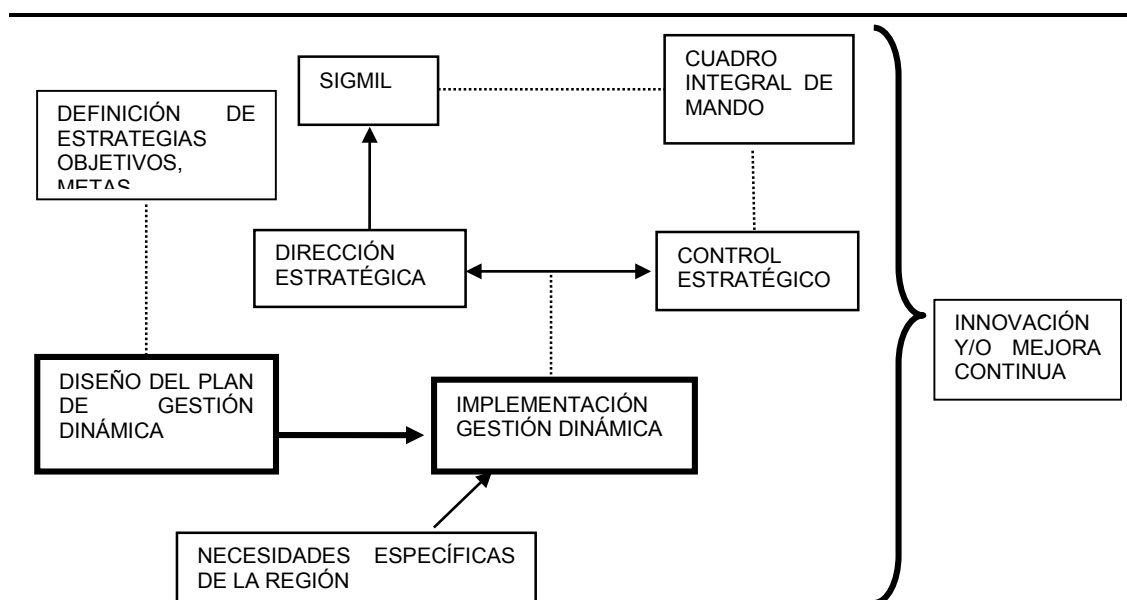

En la figura 3 se representan los elementos que autores diversos consideran para los análisis del macroambiente, la industria y la estructura organizacional, los cuales en la práctica, llevan a detectar las necesidades específicas de empresas de la región, base del diseño inicial del plan de gestión dinámica.

## CONCLUSIONES

La gestión empresarial en sentido amplio, incluye campos relacionados con la gestión organizacional, gestión de mercados, gestión del talento humano, gestión financiera y la gestión de procesos, producción y tecnología, dentro de esta última se considera a la gestión de calidad; estas temáticas son el campo de aplicación de la ingeniería administrativa del personal de la maestría, docentes, investigadores y maestros. Como mencionan los autores, el proceso administrativo consta de la fase mecánica y la fase dinámica, la primera se refiere a la estructura de la empresa y la segunda se refiere a la parte del proceso donde se realiza la ejecución. Para la primera fase se analizó el entorno y la estructura organizacional desde la perspectiva de diversos autores, la segunda fase se basó en el desarrollo y puesta en práctica de diversos proyectos estratégicos en empresas de la región de Orizaba, a partir de lo cual se establecieron las áreas temáticas de interés en las organizaciones.

Figura 4: Elementos Considerados Para Implementar Gestión Dinámica

*En la figura 4 se integran al diseño inicial, elementos que surgen de la práctica y trabajo en las empresas de la región, aspectos que le dan el carácter de dinamismo tanto por estar en la etapa de ejecución, como por formar parte de un proceso de mejora continua.*

Es de resaltar que estos proyectos pusieron de manifiesto no solo las áreas prioritarias de las organizaciones, sino también la necesidad de establecer una metodología al alcance de los responsables de las empresas que facilite e incorpore el dinamismo empresarial. Estos elementos se han empezado a desarrollar y un siguiente paso es que concluidos estos instrumentos y herramientas se realice la prueba piloto de su implementación en empresas de la región.

# LA CADENA DE VALOR DE LA CIENCIA EN MÉXICO

Jaime Apolinar Martínez Arroyo, U.M.S.N.H

Marco Alberto Valenzo-Jiménez, U.M.S.N.H

Irma Cristina Espitia Moreno, U.M.S.N.H

## RESUMEN

*En este artículo se hace la propuesta de la cadena de valor de la ciencia, es un investigación científica teórica, en el cual se realizó el mapeo de los agentes que la componen desde el eslabón inicial hasta el final, los cuales generan el producto llamado ciencia en México. Describiendo el cúmulo de actividades que realizan cada uno de los eslabones, representados por instituciones las cuales están destinadas a la generación de valor, el cual se espera que propiciara un impacto positivo en las actividades del siguiente eslabón. El inicio producto que esta cadena genera es el estado general de la ciencia y el cual se ve reflejado por la posición que México tiene en los diferentes reportes a nivel internacional.*

**PALABRAS CLAVE:** Cadena de Valor, Ciencia

## ABSTRACT

*This article proposed the value chain of the Science is, it is a theoretical scientific research, in which the mapping of agents that compose it from the initial step to the end was performed, which generates a product called science in Mexico. Describing the Cluster of activities that each of the links, represented by institutions which are aimed at generating value, which is expected that fostered a positive impact on the activities of the next link. The product start this chain generates is the general state of science and this is reflected by the position that Mexico has in the different reports internationally.*

**KEYWORDS:** Value Chain, Science

## INTRODUCCIÓN

La ciencia es en la cultura contemporánea, la palanca mediante la cual muchos países han logrado progreso económico y han generado beneficio social, mediante la creación de tecnología que satisface las necesidades de la población, la ciencia ha sido el medio para que los países desarrollados compitan, por lo tanto, si se quiere conocer a un país desarrollado es ineludible analizar los indicadores bajo los cuales su producción científica se lleva a cabo así como sus frutos. La ciencia es un estilo de pensamiento y de acción, el más universal y el más provechoso (Bunge, 2000). Desde el surgimiento de la ciencia, esta ha sido un medio por el cual el mundo ha sido transformado, en los tiempos actuales resulta impresionante observar la forma en que las fronteras del saber han sido rebasadas, por medio de la creación y diseminación del conocimiento, por lo tanto, la constante batalla por su búsqueda y generación han concebido cambios drásticos en la sociedad de muchas maneras como en la comunicación, la salud, la educación, por mencionar algunas, por lo tanto, todo lo anterior incide en la forma de competir de un país de una empresa u organización y hasta de una persona.

Las naciones que han comprendido las exigencias del entorno mundial y encontrar soluciones a sus problemáticas han evolucionando a través del uso de la ciencia, y son los más desarrollados actualmente, por ejemplo, Suiza, Singapur, Corea, Finlandia, Alemania, Estados Unidos, Japón, Holanda y China son

algunos ejemplos, desde luego que la lista es más amplia. En este trabajo se hace la propuesta de la cadena de valor de la ciencia en México, realizando el mapeo de los eslabones que la componen, así como, definiendo las actividades propias de cada eslabón, las cuales mediante su realización se traducen en la generación de valor hacia el siguiente eslabón y que al final el desempeño de cada uno de los elementos de la cadena, se verá reflejado en la calidad y relevancia de la generación de la ciencia en este país, la ciencia representada por todos los indicadores bajo los cuales se hace la evaluación a nivel internacional. Es importante mencionar que la cadena de valor, es un conjunto de actividades cuyo desempeño está dirigido para diseñar, producir, entregar y apoyar sus productos o servicios, mediante la generación de valor a través de la mejora constante de las actividades desarrolladas en cada eslabón con el propósito de ser más competitivo.

### Cadena de Valor

El concepto de cadena de valor es relativamente nuevo en algunos sectores, además está generando un gran interés por su utilidad. Cabe mencionar que no es fácil la construcción de una cadena de valor exitosa, tampoco existen recetas para su creación. El concepto de cadena de valor se refiere a una alianza vertical estratégica entre varias organizaciones independientes dentro de un negocio. Una cadena de valor se creará cuando las organizaciones tienen una visión compartida y objetivos comunes. Esta se forma para cumplir con los objetivos específicos de mercado a través de la satisfacción de las necesidades de los consumidores. Permite la toma de decisiones en grupo, así como la participación de los riesgos y beneficios. También permite la cooperación de una manera amplia y comparte información relevante para toda la estructura de la cadena. Los beneficios se comparten y la competitividad de ese sector se mejora por la cadena de valor. Es importante mencionar que los consumidores no forman parte de la cadena, pero la información que proporcionan es vital, por lo tanto, el consumidor es esencial para el éxito de la cadena. Las relaciones de los agentes de la cadena implican una constante comunicación y una enorme confianza entre sí (Hobbs, Cooney, & Fulton, 2000).

Como breve resumen a todo lo mencionado anteriormente, una cadena de valor es una red estratégica de organizaciones independientes que reconocen su necesidad mutua de unos a otros y trabajan juntos para identificar objetivos estratégicos, estando dispuestos a compartir los riesgos y beneficios asociados invirtiendo tiempo, energía y recursos para que la relación funcione. Una cadena de valor es una red de alianzas estratégicas entre empresas independientes que manejan juntos el flujo de bienes y servicios a lo largo de toda la cadena. “Alianzas Estratégicas” implica que la asociación es planeada de antemano por un grupo de personas que emprenden colectivamente las actividades que una empresa no podría emprender por sí misma (Holmlund & Fulton, 1999). El resultado es una “inteligencia competitiva”, donde se recoge y comparte información a la cual no se podría acceder en forma independiente.

Existe un número de consideraciones organizacionales claves para construir una cadena de valor exitosa, estas incluyen: Establecer objetivos comunes; Manejar los flujos de información; Evaluación del desempeño; La existencia de beneficios palpables para todos los implicados; y Construir confianza y establecer relaciones de trabajo cooperativo. Es crucial que las partes establezcan y compartan un conjunto de objetivos mutuamente acordados, si los objetivos individuales difieren, la información no fluirá libremente entre los socios. Llega a ser más difícil evaluar el desempeño de la cadena de valor, si las partes usan distintas referencias de desempeño. Por lo tanto, los estímulos para permanecer en la cadena se verán debilitados y será difícil construir la confianza y un espíritu de interdependencia cooperativa. La adopción del enfoque de la cadena de valor exige comprender un sistema en su totalidad, las empresas u organizaciones que operan dentro de una industria, desde los proveedores de insumos hasta los compradores de los mercados finales; los mercados de apoyo que prestan servicios técnicos, comerciales y financieros a la industria y el entorno comercial en el que opera la industria. De igual forma, el control de la cadena de valor es un concepto fundamental para la eficiencia de la cadena de valor. El control describe qué empresas

de una cadena de valor establecen e implementan los parámetros bajo los que operan otros miembros de la cadena. Para aumentar la competitividad de una cadena de valor generalmente se necesita hacer hincapié en la calidad sistemática de los productos, la posibilidad de localización y la entrega puntual.

Es necesario mencionar que, cuando no hay sistemas para incorporar normas globales, las cadenas de valor nacionales son excluidas de las oportunidades globales. Sin empresas líderes y sin recursos que brinden información sobre la demanda del mercado final para facilitar las mejoras, en algunos casos es imposible que una cadena de valor sea o continúe siendo competitiva. Por lo tanto, el control de la cadena de valor es un nivel de organización que facilita o dificulta las mejoras y la capacidad de responder a los cambios del mercado, especialmente en los mercados globales. (Downing, 2007). Después de lo anterior y en este mismo contexto es necesario resaltar que el establecimiento o formación de una cadena de valor usualmente involucra la identificación y mapeo de las relaciones entre los agentes económicos que la integran y estas son de cuatro tipos.

1) Las actividades desempeñadas durante cada etapa del proceso; 2) El valor de los insumos, el tiempo del proceso, los productos finales y el valor agregado; 3) La relación espacial así como la distancia y las actividades de logística; 4) La estructura de los agentes económicos. El énfasis en estos tipos de relaciones y su impacto sobre la industria base del mercado, permite que la cadena de valor no sólo ayude en las áreas prioritarias para reformar una industria en contextos específicos, sino también en la designación de las políticas de solución dentro del ambiente en el cual la empresa opera. (Bank, 2007). Es necesario aclarar que las actividades que cada agente de la cadena desarrolla, tendrá por obligación que generar valor para agregarlo al siguiente eslabón, esto es uno de los principios básicos del buen funcionamiento de toda cadena y el cual es necesario para proporcionar el producto o servicio final con un alto nivel de valor agregado que permita mejorar o mantener la competitividad de la industria principalmente en el plano internacional. La cadena de valor de la ciencia se muestra en la figura 1 y está compuesta por los eslabones Plan Nacional de Desarrollo (PND), Consejo de Ciencia y Tecnología (CONACYT), Consejos Estatales de Ciencia, Tecnología e Innovación (CECTI), Instituciones de Educación Superior (IES) y el Estado General de la Ciencia en México (EGCM).

Figura 1: Cadena de Valor de la Ciencia en México

La cadena de valor inicia con el eslabón del plan nacional de desarrollo en el cual se establecen la política pública sobre la ciencia en México en el periodo estipulado, el CONACYT es la institución encargada de la planeación en materia de Ciencia y Tecnología, para impulsar de una manera eficiente las actividades científicas y tecnológicas del país; los CECTI'S entre sus principales actividades están las de proponer la política gubernamental para el desarrollo y difusión de la ciencia, la tecnología y la innovación; Promover, fomentar, divulgar y difundir la cultura científica, humanística, tecnológica y de innovación en el Estado; Elaborar el Programa Estatal de Ciencia, Tecnología e Innovación; las IES tienen como finalidad Contribuir al desarrollo social, económico, político, científico, tecnológico, artístico y cultural de Michoacán, de México y del mundo, formando seres humanos íntegros, competentes y con liderazgo que generen cambios en su entorno, realizando investigación vinculada a las necesidades sociales, que impulse el avance científico, tecnológico y la creación artística; estableciendo actividades que rescaten, conserven, acrecienten y divulguen los valores universales, las prácticas democráticas y el desarrollo sustentable a través de la difusión y extensión universitaria y el último eslabón que corresponde al estado general de la ciencia en México, este es el resultado o el producto de las actividades realizadas por los otros eslabones, este se ve representado por la posición que México tiene en los diferentes mediciones o rankings a nivel internacional como por ejemplo, el índice de innovación, de competitividad, ranking de universidades, el reporte doing business y algunos otros más Fuente: Elaboración propia.

### Eslabón Plan Nacional de Desarrollo

Las estructuras de investigación y desarrollo (I + D), el rendimiento en ciencias, la invención y la innovación son cada vez más globales y se encuentran en un proceso de transición multidimensional. Las principales variables de cambio son: el crecimiento exponencial de las actividades relacionadas con la

innovación; el desarrollo de los BRICS en los campos científicos y tecnológicos; la significativa globalización de la Investigación y Desarrollo (I + D), un alto rendimiento de la Investigación y Desarrollo en el sector de los servicios y un creciente enfoque en la innovación no tecnológica; cambios en las políticas públicas hacia incentivos fiscales a la Investigación y Desarrollo; el aumento de la movilidad internacional de los recursos humanos altamente calificados entre los que las mujeres están incrementando una mayor participación en la ciencia y la tecnología (Holsapple & Jones, 2007). Al llegar a este punto es importante mencionar que las estrategias nacionales de ciencia, tecnología e innovación cumplen varias funciones en la formulación de la política gubernamental. En primer lugar, articulan la visión del gobierno respecto a la contribución de la CTI para el desarrollo social y económico de su país. En segundo lugar, se establecen las prioridades para la inversión pública en CTI e identificar el enfoque de las reformas del gobierno. En tercer lugar, el desarrollo de estas estrategias puede involucrar a los actores que van desde la comunidad de investigación, organismos de financiación, las empresas y la sociedad civil a los gobiernos regionales y locales en la formulación de políticas y su implementación. En algunos casos, las estrategias nacionales describen los instrumentos de política específicos que se utilizarán para cumplir con un conjunto de metas u objetivos. En otros casos, sirven como guías visionarios para diversos grupos de interés.

Francia, Italia, Japón y los Estados Unidos se apoyan en la ciencia la tecnología e innovación para reiniciar su crecimiento económico, el cual disminuyó al inicio de la crisis financiera y económica. Francia busca restaurar la competitividad en su industria a través de la inversión en innovación y apoyar las reformas institucionales del sistema nacional francés de innovación. Alemania y Corea están fomentando inversiones en nuevas áreas de crecimiento tales como la innovación verde. En este sentido, algunos países que son seguidores de la innovación enfocados desde tiempo atrás para mejorar la calidad del ambiente de los negocios han mejorado su posición en la cadena de valor global para ganar ventajas competitivas. Tal es el ejemplo de Chile y su nueva estrategia nacional de innovación para la competitividad (OECD, 2012). Entre los países de la OECD, México tiene los resultados más bajos en ciencia e innovación, que son medidos por el número de publicaciones científicas y patentes triádicas, muy pocas patentes fueron archivadas por las universidades en los últimos años, además México tiene en la formación de recursos humanos un cuello de botella para la mejora de su sistema de innovación. En el Plan Nacional de Desarrollo se contemplan varios factores mediante los cuales se pretende obtener crecimiento, entre estos se encuentra el de proporcionar una educación de calidad y dentro de este pilar se establece el apoyo a la ciencia que el gobierno de México designa, de igual manera se enuncian los objetivos que se pretenden lograr en materia de generación de la ciencia e innovación.

### Objetivos del PND

*Objetivo:* Hacer del desarrollo científico, tecnológico y la innovación pilares para el progreso económico y social sostenible.

*Estrategia:* Contribuir a que la inversión nacional en investigación científica y desarrollo tecnológico crezca anualmente y alcance un nivel de 1% del PIB.

### Líneas de Acción

Impulsar la articulación de los esfuerzos que realizan los sectores público, privado y social, para incrementar la inversión en Ciencia, Tecnología e Innovación (CTI) y lograr una mayor eficacia y eficiencia en su aplicación.

Incrementar el gasto público en CTI de forma sostenida.

Promover la inversión en CTI que realizan las instituciones públicas de educación superior.

Incentivar la inversión del sector productivo en investigación científica y desarrollo tecnológico.

Fomentar el aprovechamiento de las fuentes de financiamiento internacionales para CTI.

*Estrategia:* Contribuir a la formación y fortalecimiento del capital humano de alto nivel.

#### Líneas de Acción

Incrementar el número de becas de posgrado otorgadas por el Gobierno Federal, mediante la consolidación de los programas vigentes y la incorporación de nuevas modalidades educativas.

Fortalecer el Sistema Nacional de Investigadores (SNI), incrementando el número de científicos y tecnólogos incorporados y promoviendo la descentralización.

Fomentar la calidad de la formación impartida por los programas de posgrado, mediante su acreditación en el Programa Nacional de Posgrados de Calidad (PNPC), incluyendo nuevas modalidades de posgrado que incidan en la transformación positiva de la sociedad y el conocimiento.

Apoyar a los grupos de investigación existentes y fomentar la creación de nuevos en áreas estratégicas o emergentes.

Ampliar la cooperación internacional en temas de investigación científica y desarrollo tecnológico, con el fin de tener información sobre experiencias exitosas, así como promover la aplicación de los logros científicos y tecnológicos nacionales.

Promover la participación de estudiantes e investigadores mexicanos en la comunidad global del conocimiento.

Incentivar la participación de México en foros y organismos internacionales.

*Estrategia:* Impulsar el desarrollo de las vocaciones y capacidades científicas, tecnológicas y de innovación locales, para fortalecer el desarrollo regional sustentable e incluyente.

#### Líneas de Acción

Diseñar políticas públicas diferenciadas que permitan impulsar el progreso científico y tecnológico en regiones y entidades federativas, con base en sus vocaciones económicas y capacidades locales.

Fomentar la formación de recursos humanos de alto nivel, asociados a las necesidades de desarrollo de las entidades federativas de acuerdo con sus vocaciones.

Apoyar al establecimiento de ecosistemas científico-tecnológicos que favorezcan el desarrollo regional.

Incrementar la inversión en CTI a nivel estatal y regional con la concurrencia de los diferentes ámbitos de gobierno y sectores de la sociedad.

*Estrategia:* Contribuir a la transferencia y aprovechamiento del conocimiento, vinculando a las instituciones de educación superior y los centros de investigación con los sectores público, social y privado.

#### Líneas de Acción

Apoyar los proyectos científicos y tecnológicos evaluados conforme a estándares internacionales.

Promover la vinculación entre las instituciones de educación superior y centros de investigación con los sectores público, social y privado.

Desarrollar programas específicos de fomento a la vinculación y la creación de unidades sustentables de vinculación y transferencia de conocimiento.

Promover el desarrollo emprendedor de las instituciones de educación superior y los centros de investigación, con el fin de fomentar la innovación tecnológica y el autoempleo entre los jóvenes.

Incentivar, impulsar y simplificar el registro de la propiedad intelectual entre las instituciones de educación superior, centros de investigación y la comunidad científica.

Propiciar la generación de pequeñas empresas de alta tecnología.

Impulsar el registro de patentes para incentivar la innovación.

*Estrategia:* Contribuir al fortalecimiento de la infraestructura científica y tecnológica del país.

### Líneas de Acción

Apoyar el incremento de infraestructura en el sistema de centros públicos de investigación.

Fortalecer la infraestructura de las instituciones públicas de investigación científica y tecnológica, a nivel estatal y regional.

Extender y mejorar los canales de comunicación y difusión de la investigación científica y tecnológica, con el fin de sumar esfuerzos y recursos en el desarrollo de proyectos.

Gestionar los convenios y acuerdos necesarios para favorecer el préstamo y uso de infraestructura entre instituciones e investigadores, con el fin de aprovechar al máximo la capacidad disponible

Tabla 1: Gasto Federal en Ciencia y Tecnología (Millones de Pesos)

### Eslabón Consejo Nacional de Ciencia y Tecnología

El CONACYT es una institución que fomenta, coordina y articula las actividades científicas y tecnológicas nacionales con el objeto de promover el desarrollo de la ciencia básica para ampliar las fronteras del conocimiento y asociarlo a la formación de recursos humanos y a la ampliación y mejora de la calidad de la educación en ciencia y tecnología. Además, se promueve el desarrollo y el fortalecimiento de la investigación aplicada para atender las más urgentes necesidades sociales y ampliar las perspectivas del sector productivo, haciendo posible, como consecuencia, la elevación en la calidad de vida de nuestra población. El Conacyt tiene como visión “*impulsar y fortalecer el desarrollo científico y la modernización tecnológica de México*” El Consejo Nacional de Ciencia y Tecnología, formula y financia programas de becas y en general de apoyo a la formación de capital humano científico y tecnológico, en sus diversas modalidades, así como también integra la información de los programas de becas que ofrezcan otras instituciones nacionales, organismos internacionales y gobiernos extranjeros, a fin de optimizar los recursos en esta materia y establece esquemas de coordinación, en los términos de las convocatorias que para el efecto se emitan. Adicionalmente, se establecen las políticas para ejecutar los programas que propicien el fomento, la formación, el desarrollo y la vinculación de recursos humanos de alto nivel en el país, atendiendo las prioridades locales y regionales a través de los instrumentos establecidos en la Ley de Ciencia y Tecnología.

El CONACYT dirige El Sistema Nacional de Investigadores (SNI) fue creado Por Acuerdo Presidencial publicado en el Diario Oficial de la Federación el 26 de julio de 1984, para reconocer la labor de las personas dedicadas a producir conocimiento científico y tecnología. El reconocimiento se otorga a través de la evaluación por pares y consiste en otorgar el nombramiento de investigador nacional. Esta distinción simboliza la calidad y prestigio de las contribuciones científicas En paralelo al nombramiento se otorgan estímulos económicos cuyo monto varía con el nivel asignado. El SNI tiene por objeto promover y fortalecer, a través de la evaluación, la calidad de la investigación científica y tecnológica, y la innovación que se produce en el país. El Sistema contribuye a la formación y consolidación de investigadores con conocimientos científicos y tecnológicos del más alto nivel como un elemento fundamental para incrementar la cultura, productividad, competitividad y el bienestar social.

### Fondos y Apoyos Conacyt

El Consejo Nacional de Ciencia y Tecnología (CONACYT) vive un proceso de cambio, indispensable para que el país alcance en los próximos años el desarrollo que demanda en materia científica y tecnológica. Para ello, el CONACYT se reorganiza conforme lo indica la Ley de Ciencia y Tecnología (LCYT), determinando sus metas y políticas según lo establece el Programa Especial de Ciencia, Tecnología e Innovación (PECiTI). Los Fondos CONACYT se clasifican en:

- Fondos Sectoriales
- Fondos Mixtos
- Fondos Institucionales
- Apoyos Institucionales
- Información Fondos y Fideicomisos Conacyt
- Programa de Estímulo a la Innovación

El establecimiento de dichos fondos permite al Consejo interactuar tanto con las Secretarías de Estado, los Gobiernos Estatales y las Entidades Federativas, como con las instituciones del ámbito académico y científico, las organizaciones de la sociedad civil y las empresas privadas que integran el sistema científico-tecnológico de México. A través de los distintos tipos de fondos CONACYT se coordinan esfuerzos con un efecto multiplicador en la generación del conocimiento, la innovación, el desarrollo tecnológico y la formación de recursos humanos, así como en el fortalecimiento de la capacidad científica y tecnológica que requiere el país. Los investigadores, académicos, tecnólogos, empresarios, universidades y centros de investigación acuden a las convocatorias de los diferentes fondos para presentar propuestas que contribuyan a resolver problemas y necesidades de los sectores sociales y productivos, así como de regiones geográficas; que expanden el conocimiento en campos pertinentes a los mismos y/o que den origen a conocimientos e innovación que fortalecen el sector científico y tecnológico.

### Desarrollo Tecnológico E Innovación

Está demostrado que existe una relación positiva entre la generación y explotación del conocimiento y el desarrollo económico de los países, por lo que en México existe un gran interés por desarrollar una mejor capacidad de innovar, es decir, de “generar nuevos productos, diseños, procesos, servicios, métodos u organizaciones o de incrementar valor a los existentes”. Y con ello lograr ventajas competitivas en la economía, que le permita alcanzar un crecimiento económico sustentable.

### Apoyos A Proyectos de Innovación Empresarial

- Programa de Estímulos a la Innovación
- Información de Ciencia y Tecnología para Empresarios
- Fondos de Innovación Tecnológica
- Fondo Sectorial de Innovación
- Programa AVANCE
- Apoyos a Proyectos de Desarrollo Tecnológico e Innovación
- Apoyos Institucionales
- Fondos Sectoriales de Energía
- Fondos Mixtos
- Fondos Sectoriales
- Fondos Institucionales

*Becas Nacionales:* El CONACYT solamente otorga becas para estudiar en programas inscritos en el Programa Nacional de Posgrados de Calidad (PNPC) el cual se imparta de manera “presencial convencional” con estudiantes de dedicación exclusiva.

*Becas en el Extranjero:* Para obtener una beca del CONACYT los aspirantes deben ser profesionistas mexicanos que desean realizar estudios de posgrado en áreas científicas y tecnológicas, sociales y humanísticas en una institución de calidad reconocida en el extranjero.

Se da prioridad a aspirantes a beca a doctorado y en casos excepcionales y bien fundamentados se podrán otorgar becas para estudios de especialidad y de maestría.

*Repatriaciones y Retenciones:* Contribuir a la incorporación de los investigadores con experiencia de investigación residentes en el extranjero y dentro del país, en las Instituciones Mexicanas de Educación Superior y Centros de Investigación, con la finalidad de consolidar la formación de recursos humanos de alto nivel promoviendo además la creación y el fortalecimiento de grupos de investigación, la consolidación de los programas nacionales de posgrado y vincular la capacidad científica con los sectores público, privado, social.

*Estancias Posdoctorales y Sabáticas al Extranjero:* El programa de Estancias Posdoctorales y Sabáticas al Extranjero surge como respuesta a la búsqueda de opciones de los jóvenes recién egresados del Doctorado para continuar con su formación en el ámbito internacional y en donde investigadores consolidados pueden colaborar con investigadores del más alto nivel internacional y participar en equipos ligados a su área de conocimiento, con la finalidad de que, a su regreso, fortalezca a su grupo de investigación.

*Centros Públicos de Investigación Conacyt:* El Sistema de Centros Conacyt es un conjunto de 27 instituciones de investigación que cubren los principales campos del conocimiento científico, tecnológico, social y humanístico. De acuerdo a sus objetivos y especialidades, el Sistema de Centros de Investigación Conacyt se agrupa en tres grandes subsistemas: Ciencias Exactas y Naturales (10 Centros); Ciencias Sociales y Humanidades (8 Centros); Desarrollo Tecnológico y servicios (8 Centros); y uno más especializado en el financiamiento de estudios de posgrado. Los objetivos de los Centros Públicos Conacyt son: b Generar conocimiento científico y promover su aplicación a la solución de problemas nacionales. Formar recursos humanos de alta especialización, sobre todo a nivel de posgrado. Fomentar la vinculación entre la academia y los sectores público, privado y social. Promover la innovación científica, tecnológica y social para que el país avance en su integración a la economía del conocimiento. Promover la difusión y la divulgación de la ciencia y la tecnología en las áreas de competencia de cada uno de los Centros que integran el Sistema. Fomentar y promover la cultura científica, humanística y tecnológica de la sociedad mexicana (CONACYT, 2014).

### Eslabón CECTI

Este eslabón corresponde a los Consejos Estatales de Ciencia y Tecnología los cuales desempeñan las siguientes actividades

Proponer la política gubernamental para el desarrollo y difusión de la ciencia, la tecnología y la innovación.

Elaborar el Programa Estatal de Ciencia, Tecnología e Innovación.

Promover, fomentar, divulgar y difundir la cultura científica, humanística, tecnológica y de innovación en el Estado.

Desarrollar y aplicar estrategias de vinculación entre los sectores productivo, educativo y de investigación, tales como promover y apoyar programas de investigación e innovación en las empresas instaladas en el Estado y fomentar la creación de nuevas empresas.

Coadyuvar en las actividades científicas, humanísticas y tecnológicas entre los organismos e instituciones públicas o privadas en el Estado.

Apoyar la creación y consolidación de unidades de vinculación para la transferencia de conocimiento y tecnología al interior de las IES, CI e instituciones.

Solicitar y justificar a las instituciones de educación superior y centros de investigación establecidos en el Estado, la creación de posgrados en aquellas áreas, temas y disciplinas que sean identificadas como socialmente necesarias y que estén en el ámbito de su competencia, así como promover el fortalecimiento de los posgrados existentes en el estado

### Eslabón IES

Este agente corresponde a las Instituciones de Educación Superior, representada por las universidades públicas que ofertan programas de licenciatura, maestría y doctorado así como de los Institutos de investigación que forman parte de las IES. Este eslabón desarrolla las siguientes actividades Contribuir al desarrollo social, económico, político, científico, tecnológico, artístico y cultural de sus Estados, de México y del mundo, formando seres humanos íntegros, competentes y con liderazgo que generen cambios en su entorno, guiados por los valores éticos de la Universidad, mediante programas educativos pertinentes y de calidad; realizando investigación vinculada a las necesidades sociales, que impulse el avance científico, tecnológico y la creación artística; estableciendo actividades que rescaten, conserven, acrecienten y divulguen los valores universales, las prácticas democráticas y el desarrollo sustentable a través de la difusión y extensión universitaria.

Las IES procuran una oferta educativa de mayor cobertura, reconocida por su calidad y pertinencia social, que forma seres competentes, cultos, participativos, con vocación democrática, honestos y con identidad, con capacidades para resolver la problemática de su entorno. Oferta programas de investigación y creación artística para la solución sustentable de problemas sociales, en estrecha vinculación con los programas educativos. Los programas de vinculación con universidades y centros de investigación nacional e internacional permiten un intenso intercambio científico, cultural y artístico así como una gran movilidad de la comunidad universitaria. Las actividades de extensión proporcionan asesorías y servicios orientados a satisfacer necesidades concretas de los grupos sociales y de los sistemas productivos. Los programas de difusión cultural hacen llegar a la sociedad las diversas manifestaciones de las ciencias, las artes y la cultura promoviendo el desarrollo de los individuos y los grupos sociales en armonía con el entorno.

### Eslabón el Estado General de la Ciencia en México

Este eslabón es el resultado final de las actividades desarrolladas por todos los eslabones de la cadena, es decir es el producto que la cadena de valor de la ciencia genera, este se ve representado por la posición que México tiene en los diferentes índices internacionales tales como: The Global Innovation Index 2013, El índice de Universidades SIR Global 2013 - Rank: Output, Índice de Competitividad, el índice Doing Business, OECD Factbook 2013 y algunos otros.

Tabla 2: México en las Clasificaciones Internacionales

The Global Innovation Index 2013	Universidades Sir Global 2013	The Global Competitiveness Report 2013-14	Doing Business
Pos. 63	Pos.122	Pos.55	Pos.53

Fuente: Elaboración propia En esta tabla se muestran algunos resultados que México tiene en algunas mediciones de reportes internacionales  
Fuente: elaboración propia con base en los informes

Estos reportes son únicamente algunos de los resultados de las mediciones internacionales que reflejan la situación de México en materia de ciencia y tecnología, desde luego que faltan muchos otras mediciones, que tienen una relación entre el desarrollo de la ciencia y la posición que ocupa, mediciones como las que la OECD realiza.

## IMPACTO DE LA REFORMA FISCAL EN LAS MICROEMPRESAS

Adriana Guadalupe Chávez Macías, Universidad Autónoma de Coahuila-México

Maricela Carolina Peña Cárdenas, Universidad Autónoma de Coahuila-México

Mariel Hernández Mesta, Universidad Autónoma de Coahuila-México

### RESUMEN

*A partir del 1 de enero de 2014, entra en vigor la nueva Ley del Impuesto Sobre la Renta en México, siendo uno de los principales cambios, el concerniente al régimen de tributación de las microempresas, llamado Régimen de Incorporación Fiscal. Dicho Régimen establece cargas administrativas adicionales comparado con el régimen anterior, por lo cual las autoridades fiscales han optado por el diferimiento de algunas de ellas, aun así, los microempresarios se encuentran en una situación de incertidumbre en cuanto a las nuevas disposiciones y su proceder ante ellas. Las microempresas en México representan el 95.3% de la actividad económica en las cuales laboran el 45.6% de los trabajadores a nivel nacional, por lo anterior; el objetivo del estudio radica en identificar el impacto de la reforma fiscal en ellas. La investigación se centra en microempresas ubicadas en la región centro de Coahuila, México, a las cuales se aplicó el instrumento de medición creado.*

**PALABRAS CLAVE:** Reforma Fiscal, Microempresas, Régimen de Incorporación

## IMPACT OF TAX REFORM IN SMALL BUSINESS

### ABSTRACT

*As of January 1, 2014, comes into force the new Law on Income Tax in Mexico, one of the major changes the tax regime concerning the small business, called Regime of Incorporation. This Scheme provides additional administrative burdens compared to the previous regime, for which the tax authorities have opted for the deferral of some of them, even so the entrepreneurs are in a situation of uncertainty about the new rules and proceed to them. Small Business in Mexico account for 95.3% of the economic activity in which they work 45.6% of workers nationwide, from the above; the objective of the study is to identify the impact of tax reform on them. The research focuses on small business located in the central region of Coahuila, Mexico, to which the created measuring instrument is applied.*

**JEL:** H25

**KEYWORDS:** Tax Reform, Small Business, Regime of Incorporation

### INTRODUCCION

La actividad económica realizada por las microempresas en México es de suma importancia, son unidades económicas de producción o comercialización a menor escala, surgen en ocasiones ante la falta de oportunidades de empleo bien remunerado o por iniciativa de emprender un negocio por cuenta propia, incluso han sido una estrategia de supervivencia para las familias en nuestro país. La reciente reforma fiscal para el ejercicio 2014, contempla dentro de la Ley del Impuesto Sobre la Renta, un nuevo Régimen de Incorporación al cual se trasladan de manera automática las microempresas que tributaban hasta el 31 de

diciembre de 2013 en el Régimen de Pequeños Contribuyentes. La presente investigación se centra en la identificación del impacto que la reforma de la Ley del Impuesto Sobre la Renta en específico del nuevo Régimen de Incorporación Fiscal, ha tenido en las microempresas de la región centro del Estado de Coahuila con la reciente entrada en vigor de dichas disposiciones.

## REVISION LITERARIA

Las microempresas en México, se clasifican por sectores en Industria, comercio y servicio, las cuales cuentan con un rango de personal que va de 0 a 10 trabajadores y con ventas anuales de hasta 4 millones de pesos. De acuerdo al último censo económico realizado representan el 95.3 % de la actividad económica del país, en las cuales laboran el 45.6% de los trabajadores a nivel nacional, porcentajes muy importantes para nuestra economía. (INEGI, 2009).

### Régimen de Pequeños Contribuyentes

Se incorpora en 1998 en la Ley del Impuesto Sobre la Renta, con la intención de incorporar a vendedores que operaban en menor escala y muchos de ellos dentro de un sector informal. (PRODECON, 2013)

Las personas físicas que se dediquen al comercio, industria, transporte, actividades agropecuarias, ganaderas, y que únicamente enajenen bienes o presten servicios al público en general, podían optar por pagar el ISR como pequeños contribuyentes, siempre que los ingresos propios de su actividad empresarial y los intereses obtenidos en el año anterior no hayan excedido de \$2'000,000.00 (Dos millones de pesos 00/100 MN.) Este régimen era opcional, ya que en su lugar podían tributar en Régimen Intermedio o Régimen de Actividades Empresariales. Al iniciar actividades se podía tributar como pequeño contribuyente cuando se estimara que los ingresos o ventas del año no excederían de \$2'000,000.00. Cuando se realicen actividades por un periodo menor de doce meses, para calcular el límite anual (dos millones de pesos) se dividen los ingresos obtenidos entre el número de días que comprenda el periodo, y el resultado se multiplica por 365 días. Si la cantidad obtenida excede dicho monto, en el año siguiente no se podía tributar como pequeño contribuyente. (LISR, 2013)

Los pequeños contribuyentes debían pagar sus impuestos a más tardar el día 17 del mes posterior al bimestre al que corresponde el pago. Los pequeños contribuyentes debían entregar a sus clientes copias de las notas de venta y conservar los originales. Los contribuyentes tenían la obligación de llevar el registro de sus ingresos diarios, lo cual constituye una contabilidad mínima o simplificada. Cabe recordar que lo anterior estuvo vigente hasta el 31 de diciembre de 2013.

### Régimen de Incorporación Fiscal

A partir del 1 de enero de 2014 entra en vigor la nueva Ley del Impuesto Sobre la Renta, la cual contiene en su Título IV Capítulo I Sección II el Régimen de Incorporación Fiscal, con el cual se pretende que los contribuyentes que hasta diciembre de 2013 tributaban en el Régimen de Pequeños Contribuyentes, continúen tributando de manera similar, y para aquellas microempresas que no se encuentren inscritos, lo hagan y poco a poco aprender a pagar sus impuestos y a su vez, accedan a todos los beneficios que ofrece, en el cual solo podrán permanecer hasta por 10 años, y al término de este plazo, iniciarán el cumplimiento de sus obligaciones en el Régimen de Actividad Empresarial y Profesional, como el resto de los contribuyentes, incluye entre otras las reglas:

Podrán tributar contribuyentes personas físicas con actividades empresariales, siempre que sus ingreso propios obtenidos en el ejercicio inmediato anterior, no hubieran excedido de \$ 2,000,000. Se calcularán y enterarán el impuesto en forma bimestral, el cual será un pago definitivo, a más tardar el día 17 de los meses de marzo, mayo, julio, septiembre, noviembre y enero del año siguiente, mediante declaración que

presentarán a través de los sistemas que disponga el Servicio de Administración Tributaria en su página de Internet. Determinarán una utilidad fiscal restando de la totalidad de sus ingresos las erogaciones realizadas en el mismo periodo, así como la participación de los trabajadores en las utilidades de las empresas. Para determinar el impuesto, los contribuyentes de esta Sección considerarán los ingresos cuando se cobren efectivamente y deducirán las erogaciones efectivamente realizadas en el ejercicio para la adquisición de activos fijos, gastos o cargos diferidos.

A la utilidad fiscal que se obtenga conforme al quinto párrafo de este artículo, se le aplicará la tarifa bimestral del artículo 111 de la Ley del Impuesto Sobre la Renta. El impuesto que se determine se podrá disminuir conforme a los porcentajes y de acuerdo al número de años que tengan tributando en el régimen previsto en esta Sección, conforme a la Tabla 1:

Tabla 1: Reducción del Impuesto Sobre la Renta a Pagar en el Régimen de Incorporación

TABLA										
Años	Reducción del impuesto sobre la renta a pagar en el Régimen de Incorporación									
	1	2	3	4	5	6	7	8	9	10
Por la presentación de Información de ingresos, Erogaciones y proveedores:	100%	90%	80%	70%	60%	50%	40%	30%	20%	10%

Tabla 1. Porcentaje de disminución del Impuesto Sobre la Renta. Art. 111 (Ley del Impuesto Sobre la Renta, 2014)

Contra el impuesto reducido, no podrá deducirse crédito o rebaja alguno por concepto de exenciones o subsidios. También contempla las obligaciones:

Inscribirse en el Registro Federal de Contribuyentes.

Conservar comprobantes que reúnan requisitos fiscales.

Registrar en los medios electrónicos señalados por la autoridad fiscal, los ingresos, egresos, inversiones y deducciones del ejercicio.

Entregar a los clientes factura electrónica.

Efectuar pagos superiores a \$2,000.00 con cheque, tarjeta de crédito, débito o de servicios.

Presentar declaraciones bimestrales definitivas, a más tardar el día 17 del mes inmediato posterior.

Efectuar retenciones de impuestos a sus trabajadores, así como su entero conjuntamente con su declaración bimestral.

Presentar conjuntamente con su declaración bimestral ante el Servicio de Administración Tributaria, los ingresos obtenidos y erogaciones realizadas, inversiones e información de las operaciones realizadas con sus proveedores. Cabe mencionar que si compramos con el régimen anterior, algunas reglas subsisten pero las facilidades que se otorgaban en materia de expedición de comprobantes fiscales, comprobación de compras y gastos y registros contables, prácticamente desaparecen, en estos aspectos se presenta el mayor impacto del cambio de régimen.

## METODOLOGIA

El método que se utilizó en esta investigación fue transversal, descriptivo y cuantitativo, para lo cual se aplicó a una muestra seleccionada por conveniencia de 94 microempresas, el cuestionario para la obtención de información respecto al régimen de tributación hasta el 31 de diciembre de 2013, que tanto conocimiento tienen de la reforma fiscal, el uso de tecnología, cumplimiento de las nuevas reglas y el impacto que dichas reglas ha ocasionado en ellas. Se analizó la información contenida en las disposiciones fiscales aplicables emitidas a nivel federal, así como de analistas del tema de investigación.

La presente investigación se dirigió al análisis de las microempresas de la región centro del Estado de Coahuila, en el impacto que han sufrido con motivo de las disposiciones referentes a su nuevo régimen de tributación con apenas casi tres meses de la entrada en vigor de la reforma fiscal, en lo referente a su forma de operar y el costo financiero que ha implicado el cumplimiento de dichas disposiciones hasta la fecha. Los datos cuantitativos obtenidos se procesaron a través del programa estadístico SPSS; con dicha información se realizaron los reportes de resultados estadísticos, así como las conclusiones derivadas de la presente investigación.

## RESULTADOS

Como parte de la metodología seguida para determinar el impacto que reforma fiscal 2014 tiene sobre las Microempresas de la región centro del Estado de Coahuila; se aplicaron 94 encuestas a microempresas seleccionadas por conveniencia, de las cuales se obtuvo la siguiente información:

*Reforma fiscal:* El 45 % de las microempresas encuestadas respondió que conoce la reforma fiscal y un 55 % no tienen conocimiento al respecto, únicamente hacen referencia al conocer de la incorporación de la factura electrónica de manera general, para lo cual el 55% dice no estar preparado para entrar en ese esquema de comprobación, originado por falta de personal que se dedique a esa actividad, necesidad de adquirir o rentar el equipo necesario o la contratación de un tercero para que apoye con esas actividades, aun y cuando el 65% piensa utilizar la plataforma gratuita de facturación electrónica que ofrece el Servicio de Administración Tributaria en su portal de internet, refieren que incrementará sus costos para poder cumplir correctamente.

## CONCLUSIONES

Con los resultados anteriores, podemos concluir que el impacto en las microempresas de la reciente reforma fiscal para el ejercicio 2014 es por un lado en su operatividad y por otro en su costo financiero.

Dentro del impacto operativo se puede mencionar el cambio en el cálculo del impuesto sobre la renta, ya que anteriormente éste era determinado anualmente a través de una cuota fija bimestral, sin la necesidad de controlar para efectos fiscales los egresos, únicamente los ingresos y conservar los comprobantes fiscales de las adquisiciones de activos fijos; actualmente dicho pago se hará disminuyendo de sus ingresos las deducciones autorizadas y es necesario que cumplan con los requisitos que la ley señala, lo que de inicio ocasiona cambio en la estructura que tenían para operar, adicionalmente se tendrá que informar bimestralmente al Servicio de Administración Tributaria de todas las operaciones capturando la totalidad de los ingresos así como de las deducciones autorizadas en su portal de internet a través de una aplicación creada para este fin.

En cuanto al incremento del costo financiero, el impacto ha sido con casi tres meses de entrada en vigor de la reforma fiscal, en los casos que el microempresario decida contratar los servicios de facturación externa diferente al que ofrece gratuitamente el SAT, o que deciden adquirir o rentar el equipo necesario para realizarlo por sus propios medios; por otro lado también se incrementó el costo financiero en aquellos que decidieron que para dar cumplimiento a las nuevas disposiciones contrataron los servicios de un asesor

externo en particular un Contador Público. Podemos concluir, que conjuntamente con lo mencionado anteriormente, existe confusión por los cambios presentados y un porcentaje del 12% ha pensado en cerrar definitivamente la negociación, lo que originaría un incremento de la informalidad en nuestro país. Por lo que es importante que las reglas sean lo más claras posibles y que los microempresarios verdaderamente vean la posibilidad de crecimiento y desarrollo con dichas disposiciones.

# **LAS COMPETENCIAS LABORALES: ESTUDIO EXPLORATORIO EN EL SECTOR INDUSTRIAL DE LA COMARCA LAGUNERA**

Ana Gabriela Sologaitoa Guangorena, Universidad Tecnológica de Torreón

María del Carmen Armenteros Acosta, Universidad Autónoma de Coahuila

Laura Ofelia Zermeño Casas, Universidad Tecnológica de Torreón

Martin Jaramillo Rosales, Universidad Autónoma de Coahuila

## **RESUMEN**

*El objetivo de este trabajo es realizar un estudio exploratorio sobre las necesidades y la prioridad de la certificación de competencias laborales en las empresas del sector industrial de la Comarca Lagunera. La investigación es una exploración empírica, para conocer la percepción de los directivos sobre necesidad y prioridades de las competencias laborales en los diversos sectores industriales de la región lagunera. Para la recogida de información se construyó un instrumento que fue validado mediante un focus group integrado por empresarios y académicos. Los sujetos que participaron en el estudio fueron los dueños, gerentes y/o supervisores de las empresas. Los resultados identificaron las competencias laborales más importantes para el sector industrial, el nivel de certificación y prioridad asignado atendiendo a la formación académica del gerente, el tamaño y grado de madurez de las empresas, lo cual brinda información para el diseño de estrategias conjuntas entre la universidad y las empresas en la formación y evaluación de competencias, que contribuyan a la productividad y competitividad de las empresas.*

**PALABRAS CLAVES:** Competencias Laborales, Formación, Certificación

## **LABOR COMPETENCIES: AN EXPLORATORY STUDY IN THE INDUSTRIAL SECTOR IN THE COMARCA LAGUNERA**

### **ABSTRACT**

*The objective of this work is to perform an exploratory study on the needs and the priority of the certification of labor competencies in companies in the industrial sector of the Comarca Lagunera. Research is an empirical exploration, to know the perception of the managers on need and priorities of the competencies in the various manufacturing sectors of the Lagunera region. For the collection of information is built an instrument that was validated by a focus group composed of entrepreneurs and academics. The subjects who participated in the study were the owners, managers and/or supervisors of corporations. Results identified the most important skills for the industrial sector, the level of certification and priority assigned in response to the academic training of the manager, the size and degree of maturity of the companies, which provides information for the design of joint strategies between the university and companies in the training and competency assessment, which contribute to the productivity and competitiveness of business.*

**JEL:** M53

**KEYWORD:** Job Competencies, Training, Certification

### **INTRODUCCION**

La globalización se desarrolla en una diversidad de economías emergentes donde la mayor parte de las empresas no ha entrado en la etapa de modernidad. En esta nueva realidad productiva deben redefinirse los

mecanismos de gestión de recursos humanos, lo que influye en las condiciones operativas del mercado de trabajo. (CEPAL, 2005). Por ello, en los años noventa varios países en Europa crearon comités académicos para elaborar líneas de acción que planearan el quehacer de la Educación Superior, como la Educación Basada en Competencias (EBC), para afrontar nuevas necesidades y formar recursos humanos en un contexto nacional e internacional (Tobón, 2006).

El concepto de educación permanente se ha ido extendiendo encaminado al aprendizaje a lo largo de la vida. Por ello, en este contexto, en la formación de competencias un aspecto significativo es el conocimiento de las necesidades y demanda del mercado laboral. Existe una necesidad permanente para generar información confiable y actualizada acerca de las *competencias* de los recursos humanos actuales, de acuerdo a los estándares laborales y lograr niveles efectivos de desempeño organizacional e individual. En México existe poca información accesible a nivel regional, en particular en ciudades metropolitanas y municipios. Por ello, el objetivo del presente trabajo es la descripción de las necesidades y la prioridad de la certificación de competencias laborales en las empresas del sector industrial de la Comarca Lagunera. El desarrollo del trabajo se estructura en tres partes: la revisión de la literatura, la metodología utilizada en el estudio empírico, y el análisis de los resultados en cuanto las competencias laborales prioritarias y la importancia de su certificación en el sector manufacturero y las conclusiones.

## REVISIÓN DE LITERATURA

El carácter complejo y transdisciplinar del enfoque de competencias condiciona su impacto en disímiles áreas de conocimiento, apareciendo dividida a lo largo de la literatura de gestión en diferentes disciplinas. Los modelos provenientes de la Dirección Estratégica que han puesto mayor énfasis en el nivel organizacional, destacan el empleo de las competencias organizacionales en cualquiera de sus clasificaciones, ya sean competencias esenciales, rutinas organizacionales, competencias dinámicas o competencias distintivas; y los modelos provenientes de la Gestión de los Recursos Humanos enfatizan mayormente en el nivel de análisis individual, con enfoque en las competencias laborales en el desempeño laboral superior del individuo (Soltura Laseria, 2008). En este último enfoque se enmarca el presente trabajo. Dentro del ámbito laboral individual existen diversos conceptos de competencia entre ellas:

*La Competencia hace referencia a las características de personalidad, devenidas de comportamientos que generan un desempeño exitoso en un puesto de trabajo (Alles, 2005).*

*Las competencias son la capacidad para responder a las demandas y llevar a cabo tareas de forma adecuada. Cada competencia se construye a través de la combinación de habilidades cognitivas y prácticas, conocimiento, motivación, valores, actitudes, emociones y otros componentes sociales y conductuales (OCDE, 2005).*

A partir de los cambios en el ámbito educativo y laboral, el Tuning Educational Structures in Europe plantea la necesidad de crear condiciones que favorezcan la movilidad, la cooperación y la convalidación de créditos de la educación inicial o continua, que permita a los estudiantes ser capaces de acceder al mundo académico en cualquier momento de su vida profesional y desde diversos campos. En el contexto del Tuning América Latina, se desarrollan los perfiles profesionales en términos de competencias genéricas y específicas de cada área de estudio, en cuatro líneas de acción: competencias genéricas y específicas, enfoques de enseñanza, aprendizaje y evaluación, créditos académicos y calidad de los programas (Victorino, L., & Medina, G., 2008).

Las competencias genéricas definidas por el proyecto Tuning para América Latina fueron: capacidad de abstracción, análisis y síntesis; capacidad de aplicar los conocimientos en la práctica; capacidad para

organizar y planificar el tiempo; conocimientos sobre el área de estudio y la profesión; responsabilidad social y compromiso ciudadano; capacidad de comunicación oral y escrita; capacidad de comunicación en un segundo idioma; habilidades en el uso de las tecnologías de la información y de la comunicación; capacidad de investigación; capacidad de aprender y actualizarse permanentemente, etc. (Latina, T. A., 2007) . Un tema de trascendencia en el enfoque de competencia son los diferentes enfoques en que se sustenta, en el ámbito educativo el constructivista y los más difundidos en las competencias laborales: el conductista y el funcional. El enfoque conductista, basado normas de resultados. Desde los años 70 Mc Clelland (1973) fue el primero en indicar la importancia de verificar las competencias en lugar de la inteligencia, argumentando que los tradicionales exámenes académicos no garantizaba ni el desempeño en el trabajo ni el éxito en la vida. El análisis conductista parte de la persona que hace bien su trabajo de acuerdo a los resultados esperados, y define el puesto en términos de las características de dichas personas. El conductismo identifica las características de la persona que causa las acciones de desempeño deseado. En el ámbito educativo ha cobrado fuerza el enfoque constructivista construye la competencia no sólo a partir de la función que nace del mercado, sino que concede igual importancia a la persona, a sus objetivos y posibilidades.

Se asume en el trabajo el término competencias laborales de Soltura Laseria, (2008) como aquellas competencias que pone en vigor un individuo en ejercicio de una actividad laboral en cumplimiento de una misión y responsabilidades específicas, entendidas como constructos que expresan su capacidad para utilizar de forma sinérgica conocimientos, habilidades, características personales, sentimientos, motivaciones y valores que le permiten alcanzar un desempeño superior a él y a la organización, las cuales son desplegadas y evaluadas en determinada cultura organizacional, condiciones de trabajo y exigencias técnico-productivas o de servicio.

Dentro de los antecedentes de investigación que han servido de sustento teórico del presente estudio está la comparación entre España y México del proceso de certificación de competencias profesionales desde un enfoque funcionalista. Gómez Gamero (2012) identifica las similitudes y diferencias en ambos contextos, los parámetros que son requeridos para desarrollar la profesión de formador ocupacional, las unidades de competencia o normas técnicas de competencia laboral. México ha sido uno de los pocos países en América Latina donde se instituyó en el 1995, con ayuda financiera de organismos internacionales, el Consejo Nacional de Normalización y Certificación de Competencias, con el objetivo de proyectar, organizar y promover en todo el país, de acuerdo con las disposiciones aplicables, el desarrollo del sistema de certificación de competencia laboral (SCCL) y brindar apoyo a los comités de gestión por competencias para el desarrollo del mapa funcional como marco de referencia para identificar la necesidad de la competencia e instrumentos de evaluación.

## METODOLOGÍA

La investigación es una exploración empírica, para conocer la percepción de los directivos sobre necesidad y prioridades de las competencias laborales en el sector industrial de la región lagunera. Para la recogida de información se construyó un cuestionario basado en la guía para la evaluación del impacto en la formación de la OIT ([Billorou, 2011](#)), la cual tiene como objetivo medir el impacto de la formación y el desarrollo de competencias en las personas, en las empresas y en la sociedad; y del estudio comparado entre España y México sobre el proceso de certificación de competencias profesionales del formador ocupacional en lo concerniente al conocimiento, importancia y ventajas de la certificación por competencias (Gómez Gamero, 2012). El cuestionario fue validado mediante un focus grup integrado por empresarios y académicos (11 personas).

Los sujetos que participaron en el estudio fueron los dueños, gerentes y/o supervisores de las empresas, a quienes se les preguntó su percepción de cada pregunta, con escala nominal y de Likert. Del universo de

las empresas del sector industrial, se tomó una muestra aleatoria simple de 45 empresas, con un margen de error del 10 % y un nivel de confianza del 90 %. El cuestionario se aplicó a través de entrevistas. La confiabilidad del instrumento se realizó por medio del coeficiente Alfa de Cronbach obteniendo el valor de 0,77 considerándose como un valor bueno.

Para el procesamiento de los datos se utilizaron técnicas estadísticas de tendencia central y tabla de contingencia. El instrumento incluyó variables de control para la contrastación estadística, de carácter socio demográfico como tamaño, etapa de madurez de la empresa y formación académica del gerente, aplicando las diferencias de medias en el análisis de varianza (ANOVA) con el estadígrafo de Fischer dado el tamaño de la muestra mediante y la Chi Cuadrada para mediante tabla de contingencia para significancia relaciones.

## RESULTADOS

La presente investigación tiene como propósito indagar que tan prioritario es para las empresas la certificación de competencias laborales y sobre todo detectar aquellas empresas que se inclinan a gestionar el desarrollo de los recursos humanos como factor determinante hacia la competitividad de las empresas, atendiendo a tres variables de control: tamaño, etapas de madurez y formación académica de directivos, que caracterizan el aspecto socio - demográfico de las empresas objeto de estudio. Certificación y capacitación por Competencias Laborales.

Figura 1: Empleados Certificados

*Figura denota que el 77 % del personal no cuenta con alguna certificación y el 23 % tiene alguna certificación. Fuente: Elaboración propia*

Resulta significativo que el 77 % de las empresas no conocen los beneficios de la certificación de competencias laborales, en particular del modelo CONOCER, instaurado desde el 1995 en México. Aunque existen prácticas de capacitación y certificaciones de competencias específicas de procedencia extranjera sobre todo en área de producción y calidad, es muy bajo en nivel de trabajadores certificados (77%). Además existen diferencias según la etapa de madurez, siéndolas consolidadas tienen el 50 % más conocimiento sobre los beneficios de la certificación de competencias y las que están en crecimiento el 33%, y las desarrolladas sólo tienen un 16%.

Figura 2: Certificaciones Más Usadas Según Etapa de Madurez de la Empresa

Según la etapa de madurez las certificaciones más usadas son: en crecimiento recursos humanos; en desarrollo recurso humanos y mantenimiento; y en consolidación producción y recursos humanos. Fuente: Elaboración propia

De las 10 certificaciones de competencias laborales 6 son del área tecnológica, lo cual reafirma la necesidad en el sector industrial de desarrollar certificaciones en mantenimiento y procesos de producción tales como: resolución de problemas mediante seis sigma (13.3 %), maquinado de piezas por control numérico (11.1 %), mantenimiento correctivo a instalaciones eléctricas (8.9 %), herramientas de computo ( 8.9 %), desarrollo de código software (6.7 %), mantenimiento industrial (2.2). Y cuatro son de recursos humanos: (13 %) diseño de cursos, (11.1 %) impartición de cursos, (4.4 %) atención a clientes y (2.2 %) reclutamiento y selección de personal, muestra representativa de cubrir las necesidades de la organización en cuanto a procesamiento de la información y a la cultura organizacional, la formación de equipos de trabajo, la comunicación y valores organizacionales como atención a clientes. Utilizando la Chi Cuadrada, se acepta la hipótesis estadística alternativa de que existe evidencia de la relación entre la certificación de las competencias laborales con el grado de madurez de las empresas, al obtener un valor de significancia  $p = 0.018$  que es menor de  $p \leq 0,05$ .

Figura 3: Prioridad de la Certificación de Competencias Según Tamaño de la Empresa

Como se observa en figura para las empresas 0-10 es el 46 %, la empresa de 11-49 50 %, de 50 – 250 empleados el 60 % altamente prioritaria y las empresas de más de 250 empleados considera altamente prioritario con 55 %. Fuente: Elaboración propia.

Para todas las empresas, independientemente del tamaño, la prioridad asignada a la certificación por competencias laborales es alto oscilando entre 46 – 60%, siendo las medianas donde el valor se concentra en alto (60%) y medio (40%) y en el caso de las pequeñas se distancia en alto y bajo con un 50% cada uno. Sin embargo, utilizando el ANOVA, se acepta la hipótesis estadística alternativa de que las

percepciones sobre la prioridad de la certificación laboral no coinciden según el tamaño, al obtener un valor de significancia  $p = 0.307$  que es mayor de  $p > 0,05$  según estadístico de Fischer. Beneficios e impacto de la certificación por competencias laborales.

Figura 4: Beneficios de la Certificación de Competencia en el Factor Personal

La figura muestra que la certificación impacta en el factor personal con 45 % desarrollo de conocimientos, habilidades y destrezas, 44 % como ventaja competitiva, 44 % mejora las expectativas, 41 %, posibilidades de emplearse, 40 % evaluar el desempeño, 40 % mejorar la calidad del trabajo y finalmente desarrolla valores y actitudes en 39 %. Fuente: Elaboración propia.

El personal que participa en la certificación de competencias laborales puede acceder a desarrollar conocimientos y habilidades, esto lo convierte en una ventaja competitiva, mejora sus expectativas de empleo, calidad de trabajo, evalúa el desempeño de su trabajo y desarrolla valores y actitudes para mejorar el clima organizacional y de esta manera se adapta a los cambios organizacionales y todos estos factores contribuyen su inserción a la familia y la sociedad.

Figura 5: Beneficios de la Certificación de Competencia en el Factor Organizacional

La figura destaca los elementos que influye en el factor organizacional como parte de los beneficios de la certificación de competencias laborales con el 45 % al reclutamiento y selección del personal, cambia la forma de capacitar con el 43 %, contribuye a mejorar la gestión y desarrollo de las funciones personales 43 %, facilita la adaptación a los cambios tecnológicos con 43 % y con un porcentaje del 1 % calcula la inversión realizada con los beneficios obtenidos. Fuente: Elaboración propia

Los beneficios de la certificación de competencias laborales en las empresas promueven una cultura de aprendizaje permanente donde se convierte en una característica diferenciadora para la formación en el lugar de trabajo y facilitar el intercambio de conocimientos, de esta manera los recursos humanos se busca sean competitivos con los mercados internacionales, por lo cual se mejoran los sistemas de reclutamiento y selección de personal, cambia la forma de capacitar y esto apoya el desarrollo de las funciones para adaptarse con facilitada a los cambios tecnológicos.

Las empresas consolidadas tiene como propósito mejorar su rentabilidad y generar nuevas oportunidades de negocio, con base en la innovación y la tecnología, por lo cual requieren generar empleo basados en el conocimiento, estos motivos los inclinan a conocer los beneficios de la certificación de competencias, la cual en este estudio representa el 90 %. Las empresas en crecimiento surgen muy rápido con una pequeña estructura, tienen conocimientos en un 60 % de los beneficios de la certificación de competencias, pero en realidad no cuentan con los recursos económicos y humanos para participar en la certificación, sus objetivos están encaminados a mejorar su sistema de trabajo todavía poco tecnificados. Y las empresas en desarrollo tienen una estructura más definida, empiezan a medir resultados y a definir su visión a largo plazo pero consideran la certificación de competencias como un sistema burocrático que los desviara de sus metas a corto plazo, su apreciación sobre los beneficios de la certificación es un 30 %.

## CONCLUSIONES

La exploración diagnóstica sobre la certificación de las competencias laborales en las empresas del sector industrial de la región Laguna, objetivo de esta investigación, identificó como resultados más importantes los siguientes:

Las prácticas de capacitación y certificaciones de competencias es muy bajo, con un 77% de empleados sin certificar. En dato se puede relacionar con el hecho de que también el 77 % de las empresas no conocen el modelo CONOCER de certificación y evaluación nacional de competencias laborales de México, que siendo uno de los pioneros en América Latina ha sido calificado de ineficaz por el BID.

De las 10 certificaciones de competencias laborales 6 son del área tecnológica, lo cual reafirma la necesidad en el sector industrial de desarrollar certificaciones en mantenimiento y procesos de producción; cuatro son de recursos humanos, lo que evidencia las necesidades de la certificación de competencias genéricas como la formación de equipos de trabajo, la comunicación y valores organizacionales.

En cuanto a la percepción de los beneficios de la certificación de las CL tanto para la persona como para la organización la mayoría (del 37-39% al 45%) fueron evaluados de alto. Dentro de los beneficios los 18 ítems que miden el beneficio personal sólo tuvieron significancia el 16,6%; y de los 27 ítems del beneficio de la CL a la organización el 18,5% resultaron con significancia atendiendo al tamaño, la etapa de madurez de la empresa y formación académica del gerente, destacándose la mejora de la gestión de las funciones del personal y la mejora del clima organizacional, ambas a nivel de la organización, con el mayor nivel de significancia y atendiendo a la etapa de madurez y formación académica de los gerentes.

El aporte de la investigación reside en la obtención de datos de fuentes primarias que muestran en la región en bajo nivel de certificación y evaluación de las competencias laborales, lo cual es un factor que obstaculiza la competitividad y más porque el sector industrial es de mayor crecimiento y dinámica económica en el estado. Esta información resulta útil tanto para las empresas, como para las políticas públicas regionales de la secretaría de desarrollo económico y de educación pública, así como para la única Entidad de certificación y de evaluación de las CL de la región lagunera.

Las perspectivas de la investigación radica en que el diagnóstico realizado servirá como punto de partida para la segunda fase de investigación orientada al diseño de las competencias laborales más demandadas por las empresas y que no están dentro del catálogo nacional de ocupaciones de CONOCER conjuntamente por los comité de gestión por competencias entre las universidades y las empresas, y en una tercera fase la evaluación de la capacitación y certificación de las mismas.

Como limitación de la investigación la muestra es limitada, ya que se centró en aquellas empresas que han manifestado su intención de elaboración de certificación de competencias según sus propias necesidades. La revisión de estudios exploratorios similares, en lo teórico y metodológico, debe ser ampliada.

## MODELO DE FORMALIZACIÓN BURSÁTIL PARA PYMES EN CANCÚN QUINTANA ROO

Abelardo Castillo Galeana, Universidad del Caribe  
Rosiluz Ceballos Povedano, Universidad del Caribe

### RESUMEN

*Este documento presenta un modelo de formalización para que Pymes de Cancún, Quintana Roo tengan acceso al financiamiento bursátil. El propósito es identificar los diferentes aspectos de su estructura organizacional que de acuerdo a la Ley del Mercado Valores, les permita acceder a este mercado, calculando la probabilidad de que lo consigan. El modelo contempla la definición de financiamiento bursátil, la estructura empresarial esperada de acuerdo a la Ley del Mercado de Valores y el establecimiento del proceso de formalización desde la perspectiva del institucionalismo, como marco de análisis. La información se recabó a través de una encuesta aplicada a 16 empresas locales y con entrevistas semi-estructuradas a tomadores de decisiones. A partir de los resultados se hace una reflexión sobre la pertinencia de la bursatilización como estrategia de permanencia en el mercado para este tipo de empresas. Se explora desde el entorno y requisitos financieros hasta la visión de los pequeños empresarios, para discutir sobre la posibilidad de la entrada al mercado de valores y las acciones necesarias para fortalecer su uso. Durante el trabajo de campo se logró conocer el trabajo de los empresarios y la percepción que ellos tienen sobre el financiamiento bursátil.*

**PALABRAS CLAVE:** PYMES, Mercado Bursátil, Proceso De Institucionalización

## MODEL OF STOCK MARKET FORMALIZATION FOR SMES IN CUNCUN QUINTANA ROO

### ABSTRACT

*This document presents a formalization model so that SBS in Cancun, Quintana Roo have access to market financing. The purpose is to identify the various aspects of its organizational structure which, according to the securities law, allows them to access the stock market by calculating the probability that succeed. The model considers the definition of stock financing, business structure expected according to the law on securities and the establishment of the process of formalization from the perspective of the institutionalism, as a framework for analysis. Information was gathered through a survey, semi-structured interviews and documents and records of the companies included. Based on the results is a reflection on the relevance of the securitization as a strategy of staying in the market for this type of companies. Exploring from the environment and financial requirements to the vision of small entrepreneurs, to discuss the possibility of the entry to the market values and the actions needed to strengthen its use. During the field work was accomplished know the work of entrepreneurs and the perception they have about the stock market financing.*

**JEL:** L26

**KEYWORDS:** Small Business, Stock Market, Process of Institutionalization

## INTRODUCCIÓN

Teniendo el financiamiento como problema en las Pymes este documento pretende proporcionar una opción documental a todas aquellas empresas que en algún momento han necesitado de un financiamiento para continuar con su actividad empresarial. La propuesta se hace a través de un modelo de formalización que les permita, de manera accesible, ingresar al mercado de valores a partir del cambio de ley, así como contemplar las características necesarias para lograrlo. El modelo de formalización se aborda desde la teoría institucional que nos orienta para establecer el proceso que las pequeñas empresas de Quintana Roo pueden seguir para introducirse a esta opción de financiamiento.

## REVISIÓN LITERARIA

### Financiamiento Bursátil

Son las actividades de financiamiento que se realizan mediante el sistema bursátil (mercado de valores) y tienen especial importancia en la economía de cualquier país. Esta función facilita la transferencia de recursos económicos entre los ahorradores que desean invertir sus excedentes y las empresas o entidades públicas que demandan los recursos económicos para financiar diversos proyectos que puedan llegar a traducirse en actividades productivas que generen empleo y pago de contribuciones fiscales, mismos que en su conjunto contribuyen al desarrollo económico de una sociedad. El financiamiento bursátil es una opción real y eficaz para atender las necesidades financieras de la empresa mexicana. Cuando una empresa decide obtener financiamiento mediante la emisión de acciones en la Bolsa Mexicana de Valores (BMV), ésta deberá contratar los servicios de una casa de bolsa para que, en calidad de intermediario financiero, gestione todos los trámites que le permitan obtener la autorización para emitir títulos en el mercado de capitales. El principal requisito para emitir valores y obtener financiamiento bursátil es que la empresa debe ser profesional y transparente, abierta a proveer información a los inversionistas que confían sus recursos en ella. En la actualidad, empresas abiertas al mercado de valores encuentran cabida incluso para sanear sus finanzas de manera interna. Como puede verse en las ventajas siguientes.

*Acceso a recursos financieros conforme las necesidades de cada empresa, es decir, de acuerdo con su proceso de negocio. Los montos y plazos de la colocación son definidos por la empresa y sus necesidades. Acceso a tasas muy competitivas de acuerdo con las calificaciones estandarizadas por el mercado. Fortalecimiento de la estructura financiera. Consolidación y reestructuración de pasivos.*

*Financiamiento de proyectos de corto y largo plazo. Mejoramiento de imagen y posicionamiento ante autoridades, clientes, accionistas e inversionistas. Mejoramiento de las prácticas administrativas y directivas de la empresa. Sucesión ordenada y muy transparente.*

### Las PYMES y la Bursatilización en México

La colocación de acciones en la Bolsa Mexicana de Valores es un sueño que, para las grandes empresas de nuestro país, toma muchos años de preparación y de adopción de las mejores prácticas de gobierno corporativo que se siguen a nivel internacional. Sin embargo, esto no significa que los negocios de menor tamaño tengan cerrada la puerta del Mercado de Valores; sino al contrario, las pequeñas y medianas empresas pueden convertirse en emisoras al participar en el mercado de deuda gracias a los nuevos instrumentos que existen en la legislación mexicana respectiva. [Diciembre 2005]

Los negocios de menor tamaño, tienen la posibilidad de efectuar emisiones en el Mercado de Corto Plazo, donde estos llegan a ser de hasta 360 días y donde prácticamente no hay limitaciones en términos de la cantidad de recursos que los emisores pequeños y medianos pueden recaudar de los inversionistas a través

de la Bolsa Mexicana de Valores. Uno de los primeros pasos que deben dar las empresas, sin importar su tamaño, es que cuenten con una calificación por parte de las agencias que se encargan de medir el nivel de riesgo de todas las emisiones que existen a nivel internacional. El concepto calificación se refiere a una certificación otorgada por empresas especializadas, requisito indispensable para cotizar en la bolsa.

Tabla 1: Requisitos o Pasos Por Etapa de Institucionalización

Etapa 1	
Equipo Profesional	Consejo de Administración. Comité de Auditoría
Transparencia	Revelación de información en base a: Principio de relevancia (divulgación de toda información cualitativa y cuantitativa cuya importancia afecte la evaluación y toma de decisiones).
Intermediario	n/a
Calificación	n/a
Etapa 2	
Equipo Profesional	Consejo de Administración con al menos un consejero independiente. Comité de prácticas societarias presidido por un consejero independiente.
Transparencia	Revelación de información en base a: <ul style="list-style-type: none"> <li>• Principio de relevancia.</li> <li>• Prospecto (incluye el programa de adopción progresiva del régimen de Sociedad Anónima Bursátil).</li> <li>• Reporte anual simplificado.</li> <li>• Estados Financieros anuales auditados.</li> </ul> Estados financieros trimestrales sin anexos.
Intermediario	n/a
Calificación	n/a
Etapa 3	
Equipo Profesional	Consejo de Administración con al menos 25% de consejeros independientes. Comités de consejeros independientes desempeñando las funciones de prácticas societarias y auditoría. Desaparece el comisario y sus funciones y responsabilidad se transfieren al consejo, comités y auditor externo.
Transparencia	Revelación de información en base a: <ul style="list-style-type: none"> <li>• Principio de relevancia.</li> <li>• Prospecto.</li> <li>• Reporte anual simplificado.</li> <li>• Estados Financieros anuales auditados.</li> <li>• Estados financieros trimestrales sin anexos.</li> </ul> En esta etapa la empresa se convierte en empresa pública, por la razón de cotizar en la BMV más no por la procedencia de su capital.
Intermediario	La intermediación en el mercado de valores sólo se podrá realizar por las entidades que al efecto han sido autorizadas por la ley, es decir, las casas de bolsa, las instituciones de crédito, las sociedades operadoras de sociedades de inversión y administradoras de fondos para el retiro y la sociedades distribuidoras de acciones de sociedades de inversión y entidades financieras autorizadas.
Calificación	Los intermediarios bursátiles que contempla la LMV son los que realizan operaciones de intermediación directa con el público son las casas de bolsa. Las empresas calificadoras de valores tienen la finalidad de ayudar al inversionista a medir el riesgo asociado con los diferentes títulos-valor que se negocian en los mercados de valores. Son empresas independientes a la BMV y de las empresas emisoras. Bajo el rubro de "Calidad crediticia" las calificadoras valoran la experiencia e historial de la empresa, sus políticas operativas, los controles internos y toma de riesgos, la congruencia de la cartera con respecto al prospecto, así como, la calidad de los activos que la componen. Cada calificadora tiene su propia escala, pero todas se relacionan con una escala homogénea convenida entre las propias calificadoras.

*En esta tabla se describen los cuatro aspectos que las empresas deben cumplir para completar el proceso de formalización, en la primera columna se muestra el aspecto y en la segunda el grado de avance de la empresa que debe llevar en cada etapa.*

Con la nueva Ley del Mercado de Valores, las emisoras que busquen participar en el Mercado de deuda deben ofrecer una serie de información tanto a las autoridades como a los inversionistas, y cumplir con una serie de requisitos como el hecho de que el negocio esté debidamente constituido, que su opresión sea formal en todos los aspectos. Un cambio sobresaliente para desarrollar el Capital Privado en México, como parte complementaria del Mercado de Valores es la creación de nuevos tipos de empresa, con los cuales se facilita la llegada de socios diferentes que aporten capital, y que más tarde el negocio se convierta en una emisora de la Bolsa Mexicana de Valores, para lo cual las Pymes requieren de un proceso de formalización. Este proceso contempla la evolución de la empresa en tres tipos de Sociedad Anónima y que deben ocurrir en plazos de tres años establecidos en la LMV. Estos tipos de empresa se incorporaron en la nueva LMV y son:

Sociedad Anónima Promotora de Inversión (SAPI).

Sociedad Anónima Promotora de Inversión Bursátil (SAPIB).  
Sociedad Anónima Bursátil (SAB).

Para que las Pymes Mexicanas logren esta formalización deben llevar a cabo actividades que al permanecer en el tiempo se convierten en prácticas, muchas de ellas han sido tomadas de empresas que desarrollaron el proceso de manera natural sin que fuera un decreto. Este tipo de eventos son estudiados por el nuevo institucionalismo en el análisis organizacional y toma como punto de partida la homogeneidad de prácticas y acuerdos que se encuentran en el mercado del trabajo, escuelas, Estados y corporaciones (DiMaggio y Powell, 1999; Meyer y Rowan, 1999).

De acuerdo a lo descrito en cada una de las etapas anteriores, se entiende por empresas en transición al mercado bursátil a todas aquellas que se ubiquen en la segunda etapa de transición. Las empresas entendidas en estos términos han adoptado la figura de la SAPIB y deberá llevar a cabo un proceso de adopción con determinadas provisiones de las prácticas de gobierno corporativo exigibles a las empresas públicas conforme al plazo establecido en la LMV y con la finalidad de colocar una oferta pública en dicho mercado una vez que hayan cumplido con la totalidad de los estándares bajo la referida ley. Pero no es suficiente sino que además deben cubrir con una temporalidad por lo que a cada aspecto se le suman los años en el mercado para cubrir el aspecto y que se muestran en la tabla 2:

Tabla 2: Temporalidad de los Requisitos de Formalización

Requisitos O Pasos Por Etapa	Etapas de la Empresa	Temporalidad
Equipo Profesional	Surgimiento	
Transparencia	SAPI	Indefinida
Intermediario	SAPIB	3 años a partir de la fechas de inscripción en el registro, para cumplir con reglas del plan de transferencia.
Calificación	SAB	Indefinida. Lista para cotizar ☺

*En esta tabla puede observarse la correspondencia entre las etapas de institucionalización bursátil de la empresa y la consolidación en su estructura financiera*

Estas son las acciones que deben de llevar a cabo la empresa, pero el proceso de formalización involucra además la manera en la que estas acciones se institucionalizan al interior de la empresa por sus integrantes, por lo que a continuación se desarrolla el proceso de institucionalización como método de análisis y se plantea la forma de hallar las probabilidades que determinen el acceso al mercado bursátil.

### El Neo Institucionalismo

El proceso de institucionalización se llevará a cabo para determinar la probabilidad de formalización de 16 Pymes en Cancún Quintana Roo. Este proceso se ubica dentro del nuevo institucionalismo en la teoría de la organización y comprende el rechazo de los modelos del actor-racional, un interés en las instituciones como variables independientes, una nueva orientación hacia las explicaciones cognoscitivas de las unidades de análisis supraindividuales que no pueden ser reducidas a o motivos de los individuos, (DiMaggio, 1999). Sus estudios tienden a enfocarse en la figura institucional de la sociología: las estructuras y los procesos organizacionales que abarcan toda la industria. La vida organizada puede explicarse con un planteamiento que localiza la persistencia de las prácticas tanto en su calidad dada por sentado como en su reproducción en estructuras que en cierta medida se sostienen a sí mismas (véase Zucker, en DiMaggio, 1999) En este documento se desarrollara el de proceso de institucionalización por considerarlo una guía hacia la formalización de las empresas que están buscando acceso al mercado bursátil. La realidad de las organizaciones es posible entenderla a través de los procesos institucionalizados, ya que, la institucionalización es un ‘proceso fenomenológico por el cual algunas relaciones y acciones sociales llegan

a darse por sentado' y un estado de cosas en que los conocimientos compartidos definen 'lo que tiene significado y las acciones que son posibles', (Zucker, 1983:2).

Tolber y Zucker, describen la institucionalización de la teoría institucional, enfatizando que la aproximación institucional tradicionalmente ha sido sobre la manera en la cual los actores siguen guiones institucionales existentes. Las autoras toman el proceso de institucionalización de Berger y Luckmann basado en la tradición filosófica fenomenológica con el análisis de los individuos y sus procesos en sociedad, para explicar un proceso entre actores y organizaciones. En la aplicación de este caso de investigación tomaremos el proceso organizacional construido por una estructura normativa, (LMV) y social (La formalización de 16 empresas). En el siguiente apartado se describe el proceso de institucionalización a través de sus tres niveles secuenciales. Bajo la propuesta de Tolber y Zucker sobre el proceso de institucionalización, ellas describen el proceso de institucionalización desde la estructura de la empresa y así será tomado para este trabajo.

### El Proceso de Institucionalización

*La habituación:* Este nivel involucra la generación de nuevos acuerdos estructurales en respuesta a un problema o conjunto de problemas organizacionales específicos y la formalización de tales acuerdos en las políticas y procedimientos de una organización dada o de un conjunto de organizaciones que confrontan los mismos o similares problemas. Comportamiento que desarrollan y adoptan empíricamente actores o conjunto de ellos conforme resuelven problemas recurrentes.

Con este paso se inicia la institucionalización y abre un campo de caracterizaciones a un grupo o un tipo específico de actores, éstas se comparen y son accesibles a todos sus integrantes. Cuando dos interactúan se producirán tipificaciones con suma rapidez, en el curso de su interacción estas tipificaciones se expresarán en pautas específicas de comportamiento que cada uno habituará en papeles o "roles", la institucionalización estará en vías de construcción, para que se produzca la clase de tipificación recíproca que acabamos de describir, debe existir una situación social continua en la que las acciones habitualizadas de dos o más individuos se entrelacen, (Berger, 1979).

Este proceso resulta dentro de estructuras que pueden ser clasificadas hasta convertirse en etapas de pre-institucionalización. La creación de nuevas estructuras en esta etapa es una actividad mayormente independiente. Tolber y Zucker, 1993, siguen el proceso de adopción de una estructura organizacional, cuando ésta, es introducida se dice que está en la etapa de pre institucionalización, puede haber muchos adoptadores de la estructura, posiblemente organizaciones interconectadas enfrentando circunstancias similares y podría variar considerablemente en términos de la forma de implementación. Es lo que ocurre con las tres etapas estructurales, SAPI, SAPIB y SAB.

*La objetivación:* Es el movimiento hacia un estatus más permanente y generalizado que acompaña la difusión de la estructura. Involucra el desarrollo de algunos grados de consenso social entre tomadores de decisiones organizacionales concerniente al valor de una estructura y el incremento de adopción por organizaciones sobre la base de ese consenso. Tales consensos pueden emerger hacia dos diferentes mecanismos aunque no necesariamente relacionados. Por un lado las organizaciones pueden usar evidencia proveniente directamente de una variedad de fuentes para evaluar los parámetros de riesgo de adoptar una nueva estructura. Esperando que los resultados del cambio estructural sean generalizables, el aparente resultado para las primeras organizaciones puede ser un determinante significativo de la próxima decisión de adopción. Entonces la objetivación de la estructura es parcialmente una consecuencia de monitoreo de organizaciones de competencia y el esfuerzo para ser menos competitivas.

*La Sedimentación:* La institucionalización completa involucra la sedimentación, un proceso que fundamentalmente descansa sobre la continuidad de la estructura y especialmente sobre su sobrevivencia a través de generaciones de miembros. Es caracterizada tanto por la apertura virtualmente completa a través de la apropiación de un grupo de actores como por la perpetuación de las estructuras sobre un largo período de tiempo. Se puede decir que para que el proceso de formalización bursátil se haya institucionalizado deberá haberse sedimentado con las prácticas que hayan adoptado los integrantes de las Pymes que adopten la formalización. Consideramos que dado que tiene que reproducirse y al menos tener el relevo de una generación para considerar su sedimentación y dada la edad de estas empresas, apenas están en la etapa de surgimiento de acciones, por lo que este estudio describirá las acciones que han disparado para la bursatilización y contemplará la probabilidad de que permanezcan y desde luego entren al mercado bursátil.

## METODOLOGÍA

En este apartado se muestra la relación entre las acciones descritas que realizan las empresas, las etapas de institucionalización por las que pasan para su formalización y el tipo de empresa que la normatividad establece. El caso de estudio estuvo formado por 16 empresas, ubicadas en la ciudad de Cancún Quintana Roo, en México. Se seleccionaron en la base de datos del SIEM, que es el Sistema de Empresas Mexicana, con información del año 2013. Por lo anterior se puede plantear el modelo de formalización para que se incorporen empresas a la BMV, estas relaciones se describen en la tabla 3.

Tabla 3: Proceso de Institucionalización

	<b>Etapa 1 Habitualización</b>	<b>Etapa 2 Objetivación</b>	<b>Etapa 3 Sedimentación</b>
<b>Acciones</b>	Empresas con estándares conforme a la Ley General de Sociedades Mercantiles (LGSM). Adoptar los estándares de gobierno corporativo y avanzar en su proceso de profesionalización conforme lo señala la figura de la SAPI definida en la LMV.	Empresas medianas no listadas en el mercado de valores con estructuras organizacionales desarrolladas. Realizar en el mediano plazo una oferta pública para obtener financiamiento en el mercado de valores. No cuentan con la totalidad de los estándares de gobierno corporativo que se establece para empresas que cotizan en el mercado de valores. Cumplir con la totalidad de los estándares en un plazo definido por la LMV una vez adoptando la figura SAPIB.	Empresas grandes y medianas bajo la figura de SAPIB y que se transforman en SAB. Se encuentran listadas en algún mercado de valores cumpliendo con todos los estándares de gobierno corporativo que se señalan en la LMV. Llevar a cabo procesos de mejora continua para seguir alineados a los estándares conforme a mejores prácticas establecidas a nivel internacional.
	↓ SAPI	↓ SAPIB	↓ SAB

*En esta tabla puede observarse como cada etapa de institucionalización corresponde a una de formalización y que proporciona una estructura empresarial diferente.*

Cuando los integrantes de una empresa toman las estructuras del mercado al que pertenecen, lo hacen de manera paulatina siguiendo acciones en cada etapa, éstas ocurrirán dependiendo de dos eventos: Los aspectos involucrados en la formalización, La temporalidad en el mercado

Para cada uno de estos eventos se asocia una probabilidad de ocurrencia y luego se promedian las probabilidades para obtener la probabilidad total:

$$P_t = (P_1 + P_2) / 2$$

## Probabilidad

Se trata de hallar la probabilidad simple de ocurrencia que una empresa cotice en la BMV

$$\text{Fórmula } P_1 = a / B$$

Nomenclatura

$P_1$  = probabilidad de que una empresa cotice en la BMV

B = número de casos posible

a = número de casos favorables

Factor de temporalidad

Alto de 8 a 15 años
Medio de 16 a 23 años
Bajo de 24 a 31 años

Existen cuatro eventos asociados a la entrada de cada empresa, por lo que la probabilidad se calcula dividiendo el número de pasos con los que cuenta entre el total que son 4. Después se promedió con un factor de temporalidad en donde existen 3: bajo, medio y alto. Si la empresa lleva muchos años en el mercado será bajo (0.30) y así para los demás, medio para las empresas que están en rango medio (0.50) y alto (0.80) para las que tienen pocos años por considerar que pueden cambiar sus planes desde el principio y considerar crecer en el largo plazo. Estos argumentos están basados en que según la institucionalización, cuanto más años tenga una empresa en el mercado, será más difícil de cambiar sus prácticas para cotizar en el mercado.

## RESULTADOS

Las preguntas guía del proceso de formalización fueron utilizadas para ubicar la probabilidad de que cada una de las 16 empresas llegue a una etapa de formalización. El propósito es ver la probabilidad de cotizar en la BMV bajo la nueva LMV de las 16 Pymes. Se puede agrupar la información de la siguiente manera en la tabla 4:

Tabla 4: Pasos de Formalización del Proceso de Institucionalización

Empresa	Pasos de Formalización con los Que Cuenta			
	Equipo Profesional	Transparencia	Intermediario	Calificación
1	√E1	√E1, √E2	X	X
2	√E1	√E1	X	X
3	√E1	√E1, √E2	X	X
4	√E1	√E1, √E2	X	X
5	√E1	√E1, √E2	X	X
6	√E1	√E1	X	X
7	√E1	√E1, √E2	X	X
8	√E1	√E1, √E2	X	X
9	√E1	√E1, √E2	X	X
10	√E1	√E1, √E2	X	X
11	√E1	√E1, √E2	X	X
12	√E1	√E1, √E2	X	X
13	√E1	√E1, √E2	X	X
14	√E1	√E1, √E2	X	X
15	√E1	√E1, √E2	X	X
16	√E1	√E1, √E2	X	X

En esta tabla pueden verse los resultados de cada empresa por etapa

✓E1 = Cumple con los requisitos de la etapa

✓E2 = Cumple con los requisitos de la etapa

✓E3 = Cumple con los requisitos de la etapa

X = No cumple

Tabla 5: Resultado del Análisis

Empresa	Etapas en la Que Se Encuentra	Probabilidad de Formalización	Tiempo en el Mercado	Probabilidad de Temporalidad	Probabilidad Total
1	Etapas 1 / Habitualización	0.50	9	0.80	0.65
	Etapas 2 / Objetivación				
2	Etapas 1 / Habitualización	0.25	23	0.50	0.375
3	Etapas 1 / Habitualización	0.50	24	0.30	0.4
	Etapas 2 / Objetivación				
4	Etapas 1 / Habitualización	.05	30	0.50	0.275
	Etapas 2 / Objetivación				
5	Etapas 1 / Habitualización	.05	20	0.50	0.275
	Etapas 2 / Objetivación				
6	Etapas 1 / Habitualización	0.25	23	0.50	0.375
7	Etapas 1 / Habitualización	0.50	20	0.50	0.5
	Etapas 2 / Objetivación				
8	Etapas 1 / Habitualización	0.50	31	0.30	0.4
	Etapas 2 / Objetivación				
9	Etapas 1 / Habitualización	0.50	22	0.50	0.5
	Etapas 2 / Objetivación				
10	Etapas 1 / Habitualización	0.50	31	0.30	0.4
	Etapas 2 / Objetivación				
11	Etapas 1 / Habitualización	0.50	18	0.50	0.5
	Etapas 2 / Objetivación				
12	Etapas 1 / Habitualización	0.50	21	0.50	0.5
	Etapas 2 / Objetivación				
13	Etapas 1 / Habitualización	0.50	21	0.50	0.5
	Etapas 2 / Objetivación				
14	Etapas 1 / Habitualización	0.50	8	0.80	0.65
	Etapas 2 / Objetivación				
15	Etapas 1 / Habitualización	0.50	30	0.30	0.4
	Etapas 2 / Objetivación				
16	Etapas 1 / Habitualización	0.50	14	0.80	0.65
	Etapas 2 / Objetivación				

En esta tabla pueden observarse las probabilidades para cada empresa, tanto las individuales como las totales.

Del total de las 16 empresas estudiadas, dos tienen la probabilidad más alta de ocurrencia de entrar a la BMV con el 65% y esto puede verse, sobre todo en que cubren con un plan diseñado a largo plazo en los pocos años que llevan en el mercado. Por el lado de las menos probables se encuentran dos con un poco más del 20 % de probabilidad y esto se debe a que son las empresas que llevan años en el mercado y no han logrado cubrir más aspectos de formalización, debido a la estructura no institucionalizada.

## CONCLUSIONES

Como proceso de institucionalización apenas va en la etapa de habitualización y eso que la estructura aún no se ha consolidado, si las empresas logran adoptar esta estructura de manera natural, a través de sus prácticas, podrán pasar a la objetivación y al hacerlo recurrente a la sedimentación. Por lo tanto podemos concluir que apenas anda en el disparador que fue la LMV y no se ha institucionalizado. Lo que se necesita para la institucionalización:

Que más empresas adopten la estructura

Que la practicas se objetiven dentro de la empresa

Puede decirse que las empresas mexicanas no están accediendo al mercado bursátil y existe una baja probabilidad de que aplique a medida que permanece más tiempo en el mercado. Bajo este modelo de

formalización puede decirse que a medida que inicie actividades con la estructura que plantea la normativa, será más fácil acceder al financiamiento bursátil.

## MEJORA EN EL CLIMA ORGANIZACIONAL DE UNA EMPRESA

Fernando Agüeros Sánchez, Universidad Autónoma de Coahuila  
Héctor Javier Rodríguez García, Universidad Autónoma de Coahuila  
Leslie Betel de la Torre de León, Universidad Autónoma de Coahuila

### RESUMEN

*El estudio realizado en la empresa GAEL comprende desde su fundación hasta nuestros días, considerando sus antecedentes históricos, la evolución de sus recursos humanos, el avance tecnológico y los retos a los que la empresa ha enfrentado y está actualmente enfrentando. Después de haber analizado posibles campos de investigación se contempló la necesidad de conocer el impacto que el clima organizacional tiene en la efectividad de la empresa, para lo cual se instrumentó una herramienta de diagnóstico que fue la que se aplicó (instrumento adaptado del que desarrolló el grupo ALFA) Esta experiencia, nos permitió vivir todo un proceso de intervención organizacional que conjugada con las teorías desarrolladas en este trabajo, nos conduce a lo siguiente: Las organizaciones deben ser constantemente transformadas para responder a los cambios del entorno. Los cambios deben ser dirigidos a mejorar la calidad, productividad y calidad de vida de los trabajadores. Este importante trinomio requiere que todos los componentes de la organización incidan en un mismo objetivo, con pautas regidas por el compromiso, la participación y la responsabilidad tanto del individuo como del grupo y de la organización. El primer paso para llevar a cabo el proceso de cambio en una organización, es la conciencia plena sobre la necesidad del cambio en el grupo directivo y en los trabajadores y sus representantes. La movilización hacia el cambio debe darse en forma equilibrada y constante, tanto en el aspecto técnico, como en el administrativo y humano. Sin este equilibrio, la organización no cumple con su misión y pierde efectividad.*

**PALABRAS CLAVE:** Productividad, Calidad de Vida, Cambio

## IMPROVEMENT IN THE ORGANIZATIONAL CLIMATE OF A COMPANY

### ABSTRACT

*The study conducted in GAEL comprises the company from its founding to the present day, considering its historical background, the development of its human resource, technological progress and the challenges the company has faced and is currently facing. After analyzing potential areas of research will contemplate the need to know the impact that organizational climate on the effectiveness of the company, for which a diagnostic tool that was what was applied (adapted instrument which was orchestrated developed ALFA group) This experience allowed us to live a process of organizational intervention that combined with the theories developed in this work leads to the following: Organizations must be constantly transformed to respond to the changing environment. Changes should be directed to improve quality, productivity and quality of life of workers. This important trinomial requires that all components of the organization bearing on the same goal, with guidelines governed by the commitment, participation and responsibility of the individual and the group and the organization. The first step in carrying out the process of change in an organization, is the full awareness of the need for change in the management team and employees and their representatives. The mobilization for change should be balanced and consistent manner, both on the technical side, and the administrative and human. Without this balance, the organization fulfills its mission and loses effectiveness.*

**KEYWORDS:** Productivity, Quality of Life, Change

## INTRODUCCIÓN

A las organizaciones las consideramos como un sistema total, por lo que deben funcionar en forma coordinada, integrada y armónica para el logro de sus objetivos y propósitos. Las características de estas organizaciones y el papel que cada órgano desempeña en el sistema, determina el tipo, grado y complejidad de la interdependencia de las partes y entre las partes y el todo; por lo tanto, es necesario concebir a las organizaciones como conjuntos de componentes estrechamente vinculados, que actúan y se afectan entre si, y cualquier cambio o modificación en uno de ellos producirá cambios en el resto de los componentes del sistema. La participación de los recursos humanos en el desarrollo armónico e integral de una organización es de vital importancia, ya que son los que proporcionan la energía impulsora que la puede conducir a lograr el éxito; solo la unión de esfuerzos dirigidos hacia un mismo fin, hará posible el logro de los objetivos trazados con una alta productividad, mediante la plena conciencia de que son las actitudes individuales y de conjunto quienes forman la piedra angular de una organización exitosa.

Con el afán de incrementar nuestros conocimientos acerca de las organizaciones y lo que les afecta en su entorno inmediato, llevamos a cabo esta investigación de campo que pudiera contribuir a identificar las causas que obstaculizan la efectividad de una organización y la presentación de alternativas de cambio que permitan realizar esfuerzos coherentes, consistentes y coordinados. Considerando lo que la empresa Construcciones y Mantenimiento GAEL S.A de C.V. representa para la comunidad y deseando colaborar con el desarrollo de la misma, el estudio se realizó en esta empresa, teniendo como propósito fundamental detectar áreas de oportunidad, para en su momento, lograr un cambio de actitudes en todos sus miembros, en donde el cuerpo directivo juega un papel determinante para hacer de ésta una empresa sana, productiva y competitiva.

La industria de la construcción está atravesando por una de las peores crisis de su historia, debido, principalmente a su baja velocidad de reacción y adaptación a los cambios del entorno, por lo cual, es de suma importancia que sus recursos humanos sean capaces de responder a ellos mediante actitudes que las conduzcan a un proceso sano y consistente. Es por esto que en la actualidad es necesario detectar y comprender aquello que influye sobre el rendimiento del trabajador. Un factor decisivo en el desarrollo de una organización es el clima organizacional, ya que de él depende su evolución y adaptación al medio externo. Toda empresa requiere de instrumentos que le permitan conocer sus áreas de oportunidad en los aspectos que más influyen en su efectividad, por ser éste el único medio de conjuntar información válida y confiable que le permita establecer una auténtica dirección estratégica para su adecuado sostenimiento y crecimiento, y a la vez rescatar características culturales de la organización. También, es importante conocer rasgos de la calidad de vida del trabajador. La intención de llevar a cabo este estudio, se basa en la búsqueda de herramientas de diagnóstico que le brinde a la organización la oportunidad de conocer la calidad del clima organizacional imperante, que posean la flexibilidad y confiabilidad para aplicarse en la empresa, independientemente de su magnitud y que contribuya a identificar áreas concretas de oportunidad de desarrollo con el fin de incrementar la productividad de la misma.

**Objetivos de la Investigación:** Por medio de este estudio la empresa obtiene información válida y confiable que le permite:

Conocer sus fuerzas y debilidades actuales

Evaluar el estado de salud de la organización

Lograr mayores retos y compromisos entre los directivos y el personal: Eficientar el estilo de dirección

Dirigir mejor los esfuerzo, Tomar decisiones más acertadas, Optimizar los recursos, Elaborar estrategias que contribuyan a mantener las fuerzas y a superar las debilidades detectadas, Detectar amenazas y oportunidades del entorno

### Diagnostico de Calidad del Clima Organizacional: Hipótesis

*Primera:* Hay una correlación directa entre el clima organizacional y la productividad de cualquier empresa

*Segunda:* Las acciones que sigan la estructura del diagnóstico de calidad del clima organizacional, tienen más posibilidad de ser coherentes y enfocarse a aspectos prioritarios y por lo tanto a consumir menos esfuerzos y aumentar la productividad.

*Clima Organizacional:* Para propiciar las actitudes deseables es importante conocer la realidad en que vivimos, determinada ésta por el clima laboral existente, considerando como Clima Laboral el conjunto de características medibles del medio ambiente de trabajo, según la percepción de quienes ahí laboran, y que influyen en su comportamiento y nivel de motivación.

*Cultura Organizacional:* Todo cambio en la organización provoca un cambio en la cultura organizacional, siendo ésta el conjunto de características distintivas de una empresa a través de las cuales el hombre expresa su razón de ser, que se traduce en normas y mecanismos de interacción que le permiten lograr sus metas individuales y de conjunto.

*Herramienta De Diagnostico:* (Desarrollada por el Grupo ALFA, Monterrey) Para medir el clima en una organización existen diversas herramientas de diagnóstico. En el caso de la empresa Construcciones y Mantenimiento GAEL S.A. de C.V. hemos aplicado un diagnóstico de efectividad que nos ha permitido identificar la situación que prevalece en la empresa para determinar áreas de oportunidad y así, de esta manera, dirigir mejor los esfuerzos, tomar decisiones más acertadas, optimizar de mejor manera los recursos, etc.

*Diagnóstico de calidad del clima organizacional:* El objetivo de éste es obtener información válida acerca del funcionamiento de la empresa, para conocer las fuerzas y debilidades actuales y plantear estrategias que contribuyan a incrementar la efectividad (productividad + calidad de vida).

### Variables a Identificar y Medir

*Funciones (Roles):* Es una medida de la percepción que las personas tienen respecto a la claridad de sus roles (funciones)

*Integración (Pertenencia):* Es una medida del grado en que las personas sienten que su realización se da junto con la empresa.

*Objetivos:* Mide el grado en el que los trabajadores (obreros y empleados) conocen sus objetivos con claridad y cuál es su contribución al logro de los objetivos de la organización.

*colaboración:* Mide el grado en que las personas se ayudan entre sí. Explora la percepción de los trabajadores respecto a la competencia en su equipo de trabajo y la unidad del grupo en general.

*estilo de liderazgo:* Mide la percepción de los trabajadores respecto a la calidad y frecuencia de la delegación, el apoyo y empatía que muestra el jefe hacia ellos.

*innovación y cambio:* Es una medida de la percepción de los trabajadores sobre la disponibilidad del grupo al cambio o desarrollo de nuevas ideas y enfoques para resolver problemas.

*Higiénicos:* Explora la percepción que los trabajadores tienen respecto a: sueldo y prestaciones, condiciones de trabajo

*Motivacionales:* Mide la percepción que los trabajadores tienen respecto a: el logro y su reconocimiento el trabajo en sí (retador, innovador, trascendente), oportunidades de crecimiento personal y profesional

*Administración De Recursos Humanos:* Mide la percepción que los trabajadores tienen sobre la calidad del recurso humano y del apoyo a programas formales de crecimiento para el recurso humano

*Capacitación:* Mide la percepción que los trabajadores tienen sobre los programas para el desarrollo personal y profesional.

*Comunicación:* Mide el grado de formalidad, oportunidad y veracidad de la información, así como el efecto que tiene en las personas la forma y la manera en que se llevan a cabo los comunicados.

*Presiones:* Es una medida de la percepción que los trabajadores tienen sobre la tensión y ansiedad provocada por el trabajo

*Productividad:* Es una medida del nivel de satisfacción que los empleados tienen de sus logros

*Políticas De La Empresa:* Es una percepción de los derechos y obligaciones de los trabajadores dentro de la empresa

*Calidad En El Trabajo:* Es una percepción de la calidad del trabajo que se desarrolla en la empresa.

*Nota Importante:* Todas estas variables (objetivos de la investigación) están contenidas en el cuestionario utilizado para el diagnóstico.

*Variable Dependiente:* La interacción de las variables dependientes en diferentes grados de intensidad, nos reflejan el comportamiento de la calidad del clima organizacional de la empresa diagnosticada.

A finales de la década de los 80's México era un país en donde las industrias de la construcción y de la transformación avanzaban rápidamente, las necesidades de empresas que se dedicaban a la construcción eran únicamente grandes compañías de mucho capital, es hasta principios de los 90's cuando empieza en la región centro del estado de Coahuila a generalizarse la creación de pequeñas compañías constructoras como parte del desarrollo natural de la región ya que ocurren fenómenos que ayudan a que esto suceda, personal de Altos Hornos de México S.A. (AHMSA) reajustado, con capital para invertir y con alto valor intelectual en el ramo metal-mecánico. El expertise desarrollado por un número importante de Profesionistas a lo largo de más de 20 años les dio la confianza para invertir su capital en la creación de empresas en torno, principalmente, al gran consorcio.

Fue en 1990 cuando un grupo de industriales de una familia emprendedora del centro de Coahuila en el área de Fletes y acarreo de productos y materiales a nivel Nacional, tuvo la idea de establecer una empresa que proporcionara servicios de Mantenimiento y Construcción en el ramo Metal-Mecánico.

Para iniciar este proyecto la compañía nace con pequeños contratos al interior de AHMSA, con el nombre de COFAGASA y con una plantilla de alrededor de 10 personas y con algunos pocos equipos y herramientas ligeras; conforme pasan los años y se adquiere mayor experiencia en trabajos de Mantenimiento y Construcción la compañía comienza a crecer tanto en personal de base y temporales hasta llegar a tener 80 obreros, así como en Infraestructura a tal grado que para principios del año 2000, se adquiere equipo pesado como son grúas, titanés, retroexcavadoras, máquinas de soldar etc., y por consiguiente logran mejores contratos, que redundan en nuevas y mejores oportunidades de negocios.

Para el año 2013 GAEL es considerada una empresa confiable y consolidada como una de las principales empresas locales que le dan servicio al GRUPO ACERERO DEL NORTE.

Uno de los problemas fundamentales de Construcciones y Mantenimiento GAEL S.A. de C.V. en su arranque fue la carencia de mano de obra especializada, tanto en lo que se refiere a obreros y técnicos, como a personal directivo y administrativo. Los primeros trabajadores de GAEL eran lugareños y habitantes de regiones cercanas. Los comienzos no fueron fáciles. El Director General de la empresa narra que en muchos casos fue necesario enseñar a los obreros a medir, trazar, soldar y hasta a remachar.

Como parte del plan de capacitación, fue adquirir y hacer circular entre los interesados las principales publicaciones técnicas nacionales. Se impartieron cursos dentro de la empresa, con la ayuda de especialistas provenientes de empresas de consultoría de Monterrey y de la ciudad de México.

Se insiste a los superiores que fomenten la capacitación del personal bajo sus órdenes, transmitiéndoles conocimientos que a ellos se les está impartiendo de manera constante. Todas las acciones emprendidas se reflejan en el aumento de la productividad, en la mejor calidad de los productos y/o servicios y en la introducción de técnicas especiales de producción. Con todos estos cursos recibidos e impartidos fue posible establecer y difundir los *valores organizacionales* para reavivar la conciencia y responsabilidad: Calidad de los productos, de los servicios y de los recursos humanos. Honestidad en el manejo de la información, de los equipos, materiales y servicios. Respeto, Reconocimiento Y Capacitación de los recursos humanos de

nuestra organización. Limpieza, Orden Y Seguridad, para el propio bienestar de los trabajadores. Nacionalidad, el sentimiento de trabajar por nuestra familia, nuestra comunidad y nuestro país *Retos de Construcciones y Mantenimiento GAEL S.A. de C.V.*: En un proceso de desarrollo todos los países pasan por periodos en los cuales es necesario hacer ajustes a su estructura económica e industrial.

Estos periodos de ajuste constituyen un compromiso natural del desarrollo y, normalmente, se derivan avances tecnológicos, y cambios en los procesos productivos que incrementan la productividad de los países competidores, en ese sentido los ajustes a la economía e industria son una característica normal y permanente del desarrollo humano. Las organizaciones industriales para su sobrevivencia requieren fundamentalmente de una gran capacidad de adaptación al cambio, modernización, competitividad y desarrollo integral, es decir, hacer productivas y rentables cada una de las operaciones y no solo proporcionar productos de excelente calidad, a precios competitivos, en tiempo oportuno; de esta manera obtener los ingresos necesarios para el sostenimiento y el crecimiento.

La modernización industrial viene a ser el proceso de adaptación a esos ajustes, proceso que se debe adoptar con frecuencia para que una empresa, un sector industrial o un país mantengan su competitividad a nivel tanto nacional como internacional. De la adaptación al cambio surge la transformación constante de las organizaciones, la adecuación a las necesidades actuales del mercado, la preparación que requieren los recursos humanos para enfrentarse a esos cambios y la necesidad creciente de mejorar la calidad de sus productos, elevando su productividad y logrando un intercambio favorable a nivel internacional y un desarrollo económico sostenido. Aun cuando la necesidad de modernización industrial es común a todos los países, cada uno ha desarrollado estrategias distintas en función de sus características políticas y culturales, de la naturaleza de su estructura económica y de su desarrollo y estructura industrial. Entre algunas estrategias de carácter general se pueden mencionar la búsqueda de una posición competitiva de sus productos finales y componentes en el mercado internacional, mediante la alta productividad de sus factores y el desarrollo tecnológico, considerando entre estos al recurso humano como pieza fundamental en el proceso de modernización industrial. Lo anterior conduce a la explotación de oportunidades en el mercado internacional, para así reforzar una adaptación acelerada a los cambios estructurales actuales y por lo tanto, lograr condiciones favorables de intercambio que conduzcan a un desarrollo económico sostenido. Como ya se dijo, la modernización industrial consiste en la adaptación y ajuste de la planta industrial a los cambios tecnológicos y a los procesos productivos modernos, así como a las variaciones en los precios de los insumos y en los precios relativos de las materias primas, el proceso propiamente dicho de modernización es absolutamente crucial en las organizaciones que deseen lograr su supervivencia. Una estrategia general podría elaborarse con base en la reestructuración de la planta industrial, ya que de esta manera la economía podrá recobrar su capacidad de crecimiento y por lo tanto proveer de empleo a la fuerza laboral. Para esto será necesario hacerla internacionalmente competitiva, y la única manera de lograr competitividad es compitiendo, por ello, la liberación de importaciones es vital.

Para lograr la sobrevivencia Construcciones y Mantenimiento GAEL S.A. de C.V. deberá tomar acciones con la elaboración de productos de alta calidad a precios competitivos en un mercado internacional, para lo cual deberá iniciar un proceso de transformación hacia nuevas direcciones de trabajo y organización laboral, sistemas administrativos y valores humanos. Debe dirigir todas sus acciones a mejorar la *calidad, productividad y calidad de vida*, objetivos básicos de toda organización progresista. Para que la empresa sobreviva y crezca en un ambiente globalizado es necesario que los recursos humanos de la organización estén preparados para enfrentar los constantes cambios ya que sin la fuerza humana; la maquinaria moderna, la tecnología avanzada ni las estrategias bien elaboradas representarían algún beneficio.

*En General, Los Objetivos Pueden Resumirse En:* Sentar las bases para la elaboración de productos en la cantidad, calidad, oportunidad y costos adecuados, que permitan alcanzar condiciones de competitividad y, paralelamente, reorganizar y sanear la empresa para mejorar su rentabilidad.

## METODOLOGÍA DE LA INVESTIGACIÓN

Se realizó una investigación mixta: documental y de campo, tipo exploratorio en trabajadores de Construcciones y Mantenimiento GAEL S.A. de C.V. que se ubica en Monclova, Coah. El método utilizado para obtener la información, consistió en una encuesta, que se realizó a través de un cuestionario estructurado. *La herramienta utilizada es el resultado de años de investigación y experiencias en varias empresas del Grupo Industrial ALFA* y adaptada para éste estudio a la cultura de las empresas de la Región Centro del Estado de Coahuila. Antes de su aplicación fue sometida a revisión, para su aprobación por parte del Director de la empresa Construcciones y Mantenimiento GAEL S.A. de C.V. diagnosticada. Proceso de Intervención Diagnostico de Calidad del Clima Organizacional: Cliente: Construcciones y Mantenimiento GAEL S.A. de C.V. Compromiso: Efectuar estudio sobre la calidad del clima organizacional

Etapa	Metodología	Actividad
contacto	Entrevista	Se efectuaron reuniones con el cliente, representado por el gerente de la empresa, con la finalidad de definir alcances del diagnostico
contrato	Psicológico	Se establecen compromisos mutuos
entrada	Entrevista con jefes de las áreas a diagnosticar	Se efectúan reuniones con los jefes de área y se elabora de común acuerdo un plan de trabajo para proceder a recabar la información
recolección de datos	Cuestionario	Se procede a la aplicación del cuestionario de acuerdo al plan de trabajo
diagnostico	Procesamiento de la información	Una vez procesada la información se analizan los resultados y se dan a conocer al Cliente (gerente), posteriormente a los jefes de área en forma individual y estos a su vez al personal a su cargo para que en forma conjunta se elaboren planes de acción que contribuyan a la eliminación de las debilidades detectadas.
planeación de intervenciones	Reuniones con los directivos	Posteriormente a las reuniones de los directivos con su personal efectuadas con el objetivo de planear acciones que contribuyan a superar las debilidades detectadas, se elaboran las estrategias a seguir
acción	Institucionalización del cambio	Se dará a conocer a todo el personal las estrategias planeadas
seguimiento	Visitas	Contacto continuo con los directivos de las áreas, con el fin de evaluar los avances de los planes de acción.
<b>fin</b>		

Análisis De Resultados Resumen del diagnóstico de calidad del clima organizacional realizado en la empresa Construcciones y Mantenimiento GAEL S.A. de C.V.

INFORMACION GENERAL (Reporte Presentado Al Director General)

Con este reporte se le informa sobre la Calidad del Clima Organizacional en la unidad a su cargo y está basado en las respuestas del personal de la misma, que contesto la encuesta de diagnóstico aplicada en Construcciones y Mantenimiento GAEL S.A. de C.V. Los datos aquí reportados se basan en las respuestas proporcionadas por trabajadores de su organización que contestaron la encuesta Este reporte tiene como objetivo darle un panorama general de las fortalezas y áreas de oportunidad que los miembros de su área reportaron. Con el fin de proteger el anonimato del personal encuestado, solo se proporcionan promedios de las respuestas. De acuerdo a los estudios realizados en la región, se considera que el promedio superior a 80% es mayor fortaleza, de 70 a 80 es fortaleza, menor a 70 se considera debilidad y menor a 60 es debilidad crítica. Se considera que 11 de las quince áreas de análisis son superiores al promedio en la región. La lista de fuerzas y debilidades fue extraída del reporte de análisis de cuadrantes, la distribución de las 97 preguntas en fuerzas y debilidades es la siguiente:

## CONCLUSIONES Y RECOMENDACIONES

Un diagnóstico organizacional es un estudio de los recursos, resultados, políticas y estructuras directivas de las empresas, con miras a identificar o determinar con más precisión sus cualidades y defectos, así como los problemas fundamentales que impiden el buen funcionamiento y desarrollo. El diagnóstico del clima organizacional está sustentado en percepciones de índole individual donde la suma de estas, globalizan una percepción general, determinando el estado del clima laboral. Para que el diagnostico contribuya a satisfacer las necesidades detectadas con mayor eficacia, es de suma importancia considerar lo siguiente:

Involucración total de TODO el personal en la búsqueda de soluciones a las debilidades detectadas. Elaboración de estrategias basadas, principalmente, en las sugerencias aportadas por el personal. Implementación y establecimiento de acciones inmediatas dirigidas a la superación de las debilidades detectadas. Estas recomendaciones que se sugieren, no son una panacea para la solución inmediata de los “problemas” detectados, principalmente, por las diferentes subculturas existentes en una organización, solo marcan directrices que contribuyen, cuando se aplican de manera adecuada, a la superación de los problemas. Se recomienda que cuando se den a conocer los resultados de esta investigación, si es posible, apoyarse en un facilitador ajeno a la organización y conocedor de la herramienta de diagnóstico utilizada.

Matriz de involucrados Proyecto Mejora en el Clima Organizacional en la empresa GAEL (para mejorar la calidad de vida, la productividad y la calidad de los productos/servicios al cliente)

GRUPOS	INTERESES	PROBLEMAS	RECURSOS
Empresario	Utilidades	Baja calidad en los productos/servicios. Baja productividad Alta rotación de personal Alta resistencia al cambio por parte de los trabajadores	Invertir en cursos de capacitación, adiestramiento y desarrollo del personal
Trabajadores	Mejora en las condiciones laborales	Baja Calidad de Vida Desmotivación Problemas familiares Resistencia al cambio	Tiempo para asistir a los cursos en horario fuera de trabajo
Proveedores	Altos costos	Incertidumbre en los pedidos y en las fechas de pago	Recursos económicos para financiar al cliente
Clientes	Demora en el tiempo de entrega	No recibe sus productos/servicios a tiempo Altos costos en inventarios	Capital financiero para mantener inventario
Dependencias Gobierno	De Estabilidad laboral	Mala calidad Alta rotación de personal Problemas sociales	Inversión en la seguridad social

#### Modelo Para Vencer la Resistencia al Cambio (Implantación)

*La pirámide de resistencia:* El diseño de la pirámide de la resistencia esta basado en la jerarquía de resistencias desarrollada por Nieder y Zimmerman en la Universidad de Bremen, Alemania. Al igual que la pirámide de necesidades de Maslow, la pirámide de la resistencia es una sucesión de niveles, en este caso, niveles de resistencia. La satisfacción de un nivel reduce la resistencia del siguiente. Por ejemplo, cuando respondemos a la necesidad de saber de las personas, éstas se vuelven más abiertas al aprendizaje de nuevas habilidades y destrezas relacionadas con el cambio. Y una vez han adquirido las nuevas habilidades, tendrán la confianza necesaria para superar la falta de voluntad de cambio.

Basándonos en el concepto de la pirámide de la resistencia, lo que la gente necesita en primer lugar es conocimiento. Puede proporcionarse conocimiento con información sobre el proceso de cambio. La información debería basarse en lo que los directivos y los empleados quieren saber. La gente normalmente quiere las respuestas a las preguntas más simples: ¿Qué está ocurriendo?, ¿Por qué estamos haciendo esto?, ¿Cómo se va a hacer?, ¿Cuándo va a hacerse? y ¿A quién le va a afectar? Contestando estas preguntas a las personas en cada fase del proceso de cambio les ayudará a pasar al siguiente nivel de la pirámide. El segundo nivel de la pirámide –la capacidad- es tratado con formación y entrenamiento. Para cambiar, las personas suelen necesitar nuevas capacidades. Estas nuevas capacidades incluyen desde operar con nuevos equipos o sistemas, hasta pasar de trabajar solo a hacerlo en equipo, o seguir procedimientos revisados. La dirección a menudo necesita nuevas habilidades para crear equipos y fomentar el trabajo en equipo, para “entrenar” a los empleados y proveerles así de nuevas habilidades y para aplicar nuevos procedimientos. Al tener la capacidad de las personas un profundo impacto sobre la disposición de éstas para realizar nuevas actividades y para cambiar, la formación se convierte en parte fundamental del proceso de cambio.

El deseo de cambio se sitúa en el nivel más alto de la pirámide. La adquisición de conocimientos en los niveles más bajos y la capacitación en los niveles intermedios ayudará a las personas a tener un mayor deseo de cambio. En cualquier caso, hay otros factores que también deberían ser tratados. Como ya se dijo, la implicación de la alta dirección en el proceso de comunicación envía señales a toda la organización sobre la prioridad del cambio. Además, cuanto más se comuniquen los beneficios personales del cambio más se consigue afectar los egos de las personas y en mayor medida animamos su deseo de cambio. Finalmente, el deseo de cambio puede aumentarse por diversas acciones específicas: 1) El establecimiento de objetivos de desempeño individuales y de equipo que estén en línea con los cambios que se quieren conseguir, 2) la medida de las personas respecto a éstos objetivos, 3) el establecimiento de mecanismos eficaces de coaching y de feedback en dos sentidos y 4) el reconocimiento y la recompensa de las personas por conseguir los objetivos e implantar los cambios. Sin embargo los resultados de todo este proceso se van a poder evaluar más adelante, ya que apenas (febrero/2012) se acaba de implementar este método.

### Recomendaciones a la Empresa

Las recomendaciones que hacemos a continuación son con el único fin de colaborar, desde nuestro muy particular punto de vista, con la empresa que nos permitió llevar a cabo este estudio (investigación), del cual hemos obtenido valiosas experiencias que han contribuido a nuestro desarrollo personal y profesional. Elaborar, a la brevedad posible, un método de difusión de las políticas que garantice el entendimiento y aceptación de estas. Para esto nos basaremos en el modelo de las seis cajas de Marvin R. Weisbord con el objeto de centrar específicamente en seis variables su entorno y grado de influencia, ya que en cada una de ellas se encuentran una serie de elementos y cuestionamientos que consideramos importante comentar. Pero, primeramente, es necesario establecer que la empresa GAEL decidió implementar un modelo para eliminar la resistencia al cambio, que seguramente se va a presentar durante el proceso de aplicación de los nuevos métodos y sistemas.

Modelo de las Seis Cajas de Marvin R. Weisbord (Contacted a los autores para obtener esta figura)

DESCRIPCION	PROBLEMA	RECOMENDACIONES
<p><b>PROPOSITO</b> Actualmente la industria de la construcción y los servicios atraviesa por una etapa de transición, principalmente por la alta competencia, propiciando que solamente sobrevivan las empresas mas competitivas</p> <p>Por esto GAEL no debe perder de vista su propósito fundamental. Sentar las bases para elaborar productos en la cantidad, calidad, oportunidad y costos adecuados, que permitan alcanzar condiciones de competitividad y, paralelamente, reorganizar y sanear la empresa para mejorar su rentabilidad.</p>	GAEL no ha difundido con claridad su misión, visión, propósitos, objetivos y políticas, así como tampoco ha establecido los métodos y sistemas para que esto se lleve a cabo.	<p>El grupo directivo de la empresa deberá cuestionarse la razón de ser de la organización y definir las estrategias a seguir así como los objetivos y proyectos prioritarios de tal forma que estas líneas de acción lleguen a todos los niveles de la empresa con la finalidad de que sus miembros sean conscientes de su compromiso</p> <p>Para que las estrategias sean efectivas se requiere de métodos y sistemas, además de un proceso ágil de toma de decisiones y un liderazgo efectivo</p> <p>Es necesario que el grupo directivo supervise, vigile y adecue el desarrollo del recurso humano a los procesos de la organización y se involucre en acciones concretas y decisiones oportunas.</p>
<p><b>ESTRUCTURA</b> Su estructura piramidal funcional la hace verse compleja y su accionar le produce una serie de dificultades operativas</p> <p>Los procesos de comunicación, por este tipo de estructura, no son los mejores, teniendo en ocasiones fuertes problemas por esto</p>	<p>El diseño de la estructura administrativa de GAEL no corresponde a los conceptos modernos de calidad y modernización</p> <p>La mayor parte de los miembros de la organización no conoce la estructura administrativa</p> <p>El desconocimiento de la estructura administrativa ocasiona confusión e indefinición en las funciones de los puestos, y esto, origina duplicidad en su desarrollo</p>	<p>El programa de adelgazamiento y achaparramiento de la estructura organizacional es una medida adecuada. Se debe llevar a cabo con una planeación estratégica adecuada hasta el logro de las condiciones deseadas</p> <p>Se requiere un proceso de concertación acelerado, con dirección y decisiones oportunas</p> <p>La compactación de categorías debe hacerse a TODO el personal</p> <p>Será necesario un programa de difusión de la estructura organizacional, asegurándose que llegue a todos los niveles de la organización</p>

DESCRIPCION	PROBLEMA	RECOMENDACIONES
<b>RELACIONES</b> Las relaciones interpersonales y grupales de cualquier organización contribuyen en su eficiencia y productividad, por lo que es necesario exista un alto grado de colaboración entre sus miembros y unión de esfuerzos hacia objetivos comunes	<p>En GAEL la estructura organizacional se aprecia compleja, provocando confusión y desgaste de energía en conflictos improductivos</p> <p>Los objetivos individuales son prioritarios a los organizacionales y como consecuencia el personal no trabaja en forma integrada, coordinada y armónica.</p>	<p>Diseñar e implementar un sistema de información interno que propicie la integración de grupos de trabajo, la participación y compromiso de todos los miembros de la empresa; ya que todos los problemas que le ocurran a la empresa (liquidez, mercados, rentabilidad, proyectos, etc.) deben ser conocidos por todos sus integrantes para que estos contribuyan con su esfuerzo a resolverlos</p> <p>Integrar al grupo directivo bajo un liderazgo firme y efectivo, propiciando su participación y compromiso en el logro de los objetivos comunes de la empresa</p> <p>Adecuación de los objetivos organizacionales a los procesos de cambio que actualmente vive la empresa, difundiendo con la finalidad de que los objetivos individuales, y de las diferentes áreas sean coincidentes y así lograr una mayor sinergia organizacional.</p>
<b>RECOMPENSAS</b> <p>El ser humano necesita de estímulos para lograr un mayor rendimiento en el desempeño de su trabajo, un factor importante es el reconocimiento a sus logros y un sueldo que le permita vivir con dignidad</p> <p>De no llevarse a cabo lo anterior la empresa no contaría con un personal altamente estimulado y dispuesto a colaborar en la eficiencia y productividad de la organización</p>	<p>En GAEL existe un elevado sentido de pertenencia, la gente se percibe integrada a la organización, sin embargo, siente escaso reconocimiento a su labor</p>	<p>Establecer programas formales que permitan mantener el sentido de pertenencia existente</p> <p>Hacer funcionar el sistema actual a su máxima capacidad</p> <p>Adecuar el sistema de recompensas de acuerdo a resultados o meritos individuales, grupales o de empresa</p> <p>Dar autonomía a las áreas de la organización para que establezcan sus sistemas de reconocimiento</p> <p>Promover la conciencia en los niveles de mando de que el logro de resultados depende, principalmente, del esfuerzo de sus colaboradores y estos deben ser reconocidos</p>
<b>LIDERAZGO</b> Es la variable central de este modelo ya que de ella emanan las decisiones que marcan las directrices de la empresa	<p>En GAEL esta variable reúne un sinnúmero de matices pues los estilos de liderazgo existentes son muy variados pasando de una polaridad a otra. Así como hay estilos de dirección inadecuados, se encuentran líderes con un alto grado de sensibilidad en el desarrollo de habilidades directivas</p> <p>No cabe duda de que esta es una área de oportunidad para la organización ya que en ocasiones las mencionadas polaridades provocan lucha por el poder, manifestándose en desintegración y desinterés ante proyectos que requieren de actitudes sanas</p>	<p>Definir desde un punto de vista humano, técnico y administrativo el estilo de liderazgo que debe imperar en la organización respetando la individualidad de cada uno de los directivos</p> <p>Diseñar e implantar un sistema de selección de directivos</p> <p>Aprovechar el potencial de los recursos humanos de la organización y preparar a los líderes que en el futuro ocuparan los puestos directivos</p> <p>Diseñar e implantar sistemas de evaluación de directivos en base a los principios de la organización</p> <p>Provocar que los directivos de las diferentes áreas formen equipos de trabajo donde sus esfuerzos sean encaminados hacia un mismo fin</p>
<b>MECANISMOS DE APOYO</b> La alta competitividad actual se considera como el proyecto que provocara una metamorfosis organizacional, sustentado en la calidad y soportado por una tecnología acorde a los competidores globales	<p>Este proceso de adecuación se ha visto pausado e inclusive lento y retrasado, originando problemas en su desarrollo</p> <p>Los cambios que se requieren no se han hecho a la velocidad exigida por el entorno y en el aspecto humano se han hecho menos esfuerzos con mínimos resultados</p> <p>Este punto puede convertirse en una debilidad crítica ya que de no satisfacerse las necesidades de los clientes cualquier empresa corre el riesgo de desaparecer parcial o totalmente</p>	<p>El plan de cambio debe contemplar el aspecto humano, el técnico y el administrativo deben seguir su curso en forma integral con el fin de que se cumplan los programas de calidad que la empresa se ha propuesto, efectuando un estricto seguimiento y aplicando las medidas correctivas necesarias a las desviaciones detectadas de manera inmediata</p> <p>Los departamentos de servicios deben actuar de acuerdo a su misión para que su participación sea mas efectiva y brinden a las áreas cliente un verdadero apoyo</p> <p>Se deberán estructurar sistemas y procedimientos necesarios para hacer llegar a las áreas cliente los</p>

DESCRIPCION	PROBLEMA	RECOMENDACIONES
<p><b>ENTORNO</b></p> <p>Este renglón es la esfera en la que se encuentran las seis variables anteriores siendo de una trascendencia vital por ser un elemento de difícil control dados los aspectos que lo configuran como lo son el económico, el político y el social</p> <p>Hace algunos años no nos imaginábamos que el mercado se encontraría en una turbulencia tal, que para las empresas permanecer en él representaría un reto</p> <p>GAEL para subsistir tiene que adaptarse a los repentinos cambios, contar con metas claramente definidas y dirigir todas sus acciones a mejorar la calidad, productividad y calidad de vida de sus miembros</p>	<p>No se ha preocupado por mejorar su entorno ecológico provocando malestar en la comunidad</p> <p>El personal que ingresa a la empresa no esta orientado a la productividad y calidad</p> <p>Ha perdido mercado por no cubrir las necesidades de los clientes</p>	<p>mecanismos de apoyo que requieran con oportunidad, eficacia y calidad.</p> <p>Debe involucrarse mas con la comunidad por medio de campañas de mejoramiento personal y a través de actividades educativas, culturales, sociales y recreativas</p> <p>En el proyecto de cambio se deberá buscar el beneficio de las aguas, la eliminación y control de contaminantes que pongan en peligro la salud social y la operación de la propia empresa</p> <p>GAEL debe dirigir todos sus esfuerzos al cumplimiento de sus propósitos fundamentales y debe estar alerta a los cambios en el entorno que se generan día a día, contando con una estructura organizacional flexible y adecuando constantemente los objetivos organizacionales a las demandas del mercado</p> <p>La empresa debe desarrollar sistemas de información y servicio al cliente para lograr una mayor penetración en el mercado.</p>

# IMPACTO DE LA RECESIÓN MUNDIAL EN LA ECONOMÍA MEXICANA (2008-2010)

Guadalupe Mariana Rojas Ortiz, Universidad Nacional Autónoma de México

## RESUMEN

*Los objetivos del presente estudio son describir las características esenciales de la Gran Recesión e identificar los efectos que tuvo esta en la economía del país y citar la reacción que tuvo el gobierno mexicano frente a la misma. Es de particular atención para el presente trabajo, el estudio de la Gran Recesión, debido a que fue una crisis de carácter financiero característica que la diferenció de las anteriores sufridas por la economía mexicana, y que además se pudo haber minimizado el impacto sufrido, si no hubiera existido tanta dependencia en las relaciones comerciales y financieras entre México y EEUU. El comportamiento cíclico de la economía capitalista, permite prever que la parte baja del ciclo donde se registran las crisis, tarde o temprano mostrará signos de recuperación pero, sin duda de todas ellas tenemos mucho que aprender.*

**PALABRAS CLAVES:** Crisis, Gran Recesión, México, efectos en la Economía Mexicana, Reacción del Gobierno Mexicano.

## THE GREAT RECESSION AND MEXICAN ECONOMY (2008-2010)

### ABSTRACT

*The objectives of this study are to describe the essential features of the Great Recession and identify the effects this had in the Mexican economy and cite the reaction that the government of Mexico to this. It is of particular attention for the present work, the study of the Great Recession, due to the fact that it was a crisis of financial nature feature that distinguished it from the previous crisis suffered by the Mexican economy and that could have been done also minimized the impact if there had not been so dependent on trade and financial relations between Mexico and United States. The cyclical behavior of the capitalist economy, make it more likely that the low part of the cycle where the crisis are recorded, sooner or later will show signs of recovery but, without doubt all of them we have a lot to learn.*

**JEL:** E02, E32, F29, F63, F65, G01, G20, H12

**KEYWORDS:** Great Recession, Mexican Economy, Financial Crisis, Reaction of the Government of Mexico

## INTRODUCCIÓN

La economía de México tiene una vinculación muy estrecha con la economía de Estados Unidos (EEUU) a través del intercambio de mercancías, servicios y capital, así como del flujo de divisas que proviene de las remesas familiares hacia México provenientes de EEUU. La crisis financiera que se desató en EEUU a finales de 2008 fue el catalizador que ocasionó la desaceleración económica más grave desde la Segunda Guerra Mundial. En varios años más, seguirá afectando a las economías dejando graves secuelas como el desempleo y la deuda pública.

“La Gran Recesión- a todas luces la peor crisis económica desde la Gran Depresión de hace setenta y cinco años-...” (Stiglitz, 2010, p.13).

“En la Gran Recesión que comenzó en 2008, millones de personas en Estados Unidos y en todo el mundo perdieron sus hogares y sus empleos. Muchos otros padecieron angustia de que les sucediera lo mismo.” Stiglitz (2010:11). Muchas personas habían ahorrado para su jubilación o para la educación superior de sus hijos, y repentinamente todos sus ahorros se vieron drásticamente reducidos.

Por su parte, de acuerdo con Flores (2010), en México el gobierno confió en que la Gran Recesión no tendría un efecto grave en la economía del país, ya que en la última crisis que había enfrentado al finalizar 1994, había sido cuidadoso en mantener las principales variables macroeconómicas bajo control. A pesar que ello costara un bajo crecimiento económico del Producto Interno Bruto (PIB), provocando así un efecto negativo en el empleo y los salarios reales.

Durante el primer cuatrimestre del 2009 la desaceleración de la economía mexicana se manifestaba abiertamente y se agudizó con la emergencia sanitaria (virus AH1N1), ya que en el mes de abril semiparalizó la actividad productiva.

El presente artículo contiene cinco secciones, además de esta introducción y una sección de conclusiones. La primera sección contiene una breve presentación de los antecedentes generales de la Gran Recesión así como las tres estrategias que el capitalismo ha utilizado para recuperar su tasa de ganancia: la globalización, el neoliberalismo y la financiarización.

La segunda sección contiene una cronología de los hechos relativos a la Gran Recesión, en EEUU y México. Y revisa en qué condiciones se encontraba la economía mexicana al momento de recibir el impacto de la Gran Recesión.

La tercera es dedicada a identificar los efectos principales que tuvo esta crisis mundial en la economía mexicana.

La cuarta sección describe las medidas que el gobierno mexicano adoptó al tener conocimiento de los graves problemas financieros, económicos y sociales que creó la Gran Recesión. Finalmente son presentadas las conclusiones.

### La Gran Recesión. Antecedentes

De acuerdo con Amin, Altwater, Morin, Gowan(2010). La crisis sistémica denominada la Gran Recesión, tuvo crisis financieras precursoras tales como: la de México en 1994, la de Japón en 1995, la de Asia en 1997 y 1998, la de Rusia en 1998, la de Brasil en 1999, la de Argentina en 2001. Todas ellas con consecuencias dolorosas para la población y en muchos casos con efectos regionales sin afectar a otros países. Dichas crisis se interpretaron como desarreglos de tipo nacional típicos de la periferia del sistema. Sin embargo no hay que olvidar la crisis financiera ligada a Internet, cuya burbuja especulativa también comenzó a formarse a partir de 1995. Por consiguiente, los procesos de globalización son inseparables de las burbujas así como de las crisis cuyo carácter sistémico resultó evidente en la Gran Recesión.

Cuando el mercado financiero se liberó a principios de la década de los noventa, sobrevino un auge en la concesión de préstamos, en el cual el crédito bancario hacia el sector privado de negocios no financieros se aceleró de manera muy pronunciada. Debido a una supervisión débil y a la asignación descuidada en la selección y control de los prestatarios, los préstamos no fueron pagados, y el capital contable de los bancos disminuyó drásticamente, esto a su vez llevó a la falta de concesión de préstamos y finalmente condujo a una contracción de la actividad económica.

Reducir la crisis financiera sólo a su relación con el desarrollo de los créditos *subprime* en el sector inmobiliario americano, es demasiado miope, ya que es evidente que ésta procedió de años atrás así como de muchas variables, además fue global y sucedió a otras crisis que ya tenían carácter sistémico.

Para Estrada (2010:18-19). La Gran Recesión va más allá de una crisis únicamente de tipo financiero de carácter sectorial. Dicha crisis tiene que ver también con la producción. Algunos medios de comunicación dieron un enfoque ortodoxo a la creación de la burbuja especulativa en el mercado inmobiliario que tenía que ver con acciones y excesos de unos cuantos, que fue lo que reventó la burbuja, colapsó el mercado y condujo a la crisis

No obstante las imperfecciones de los mecanismos y normas existentes para regular el funcionamiento del mercado financiero, ello permitió neutralizar los riesgos de crisis sistémica que ocurrieron después con la desregulación financiera, la cual fue lograda con la revocación de la Ley Glass-Steagall por el Congreso Norteamericano en noviembre de 1999 ( Stiglitz, 2010: 206) .

La desregulación, se define como “el paulatino o parcial alejamiento de las autoridades financieras respecto de los intermediarios y de su quehacer.” Para Correa (1998:138 ), es el volver las normas y leyes de control más laxas.

Los elementos más importantes de la desregulación financiera son los siguientes:

La desregulación de las tasas de interés (no existen reglamentaciones respecto a los techos sobre éstas).

La simplificación y en algunos casos abolición de los controles de crédito, de inversión y de depósitos obligatorios.

La disminución el número de intermediarios financieros lo cual concentró el mercado en menos intermediarios.

La multiplicación el número de instrumentos financieros con reglas mínimas respecto a su creación, a su operatividad, así como también a su expresión en los balances de las instituciones, y por último a la falta de homogeneidad en dichas reglas de un mercado a otro.

La remoción de los obstáculos que impedían la expansión local de los intermediarios extranjeros en los países subdesarrollados.

La aplicación de las tecnologías de información y comunicación, así como la creciente innovación han sido los elementos catalizadores.

### Cronología de los hechos

La Gran Recesión se desató tan repentinamente, que a muchas personas las tomó por sorpresa. Para muchas otras se desenlazaron los hechos que ya esperaban. “En realidad, las presiones financieras llevaban años acumulándose conforme el capital fluía de las economías emergentes como la de China, a economías desarrolladas como la de EEUU. La situación se agravó debido a la irresponsable y creciente propensión de los bancos al riesgo”. OCDE-UNAM (2011:20).

Para Stiglitz (2010:31), las cosas estaban gravemente desajustadas debido a lo siguiente:

Los factores que la desencadenaron eran comunes a los de otras crisis financieras, “lo que *era* distinto en esta crisis respecto a las numerosas otras que la habían predicho durante el último cuarto de siglo era que esta crisis llevaba la etiqueta <<*made in USA*>>” Stiglitz (2010:31). Esta crisis se extendió rápidamente por todo el mundo.

Desde 2007, se habían dado los primeros indicios de la crisis, cuando el mercado de hipotecas *subprime* (de alto riesgo) comenzó a sentir presión.

En marzo (17/03/08), el banco de inversión y corretaje Bear Stearns quebró.

En septiembre (07/09/08), el gobierno estadounidense anunció que asumía el control de Fannie Mae y Freddie Mac, dos enormes instituciones que respaldan préstamos hipotecarios en EEUU, con 200,000 millones de dólares americanos (USD), lo cual llamó la atención de muchos.

A mediados de septiembre (15/09/08), llegaron noticias del derrumbe del banco de inversión Lehman Brothers, uno de los íconos de Wall Street. “Lehman había albergado al tipo de negociantes y corredores de bolsa que el novelista Tom Wolfe llamó alguna vez “amos del universo”.” OCDE-UNAM (2011:20).

Más o menos al mismo tiempo, Merrill Lynch no corrió con la misma suerte, gracias a que la compró Bank of America.

En septiembre (17/09/2008), American Insurance Group (AIG) estuvo cerca de la quiebra, por asegurar complejos valores financieros. Esta fue rescatada por el gobierno estadounidense por un monto USD \$85,000 millones para evitar su quiebra.

En Nueva York (29/09/2008) el Índice Dow Jones sufrió una caída de 777 puntos, la más grande ocurrida en un solo día. Eso reflejaba que el sistema financiero estaba a punto del desplome. En octubre (03/10/2008) el anuncio del acuerdo en el Congreso de EEUU de la aprobación de un plan de rescate financiero por USD\$700,000 millones, apenas fue un respiro en el ambiente de pánico financiero producido en las bolsas de valores de todo el mundo.

“...Y cuando el señor Paulson anunció su gran plan de ayuda para sacar de apuros a la economía, se pudo experimentar un sentimiento temporal de optimismo. Pero pronto se aclaró que fatalmente al plan le faltaba claridad intelectual. El señor Paulson propuso comprar a los bancos por un valor de 700 mil millones de dólares de los ‘activos en dificultad’ - títulos valores relacionados con hipotecas tóxicas-, pero nunca pudo explicar cómo podría ayudar esto a resolver la crisis.” Krugman, premio Nóbel de Economía citado por Flores (2010:4).

La pérdida de activos fue mucho mayor que el rescate financiero de los 700 mil millones de dólares que otorgó la reserva federal aprobado por el Congreso de EEUU lo cual fue insuficiente para hacer frente a los problemas de dicha economía y más aún para no perjudicar a economías fuertemente dependientes como la de México, dando lugar a prácticas especulativas y fraudulentas terminando por desestabilizar al sector financiero y finalmente a la economía real, que es donde se crea riqueza con el trabajo de millones de seres humanos.

La lógica de las innovaciones financieras habían dejado de lado a la esfera productiva y al crecimiento del empleo así como al poder adquisitivo de los trabajadores, por lo que no se generaba riqueza material ni la capacidad de pago para hacer frente a la deuda contraída, como para valorar los activos financieros emitidos. Esto dio lugar a la cartera vencida y a la desvalorización de dichos activos así como a la quiebra de instituciones financieras que emitieron y compraron dichos activos.

Todo esto se tradujo en la reducción de otorgamiento de créditos por parte de los bancos, frenando así la inversión, el consumo y por lo tanto la actividad económica y la generación de empleos en los países desarrollados. Lo mismo sucedió en América Latina, dado que la Banca que opera en éstos países es filial de las empresas matrices de los países desarrollados que siguieron las mismas prácticas: especulan, otorgan mayores créditos al consumo y a la vivienda en relación con lo concedido a la industria y a la agricultura, por lo que no aseguran la forma en que se puedan cobrar dichos créditos, engrosando así la cartera vencida la cual ya estaba latente en nuestra economía.

### Impacto de la gran recesión en México

Mientras en el mundo se manifestaban los efectos del “tsunami financiero”, particularmente desde la segunda mitad de 2008, en México estos efectos trataban de ser minimizados en el discurso oficial, pero en los hechos el impacto se manifestaba en diversos ámbitos.

Un factor de importancia que condujo a las crisis financieras de México fue el deterioro de los balances generales de los bancos a causa de las pérdidas crecientes sobre los préstamos. Cuando el mercado financiero se liberó a principios de la década de los noventa, sobrevino un auge en la concesión de préstamos en el cual el crédito bancario hacia el sector privado de negocios no financieros se aceleró de manera muy pronunciada. Debido a una supervisión débil y a la asignación descuidada en la selección y control de los prestatarios, los préstamos no fueron pagados, y el capital contable de los bancos disminuyó drásticamente, esto a su vez llevó a la falta de concesión de préstamos y finalmente condujo a una contracción de la actividad económica. De acuerdo con Huerta (2009) La Banca Mexicana así como muchas empresas que operan en la Bolsa Mexicana de Valores, junto con su gran endeudamiento y la contracción de “derivados” en dólares, quedaron colocados en posición de insolvencia, que no pudieron resolver por más que el gobierno les otorgara apoyos. Las exportaciones cayeron, hubo una reducción en los ingresos por remesas así como por la inversión extranjera, además de la demanda de dólares por parte de las empresas con altos pasivos en ésta moneda, así como la presión que ejercían los especuladores, todo esto ocasionó una gran presión sobre el tipo de cambio.

El Banco de México desperdició las reservas internacionales al colocarlas en el mercado de divisas para evitar que el precio del dólar aumentara. De seguir así las reservas se agotarían y la economía entraría en una recesión de mayores proporciones a las sucedidas en los años de 1982 y 1995, ya que se contaba con menos producción en los sectores de la agricultura e industria para hacer frente a las adversidades provenientes del exterior. De acuerdo con Ros (2012) la economía mexicana, tuvo la ventaja de que los bancos e instituciones financieras que afectaron su desempeño durante la Gran Recesión tenían un nivel menor de exposición a los mercados de crédito de alto riesgo que los que prevalecían en EEUU y en otros países desarrollados de Europa.

Como una gran desventaja la economía comparte un alto grado de integración con la economía de EEUU. Un alto grado de apertura al comercio exterior con un altísimo grado de dependencia con respecto al mercado estadounidense así como una significativa participación en la exportación total de productos como el petróleo o los de la industria automotriz, los cuales fueron duramente golpeados durante la Gran Recesión.

De acuerdo con Ros (2012) la recesión fue muy severa en México con una caída del 6.1% en 2009, ya que en los países miembros de la OCDE la caída promedio fue del 3.5%. Después de la crisis financiera ocurrida a principios del sexenio del presidente Zedillo (diciembre de 1994) como parte de la continuidad en la política económica se asumió un mayor celo en el cumplimiento de los lineamientos del Consenso de Washington. Las variables macroeconómicas fundamentales ( como la tasa de inflación, el balance presupuestal del sector público, la deuda externa del sector público, la deuda interna del sector público) fueron mantenidas bajo control aunque el precio por ello fuera un muy bajo crecimiento económico. El promedio anual del crecimiento económico durante el mandato del presidente Zedillo (1994-2000) fue del 3.5% y durante el siguiente período correspondiente al presidente Vicente Fox (2000-2006) el promedio fue de 2.4%. (Banco de México 1995-2006).

La estabilidad económica ha sido la prioridad a pesar de la gran necesidad que tiene el país de lograr un mayor crecimiento, el cual se ha sacrificado para darle prioridad a los compromisos financieros derivados del llamado “error de diciembre (1994)”; teniendo como objetivo mantener una “buena calificación” de la

deuda soberana por parte de las calificadoras internacionales. De acuerdo con Flores (2010:9) el impacto que tendría la crisis fue minimizada por el gobierno de Calderón desde que aparecieron las primeras señales de alarma en 2008, al extremo que el Secretario de Hacienda se atrevió a declarar públicamente que dada la fortaleza financiera del país, a diferencia del pasado, entonces “México sólo sufriría un catarrito” como efecto de la grave crisis financiera que ya padecía la primera potencia mundial, su principal socio. Al reducir claramente el fenómeno a una crisis financiera, el gobierno pasó por alto que la misma se transformó en una crisis económica y que dada la estrecha dependencia de México respecto a la economía norteamericana, la magnitud del impacto fue inmenso. Esa dependencia y el riesgo implícito se evidenciaron en aspectos tan concretos como los siguientes:

Más del 80% de las exportaciones mexicanas tiene como destino EEUU.

El ingreso de divisas por envío de remesas de los inmigrantes en EEUU desde el año 2003 fue un monto cercano al obtenido de la inversión extranjera directa (cuyo origen en más del 45% es también EEUU) y en 2008 este fue superado por aquél.

Las divisas que ingresaban por concepto de turismo superaron los USD \$10,000 millones en 2008 y más del 80% de este proviene de EEUU.

México venía creciendo en los últimos años “gracias” al alza internacional del precio del petróleo, así como al crecimiento de las exportaciones no petroleras, a las remesas y a la inversión extranjera; es decir, a factores exógenos a la economía, dado que no teníamos crecimiento del mercado interno, que es el que constituye el motor de crecimiento. Cuando dichos factores externos dejaron de operar las exportaciones petroleras y no petroleras cayeron, provocando una disminución en las remesas recibidas así como en los flujos de inversión extranjera y la caída en la Bolsa Mexicana de Valores.

La devaluación de la moneda nacional encareció los productos provenientes del exterior (se importa más de lo que se produce internamente, en el caso de los productos manufacturados) y también se incrementó el costo de la deuda externa.

#### Medidas Adoptadas por el gobierno mexicano durante la Gran Recesión de 2008

La crisis iniciada en 2008 ha sido señalada por muchos especialistas como la “crisis de los países desarrollados”, ya que sus consecuencias se observaron y se continúan observando en los países más ricos y desarrollados del mundo.

Para el caso de México, al finalizar el año de 1994 (el llamado “Error de Diciembre”) el gobierno mexicano había sido cuidadoso de mantener bajo control las principales variables macroeconómicas aunque a costa de un escaso crecimiento del Producto Interno Bruto (PIB), así como de su consecuente efecto negativo en el nivel de empleo y de los salarios reales.

En octubre de 2008, el equipo económico de Calderón reaccionó improvisando un Plan para Impulsar el Crecimiento y el Empleo (PICE), que calificó de “contracíclico”, pero más adelante se vio, que no articulaba objetivos, ni metas y ni estrategias. Fue calificado por el Congreso de la Unión como “el mayor presupuesto de la historia” para 2009. De acuerdo con Flores (2010:11), después de tener conocimiento de los graves problemas financieros, económicos y sociales que la Gran Recesión había creado, el gobierno mexicano adoptó una serie de medidas que a continuación se mencionan:

Las tasas de inflación se lograron reducir de dos a un dígito; por su parte, el balance presupuestal del sector público se había mantenido muy cercano a su punto de equilibrio. Otra variable como la deuda externa del sector público fue reducida hasta un monto cercano a la mitad de lo que existía en 1995.

La desacreditación de la banca comercial en México así como las presiones a mantener elevadas las tasas de interés crearon muchos problemas para cubrir los requerimientos financieros gubernamentales. La presión sobre las finanzas públicas provocaron la existencia de otros requerimientos financieros del mismo ramo, derivando en la existencia de compromisos para elevar el gasto público para los siguientes años, tales como los recursos financieros de los proyectos de infraestructura productiva de largo plazo, los recursos financieros del IPAB después de los apoyos fiscales, los recursos financieros de la banca de desarrollo y los fondos de fomento entre otros.

Una decisión un tanto afortunada pero a la vez riesgosa fue la creación del Plan para Impulsar el Crecimiento y el Empleo (PICE) calificándolo de contracíclico, con este Plan el Congreso de la Unión aprobó lo que fue calificado como “el mayor presupuesto de la historia” para 2009.

Al no ser consistente dicho plan, fue firmado el Acuerdo Nacional a favor de la Economía Familiar y el Empleo (ANEFE), creado por la esfera política y empresarial del país, en donde se retomaron algunas propuestas aisladas del plan anterior.

La medida que el gobierno mexicano adoptó en cuanto a la oferta de varios millones de dólares con el fin de contrarrestar la ola financiera especulativa generó el anuncio de que México sería uno de los países que contaría con una línea de crédito flexible con el FMI hasta de USD\$47,000 millones para contrarrestar las secuelas de la crisis, lo cual finalmente sería aprobado.

El ANEFE sólo comprometía parcialmente los recursos presupuestales del gobierno mexicano, en otros se trataba de permitir a los empleados disponer de mayores márgenes del fondo de retiro.

El haber realizado cambios en el gabinete económico como la sucesión del Secretario de Hacienda a ocupar el puesto de Gobernador del Banco de México supuso el logro de una estabilidad macroeconómica buena, sin embargo no sucedió así ya que la inversión extranjera directa había caído poco más del 50%.

Lo observado en la nueva Ley de Ingresos para 2010 fue la provisión de los ingresos por petróleo tendería a disminuir, tanto por la tendencia a la baja de los precios internacionales del petróleo como por la reducción de las reservas de hidrocarburos. El incremento de impuestos como el IVA, el ISR y el IETU fue con el fin de reducir los ingresos presupuestales pretendió una política contracíclica en cuanto a que en lugar de estimular la actividad económica, la frenaría. El gobierno en turno incluyó en incurrir en un déficit presupuestal, el cual debería ser moderado y temporal, para evitar que el acceso al financiamiento internacional para México se vea afectado por la reacción de las calificadoras de deuda soberana.

De acuerdo con Cruz (2010), es preciso definir cuáles son las variables fundamentales que promueven el crecimiento económico y de qué forma inciden en la economía; al respecto se reconocen tres: La inversión o acumulación de capital, la fuerza trabajadora y la productividad de ambos factores de producción.

Existen una cantidad de variables importantes y diversas denominadas determinantes “más profundos del crecimiento” para explicar y entender el crecimiento económico tales como: la apertura financiera y/o comercial, la corrupción, la democracia, los derechos de propiedad, el marco institucional y la estabilidad macroeconómica entre otras, las cuales afectan indirectamente a las variables fundamentales de crecimiento económico.

Si la política económica incide sobre las variables fundamentales se determina la rapidez con que la economía pueda crecer.

La manera en que cada una de las variables fundamentales contribuye al crecimiento económico es la siguiente:

La inversión o acumulación de capital expande la capacidad productiva de una economía. Al realizarse una inversión, una economía amplía o renueva su capital físico y esto genera nuevos empleos y mayor ingreso vía los nuevos salarios. De manera simultánea, al proveer a los trabajadores de bienes de capital éstos podrán realizar sus funciones más eficientemente a un menor costo y en menor tiempo, y en éste sentido también la inversión “simultáneamente genera ingreso y aumenta la capacidad productiva, pero conlleva fuertes complementos con otros elementos del proceso de crecimiento, tales como el progreso tecnológico, la adquisición de habilidades y la profundización institucional” (UNCTAD, 2003:61, citado por Cruz (2010:18). La inversión o acumulación de capital mantiene un papel central entre las diversas conexiones que inician y mantienen un círculo virtuoso de crecimiento.

La productividad es una de las variables fundamentales en el crecimiento económico, ya que permite incidir en menores costos de producción, permitiendo que las ganancias (y la inversión) se mantengan constantes e incluso aumenten. Y la reducción de costos incide en la reducción de precios. Uno de los resultados deseables sería lograr una inflación baja, la cual redundaría en un incremento en el poder adquisitivo de los consumidores y en un incremento en la demanda local, provocando aumentar la competitividad de los bienes comerciales beneficiando el aumento de las exportaciones.

La productividad es el eje sobre el cual se sostiene y gira la transformación estructural de una economía ya que permite mejorar y transformar las formas de producción, por medio de innovaciones administrativas, financieras y tecnológicas, con el fin de crear nuevos bienes y servicios. Esto tiene una gran importancia cuando se trata de entrar o mantener la competitividad en mercados externos. Según Adam Smith en sus escritos de manera implícita sostiene que es posible crear economías de escala por medio de la especialización laboral.

Ragnar Nurkse citado por Cruz (2010), reconoció la productividad como la variable clave en el tamaño del mercado interno (medido en términos de su poder de compra) y por lo tanto, como variable fundamental en la determinación de la acumulación de capital. Nurkse lo sintetiza como “capacidad de compra significa capacidad de producción”. Lo anterior parte de la idea de que los salarios van en aumento en función del aumento de la productividad incrementando el poder adquisitivo y el crecimiento del consumo. Y de esa forma el tamaño del mercado también crece.

La productividad también es una variable fundamental debido a que cuando la productividad se incrementa se pueden alcanzar niveles satisfactorios de la capacidad productiva de la economía y acercarse al pleno empleo. De ésta forma la productividad a diferencia de la inversión y la fuerza laboral es una variable que puede crecer de manera sostenida sin generar desequilibrios micro y macroeconómicos contribuyendo siempre de manera positiva al proceso del crecimiento económico.

Hablando de la fuerza laboral es claro que mientras más saludable mental y físicamente se encuentre y mejor educada esté, mayor será su capacidad para realizar adecuadamente su trabajo. Es de esperarse que una fuerza laboral sana y educada que incrementa significativamente sus habilidades para mejorar sus procesos de trabajo, logre aumentar la productividad, un capital humano con las características mencionadas pueda contribuir de manera constante y significativa al crecimiento económico.

Gracias a los acuerdos que se tomaron en el Grupo de los 20 en su reunión de Londres en 2009, México se vio beneficiado con la asignación de un monto importante de dólares, que estarían a su disposición para fortalecer sus reservas internacionales y hacer frente a contingencias financieras. Con la finalidad de enviar un claro mensaje a los mercados financieros que la comunidad internacional mantiene la voluntad, el compromiso y la capacidad de apoyar a las economías en dificultades como resultado de las recurrentes crisis y que se mantiene la determinación de ayudarlas a reencontrar la senda del crecimiento.

## CONCLUSIONES

Aunque el efecto financiero de la recesión fue sorteado por México con un costo relativamente bajo en cuanto a que no se presentó una devaluación fuerte, ni se desequilibraron las finanzas públicas en dimensiones peligrosas, el costo que pagó el país se centró más en la economía real, en tanto que ocurrió una caída del PIB que fue la más importante en América Latina, cayeron la captación de divisas por exportaciones, por IED, por remesas de inmigrantes y el desempleo aumentó significativamente.

En suma, se logró mantener la estabilidad macroeconómica con un costo social y económico. Aunque la política económica enfrenta grandes retos, para reactivar el crecimiento económico, y además que se reduzca el elevado costo social que paga la población como consecuencias de las recurrentes crisis que han golpeado a nuestra economía. Es necesario un cambio de pensar radicalmente y tomar medidas correctivas como las siguientes: una reforma hacendaria que someta a los evasores fiscales, así como hacer que los grandes corporativos que operan en México también paguen los impuestos que corresponden con respecto a las ganancias que obtienen, realizar inversión social de largo plazo.

La prosperidad de México no se puede dar al margen de un entorno global, es necesario que surjan cambios en el sistema financiero mundial que generen mecanismos de regulación en los mecanismos financieros internacionales, la depuración de los paraísos fiscales y cierre de oportunidades para el manejo del dinero proveniente de actividades ilícitas; realizar acciones coordinadas entre las grandes potencias que eviten caer en el proteccionismo, así como el establecimiento de grandes monopolios, impulsando acciones de cooperación científica y tecnológica con especial cuidado en la mejora del medio ambiente y en la seguridad pública para darle un freno a las actividades del crimen organizado a niveles regionales y mundiales.

# FACTORES ASOCIADOS AL PROCESO DE ELECCIÓN Y CAMBIO DE CARRERA EN LA UABC

Sonia Martha Noreña Montoya, Universidad Autónoma de Baja California

Raquel Talavera Chávez, Universidad Autónoma de Baja California

Adelina Melgar Selvas, Universidad Autónoma de Baja California

## RESUMEN

*Una de las problemáticas que enfrentan las instituciones de educación superior está asociada con la deserción escolar de sus estudiantes; particularmente para el objeto de estudio de la presente investigación nos enfocaremos en la identificación de los factores de riesgo asociados al proceso de elección y cambio de carrera una vez que ingresan a la UABC, que se traduce en la insatisfacción del estudiante con la primera opción elegida, el cambio hacia otra alternativa vocacional y, en el peor de los casos, la deserción escolar, generalmente en la etapa básica de sus estudios universitarios. El objeto de estudio se basó en un modelo metodológico interpretativo de Sandoval (2002a) y McCurdy, Spradley y Shandy (2004), desde un enfoque cualitativo. Los sujetos de estudio fueron siete estudiantes de la UABC, campus Tijuana de diferentes carreras que realizaron su trámite de baja escolar por cambio de carrera y que accedieron voluntariamente a participar en una entrevista estructurada, cuyo protocolo fue revisado por un panel de expertos y piloteado, siendo la finalidad indagar sobre los factores que intervienen en el proceso de exploración vocacional y cambio de carrera. Los resultados del estudio muestran que en el proceso de la elección vocacional intervienen una diversidad de factores tanto internos como externos que inciden positiva o negativamente en la permanencia, elección de una segunda opción vocacional ó en la deserción escolar del estudiante.*

**PALABRAS CLAVES:** Deserción Escolar, Cambio de Carrera, Proceso de Elección, Factores de Riesgo

## FACTORS ASSOCIATED WITH THE ELECTION PROCESS AND THE UABC CAREER CHANGE

### ABSTRACT

*One of the problems faced by institutions of higher education is associated with dropout of students; particularly for the purpose of this research study we will focus on the identification of risk factors associated with the process of selection and career change once you enter the UABC, which translates to the dissatisfaction of the student with the first choice, the shift towards vocational alternative and, in the worst case, dropping out of school, usually at the basic stage of College. The object of study was based on a methodological interpretation model of Sandoval (2002a), Spradley and McCurdy, Shandy (2004), from a qualitative approach. Study subjects were eight students of the UABC, campus Tijuana of different careers that were your processing of low school for career change and who voluntarily agreed to participate in a structured interview, whose Protocol was reviewed by a panel of experts and piloted, being order to inquire about the factors that are involved in the process of vocational exploration and career change. The results of the study show that a variety of both internal and external factors that affect positively or negatively the permanence, choice of a second vocational choice or dropout of the student involved in the process of vocational choice.*

**JEL:** I2, I20, I21, I23

**KEYWORDS:** Dropout, Career Change, Choice, Risk Factors

## INTRODUCCIÓN

Una de las preocupaciones principales de las instituciones de educación superior está vinculada a los problemas de rezago académico, deserción temporal o definitiva (abandono escolar) de los estudios y la baja eficiencia terminal, siendo necesario la detección y prevención oportuna de dichas problemáticas. El Centro Interuniversitario de Desarrollo (CINDA, 2006), a este respecto hace mención del tema de la deserción como una forma de abandono de los estudios superiores, la cual adopta distintos comportamientos en los estudiantes afectando la continuidad de sus trayectorias escolares. Estos comportamientos en términos generales se caracterizan por: el abandono o suspensión voluntaria y definitiva de los estudios y del sistema de educación superior; la expulsión del alumno debido a deficiencias académicas y bajo rendimiento escolar; el cambio de carrera (dentro de la misma institución) o de institución; y la expulsión disciplinaria dada por conductas inadecuadas que alteran el orden institucional. En este sentido, el trabajo de investigación presenta un apartado con la revisión de la literatura pertinente al tema de la deserción escolar, particularmente con respecto a los factores que intervienen en el proceso de elección y cambio de carrera. Posteriormente se menciona el tipo de modelo metodológico empleado y las etapas del proceso de investigación, que incluyen los sujetos de estudio, la técnica de recolección de datos, así como el tratamiento, análisis e interpretación de la información. Derivado de ello, los resultados de la investigación, cuyo objeto de estudio es la identificación de los factores de riesgo asociados al proceso de elección y cambio de carrera en la UABC. Por último, las conclusiones, que pretenden aportar elementos de análisis relevantes para los tomadores de decisiones; así como las limitaciones del estudio que den origen a futuras investigaciones.

## REVISIÓN DE LITERATURA

La deserción escolar, de acuerdo con Tinto (1992), es una problemática reconocida mundialmente que ha sido abordada desde diferentes enfoques y disciplinas. La literatura en el tema hace referencia a cinco posturas en el estudio de la misma: psicológica, social, económica, organizacional e interaccional (ANUIES, 2001). Dichas posturas hacen alusión a factores tanto internos, esto es, propios del estudiante que involucran aspectos cognitivos y de personalidad; como externos, aquellos vinculados al contexto económico, social y cultural en el que se desenvuelve, incluyendo las condiciones propias de la institución educativa a nivel superior. Blanco y Rangel (2000) mencionan que un tipo de deserción escolar es el relativo al abandono voluntario de los estudiantes en los primeros meses posteriores al ingreso a la universidad, principalmente en carreras con baja demanda. En este sentido, uno de los motivos es el relacionado con el cambio de carrera, ya sea dentro de la misma institución o hacia otra institución de educación superior, lo cual lleva a cuestionar sobre el proceso de elección de carrera y la orientación vocacional proporcionada al estudiante previo a su ingreso a la universidad. Al respecto Fresán y Romo (2001) señalan que la transición entre el nivel medio superior y superior debe ser analizada, debido a las dificultades que representa para el estudiante integrarse al medio académico y social de la universidad. Siendo uno de los elementos las dificultades inherentes a la toma de decisión del estudiante con respecto a su futuro profesional, en la que influyen una serie de factores que inciden en la permanencia o deserción de los estudios universitarios.

## METODOLOGÍA

El modelo metodológico empleado en la investigación es de tipo interpretativo-cualitativo, basado en los métodos de investigación de Sandoval (2002a) y McCurdy, Spradley y Shandy (2004); integrando las etapas del proceso de investigación de ambos enfoques para efectos del fenómeno de estudio, como se muestra en la Tabla 1.

Tabla 1: Modelo Metodológico Integrado

Fases	Descripción	Actividades
I	Adquisición de herramientas conceptuales y contextuales	Revisión de la literatura Preparación para la entrada al campo
II	Identificación y focalización del fenómeno de estudio	Construcción del objeto de estudio Definición de los participantes Elaboración de la guía de entrevista estructurada
III	Aplicación del trabajo de campo	Entrevista con los participantes del estudio Registro de los datos
IV	Descripción de resultados	Tratamiento de la información Análisis e interpretación de los datos

*En esta tabla se muestran las fases y actividades, producto de la adaptación de la metodología de Sandoval (2002a) y McCurdy, Spradley y Shandy (2004) al fenómeno de estudio.*

Los sujetos de estudio fueron siete estudiantes de la Universidad Autónoma de Baja California (UABC), campus Tijuana, que realizaron su trámite de baja escolar por cambio de carrera en el Área de Orientación Educativa y Psicopedagógica (AOEP) de las diversas unidades académicas de la universidad y que accedieron voluntariamente a participar en la investigación. Cinco de los participantes son hombres y dos mujeres; cuatro de ellos de la carrera de ingeniería, los otros de medicina, negocios internacionales e informática. La técnica de recolección de datos utilizada fue la entrevista estructurada, cuya guía fue revisada por un panel de expertos y piloteada previamente para el protocolo de la entrevista final (ver anexo). La estructura de la guía de entrevista abarca dos posturas: una de ellas desde la perspectiva y experiencia del estudiante, y la otra desde el interés del investigador con respecto al fenómeno de estudio; siendo la finalidad indagar sobre los factores que intervienen en el proceso de exploración vocacional y cambio de carrera dentro del marco institucional de UABC.

Para el tratamiento de los datos se realizó la transcripción y análisis de las entrevistas estructuradas, acorde a los parámetros de Woods (2010) sobre el análisis especulativo. En un segundo momento se procedió a la técnica del microanálisis recomendada por Corbin y Strauss (2002), la cual consiste en realizar un análisis a detalle, palabra por palabra, oración por oración o párrafo por párrafo de la información, con la finalidad de obtener un sistema de códigos y categorías específicas, apoyándose para ello del software científico Atlas Ti. Por último se procedió a la codificación axial (Corbin y Strauss, 2002). Dicha clasificación trata de la identificación de códigos o categorías que tienen la propiedad de agruparse y relacionarse, hasta obtener categorías centrales y niveles de organización cada vez más incluyentes, de manera que se pudieran establecer relaciones entre las categorías (Porta y Silva, 2003).

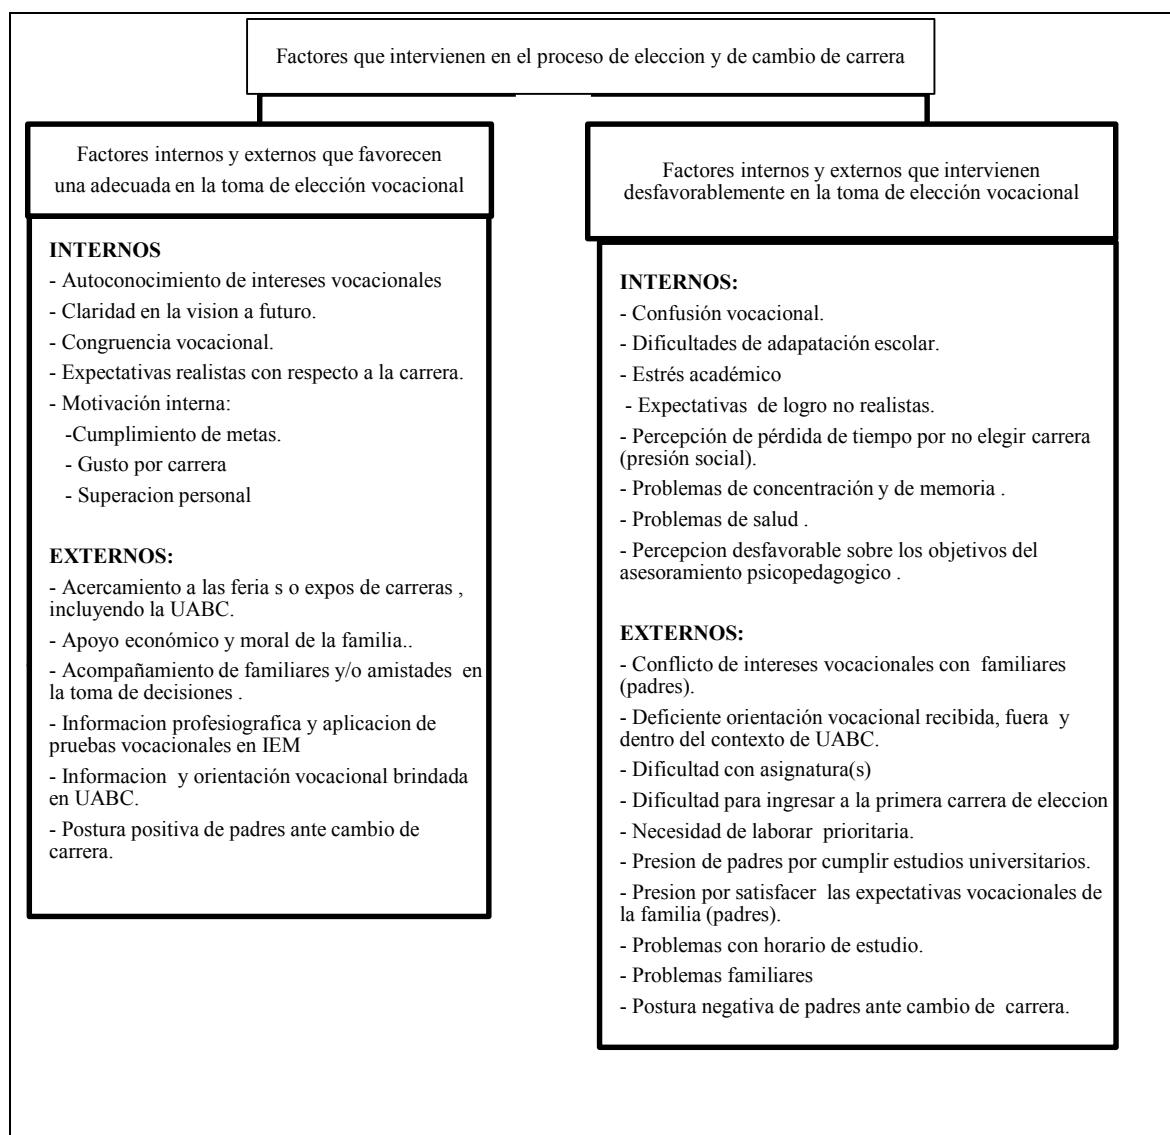

## RESULTADOS

Los resultados obtenidos muestran que los factores asociados al proceso de elección y cambio de carrera están ubicados en diferentes momentos de la toma de decisión vocacional. El primero, en el contexto de la educación media superior, en éste el estudiante se encuentra en un proceso de exploración y selección de la carrera a elegir; el segundo, en el contexto del ingreso en la universidad, en el cual continúa el proceso de exploración y evaluación de la carrera elegida. En el primer momento, el estudiante se ve influenciado por un conjunto de factores tanto externos (del contexto) como internos (propios del estudiante) para hacer una elección vocacional lo más acertada y congruente posible con su perfil vocacional, sus expectativas y su visión a futuro. En el segundo momento, y dependiendo de la resolución de la primera etapa de exploración y selección, el estudiante lleva a cabo un proceso de evaluación con respecto a la carrera elegida y si ésta cubre sus expectativas. Es en este segundo momento en donde aún eligiendo de forma acertada, el estudiante puede a lo largo del proceso de ingreso a la carrera verse afectado por diversos factores que pueden generar un proceso de atenuación y consecutivamente de deserción escolar.

En este sentido y como resultado de las entrevistas estructuradas realizadas a los participantes en el estudio, en la Figura 1 se muestran en términos generales los factores internos y externos que se identificaron

intervienen favorable o desfavorablemente en la toma de decisión vocacional en cada uno de los momentos o etapas del proceso de elección y cambio de carrera. Considerando como favorables, aquellos factores que estimulan la congruencia del individuo en cuanto a la elección de carrera, y como desfavorables, aquellos relacionados con la continuidad de estudios en una inadecuada elección de carrera, o la deserción escolar, en caso de una elección no acertada.

Figura 1: Factores Que Intervienen en el Proceso de Elección y Cambio de Carrera

La presente tabla muestra los factores internos y externos que intervienen favorable o desfavorablemente en el proceso de elección y cambio de carrera, tanto en la etapa de exploración vocacional (previo al ingreso del estudiante) como en la etapa de evaluación vocacional (una vez que ingresa a la universidad) en una primera o subsecuentes elecciones de carrera.

## CONCLUSIONES

Como resultado del estudio respecto al proceso de elección y cambio de carrera desde el contexto de la educación media superior hasta su inserción en el contexto de la UABC, se concluye que es de suma importancia considerar, tanto en el momento de exploración como en el de evaluación vocacional, los

factores internos y externos que intervienen favorable o desfavorablemente en el momento de la toma de decisión vocacional en una primera, segunda o incluso tercera oportunidad para que el proceso llegue a buen fin; esto es, que en el proceso de la elección de carrera en una primera ocasión, el estudiante cuente con los elementos y herramientas necesarias que le permitan una confirmación vocacional basada en una consolidación de la elección de carrera, o que la deserción escolar, en el mejor de los casos, trascienda en un cambio de carrera hacia la confirmación de una nueva elección vocacional más congruente con los intereses y necesidades del estudiante y no en el abandono escolar definitivo de los estudios. El análisis del proceso de elección y cambio de carrera, así como los factores implicados en ello, muestran los momentos cruciales en los que la intervención educativa e institucional es fundamental, con acciones preventivas y/o remediales que permitan disminuir la deserción escolar definitiva, asociada a la inadecuada elección vocacional y con ello el logro de la eficiencia terminal, no sólo en términos de porcentajes, sino de estudiantes satisfechos consigo mismos con la elección y visión de su futuro profesional.

### Limitaciones

Cabe mencionar, que si bien la metodología seleccionada es de tipo interpretativo-cualitativo y la riqueza en cuanto a la información que aporta de primera mano es valiosa porque parte de la percepción del sujeto participante, carece del referente cuantitativo que permita establecer estadísticamente con una muestra más amplia, la jerarquía o grado de incidencia de cada uno de los factores asociados al proceso de elección y cambio de carrera. Dicha situación, sin embargo, representa un nicho de oportunidad para dar continuidad y complementar el presente estudio, así como para la réplica o evaluación de futuras investigaciones.

## ANEXOS

### Anexo 1: Protocolo de la Guía de Entrevista Estructurada

Momentos	Etapas	Prototipos De Preguntas
I. Exploración del cambio de carrera.	1.1 Exploración desde la lógica emergente sobre factores que incidieron en el cambio de carrera.	-¿Cuáles fueron tus razones para cambiar de carrera? -¿Cuáles son las causas o motivos por los que decides abandonar la carrera para ingresar o intentar tu ingreso a otra carrera?
	1.2 Exploración puntual de factores asociados al cambio de carrera en diferentes niveles y contextos de la vida del estudiante. (explorar solo los pertinentes).	<b>Factores asociados a nivel personal.</b> - De manera particular ¿Hubo alguna circunstancia personal o de salud por la cual decidiste cambiar de carrera? Si, no ¿Cuál y como se dio? <b>Factores asociados a redes sociales (familia, amigos, compañeros de clase, etc.)</b> -En cuanto a la influencia de otras personas cercanas a ti ¿Hubo alguna influencia por parte de alguien? Si, no ¿Cuál? ¿De qué tipo? ¿Cómo se dio? <b>Factores a nivel aula.</b> -dentro del contexto del aula ¿Consideras que hubo alguna circunstancia, persona o situación haya influido en tu decisión para cambiar de carrera? Si, no ¿Cuál y como se dio? <b>Factores a nivel institucional (DOEP y UA).</b> -¿Hubo alguna circunstancia, persona o situación dentro del ambiente universitario que haya influido en tu decisión para cambiar de carrera? Si, no ¿Cuál y cómo se dio? -Platicame a mayor profundidad sobre como elegiste esta otra carrera. Es decir ¿Cómo llegaste a la decisión de cambiar de carrera? (El entrevistador deberá de explorar de tal manera que pueda identificar las diferentes etapas del proceso de exploración, selección y toma de decisiones del cambio de carrera y los factores que intervinieron en cada una de estas etapas. De ser posible, el entrevistador junto con el entrevistado en una hoja en blanco o en un pintaron estructuraran un esquema general en donde se visualice el proceso y los factores intervinientes). -Cuando decidiste cambiar de carrera, necesariamente tuviste que darte de baja definitiva y sabemos de las repercusiones de ello. Tomando en cuenta esto ¿Cómo te fue en este proceso de decisión? -¿Recibiste algún tipo de asesoramiento -psicopedagógico u otro-? Si, no ¿en qué consistió? -¿Te apoyaste de algún otro elemento para elegir la carrera? Si, no ¿Cuál y en qué consistió? -¿Qué tipo de apoyo crees tú que sería el ideal para realizar un adecuado cambio de carrera?
	1.3 Exploración del Proceso de Cambio de Carrera (PEC).	

<p>2.1 Exploración del PEC del estudiante previo a la primera elección de carrera.</p> <p>II. . Exploración del PEC en diferentes niveles contextuales y etapas de la trayectoria escolar previo al cambio de carrera.</p> <p>2.2 Exploración del PEC del estudiante durante el tiempo recorrido en la carrera de 1er elección.</p> <p>III. Cierre</p>	<p><b>En el nivel personal.</b>          -Platicame a mayor profundidad sobre cómo y por qué elegiste la carrera de 1er elección -de la que te diste (das) de baja definitiva-.          -¿Qué elementos tomaste en cuenta para elegir la carrera?          -¿Cuáles fueron tus expectativas al momento de elegir la carrera?          -En lo personal ¿Qué te llevó a tomar la decisión de estudiar una carrera universitaria principalmente la carrera que actualmente cursas?          -¿Consideras la elección de carrera parte de un proyecto de vida?          -¿Cuál es la razón o motivo por la que elegiste una carrera que no es de tu agrado?</p> <p><b>En el contexto de las redes sociales (familia, amigos, compañeros de clase, etc.)</b>          -Con respecto a las personas cercanas a ti ¿Hubo alguna influencia por parte de alguien en tu elección de carrera? Si, no ¿Cuál? ¿De qué tipo? ¿Cómo se dio?          -En tu opinión ¿Crees que las expectativas de tu familia o la influencia de tus amigos influyeron en tu elección de carrera? Si, no ¿Cómo?</p> <p><b>En el contexto de la orientación vocacional dentro de la institución media superior de procedencia.</b>          -¿Recibiste algún tipo de asesoramiento? Si, no ¿Cómo fue?          -¿Te apoyaste de algún otro elemento para elegir la carrera? Si, no ¿Cuál?          -¿De qué medios de información te apoyaste para elegir la carrera?          -¿Qué tipo de información te fue útil en la elección carrera?          -En caso de haber recibido algún tipo de información profesiográfica ¿Cuál fue la utilidad de esta información en tu elección de carrera?          -¿Cuál o qué tipo de apoyo crees que sea necesario para realizar una adecuada elección de carrera?          -¿Consideras necesario recibir algún tipo de información profesiográfica o asesoría vocacional previa a la elección de tu carrera?</p> <p><b>En el contexto del programa de atención a aspirantes por parte del AOEP.</b>          -¿Qué situaciones fueron importantes para ti en el momento de sacar la ficha para ingresar a la universidad?          -Los folletos, expo-profesiones, conferencias y talleres que organiza la UABC ¿te fueron de utilidad para la elección de carrera? o ¿Cómo los utilizaste?</p> <p><b>En el contexto de las actividades del curso de inducción y del proceso de integración a la vida universitaria.</b>          -Durante las actividades del curso de inducción ¿Qué información fue útil para confirmar tus expectativas sobre la carrera de tu elección?          -¿Cuáles de tus expectativas vocacionales no se cumplieron al momento de ingresar a la carrera?          -¿Que otra información sería de utilidad para confirmar tu elección o para ayudarte en tu proceso de exploración vocacional durante el curso de inducción?</p> <p><b>En el contexto de la intervención de los profesionales del AOEP posterior al curso de inducción.</b>          -Durante el tiempo recorrido hasta el momento como estudiante oficial de la UABC ¿Qué información fue útil para evaluar tus expectativas sobre la carrera de tu elección?          -¿Cuáles de tus expectativas vocacionales durante tu recorrido por la carrera?          -¿Que otra información sería de utilidad para confirmar tu elección o para ayudarte en tu proceso de exploración vocacional durante tu recorrido por los diferentes semestres de la carrera?          -¿Cuáles de tus expectativas no se cumplieron durante el tiempo recorrido hasta el momento como estudiante oficial de la UABC?</p> <p><b>En el contexto de las interacciones con otros actores propios de la institución como profesores, directivos, staff, administrativos, etcétera).</b>          -¿Qué circunstancias identificas dentro del aula (las interacciones con otros actores propios de la institución como el profesor, directivos, staff, administrativos, etcétera) que pudieron haber influido en tu decisión para cambiar de carrera?          -Desde tu propia experiencia ¿Qué sugieres/recomendarías para elegir una carrera?          -Si tuvieras la oportunidad de elegir nuevamente la carrera ¿qué volverías a hacer y que cambiarías?          -¿Qué aprendizaje te deja esta experiencia?</p>

## RECONOCIMIENTO

Los autores agradecen a la Universidad Autónoma de Baja California por las facilidades brindadas en recursos y tiempo para el desarrollo de la presente investigación, cuyos resultados pretenden aportar elementos de análisis en la toma de decisiones de las problemáticas que aquejan a la población estudiantil y, por ende, en el proceso educativo.

## BIOGRAFÍA

Sonia Martha Noreña Montoya es Maestra en Ciencias Educativas por la Universidad Autónoma de Baja California (UABC), campus Ensenada. Técnico Académico de Carrera, Tiempo Completo, Coordinadora del Área de Orientación Educativa y Psicopedagógica. Se puede contactar en la Facultad de Contaduría y Administración de la UABC, Calzada Universidad #14418 Mesa de Otay, C.P. 22390, Tijuana B.C., México. # **LAS FINANZAS PÚBLICAS EN MÉXICO ASPECTOS JURÍDICOS E HISTÓRICOS**

Jorge Alfonso Galván León, UABC  
Georgina Tejeda Vega, UABC  
Sergio Octavio Vázquez Núñez, UABC

## **RESUMEN**

*El presente trabajo aborda dos temáticas relacionadas a las finanzas públicas de México. La primera, incluye los aspectos jurídicos que se constituyen como la base legal sobre la cual las finanzas públicas se desenvuelven a nivel federal. En segundo plano se hace un análisis sobre los aspectos históricos que han marcado el rumbo del modelo federalista con el que funcionan las finanzas públicas en México. El objetivo general de la ponencia es mostrar la estructura general del modelo federalista en México y sustentar su funcionamiento con las principales leyes que regulan su accionar, dimensionando el esquema en el involucramiento de los tres niveles de gobierno a través de la estructura hacendaria nacional.*

**PALABRAS CLAVE:** Finanzas Públicas, Federalismo, Gobierno Federal

## **PUBLIC FINANCES IN MEXICO LEGAL AND HISTORICAL ASPECTS**

## **ABSTRACT**

*This working paper addresses two topics related to the public finance of Mexico. The first one includes legal aspects that constitutes the legal framework from where the public finance works at a federal level. In a second way, there is an analysis of historical aspects that have marked the course of the federalist model to operate in Mexico's public finances. The main objective of the working paper is to show the general structure of the federalist model in Mexico and to sustain its operation with the main laws that regulate it, involving the three government levels through the national finance structure.*

**JEL:** M00

**KEYWORDS:** Public Finances, Federalism, Federal Government

## **INTRODUCCIÓN**

En materia de gasto público, las acciones se han orientado hacia un ejercicio de los recursos públicos de forma responsable, eficiente y equitativa, con mayor transparencia y mejor rendición de cuentas, en un entorno que contribuya a la estabilidad económica (CGPE, 2010). Las reformas al marco legal presupuestario en consonancia con el objetivo del Plan Nacional de Desarrollo 2007-2012 en materia de gasto público para mejorar su calidad y su eficiencia, así como para darle un mayor impulso a la rendición de cuentas y la transparencia, mediante un Presupuesto basado en Resultados y un Sistema de Evaluación del Desempeño, fortalecen los mecanismos institucionales para: Incrementar la calidad del gasto público con un enfoque por resultados; promover la productividad y austeridad, y fortalecer la transparencia y la rendición de cuentas. Establecer un proceso riguroso de evaluación de las políticas públicas de acuerdo con el logro de metas y resultados, incluyendo el gasto federalizado y los subsidios a las entidades federativas (CGPE, 2010).

### Marco Normativo de las Finanzas Públicas en México

El marco normativo del tema de las finanzas públicas para el caso de México está respaldado, principalmente, en la Constitución Política de los Estados Unidos Mexicanos, promulgada en febrero de 1917 y que en ella descansan las bases del sistema hacendario mexicano, resaltando las atribuciones que la federación, los estados y los municipios tienen respecto al tema. El marco legal básico en el tema hacendario en México, para efectos de la presente investigación, es el siguiente:

### Constitución Política de los Estados Unidos Mexicanos (CPEUM)

Las facultades del poder legislativo, para efectos del tema tratado en la presente investigación, son las siguientes:

Inciso VII. La de imponer las contribuciones necesarias para “*cubrir el presupuesto*”.

Inciso XXIX. Para establecer todas las contribuciones que se utilizan en el sistema fiscal nacional (Artículo 73, CPEUM).

Por otro lado las facultades exclusivas de la Cámara de Diputados se señalan en el artículo 74, de las cuales algunas se mencionan a continuación, considerando las que resultan afines al tema de la presente investigación:

*“Aprobar anualmente el Presupuesto de Egresos de la Federación, previo examen, discusión y, en su caso, modificación del Proyecto enviado por el Ejecutivo Federal, una vez aprobadas las contribuciones que, a su juicio, deben decretarse para cubrirlo”. “El Ejecutivo Federal hará llegar a la Cámara la Iniciativa de Ley de Ingresos y el Proyecto de Presupuesto de Egresos de la Federación a más tardar el día 8 del mes de septiembre, debiendo comparecer el secretario de despacho correspondiente a dar cuenta de los mismos. La Cámara de Diputados deberá aprobar el Presupuesto de Egresos de la Federación a más tardar el día 15 del mes de noviembre”. “Cuando inicie su encargo en la fecha prevista por el artículo 83, el Ejecutivo Federal hará llegar a la Cámara la Iniciativa de Ley de Ingresos y el Proyecto de Presupuesto de Egresos de la Federación a más tardar el día 15 del mes de diciembre” (Art. 74, CPEUM).*

En el artículo 89 inciso I se destacan las facultades y obligaciones del Presidente como la de promulgar y ejecutar las leyes que expida el Congreso de la Unión, proveyendo en la esfera administrativa a su exacta observancia. El artículo 115 menciona la forma de gobierno que adoptarán los Estados, los cuales tendrán como parte fundamental a los Municipios. En el tema municipal, resaltan las funciones y los servicios que por ley están obligados a prestar a la ciudadanía. Continuando con la parte normativa de la actividad fiscal y presupuestaria en México, encontramos al Sistema Nacional de Coordinación Fiscal (SNCF) el cual tiene su origen, según se menciona en el sitio oficial de internet del sistema, en la propia Ley de Coordinación Fiscal que está en vigor desde enero de 1980, buscando mantener una relación estrecha de cooperación entre los actores representantes del Poder Ejecutivo a nivel Federal y Estatal relacionados a temas de finanzas públicas. Dentro del marco legal del SNCF encontramos, como principal referencia en la materia, a la Ley de Coordinación Fiscal, de la cual a continuación enunciaremos los aspectos que a juicio de la presente investigación se consideran de mayor impacto a la forma en que las Finanzas Públicas funcionan en México.

### Ley de Coordinación Fiscal

Esta ley pretende sentar las bases de lo que es el Sistema Nacional de Coordinación Fiscal en México, el cual permite manejar las reglas para las asignaciones presupuestales del Gobierno Federal a los Gobiernos

Estatales y Municipales. Haciendo mención de ocho fondos que se analizan más adelante, y de los cuales se determinan de manera particular las fórmulas para el cálculo de los montos correspondientes, según lo señala el propio capítulo a lo largo del texto.

*Convenios de adhesión al Sistema Nacional de Coordinación Fiscal y sus anexos.*

*Convenios de Colaboración Administrativa en materia Fiscal Federal y sus anexos.*

*Convenios en materia de puentes de peaje.*

*Reglamentos y reglas de los organismos del SNCF.*

Con la Ley de Planeación se busca regular la actividad propia de la planeación a la que está sujeto el Gobierno Federal, incluyendo la propia planeación financiera a través de la presentación del paquete económico año con año, específicamente de la propuesta de ley de ingresos y del presupuesto de egresos. El Presidente de la República, al enviar a la Cámara de Diputados las iniciativas de Leyes de Ingresos y los Proyectos de Presupuesto de Egresos, informará del contenido general de dichas iniciativas y proyectos y su relación con los programas anuales que, conforme a lo previsto en el Artículo 27 de esta ley, deberán elaborarse para la ejecución del Plan Nacional de Desarrollo (Art.7, Ley de Planeación).

### El Federalismo en México

El punto de partida para estudiar el federalismo es considerar los principios constitucionales del Estado federal y revisar si cumplen las siguientes características:

*pluralidad en los centros de poder, soberanos y coordinados entre sí; b) que el Estado federal tenga conferidos poderes indispensables para garantizar la unidad política y económica; c) que a los Estados federados se les confieran y asignen los poderes restantes; d) que al gobierno federal se le confieran competencias de monopolio en materia militar y de política exterior; e) que al gobierno federal se le permita eliminar fronteras militares entre los Estados; f) que los problemas y conflictos entre el gobierno federal y estatal se resuelvan a través de tribunales; g) que la consecuencia de la distribución de competencias entre pluralidad de centros de poder independientes y coordinados entre sí, en cada parte del territorio y cada individuo, se sometan al gobierno federal y al Estado federado, sin que desaparezca el principio de unidad de decisión sobre cada problema (Moctezuma, 2003)*

El federalismo fiscal es un término que agrupa las relaciones económico-financieras entre los distintos niveles de gobierno y demás actores del sector público, con fines de analizar y comprender el andamiaje institucional y normativo de dichas relaciones. En México, estas relaciones se encuentran básicamente establecidas bajo el régimen de transferencia de recursos entre los distintos órdenes de gobierno, que se delimitan en gran medida bajo los lineamientos del Sistema Nacional de Coordinación Fiscal, fundamentado así mismo por la llamada Ley de Coordinación Fiscal, donde se determina la forma y monto de estos recursos (Saucedo, 1997). Dicho sistema se funda hacia 1980 y descansa, normativamente hablando, en la Ley de Coordinación Fiscal, principalmente, además de la propia Constitución Política de los Estados Unidos Mexicanos, y de una serie de convenios y reglamentos relacionados al tema del federalismo fiscal. La necesidad de reformar la manera en que interactúan gobierno federal y los gobiernos estatales en el tema de las finanzas públicas, en particular en lo relacionado a la transferencia de recursos, ha quedado evidenciada en propuestas como la hecha por el ex presidente de México, Ernesto Zedillo, donde hablaba de la necesidad de trabajar para lograr un “renovado federalismo”, o bien el Programa Especial para un Auténtico Federalismo 2002-2006 promovido durante el gobierno del también ex presidente Vicente Fox, en donde se dice que el auténtico federalismo plantea nuevas formas de interacción

y coordinación entre los órdenes de gobierno, así como mecanismos efectivos de rendición de cuentas y participación ciudadana, orientadas a la atención eficaz de las demandas sociales, en un marco de cooperación y respeto recíproco (SEGOB, 2002).

Es por ello que en México se requiere dar un importante giro que lleve a una profunda redistribución de autoridad, responsabilidades, atribuciones y recursos, así como de capacidad real de decisión; esto, por supuesto, sin limitar de manera alguna la capacidad de respuesta de la Federación (Saucedo, 1997). Es importante recordar que las principales decisiones en esta materia se toman desde el Gobierno Federal, impactando la manera en que las finanzas públicas de los Estados, y a su vez de los Municipios, funcionan, donde muchas de las ocasiones se desconocen las necesidades de todas y cada una de las entidades federativas y sus comunidades, lo que provoca una desconexión y un mal funcionamiento del sistema.

### Visión del Federalismo Mexicano

En el marco del mundo global y al inicio del siglo XXI, el federalismo que México requiere es distinto al que nuestros fundadores imaginaron y mucho más profundo que el experimentado en los últimos años. Cuando el concepto de soberanía se redefine, las nociones de lo local, lo nacional y lo mundial se modifican, y nuestros gobiernos locales no sólo compiten con la región inmediata, sino con entidades sub-nacionales de otros países, el Auténtico Federalismo adquiere un cariz distinto (SEGOB, 2002). La globalización y el pluralismo cultural constituyen los dos principales retos para las democracias liberales actuales. Se trata de dos retos que inciden en la renovación del federalismo. Uno de los rubros a los que se enfocaron las propuestas que se presentaron en los tres foros nacionales y los veintinueve estatales fue, precisamente, el rubro de las finanzas públicas, destacando la importancia de la acelerar la transición de un Sistema Nacional de Coordinación Fiscal a uno de Coordinación Hacendaria. Considerando que la Coordinación Hacendaria va más allá de la actividad recaudatoria que la política fiscal promueve, buscando volver más eficiente el cobro de contribuciones y optimizando el uso de los distintos instrumentos de política fiscal con los que cuenta el Gobierno Federal, pero también resaltando la importancia de la correcta aplicación de la Política de Gasto Público, haciendo más eficiente el uso de los recursos que de entrada, cada vez se vuelven más escasos. De acuerdo al Programa Especial para un Auténtico Federalismo 2002-2006, se trata de contar con los siguientes aspectos en materia hacendaria:

*Un Sistema Fiscal competitivo a nivel internacional que aliente el ahorro, la inversión y el empleo; Generar una mayor autonomía financiera de los estados y municipios, mediante instrumentos que amplíen sus capacidades para generar ingresos propios; Mejorar su esfuerzo en la colaboración administrativa en materia fiscal; Mantener la certeza en el acceso a sus participaciones, contando para ello con reglas claras para solventar sus responsabilidades en materia de gasto público descentralizado; Fortalecer y ampliar su acceso al financiamiento público.*

Según lo menciona el Gobierno Federal en el Programa Especial para un Auténtico Federalismo (PEAF), que el federalismo hacendario se constituye en un elemento esencial de coordinación intergubernamental, dada la necesidad de garantizar cargas fiscales equitativas y proporcionales a los contribuyentes, de promover un ejercicio de gobierno más eficiente, así como de impulsar un desarrollo regional equilibrado, en un marco de respeto a las autonomías locales, estabilidad económica y coherencia con las políticas nacionales. La evolución del federalismo, como lo afirma Marcello Carmagnani (1993), descansa bajo dos vertientes, por un lado considerando los elementos condicionantes relativos a la economía y a la sociedad, y por otro, a los elementos internos, relativos a las instituciones, la política y la cultura política.

La tensión entre federación y estados tiñe al mismo tiempo las relaciones entre el Ejecutivo y el Legislativo federal, y deriva del hecho de que el control que constitucionalmente podía ejercer el congreso sobre el presupuesto federal se limitaba exclusivamente a decretar, según la Constitución de 1857, las contribuciones para cubrir los gastos y al examen del presupuesto ejercido en el año precedente, pero no tenía injerencia en la definición del gasto público, según los artículos 68 y 69 (Carmagnani, 1993). El

funcionamiento del federalismo descansa en cuatro aspectos: prácticas políticas, funcionamiento de órganos constitucionales, elecciones y finanzas públicas.

De igual forma es importante asociar el tema del federalismo con la descentralización política, parte fundamental para lograr la funcionabilidad necesaria del auténtico federalismo basándose en el empoderamiento de dos entes participantes en la vida republicana de México y que le permiten al propio Estado mexicano integrarlos al sistema de instituciones: los estados y municipios. Las esferas de poder que emanan de los tres niveles de gobierno que encontramos en el Estado mexicano manifiestan tres distintas fuerzas que concurren o divergen, según sea el tema y el caso en particular, pero que juntas forman parte del sistema institucional fundado en las relaciones interdependientes entre los miembros, considerando diversos temas como el propio de las finanzas públicas, la cuestión fiscal, la ejecución del gasto público, la adecuación de sus sistemas financieros acorde con el dinamismo de la propia economía mundial, entre otros. Es prioritario resaltar que el modelo de Federalismo se concibe como una suma de poderes de los tres niveles que lo integran -para el caso mexicano el nivel federal, estatal y municipal- donde debe de existir una voluntad para la cooperación inter e intra-institucional, que facilite el desenvolvimiento del gobierno y mejore conforme transcurre el tiempo, la relación de gobernantes con gobernados. Entendiendo que el grado de voluntad para la cooperación entre las distintas esferas puede variar, de hecho lo hace, por diversos motivos, lo que llega a dificultar, para el caso de las finanzas públicas, el flujo del recurso a través de los distintos mecanismos existentes para la distribución del dinero desde la federación hacia los estados y municipios y su utilización a través de la ejecución del presupuesto gubernamental en los tres niveles de gobierno, principalmente.

El federalismo implica que la descentralización política le sea consecuente. Un federalismo proclamado en espacios centralizados, no tiene opción de realización plena. Un federalismo proclamado en terreno abonado para la centralización factual del poder, se queda en mera noción doctrinaria. En cambio, cuando hay decisión para dar vigencia al federalismo, es básico dar cauce a los movimientos de la descentralización política que, unida a la democracia moderna, permite que la representación geográfica - provincial, regional, comunal, municipal - de un país sea amplia y efectiva (Uvalle, 1995). Uno de los problemas que el propio Ricardo Uvalle resalta es que “El federalismo mexicano se encuentra limitado por el papel protagónico del presidencialismo. Las relaciones políticas son asimétricas y las relaciones administrativas favorecen al poder central en detrimento de los estados y los municipios”. Lo que provoca que tanto Estados como Municipios reclamen, entre otras cosas, mayor grado de descentralización y autonomía financiera para fortalecer sus sistemas de finanzas públicas y poder utilizar el gasto público como uno de los motores de crecimiento dentro de sus propios territorios.

#### El Papel de los Estados y Municipios en el Federalismo Mexicano

En la actualidad, el federalismo en México se encuentra integrado por tres ámbitos de gobierno: el federal, el estatal y el municipal (El Municipio fue reconocido como ámbito de gobierno en las modificaciones que se realizaron al Artículo 115 constitucional en el año de 1999.) La óptica que cada uno de los tres niveles de gobierno tiene respecto al tema del federalismo es diferente. Por un lado los estados y municipios promueven el funcionamiento de un federalismo más eficaz que les permita contar con mayores recursos para hacerle frente a las múltiples y crecientes necesidades de su población, y por otro lado, el gobierno federal ha promovido a lo largo de los últimos veinticinco años, procesos continuos de descentralización de funciones hacia los propios estados y municipios, lo que, en teoría, busca responder a esas necesidades de mayor autonomía de las dos esferas de gobierno más cercanas a la ciudadanía. Con estos movimientos, los estados y en particular los municipios empiezan a cobrar una relevancia cada vez mayor y que es evidente cuando se analizan temas relacionados a las condiciones de vida de las diferentes regiones en el país. Por ejemplo, es evidente el rezago en el desarrollo social y económico que presenta la región del sur en comparación al alto grado de industrialización y mejoramiento de las condiciones de vida de los

habitantes de los estados del norte de México, dejando en el plano intermedio la región centro que ve a la consolidación del sector terciario de la economía como una vía para seguir promoviendo el desarrollo de la misma, dadas las carencias de espacios físicos y la baja dotación de recursos naturales para un sector industrial demandante de los mismos, como es el caso concreto del Distrito Federal.

El movimiento que el Gobierno Federal inició en la década de 1980 enfocado en la descentralización administrativa hacia los estados y municipios, motivó las reformas constitucionales que a mediados de la misma década se dieron para otorgarle nuevas responsabilidades respecto al otorgamiento de servicios públicos por parte de los ayuntamientos para con la ciudadanía, así como los mecanismos a través de los cuales sus finanzas se iban a ver beneficiadas por fuentes nuevas de ingresos públicos, particularmente el impuesto predial. Esto vino a fortalecer a la figura de los presidentes municipales y de los gobernadores de los estados, ya que dicha descentralización los obligó a ampliar los servicios públicos que otorgaban a la ciudadanía y con ello ver incrementados los montos presupuestales, por obvias razones, que todos y cada uno recibía, ya que las reformas constitucionales así lo estipulaban. De cualquier forma, es necesario tener presentes dos elementos importantes en esta reorganización administrativa y presupuestal.

La primera es que los gobernadores obtuvieron una mayor influencia política y social, y, aunque también lo fue económica, ésta se vio condicionada por criterios de aplicación que siempre se ha reservado el gobierno federal. El segundo aspecto es que son precisamente las restricciones económicas las que se han convertido en el principal problema de los gobernadores con la federación, lo que ha motivado demandas en el sentido de que se rediseñe el esquema de asignación, pues los requerimientos financieros, derivados de una mayor administración y prestación de servicios, no se han acompañado de un flujo de recursos equivalente (Hernández, 2006). Por otro lado, es importante resaltar que la globalización tiende a limitar la actuación económica de los estados nacionales y otorga un nuevo y protagónico papel a las regiones y a las redes de ciudades (Ziccardi, 2003). Por lo que el papel principal que ha adquirido el municipio para consolidar la democracia social que se ha promovido por occidente en los últimos años, por ser el ámbito de gobierno más cercano a la ciudadanía, resulta vital para la consolidación de un modelo de federalismo que responda a la constante necesidad de fortalecer los vínculos existentes.

Aunque es importante señalar que los cambios en el federalismo actual que se aplica en México, con la finalidad de otorgarle mayor autonomía y descentralización en aumento de funciones recaudatorias, principalmente, representarían un riesgo que Jaime Cárdenas Gracia, en su publicación titulada “México a la luz de los modelos federales”, identifica como “el riesgo de la desigualdad socioeconómica regional”; que en las palabras del propio autor consiste en que “como posible solución a la injusta distribución, algunos partidos políticos han propuesto la competencia de tipo fiscal o hacendario entre estados para atraer inversiones a los respectivos territorios”, lo que puede traer como consecuencia un desequilibrio en los ya de por sí dispares niveles de desarrollo socioeconómico que tienen los estados de México, así como evidenciar las debilidades del modelo federalista mexicano mostrando señales de rompimiento de la unidad nacional a través de la promoción de los sentimientos localistas, lo que más que beneficiar al actual modelo federalista, lo perjudicaría.

Aunque con los cambios administrativos y presupuestales que se han venido dando desde el gobierno federal, la cesión de atribuciones y recursos a los gobiernos estatales y a los municipales es evidente y sigue en aumento, lo que ha ampliado el grado de autonomía política con el poder ejecutivo federal y han visto fortalecidas sus finanzas públicas, lo que representa un cambio de paradigma en la manera que históricamente funcionaban estos temas, lo cual viene a representar un progreso sustancial para el nuevo modelo de finanzas públicas en México, ya que el exceso de centralismo que se tuvo en el país a lo largo de su historia, por un lado aseguró la integración federal de todos los estados y municipios, independientemente de las diferencias locales que cada uno presentaba, y por otro trajo consigo un sometimiento excesivo de los gobiernos de las entidades federativas al ejecutivo federal, esquema que inició

su rompimiento precisamente en la alternancia que empezó en 1989 con el triunfo del Partido Acción Nacional (PAN) en las elecciones para gobernador del Estado de Baja California, hecho histórico que representó el primer gobierno estatal de oposición hacia el poder ejecutivo federal, e inició el cambio en el modelo presidencialista que hasta entonces reinaba en México.

Sin mecanismos de subordinación como los que anteriormente existían entre las relaciones del ejecutivo federal y los ejecutivos estatales, los gobernadores han cuestionado a lo largo de los últimos veinte años el esquema federal de repartición de recursos por parte del gobierno central y han logrado construir una agrupación que representa sus intereses, la CONAGO (La Conferencia Nacional de Gobernadores (CONAGO) es un organismo que agrupa a Gobernadores de las entidades federativas de México la cual busca “fortalecer el federalismo mediante mecanismos democráticos”, según se menciona en el propio sitio electrónico del organismo, <http://www.conago.org.mx/Default.aspx>.) y han estrechado sus relaciones con el Poder Legislativo Federal, aprovechando los vínculos estrechos de los poderes ejecutivo y legislativo a nivel estatal, aunque la pluralidad política de las cámaras algunas veces dificulta o retrasa las negociaciones relacionadas a los temas presupuestales, aspecto que es visto como parte del progreso político y de la madurez democrática que México está adquiriendo conforme transcurre el tiempo.

Aunque los gobernadores no han conseguido modificar sustancialmente el esquema fiscal y por lo tanto se mantienen las limitaciones en su aplicación, sí han obtenido incrementos en las asignaciones que presionan los márgenes de acción del gobierno federal (Hernández, 2006). Por lo que la independencia de poderes y el haberse liberado del yugo excesivo que ejercía el poder ejecutivo federal no servirá de mucho, si no se logra emparejar las necesidades de cada estado con las de la nación en su conjunto, ya que el aislamiento y la separación entre entidades federativas y gobierno federal más que fortalecer el federalismo mexicano, lo debilitaría, lo que iría en sentido contrario al objetivo que se busca que es lograr un país integrado y equilibrado. Para el caso de los municipios, que se considera como la dimensión política más cercana al ciudadano y la más compleja, en muchos aspectos, de analizar y comprender, presentan varios problemas en cuanto al tema hacendario y de finanzas públicas se refiere, entre los que destacan los siguientes:

*No cuentan con suficientes fuentes de ingresos. Este tema se abordará más adelante cuando se analice la participación del Municipio dentro del Sistema de Coordinación Fiscal que funciona en México. El porcentaje de ingresos propios es muy bajo en proporción a las participaciones federales. El porcentaje de gasto corriente es muy superior a la inversión que se genera por parte del propio gobierno municipal. Los criterios de distribución de las participaciones federales es obsoleto, ya que no cumple con las necesidades de ciertos municipios que, dada la dinámica poblacional actual, demandan mayores recursos para hacerle frente a sus obligaciones que por ley tienen. El tema de la rendición de cuentas parece ser ajeno a los municipios, es muy poco lo que se ha avanzado en el tema. El nivel de apalancamiento financiero que algunos gobiernos municipales tienen, condiciona recursos futuros.*

Por lo mencionado anteriormente es importante tener bien claro qué se entiende por Federalismo Hacendario, el cual se define, según lo hace la propia Secretaría de Gobernación: “Es el proceso relacionado con el logro de los acuerdos necesarios para alcanzar una distribución equitativa y eficiente de los recursos públicos y potestades tributarias entre los tres órdenes de gobierno” (PEPAF 2002-2006).

Los recursos transferidos a las entidades federativas y municipios, a través de los fondos del Ramo 33, representan hoy en día la principal fuente de ingresos de los diferentes niveles de gobierno. Sin embargo, dichos recursos tienen una aplicación etiquetada, lo que limita a los gobiernos estatales y municipales en la aplicación de los mismos. En teoría, los recursos “etiquetados” del Ramo 33 son un instrumento diseñado para avanzar en el federalismo, pero en el que las decisiones se continúan tomando a nivel central (CIDE, 2004). Según el diagnóstico del CIDE, “fue la situación de gobierno dividido lo que promovió las condiciones para iniciar la descentralización de recursos hacia los gobiernos estatales y municipales”. Los

convenios de descentralización fueron sustituidos por los Fondos de Aportaciones Federales del Ramo 33. Los fondos existentes son los siguientes:

*Fondo de Aportaciones a la Educación Básica y Normal (FAEB). Fondo de Aportaciones para los Servicios de Salud (FASS). Fondo de Aportaciones para la Infraestructura Social (FAIS). Fondo de Aportaciones para el Fortalecimiento de los Municipios y de las Demarcaciones Territoriales del Distrito Federal (FORTAMUN). Fondo de Aportaciones Múltiples (FAM). Representa los recursos que descentraliza el Sistema Nacional para el Desarrollo Integral de la Familia (DIF) y el Comité de Administración y Construcción de Escuelas (CAPFCE). Fondo de Aportaciones para la Educación Tecnológica y de Adultos (FAETA). Fondo de Aportaciones para la Seguridad Pública de los Estados y del Distrito Federal (FASP). Fondo de Aportaciones para el Fortalecimiento de las Entidades Federativas. El fondo fue creado con la finalidad de fortalecer las finanzas públicas de las Entidades Federativas y del propio Distrito Federal.*

Son evidentes las incongruencias entre las fórmulas que se consideran para la distribución de los recursos, previstas en la LCF y los montos distribuidos entre los estados y municipios. La historia de las federaciones se ha caracterizado principalmente por el desarrollo de modelos simétricos. Fundamentalmente, estos modelos se hallan asociados a entidades uninacionales y a sus procesos de *nation-building* (Requejo, 2000). Podemos decir que en México existe una federación simétrica, ya que “el pacto desde el que este tipo de federalismo queda ‘constituido’ se basa normalmente en un proceso de agregación que conlleva la cesión por parte de las unidades federadas de una serie de competencias y poderes a la autoridad central”, según lo menciona el propio autor. Además, también señala que “las unidades federadas normalmente ejercen competencias legislativas, ejecutivas, judiciales y económicas” como sucede en el caso mexicano, ya que las entidades federativas tienen plena autonomía para conformar los tres poderes de gobierno, según se señala en la Constitución Política de los Estados Unidos Mexicanos y, de manera individual, en todas las constituciones políticas de cada uno de los estados.

## CONCLUSIONES

Es evidente que la estructura actual que conforma el andamiaje institucional y legal relacionado a las finanzas públicas en México es complejo y necesita ser analizado desde diferentes contextos para comprender el funcionamiento práctico del mismo. Conforme vaya evolucionando la relación de los diferentes niveles de gobierno y reformándose el actual sistema, la hacienda pública en México trabajará con reglas modernas acordes a las necesidades y al contexto actual del país, de lo contrario se seguirán presentando problemas en las reglas para el reparto del dinero público como hasta hoy.

## RESUMEN

*En éste artículo se analizó la importancia que tiene la actividad agrícola y los mercados rurales de Huixcolotla y Zacapoaxtla, ubicados en el estado de Puebla, México, en el desarrollo económico regional. El trabajo de campo se realizó en los años 2010, 2011 y 2012. Es un estudio explicativo que profundiza el conocimiento de dichos mercados con respecto a la producción, comercialización, costos, ganancias, generación de empleos, entre otros. El estudio se centró en dos regiones del estado de Puebla: norte y centro. La primera se caracteriza por la producción de cultivos bajo la modalidad de temporal, la segunda es de riego. Los resultados indican que ambas regiones son un importante generador de ingresos para los proveedores de materias primas, productores y comercializadores. La región de Huixcolotla aporta más elementos para que se dé un proceso de desarrollo económico regional más acelerado, debido a que genera mayores ganancias cuando se vende el producto en el mercado; además, la inversión de insumos agrícolas y generación de empleos es mayor. La existencia de estos mercados rurales, asegura ingresos para los productores y la actividad económica incrementa.*

## AGRICULTURAL AND RURAL MARKETS HUIXCOLOTLA AND ZACAPOAXTLA, PUEBLA, AS POTENCIAL FOR REGIONAL ECONOMIC DEVELOPMENT

## ABSTRACT

*In this article study the importance of agriculture and rural markets and Zacapoaxtla Huixcolotla , located in the state of Puebla, Mexico , in regional economic development. Fieldwork was conducted in the years 2010, 2011 and 2012. It is a descriptive study that deepens the knowledge of these markets for the production, sales, costs, profits, employment generation, among others. The study focused on two regions of the state of Puebla: north and center. The first is characterized by the production of crops in the form of time the second irrigation. The results indicate that both regions are an important revenue generator for raw material suppliers, producers and marketers. Huixcolotla region contributes more items for a faster process of regional economic development to occur, because it generates higher profits when the product is sold in the market, investment in agricultural inputs and job creation is higher. The existence of these rural markets, says producer incomes and economic activity increases.*

## INTRODUCCIÓN

En las últimas décadas la aportación del sector agrícola al Producto Interno Bruto de México (PIB) ha sido escaso, representó apenas el 3.4% en 2012. Uno de los problemas es la desarticulación entre la producción, comercialización y consumidor final. Además, las crecientes importaciones de productos agrícolas han puesto de manifiesto la falta de competitividad que tienen los productores en ciertos eslabones de la cadena de suministro y logística. Sin embargo, existen zonas productoras agrícolas y mercados rurales regionales que pueden llegar a reactivar parte de la economía de la región, presionar para que la oferta y demanda de productos agrícolas se lleguen a equilibrar y fluya la información adecuadamente y la generación de ingresos suficientes para que las personas puedan obtener servicios básicos. Ésta investigación se presenta organizada como sigue. En la sección de literatura se plantean diversos puntos de vista del concepto de mercado, mercados rurales y su influencia económica en los productores agrícolas y comercializadores. Posteriormente se presenta la metodología utilizada, en donde se describe el proceso que se siguió para elegir a las zonas de estudio, productos agrícolas y los instrumentos para obtener la información, que fue a través de entrevistas y cuestionarios. Se hizo énfasis en la inclusión de autoridades federales y estatales que tienen que ver con la temática abordada. Para calcular costos, ganancias y aportación económica de la región se utilizó el método de reconstrucción de costos de producción, ganancias y precios de mercado. Por último se presentan las conclusiones resaltando la importancia de la existencia de éstos mercados rurales y regiones productoras agrícolas para la reactivación económica regional.

## REVISIÓN DE LITERATURA

En los últimos años ha existido un interés constante por el papel que tiene la agricultura en los procesos de desarrollo y la implementación de mecanismos que permitan atacar las causas estructurales que han impedido su avance. Para enfrentar éstas causas, se requiere de un nuevo pensamiento, formas diferentes de relación entre los actores, una mayor inclusión de los segmentos más pobres y una definición clara de un nuevo rol para el sector público y privado, además de una nueva gobernabilidad (IICA, 2010). Esto ha influido al interés constante sobre la búsqueda de formas exitosas para vincular a los productores-campesinos de pequeña escala con los mercados y cadenas de valor. El tema es relevante porque éste grupo de actores contribuye con cantidades sustanciales de alimentos en el mundo. Para que los productores de pequeña y mediana escala se sean incluidos en los procesos de intercambios de mercancías y económicos, ya sean locales, regionales o de exportación, es necesario una acción conjunta entre los gobiernos, el sector privado y población en general. La vinculación de los pequeños y medianos productores con los mercados requiere una forma asociativa para reducir costos de transacción, mejorar sus capacidades de negociación, aumentar cohesión social y mejorar la autogestión.

Diversos autores han definido las funciones del mercado desde varios puntos de vista. Desde la perspectiva económica, Shepherd (1946) señala que un mercado es un grupo de vendedores y compradores compitiendo libremente con facilidades para comerciar. Molho (1997) lo concibe como un espacio en que las fuerzas de la oferta y demanda (compradores que intercambian dinero por bienes y servicios y vendedores bienes y servicios por dinero), se ponen en contacto para determinar o modificar los precios de los productos (mercancías), y donde la posesión de un bien o servicio es transferida en forma física o institucional. Además, es ahí donde se establecen los precios con base en: nivel rural y/o urbano, mayoreo, menudeo y al consumidor final (García, 2003). En el ámbito rural, Chayanov (1979) consideró que el sistema de mercados rurales es importante para los habitantes del medio rural, pues les permite vender sus excedentes de producción y adquirir otros que ellos no producen; es generador y reproductor de mano de obra disponible y barata, orientada a empresas locales y regionales de los tres sectores de la economía; productor y proveedor de bienes de consumo y materias primas a bajos precios, en los mercados locales y regionales.

Para llevar a cabo el sistema de mercadeo, dos o más agentes sociales en condiciones de igualdad o desigualdad, establecen relaciones de intercambio que se sujetan a racionalidades particulares y marcan sus pautas de acción social. Se entiende en términos de un sistema en el que los agentes son los medios que permiten los intercambios, mismos que constituyen el fin. No se refiere únicamente al lugar concreto donde ocurren las transacciones, se entiende más bien como síntesis de un fenómeno social que se realiza en todas partes y de manera continua (Malinowsky, 2005). A pesar de las ventajas económicas que ofrecen los mercados rurales, en los últimos años se han enfrentado a diversas problemáticas: carencia de infraestructura adecuada para la distribución de productos agrícolas (Arvizu, 2013); pocas oportunidades para que los productores obtengan crédito antes de iniciar el proceso de producción y comercialización; falta de organización para que los agentes económicos (productores, acopiadores, comerciantes, consumidores) participen de una manera más activa en las actividades del mercadeo agrícola local, regional y nacional; carencia de valor agregado a los productos durante la producción, cosecha y postcosecha (Caldentey y Haro, 2004); ausencia de los servicios de comercialización en los mercados regionales; estructuras imperfectas de mercado, así como, información incompleta de los mercados y precios (Siller, 2009).

Malinowski (2005) afirma que para el estudio de mercados rurales se necesita definir regiones como unidad de análisis, ya que éstos constituyen el principal mecanismo de distribución, además revelan la forma en que la gente dispone de productos y adquiere estos para su consumo, así como para la organización económica de cada localidad y distrito. La formación de un mercado regional se da a partir de los centros de consumo, la demanda es la fuerza activa en un mercado competitivo (Villa, 2011); la oferta a su vez reacciona con la demanda, de ahí que cada zona consumidora establece sus áreas de abastecimiento dependiendo de sus referencias de precio (Smith, 1981). El área de abastecimiento se extiende tanto como los precios de otras zonas consumidoras le permitan ser competitiva en la compra de cierto producto. Desde ésta perspectiva cobra importancia el tema de los mercados agrícolas en las áreas rurales, ya que existen problemas muy serios en relación a la productividad y comercialización.

Si bien, existen estudios relacionados al análisis de costos de producción para productos agrícolas, dejan a un lado la relación estrecha que hay entre la producción agrícola y comercialización, además de la posibilidad de convertirse en un instrumento clave para el desarrollo económico y social de localidades y regiones. Los objetivos del desarrollo en materia de Desarrollo Rural se enfocan básicamente en 4 aspectos: mejoramiento de capacidades económicas, humanas, protección al medio ambiente y a capacidades políticas. En relación a las capacidades económicas, se refiere al mejoramiento del ingreso por actividades agrícolas, por actividades diferentes a las agrícolas, mejoramiento de industrias y desarrollo de infraestructuras (BID, 2014). De acuerdo a Villa (2011), el desarrollo ha buscado la reducción de la pobreza y el mejoramiento de las condiciones de vida de la población más pobre. El incremento del nivel de vida incluye mejores ingresos, provisión de trabajo, acceso a educación, cultura y valores humanos.

## METODOLOGÍA

Se revisó literatura relacionada a los mercados campesinos, tanto de la región de Huixcolotla como de Zacapoaxtla, ambos situados en el estado de Puebla, así como de otros estados de la República Mexicana; programas de desarrollo local y regional de Puebla proporcionados por la Secretaría de Desarrollo Rural y la Delegación Estatal de Secretaría de Agricultura, Ganadería, Desarrollo Rural, Pesca y alimentación; artículos científicos relacionados al funcionamiento de los mercados desde el punto de vista económico y social. El estudio se llevó a cabo en dos regiones del estado de Puebla, Huixcolotla y Zacapoaxtla. Para realizar el estudio de ambos mercados se definieron regiones como unidad de análisis. Para el de Huixcolotla se eligió la región que comprende el Distrito de Desarrollo Rural (DDR) de Tecamachalco, en Zacapoaxtla el DDR de Teziutlan. Se hizo una revisión bibliográfica, tanto electrónica como en campo, con el fin de determinar los cultivos y municipios que se tomaron como muestra para esta investigación. Se

realizaron dos recorridos exploratorios en cada una de las regiones aledañas a los mercados en estudio con la finalidad de determinar los productos y municipios que se van a incluir en la investigación. Otra fuente importante de información fue la que se obtuvo en la página web del Sistema de Información Agroalimentaria y Pesquera (SIAP). De acuerdo a las estadísticas del SIAP (2011) la producción agrícola del distrito de Tecamachalco se basa en su mayoría en hortalizas, tanto de temporal como de riego, siendo ésta última la que ocupa mayor superficie sembrada. Por tanto se puede decir, los productos que se comercializan en el mercado de Huixcolotla son en su mayoría hortalizas.

Una vez analizada la información nacional, estatal y distrital, tomando en cuenta dos aspectos; la superficie sembrada y valor de la producción por municipio del Distrito de Desarrollo Rural de Tecamachalco, se determinaron los municipios y hortalizas objeto de estudio para esta zona: Huixcolotla, Los Reyes de Juárez, Zacapala, Cuapiaxtla, Ixcaquixtla y Quecholac; Tomate verde, calabacita, brócoli, col, lechuga y zanahoria. Para el caso de Zacapoaxtla son los siguientes municipios y cultivos: Cuetzalan del Progreso, Nauzontla, Zacapoaxtla, Xochiapulco, Xochitlán de Vicente Suárez; maíz, café, papa, haba, frijol y chícharo. Con el fin de facilitar el levantamiento de la información primaria, se presentó el proyecto ante autoridades institucionales de los diferentes niveles de gobierno mexicano: Federal, Estatal y Municipal. Así mismo, se identificaron a las autoridades, productores y agentes de comercialización que tienen una relación directa con los mercados de Zacapoaxtla y Huixcolotla. Para entrevistar a los productores se identificaron a los siguientes informantes: Delegación Estatal de la SAGARPA en Puebla, Secretaría de Desarrollo Rural del Estado de Puebla, Subsecretaría de Agronegocios de Puebla, Jefes de Distrito de Desarrollo Rural, Jefes de los centros de apoyo al desarrollo rural (CADER), Presidentes Municipales, Jefe del Programa de Desarrollo Agropecuario municipal, Jueces de paz por localidad, Comisariados ejidales y productores.

En el caso de comercializadores los agentes informantes son los siguientes: Subsecretaría de Agronegocios de Puebla, presidencia municipal, regidores de regulación comercial del Ayuntamiento, inspectores comerciales del municipio, asociación de comerciantes por mercado y comerciantes del mercado por producto. Cuando se inició el recorrido de campo en ambas regiones de estudio, los informantes claves (funcionarios estatales, municipales y locales) explicaron que era difícil obtener un marco poblacional para obtener una muestra de los productores que en el último año, o durante el 2011 sembraron los cultivos que se seleccionaron para el estudio, debido a que cambian con frecuencia el tipo de productos sembrados por cada ciclo de producción. Entonces en cada reunión con los productores y funcionarios por municipio seleccionado, se convocaron únicamente a los productores que cumplieran con cierto perfil. Para el caso de los comerciantes se tomó el mismo criterio, productos comercializados considerados en la muestra en el último año. Por lo anterior, para saber a cuántas personas se iban a entrevistar en cada región, se usó el muestreo no estadístico, del tipo dirigido.

Los criterios que se tomaron en cuenta para entrevistar a productores fueron los siguientes: tierras sembradas mayor a 1 hectárea, tierras sembradas con cultivos considerados en la muestra, producción representativa en volumen y valor de la producción, destino de la cosecha para cualquiera de los dos mercados. En comercializadores: comercializar productos considerados en la muestra, vender los productos en cualquiera de los dos mercados, nivel de compra-venta sea representativo y evaluar características de calidad para la compra-venta de productos. Una vez que se definieron los criterios para aplicar los cuestionarios en cada uno de los mercados, se determinó que se aplicaran 15 cuestionarios en cada municipio. Es decir, para el área de influencia del mercado de Huixcolotla se aplicaron 90 y para el de Zacapoaxtla 75. Para el caso de los comerciantes se aplicaron 50 cuestionarios en cada región. En los cuestionarios para productores se consideraron los siguientes apartados: información personal, caracterización del productor, caracterización de la unidad de producción, costos de producción, organización para la producción, caracterización de la producción y tecnología, comercialización e ingresos. En comercializadores se incluyó información como: tipos de productos que comercializa, destino,

años que lleva en el negocio de la comercialización, instrumentos legales para establecer un trato entre comercializadores y productores, entre otras.

## RESULTADOS

Ambos mercados cumplen con funciones económicas, sociales y culturales semejantes, además de tener objetivos y medios en común: 1) los productores también son comercializadores, una vez que cosechan los productos, los trasladan al mercado para su venta; 2) la cantidad de oferta y demanda es desorganizada, ya que no existe una calendarización en la producción, entonces, los demandantes no tienen certeza de la cantidad y calidad de producto que se va a ofrecer cada día; 3) a pesar que los precios están fijados en el mercado por el supuesto de que los comerciantes son tomadores de precios, puede existir la negociación. Esto se debe principalmente a que la calidad del producto es heterogénea y los mayoristas negocian con base a la presentación, tamaño, color, presencia de plagas y enfermedades, entre otras; 4) el pago por la venta y compra de productos lo hacen directamente productores y vendedores.

No existe un intermediario para llevar a cabo la negociación del precio y la forma de pago. En general, el pago se hace en efectivo al hacer la entrega en las bodegas de los comercializadores; 5) los vendedores traspasan sus fronteras políticas para ofertar su producto y así tener un mayor ingreso por la venta, ya que aumentan su población consumidora. Por tanto, se pueden encontrar productos que no son originarios de la zona, tanto de climas secos hasta los tropicales; 6) ambos mercados sirven como un espacio para que los productores y comercializadores se integren y comuniquen, desde el punto de vista de región.

Con base a la información procesada de los cuestionarios aplicados a cada región de estudio, a continuación se resaltan diferencias notables, tanto en los procesos de producción como en la comercialización. En relación a la producción se describen las siguientes: 1) Tipología de los productores. Para el caso de Huixcolotla son productores que poseen de 2 a 5 hectáreas que cuentan con agua procedente de pozos profundos, ocupan esta ventaja para la producción de hortalizas dejando a un lado cultivos de granos y oleaginosas. En relación a la tenencia de la tierra poseen pequeña propiedad y ejidos. Para Zacapoaxtla, los productores poseen en promedio 5 hectáreas en modalidad de temporal, por lo regular producen granos, oleaginosas y frutales. Son productos que no son rentables, pues apenas logran recuperar parte de los costos variables de producción. 2) Tipo de cultivos y destino de la producción. Los productores de Huixcolotla siembran hortalizas que son rentables y destinan el 100% de la producción al mercado. Los de Zacapoaxtla siembran granos, oleaginosas y frutales.

En el caso de los granos y oleaginosas parte de su producción es para el autoconsumo (aproximadamente el 50%) y el excedente es para venta en el mercado. 3) Técnicas de producción. Los productores de Huixcolotla están mejorando constantemente sus sistemas de producción, ya que reciben visitas de técnicos especialistas del Comité Estatal de Sanidad Vegetal del Estado de Puebla (CESAVEP), los cuales dan recomendaciones para mejorar la siembra, control de plagas y enfermedades, así como de las Buenas Prácticas Agrícolas; además, reciben asesorías de ingenieros a cargo de las tiendas de agroquímicos. Las técnicas de producción utilizadas en Zacapoaxtla son heredadas por ancestros, y conforme a la experimentación van mejorando sus procesos productivos. 4) Nivel de inversión. Los productores de Huixcolotla tienen un alto nivel de inversión en la compra de insumos agrícolas, renta de maquinaria agrícola, semillas y plántulas de vivero y en jornales. Los de Zacapoaxtla invierten escasamente para la compra de semilla criolla, compra de agroquímicos y jornales. Las labores agrícolas la realizan con yuntas de animales. 5) Condiciones geográficas: los productores de la región de Huixcolotla producen en terrenos planos, es decir, en valles, haciendo más fácil el proceso de producción, tanto para el uso de maquinaria agrícola como para la cosecha. En la región de Zacapoaxtla, la producción se lleva a cabo en terrenos accidentados y algunas zonas del municipio, en valles.

Esto hace complicado las actividades de labores agrícolas, siembra y cosecha; 6) calendarios de siembra. Los productores de Huixcolotla proponen un calendario de siembras a la Comisión Nacional del Agua (CNA), indicando el tipo de cultivo, la modalidad, y lámina de riego; los productores tienen la opción de cambiar el tipo de cultivo a sembrar cuando ellos lo decidan. Esto lo hacen para extraer agua de los pozos. En Zacapoaxtla no existe un calendario de siembras, debido a que ninguna institución gubernamental se los exige. 7) Organización para la producción. Para que los productores hagan uso del agua de pozo profundo, la CNA exige que se organicen y se constituyan legalmente como una Sociedad.

Sin embargo, esta Sociedad se limita únicamente a la programación de riegos a las parcelas. Para realizar procesos productivos y de mercadeo, cada persona lo hace individualmente. En Zacapoaxtla no existe ningún tipo de organización para riegos, producción y comercialización; Con respecto a la comercialización, los productores que venden sus productos agrícolas en el mercado de Huixcolotla tienen un lugar fijo para llevar a cabo estas actividades, el cual es proporcionado por la Sociedad “Benito Juárez”; ésta área es llamada “Subastas”. Conforme van llegando las camionetas que transportan hortalizas, se forman en las áreas que corresponden, según el tipo de producto.

Para Zacapoaxtla, las autoridades municipales destinan aproximadamente dos metros cuadrados por comerciante para llevar a cabo actividades de mercadeo. La infraestructura que usan es precaria, algunos comerciantes tienen mesas de fierro y la mayoría de los productores-comerciantes sólo cuentan con mantas que las colocan en el suelo. En la región de Huixcolotla, la decisión de qué sembrar para comercializar es determinada por el precio de la cosecha pasada, dinámica del mercado, agentes de comercialización, y muy pocas veces por decisión familiar. En la región de Zacapoaxtla la decisión se da por consejos de la familia y en base a las necesidades de autoconsumo. En segunda plano se toma en cuenta el precio de mercado. Por lo regular se preocupan por el autoabasto de granos y oleaginosas durante todo el año. Los productores-comerciantes de Huixcolotla tienen información para fijar precios y establecer el nivel de oferta para el mercado. Regularmente, los precios se fijan de acuerdo a días anteriores por información generada en la Central de Abastos de Puebla e Iztapalapa, D.F.

En Zacapoaxtla no se cuenta con información suficiente para fijar precios de productos agrícolas. Se debe a la lejanía de las principales centrales de abasto. Regularmente los precios son fijados por los acopiadores rurales. La calidad de los productos está dada por el nivel de inversión en la siembra, cosecha y traslado al mercado regional. Los productores de Huixcolotla invierten en los dos primeros rubros, para trasladar el producto utilizan transporte no especializado, lo cual genera pérdidas de hasta un 10%. Cuando se inicia la negociación del precio, los agentes de comercialización evalúan el tamaño, color, presencia de plagas y enfermedades y la homogeneidad. Los productores de Zacapoaxtla no realizan una fuerte inversión en estos rubros, debido a que en este mercado no existen parámetros de calidad a evaluar; por tanto, el productor no tiene certeza del precio que va a obtener de su cosecha.

Gran parte de la población del medio rural obtiene sus ingresos por actividades agrícolas, por tanto, es importante tomar en cuenta la generación de los ingresos a través de la productividad y el comercio de productos agrícolas. Esta investigación analizó la relación que existe entre la región productiva agrícola y la comercialización en Huixcolotla y Zacapoaxtla, con el propósito de saber cuál es la importancia que tienen estas actividades en el desarrollo regional económico. Se identificaron variables que ayudaron a realizar este análisis: el nivel de empleo que se genera en la contratación de jornales; la inversión en insumos agrícolas y la cantidad de ingreso que el productor agrícola está percibiendo por la venta de su producto en el mercado. La cantidad de empleo que se genera por actividades agrícolas en la región del mercado de Huixcolotla es importante. Tomando en cuenta la muestra de seis cultivos, el tomate verde es quien ocupa mayor cantidad de jornales para llevar a cabo el proceso de producción por hectárea (102), de ahí le sigue zanahoria (82), calabacita Italiana (80), Col (73), brócoli (72) y lechuga (56).

Si se llega a producir una hectárea de cada cultivo al mismo tiempo, en promedio, los seis cultivos necesitan 465 jornales para llevar a cabo su producción, dejando una derrama económica de \$60,450 pesos mexicanos; a nivel DDR se siembran 9,193 has, se requieren de 719,309 jornales y una inversión de \$93,510,170. Por tanto, si se dejan de sembrar hectáreas dedicadas a la producción de los seis cultivos, el nivel de trabajo se reduciría drásticamente y se dejaría de percibir por concepto de mano de obra alrededor de 93 millones de pesos por cada periodo de siembra. Para el caso de la región de Zacapoaxtla, los cultivos que tienen una mayor extensión de tierras sembradas son el maíz, papa y haba.

Para llevar a cabo las actividades de producción para los seis cultivos en estudio y bajo el supuesto que se siembre una hectárea de cada cultivo al mismo tiempo, se requieren en promedio 190 jornales y una inversión de \$20,710 pesos; los productos que necesitan mayor cantidad de mano de obra por hectárea son: papa (51 jornales), higo (39 jornales) y maíz (37 jornales). En el DDR de Teziutlán se siembran aproximadamente 66,197 hectáreas de los seis cultivos estudiados, de los cuales el maíz representa 94%, respecto al total; esto se debe a que la mayor parte de los productores conservan la tradición de sembrar este grano, destinando una gran parte al autoconsumo y el resto al mercado, a pesar que las ganancias son mínimas. La producción de estos cultivos genera fuente de empleo temporal a los jornaleros, llegando a ocupar hasta 2 millones de personas, la derrama económica es de 246 millones de pesos. Se debe tener cuidado para interpretar estas cifras, ya que la actividad que genera mayor consumo de mano de obra es el maíz, por el número de hectáreas sembradas; sin embargo, es de los cultivos con menor rentabilidad.

En relación a la inversión necesaria para la aplicación de insumos agrícolas en la producción, la cual incluye: compra de semilla, fertilizantes, fungicidas, insecticidas, adherentes, foliares, costo del riego de agua y la renta de tierra para la producción, se encontró que parte de estos insumos los proveen las tiendas de agroquímicos y viveros localizados en la periferia de la región en estudio. Para el caso de la región de Huixcolotla, el cultivo que requiere mayor inversión por hectárea en insumos agrícolas es la col y zanahoria, \$28,736 pesos y \$28,160 pesos, respectivamente; sin embargo, a nivel DDR, por el número de hectáreas sembradas, el tomate verde es quien absorbe importante gasto (23%). Por tanto, si se abandona la producción de éstos cultivos en el área de Huixcolotla, se estaría dejando de invertir alrededor de 232 millones de pesos por ciclo agrícola. Esto impacta directamente a las tiendas de agroquímicos y viveros de la zona, así como, empleos generados por estas actividades. La región de Zacapoaxtla tiene menor inversión por insumos agrícolas, debido al tipo de productos que se cultivan; en promedio de los cultivos de Chicharo, Haba, Maíz Blanco y frijol, se requiere una inversión de \$2,711 pesos por hectárea.

Para el caso del higo se requieren \$11,840 pesos por hectárea. El cultivo de la papa sale de este contexto, ya que necesita una inversión de hasta \$43,000 pesos por hectárea. Contemplando la gran extensión de hectáreas sembradas de maíz, los productores que se dedican a sembrar los cultivos analizados del DDR de Teziutlán, requieren 220 millones de pesos para llevar a cabo los procesos productivos. Los productos analizados para la región de Huixcolotla generan ingresos importantes para el productor cuando comercializa su producto en este mercado, obtiene ganancias que van de \$20,000 a \$50,000 por hectárea. En el DDR de Tecamachalco se generan ingresos totales de \$1,130,872,875 y ganancias netas de 237 millones de pesos (Tabla 1). Por tanto, la actividad agrícola en esta área es importante en términos económicos, dejar de hacerla, resultaría perjudicial para el productor, ya que en la mayoría de ellos es la única fuente de ingresos.

Tabla 1: Ingresos Totales Que Percibe el Productor, Región de Huixcolotla

Producto	Ingresos (Pesos/Hectárea)			Ingresos DDR Tecamachalco (Pesos)	
	Ingreso total (pesos/hectárea)	Ganancia neta (pesos/hectárea)	Superficie cosechada	Ingreso total (pesos)	Ganancia neta (pesos)
Tomate verde	112,000	48,412	2,042	228,704,000	98,857,304
Calabacita	75,000	19,395	1,441	108,087,000	27,951,298
Brócoli	67,500	21,028	708	478,014,750	14,891,399
Col	76,500	23,092	1,328	101,611,125	30,671,949
Lechuga Romana	65,000	20,360	1,892	122,980,000	38,521,120
Zanahoria	72,000	21,158	1,271	91,476,000	26,881,239
Total	468,000	153,445	8,682	1,130,872,875	237,774,309

Los datos de la Tabla 1 muestran la influencia que tiene cada uno de los productos en el ingreso total del productor, así como la ganancia neta, una vez descontados los costos de producción en la región productora y comercializadora de Huixcolotla. Se puede observar que los productos que más generan ganancias al productor, siempre y cuando se venda el producto en el mercado son el tomate verde y la col, los cuales tienen un tiempo de producción, entre la siembra y cosecha de 4 meses. Por otro lado, la calabacita y zanahoria tienen áreas de oportunidad para aumentar su rentabilidad y una aportación mayor al ingreso neto del productor. Fuente: elaboración propia (2011).

En la región de Zacapoaxtla se generan ingresos cuando el productor decide comercializar su producción en el mercado. Estos dependen del tipo de producto, por ejemplo, el higo y papa son altamente rentables comparados con los granos, pues las ganancias oscilan entre \$7,000 y \$14,000 pesos por hectárea. Actualmente, los productores están dedicando parte de sus tierras a productos más rentables. Los productores que pertenecen al DDR de Teziutlán y siembran estos productos, tienen ingresos totales por 324 millones y ganancias netas por 72 millones de pesos (Tabla 2).

Tabla 2: Ingresos Totales Que Percibe el productor, Región de Zacapoaxtla

Producto	Ingresos (pesos/hectárea)			Ingresos DDR Teziutlán		
	Ingreso total (pesos/hectárea)	Ganancia neta (pesos/hectárea)	Superficie cosechada (hectáreas)	Superficie que se destina al mercado (hectáreas)	Ingreso total (pesos)	Ganancia neta (pesos)
Chicharo	7,500	1,200	15	15	112,500	18,000
Haba	7,650	341	1,300	650	4,972,500	221,650
Higo	24,500	7,010	30	30	735,000	210,300
Papa	67,500	14,508	1,407	1,407	94,972,500	20,412,756
Maíz	8,460	1,960	52,768	26,384	223,208,640	51,712,640
Frijol	5,400	1,620	155	78	421,200	126,360
<b>Total</b>	<b>121,010</b>	<b>26,639</b>	<b>55,675</b>	<b>28,564</b>	<b>324,422,340</b>	<b>72,701,706</b>

La Tabla 2 muestra la importancia económica que tiene la región productora y comercializadora de Zacapoaxtla, Puebla. Los productos que generan mayor ganancia a los productores, una vez vendido el producto al mercado, son el higo y papa. El haba es un producto con baja rentabilidad y se necesita especial atención en disminuir sus costos de producción y buscar mercados alternativos en donde se alcance mayor precio. Fuente: elaboración propia (2011).

## CONCLUSIÓN

Desarrollo rural es una estrategia para mejorar las condiciones de vida de la población que vive en este medio, enfocándose a cuatro aspectos prioritarios: económico, humano, protección al medio ambiente y político. Los mercados rurales sirven como un espacio para que los productores del sector agrícola ofrezcan su producción y excedentes, cumplen funciones importantes como el abasto de alimentos básicos, generación de ingresos económicos, empleos, entre otros. Haciendo la comparación en los ingresos que se generan en ambas regiones, se puede inferir que las hortalizas, producidas y comercializadas en la región de Huixcolotla, generan más beneficio económico para los productores-comerciantes y son rentables con un ciclo de producción más corto (en promedio de 4 meses). Por lo anterior, ambos mercados contribuyen al desarrollo económico regional, reactivan la economía, generan un cambio y transformación en las actividades agrícolas, económicas y sociales.

# LA TUTORÍA ACADÉMICA, CASO: UNIVERSIDAD ESTATAL DE SONORA

Bertha Guadalupe Ojeda García, Universidad Estatal de Sonora  
María Guadalupe Durazo Bringas, Universidad Estatal de Sonora  
Luis Enrique Ibarra Morales, Universidad Estatal de Sonora

## RESUMEN

*En el presente documento se expone el papel que juega la tutoría académica en el proceso formativo de estudiantes de la Universidad Estatal de Sonora, desde que se instituyó en esta Institución Educativa, puntualizando el proceso que se ha llevado a cabo, también se abordará quienes son los operadores del programa y las repercusiones que ha tenido en los estudiantes. Este es un estudio de caso que analiza la contribución que ha aportado el Programa Institucional de Tutorías en el desempeño académico, personal y profesional de los estudiantes adscritos a la licenciatura en Comercio Internacional, así mismo, se investigan los factores que dificultan el aprendizaje de los estudiantes y los apoyos que ofrece la Universidad para que culminen sus estudios profesionales.*

**PALABRAS CLAVE:** Tutoría, Estudiantes, Desempeño Académico

## THE ACADEMIC TUTORING, CASE: SONORA ESTATE UNIVERSITY

### ABSTRACT

*Through this present document it is exposed the position that takes the academic tutoring in the formative process of students, at the State University of Sonora. This, from the time that it was established in this Educational Institution; explaining the current process to achieve it, which will deepen in who the operators of the program are and the repercussions that this program has achieved in the students.*

*This is a case of study that analyzes the contribution that the Institutional Tutoring Process has brought in the personal, academic and professional performance of students of the International Commerce career. Also, the factors that hinder the apprenticeship of students and the support that the University offers for them to fulfill their professional studies, are evaluated.*

**JEL:** I2

**KEYWORDS:** Tutoring, Students, Academic Performance

## INTRODUCCIÓN

Sin duda, uno de los mayores retos que enfrentan las universidades, tanto a nivel nacional como internacional, es el índice de reprobación estudiantil; en todas ellas se realizan grandes esfuerzos para tratar de abatir al mínimo dicho índice, sin embargo, aun no se ha alcanzado el objetivo a cabalidad. El gran desafío es mejorar el proceso formativo de los alumnos, logrando aumentar el aprovechamiento académico, para con eso disminuir el rezago escolar y la deserción, debido a la reprobación. Para conseguir lo anterior, una luz en el camino es la tutoría; muchas universidades le están apostando a esta actividad, como un soporte para el estudiante durante su trayectoria académica (Corral, V, Díaz, X., 2009; Talavera, R., Noreña, S., Melgar, A., Plazola, S., 2006).

En la Universidad Estatal de Sonora, el índice de reprobación promedio de la generación 2012-1, al terminar el primer semestre, fue del 29.99%, según datos proporcionados por Control Escolar de la Unidad Académica Hermosillo; observándose el mayor porcentaje en Matemáticas Básicas, seguida de la asignatura Tecnologías de la Información y Comunicación. Al conocer estos porcentajes de reprobación en el estudiantado, surgió la inquietud de realizar una investigación relacionada con la práctica de la Tutoría Académica en esta universidad, con el propósito de conocer las repercusiones de este programa en la formación académica y personal en los estudiantes y la percepción que ellos tienen del mismo.

## REVISIÓN LITERARIA

Para el Centro de Estudios Superiores del Estado de Sonora (2009), la tutoría es definida como *“un proceso de acompañamiento durante la formación de los estudiantes, que se concreta mediante la atención individualizada del alumno o a un grupo de éstos, por parte de académicos competentes y formados para esta función. Es una modalidad de la actividad docente que comprende un conjunto sistematizado de acciones educativas centradas en el estudiante e implica, evidentemente, la preparación de los profesores, para el cumplimiento eficaz de esta función”*.

La tutoría para la Universidad Estatal de Sonora, se ofrece en espacios y tiempos diferentes a los programas de estudio. Incide en el mejoramiento de las condiciones de aprendizaje de los alumnos y del abatimiento de problemas institucionales, como son el rezago académico y la deserción escolar. Con la tutoría se pretende desarrollar la capacidad del alumno para asumir responsabilidades en la toma de decisiones, desarrollar una metodología de estudio, y en términos generales, mejorar su actitud hacia el aprendizaje. Dentro de la Institución se cuenta con un Programa de Salud Universitaria (integrado por un médico general y dos psicólogos), de esta forma los tutores pueden canalizar a los alumnos de acuerdo a sus necesidades particulares.

Se lleva a cabo en dos modalidades: Individual y grupal, la primera se refiere a la atención personalizada para atender problemáticas personales, seguimiento académico y apoyo en la regularización académica, entre otros, mientras que la modalidad grupal, es aquella donde se otorga atención a grupos de tutorados para tratar problemáticas generales detectadas y/o transmitir información y orientación en temas diversos de la formación integral, como temas de tipo académico, emocional, físico, valores y aspectos de la sociedad actual, los cuales pueden influir en el rendimiento académico del alumno (Universidad Estatal de Sonora, 2012).

## METODOLOGÍA

Se calculó un tamaño de muestra de 56 personas, que se tomó de una población de estudio de 172 estudiantes del segundo semestre de la Licenciatura en Comercio Internacional, durante el período 2013-1, quienes recibieron tutorías conforme al Programa Institucional de Tutorías de la Universidad Estatal de Sonora. La encuesta aplicada fue un diseño propio, enriquecido con preguntas que fueron tomadas y adaptadas a partir de la revisión y análisis de dos instrumentos, uno de ellos es un cuestionario aplicado en la Universidad de Sonora, (Pacheco, M., Burgos, B., 2007); el otro es de un estudio realizado en el Centro de Estudios Superiores del Estado de Sonora (Ojeda, B., 2009).

## RESULTADOS

Al examinar los datos obtenidos en esta investigación, se encontró que el 87.7% de los estudiantes del segundo semestre de la Licenciatura en Comercio Internacional tienen una edad media de 20 años; el 52.63% de los alumnos son de género masculino; además, el 93% de ellos son solteros. También se pudo observar que el 71.93% de la población de estudio son originarios de Hermosillo, Sonora, lugar sede de

esta Unidad Académica. Las materias con mayor índice de reprobación son, Matemáticas Básicas (24.4%), Estadística (13.13%), Economía (10%) e Inglés Básico (8.9%). También se halló que el 47.27% de estos estudiantes dedican parte de su tiempo a trabajar; de ese porcentaje, el 38.46% lo hace con el fin de ayudar al gasto familiar; el 30.77% utiliza su sueldo para sostener sus estudios; el 23.08%, para tener independencia económica. Considerando únicamente a los alumnos que trabajan, se tiene que el 61.4% de ellos son hombres, el resto son mujeres.

Otro resultado que se encontró fue que el tiempo promedio que los educandos dedican a actividades académicas, después de clases, es 2.46 horas, con una desviación estándar de 1.21 horas, observando que la moda es de 2 horas; lo anterior, independientemente de que tengan que laborar o no. Por otra parte, se observó que el 94.74%, han reprobado al menos una materia. De igual manera, se analizó la relación entre la edad de los educandos y la reprobación de materias, encontrándose que un 88.89% de ellos tienen de 19 a 21 años, el 11.11% son de entre 23 y 29 años de edad. Se efectuó una comparación entre las causas de reprobación de los alumnos y el hecho de que realicen una actividad laboral formal, observándose que, independientemente de que cuenten con un trabajo o no, los principales motivos de reprobación son, en primer lugar, con un 48.5%: *“No entendía la explicación del profesor”*; después se encontró con el mismo porcentaje (16.67%): *“No podía llegar a tiempo”* y *“No asistía a clases”*.

Al analizar la relación entre las causas de reprobación y la edad de los estudiantes, se pudo observar que, aquellos que tienen entre 19 y 21 años, indican, en un 42.6%, que la principal causa de reprobación es que *“no entendían la explicación del profesor”*; en cambio de los 22 a los 29 años, los motivos de reprobación más relevante es, *“no podían llegar a tiempo a clases”*. Desde otro punto de vista, independientemente de la edad, el 48.15% de los alumnos, expresaron que la principal causa de reprobación es que no entendían la explicación del maestro, comparado con el 18.52% de los estudiantes que, el no llegar a tiempo a la clase es la causa de reprobación y el 14.81% que afirma que el no asistir a clase es la principal causa de su reprobación.

Con respecto a los factores que dificultan el aprendizaje, realizando un análisis global de ellos, se encontró que la población analizada, considera *“los hábitos de estudio”* como un factor muy importante que dificulta el aprendizaje de los estudiantes, al tener la frecuencia más alta; además, dicen que lo que afecta de manera importante su aprendizaje es *“la actitud de los profesores”*. El 63% de los alumnos de segundo semestre, considera que la tutoría ha contribuido positivamente en su desempeño académico, lo cual indica que, según la percepción de los estudiantes, este es un programa provechoso para ellos. De esos estudiantes, la mayoría opina que la tutoría ha contribuido en los hábitos de estudio y de alguna manera, para evitar una carga excesiva de materias. En cambio, del 27% restante, que afirma que la tutoría no ha ayudado en su desempeño académico, la mayoría expresa que en lo que menos ha favorecido es en sus hábitos de estudio. De la misma forma, estos manifiestan que reprobaron materias porque no entendían la explicación del profesor y la tutoría no les benefició en este aspecto.

## CONCLUSIONES

Después de analizar los resultados, se encontraron algunas similitudes con respecto a otras investigaciones realizadas en esta Unidad Académica, tales como: El promedio de edad de los estudiantes del segundo semestre de la Licenciatura en Comercio Internacional es de 20 años; la mayoría son solteros, que viven con sus padres, son originarios de la ciudad de Hermosillo, Sonora (sede de esta Unidad Académica); las materias con mayor índice de reprobación, siguen siendo las del área de las matemáticas, lo cual, no es de extrañarse, debido a que un gran número de universidades tienen un mayor índice de reprobación en las materias del área de las matemáticas, y el otro es que, en los primeros semestres se tienen los índices de reprobación y de deserción más altos.

También se encontró que casi la mitad de estos estudiantes (47.27%), dedican parte de su tiempo a actividades laborales; de ese porcentaje, alrededor de la tercera parte lo hace para ayudar al gasto familiar; otra tercera parte lo destina a sostener sus estudios; y casi otra tercera parte de ellos, trabaja para tener independencia económica, lo cual coincide con lo que manifiestan Corral, V., Díaz, X. (2009) en el *X Congreso de Investigación Educativa. Consejo Mexicano de Investigación educativa, A.C* y Ojeda, B. (2009) en su tesis de maestría.

Por otro lado, se encontró que los alumnos dedican un promedio de 2.46 horas, con una desviación estándar de 1.21 horas, a actividades académicas después de clases, ya sea para realizar investigaciones, tareas o estudiar para los exámenes, encontrándose que la moda es de 2 horas, independientemente de que realicen una actividad laboral o no. Todo esto, obliga a los docentes-tutores a preocuparse y ocuparse de corregir esta situación, ya que para que el alumno aumente su rendimiento escolar y con eso disminuya el índice de reprobación, necesita dedicarle más tiempo a estudiar. De acuerdo con Rufino Cano González (2009), es muy importante que dentro de las reuniones con los tutorados se dedique un espacio para enseñarles técnicas de estudio y cómo organizar su tiempo libre, para un mayor aprovechamiento académico. De igual modo, se sugiere, para atender y abatir las causas de reprobación, según los resultados obtenidos, es que ambos, tanto docentes como estudiantes, tengan una mayor disposición, unos para explicar en forma clara los temas de las asignaturas, en proporcionar asesoría académica, y los otros para ser más dedicados, acudir a asesorías, ser más responsables con su propio aprendizaje; así como que aprendan a administrar su tiempo, en concordancia con Cano González (2009). Finalmente, solo nos resta puntualizar que un profesor tutor que cuente con todos los atributos y competencias que se requieren para cumplir su función, en conjunto con los programas que brindan soporte al Programa Institucional de Tutorías, van a ser de gran apoyo para encausar al estudiantado en su formación académica y profesional.

#### Limitaciones y Futuras Líneas de Investigación

Algunas limitaciones que pudieran considerarse, es el factor de disposición por parte del estudiantado para responder a las encuestas que se formulen para tal efecto; así como el apoyo que la institución brinde a los investigadores. Por otro lado, el presente trabajo brinda la posibilidad de extender la investigación hacia otros semestres, sobre todo, para aquellos alumnos que se encuentran en la etapa media de sus estudios universitarios, pudiéndose considerar como una evaluación de trayecto académico y detectar áreas de oportunidad para el reforzamiento escolar, antes de iniciar con la segunda etapa de su formación y de egreso.

# GESTIÓN EFICIENTE DE RESIDUOS SÓLIDOS URBANOS: UNA ESTRATEGIA DE MITIGACIÓN PARA EL CAMBIO CLIMÁTICO

Miguel Ángel Rodríguez Lozada, UPAEP, México

Beatriz Pico González, UPAEP, México

Manuel González Pérez, UPAEP, México

Tomás Acoltzi Morales, UNAM, México

## RESUMEN

*La sobrepoblación humana, el crecimiento urbano y el desarrollo industrial así como el consumo irracional de los productos puestos en el mercado a total disposición de los consumidores, provoca la alta generación de Residuos Sólidos Urbanos (RSU). La importancia de reducir de forma considerable el impacto ambiental ocasionado por la generación de dichos residuos, depende de la gestión eficiente de los mismos, esto es posible mediante la utilización de un enfoque de logística inversa y una metodología 3 R's aplicada de forma estratégica para la generación de un centro integral que permita dicha gestión.*

**PALABRAS CLAVE:** Logística Inversa, RSU, 3 R'S, Centro Integral

## EFFICIENT MANAGEMENT OF MUNICIPAL SOLID WASTE: A MITIGATION STRATEGY FOR CLIMATE CHANGE

### ABSTRACT

*The human overpopulation, urban growth and industrial development and irrational consumption of products placed on the market fully available to consumers, causing the high generation of Municipal Solid Waste (MSW). The importance of considerably reducing the environmental impact caused by the generation of such waste depends on the efficient management of the same, this is possible by using an reverse logistic and methodology 3 R's applied strategically to generate a comprehensive center that allows this management.*

**JEL:** Q01, Q51, Q54

**KEYWORDS:** Reverse Logistics, MSW, 3 R's, Center For Integrated

## INTRODUCCIÓN

Desde hace algunas décadas se ha empezado a observar la importancia que tiene, desde el punto de vista ambiental y económico, la gestión responsable y adecuada de los residuos sólidos urbanos (RSU) generados por un consumo incontrolable, uno de los actores principales en la generación de los residuos son las industrias, que con el afán de cubrir ciertas necesidades, procesan y elaboran una gran variedad y cantidad de productos que son puestos a disposición de los consumidores, asumiendo la existencia de una responsabilidad compartida entre empresas, gobiernos y consumidores, se señala que el papel de las empresas es la lenta degradación del planeta (Olvera de Miguel 2010). La alta generación de RSU, influyen directamente en la salud humana y en los cambios funcionales de la naturaleza. El aumento en la cantidad de dichos residuos, está produciendo un fuerte impacto ambiental, que bien podría reducirse mediante una gestión más adecuada. Estos residuos se han ido incrementando con las modernas tecnologías actuales y

que sólo se fijan en la rentabilidad que les puede proporcionar "el negocio" sin tener en cuenta el daño ambiental que el mismo genera. Se trata entonces, de llevar a cabo una estrategia que contemple el desarrollo de un Centro Integral que gestione de manera eficiente dichos residuos.

Los residuos sólidos urbanos (RSU) son originados en la actividad doméstica y comercial de las ciudades y pueblos. En los países desarrollados en los que cada vez se usan más envases, papel, y en los que la cultura de "usar y tirar" se ha extendido a todo tipo de bienes de consumo, las cantidades de basura generadas se han ido incrementando hasta llegar a cifras muy altas.

## REVISIÓN DE LA LITERATURA

La Gestión de los residuos sólidos urbanos (RSU) es un problema global demasiado complejo en el cual es necesario integrar conceptos ambientales, económicos, institucionales y sociales (Rollandi, 2012). Sin duda alguna, el problema de gestión de los RSU representa un gran problema, en el que los países con economías emergentes resultan ser los más afectados debido a la falta de capital, infraestructura, y programas para gestionar de manera eficiente sus propios RSU generados. De 1950 al 2000, la población del mundo se duplicó, la producción agrícola se triplicó, el consumo de energía y la producción se cuadruplicaron, pero la generación de basura se quintuplicó (Harris, 2006; Gandy, 1994). De modo que lo que antes se resolvía de manera domiciliaria y en pequeña escala al crecer las ciudades se tiene que hacer para grandes volúmenes de un número cada vez más grande de hogares que desechan más basura.

La generación de RSU está rebasando la capacidad de poderlos reciclar y reutilizar, esto se está convirtiendo en un problema de gran magnitud, debido a que cada vez se contamina más el medio ambiente y los tiraderos a cielo abierto cada vez son más grandes y requieren de mayor espacio, el problema de la recolección y tratamiento de los RSU, se hace más grande a medida que las ciudades crecen y que la economía se industrializa (Pineda, Pablos 2006). Los residuos sólidos urbanos (RSU), en tanto, pueden definirse como los desechos generados en la comunidad urbana, provenientes de los procesos de consumo y desarrollo de las actividades humanas, además de los producidos por los usos residenciales, comerciales e institucionales, y por el aseo del espacio público, los RSU incluyen los residuos originados en las industrias y establecimientos de salud, siempre que no tengan características tóxicas ni peligrosas, en cuyo caso constituyen corrientes de residuos de otro tipo que deben ser manejadas según lo establecen las normativas específicas (Gaggero, Elba 2002).

## METODOLOGÍA

El mal manejo de los residuos sólidos urbanos (RSU) constituye en la actualidad uno de los problemas ambientales que afectan a la gran mayoría de los países del mundo, por la cantidad de recursos económicos y tecnológicos que son necesario invertir para evacuarlos hacia lugares adecuados, así como por las grandes extensiones de terreno que se necesitan para estos fines. Se identifica la necesidad de plantear la solución a un problema de gestión de RSU generados por el consumo incontrolable en la actividad doméstica y comercial de las ciudades, esto es posible de resolver mediante el uso del enfoque de Logística Inversa y la planeación estratégica como herramienta principal. (Identificando características, clasificación, cantidades y frecuencia de los RSU).

Figura 1: Esquema de la Metodología a Seguir

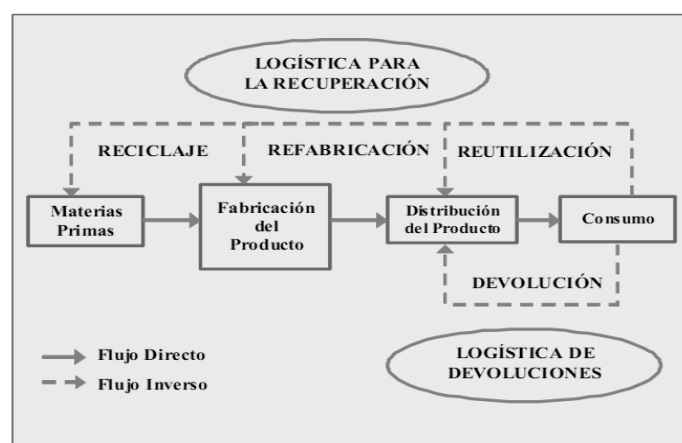

### Enfoque de Logística Inversa

La función logística se enmarca dentro del conjunto de actividades primarias que componen la cadena de valor de una empresa y puede ser, por tanto, fuente de ventajas competitivas. La logística inversa es sin duda una filosofía que cualquier estado, municipio y/o localidad debe agregar a su entorno, debido a todos los factores mencionados y ante la globalización que se está dando, es importante tener una planeación

estratégica de logística inversa. Para poder comprender esta filosofía, definiremos la Logística Inversa como: el proceso de proyectar, implementar y controlar un flujo de materia prima, inventario en proceso, productos terminados e información relacionada desde el punto de consumo hasta el punto de origen de una forma eficiente y lo más económica posible con el propósito de recuperar su valor ó el de la propia devolución (Arbones Malisani 2005).

La consecución de ventajas competitivas sostenibles a través de la recuperación y gestión de los productos fuera de uso requiere analizar la forma en que estos productos llegarán de nuevo a la cadena de suministro. A continuación, la figura muestra una red de recuperación, en la cual se puede observar esa reintegración de dichos productos al proceso productivo.

Figura 2: Esquema Representativo de Logística Directa y Logística Inversa

Partiendo de este enfoque, se pueden determinar las bases suficientes para poder manejar de manera eficiente los residuos generados, así como el tratamiento y disposición final de los mismos.

### Las 3 R'S

Dicho lo anterior, se puede apreciar que existen áreas de oportunidad para que se absorba la responsabilidad de gestionar los propios residuos sólidos urbanos de manera sostenida para el bienestar de las localidades aprovechando la displicencia de las empresas en dicho proceso pero ahora con las actividades propias de la estrategia de las 3 R's. Dentro de la Gestión Integral de Residuos Sólidos, internacionalmente se reconoce la terminología de las 3 Eres o 3-R refiriéndose a las tres primeras letras de las tres palabras que son Reducir, Reciclar y Reutilizar. A continuación se presenta una tabla para jerarquizar las 3 R's.

Tabla 1: Jerarquía de las 3 R'S

<b>Reducir</b>	<b>No producir tantos residuos: reducir o minimizar la generación de residuos.</b>
Reciclar	Reusar o volver a usar algunas cosas consideradas inútiles o inservibles, el objetivo es alargar el ciclo de vida de muchos productos.
reutilizar	Volver a usar algunos de los residuos generados como materias primas en procesos industriales con el fin de convertirlos nuevamente en productos nuevos de calidad.

### Determinación de la Infraestructura

En la mayoría de los Estados que conforman la República Mexicana, y en particular, de sus municipios, se cuenta con servicios municipales, que forman parte de la planeación y organización y que se encuentran conformadas en unidades estratégicas que brindan el servicio a la ciudadanía.

Alumbrado Público  
Recolección de Basura  
Semáforos  
Camellones y Áreas Verdes  
Barrido Nocturno  
Mantenimiento a Mercados  
Entre otros.

A partir de esta mención, la investigación solo se centrará en la recolección de basura, que es el punto central de la misma, haciendo referencia a Residuos Sólidos Urbanos (RSU). El servicio de limpieza y recolección de basura normalmente está subcontratado por empresas particulares, dichas empresas realizan su propia logística de recorrido para la compilación de basura en general (RSU) que finalmente se deposita ya sea en rellenos sanitarios y/o tiraderos a cielo abierto, asimismo, del total de residuos generados, aproximadamente el 30% de esta cantidad no llega a los rellenos sanitarios, sino que queda en caminos, barrancas y calles ensuciando el paisaje e incrementando los riesgos a la salud y al ambiente. (SEMARNAT 2012).

### Identificación y Clasificación

Ahora, es necesario identificar y clasificar de manera correcta los diferentes residuos generados para su mejor gestión. Los residuos sólidos urbanos están compuestos de los siguientes materiales:

Vidrio. Son los envases de cristal, frascos, botellas, etc.

Papel y cartón. Periódicos, revistas, embalajes de cartón, envases de papel, cartón, etc.

Restos orgánicos. Son los restos de comida, de jardinería, etc. En peso son la fracción mayoritaria en el conjunto de los residuos urbanos.

Plásticos. En forma de envases y elementos de otra naturaleza.

Textiles. Ropas, vestidos y elementos decorativos del hogar.

Metales. Son latas, restos de herramientas, utensilios de cocina, mobiliario etc.

Madera. En forma de muebles mayoritariamente.

Escombros. Procedentes de pequeñas obras o reparaciones domésticas

Figura 3: Clasificación de los Residuos Sólidos Urbanos

### Gestión Adecuada

Gestionar adecuadamente los RSU es uno de los mayores problemas de muchas ciudades en la actualidad.

### Fases

*Cultura de selección y clasificación:* fomentar la cultura en la sociedad de separar la basura en bolsas que a su vez permita la clasificación de los RSU para posteriormente depositarlos en el camión recolector y hacerlos llegar al Centro de Recuperación como destino final.

*Recogida Selectiva:* Utilizar contenedores específicos para cada tipo de residuo sólido urbano, una vez que han sido separados desde su origen (domicilios) evitando así la mezcla de los mismos y colocarlos en sus contenedores correspondientes.

*Tratamiento y Procesamiento:* determinar el proceso específico de tratamiento, dependiendo del tipo de RSU para poderlo reciclar, reutilizar, incinerar o bien para su confinamiento. Lo ideal sería recuperar y reutilizar la mayor parte de los RSU.

*Disposición final:* Aun utilizando buenos sistemas de reciclaje e incineración, al final siempre quedan restos que deben ser depositados en los rellenos sanitarios o tiraderos a cielo abierto, existe la alternativa de subcontratar los procesos.

## **RESULTADOS**

El problema planteado se centrara en la propuesta del Diseño de un Centro Integral para la gestión eficiente de RSU y dar respuesta inmediata a las necesidades de identificación, clasificación y tratamiento de dichos

residuos. Se espera generar un impacto tanto en el sector económico, social y ambiental. A continuación se presenta la propuesta del Centro Integral de Recuperación (CIR) para la gestión de RSU.

Fig 3: Esquema de la Gestión Integral de RSU

### Beneficios Esperados

*Dimensión Económica:* Se pretende generar ingresos a partir de insumos que no le costaran al CIR al procesar productos que en teoría ya no le sirven a nadie en específico y que las empresas manufactureras y de transformación generan en función a su giro empresarial y en función a su proceso productivo.

*Dimensión Social:* concientizar y sensibilizar a las personas (la parte más difícil) de la importancia que tiene en la actualidad, el cuidado del medio ambiente, mediante foros, conferencias y buenas prácticas ambientales, así como la apertura de empleo para personas más necesitadas.

*Dimensión Ambiental:* al manejar de forma eficiente la generación de productos sólidos urbanos así como productos fuera de uso, y con el compromiso de todos los involucrados, se pretende cooperar en la reducción de contaminación que actualmente existe en el Estado.

### **CONCLUSIONES**

Muchos de los residuos sólidos que se producen en las industrias y en los centros urbanos, si se separan convenientemente, pueden reciclarse y volver a ser utilizados, como el vidrio, el plástico, el papel y el compost. Por otra parte, los desechos orgánicos pueden ser incinerados o almacenados en un vertedero, y finalmente los residuos tóxicos deben ser aislados. Si se realizan estos pasos, la gestión de los RSU será integrada y producirá menos impactos en el ambiente. Los RSU no son basura, son materiales que se pueden reusar y reciclar, en beneficio del ambiente y de la economía, se debe realizar un esfuerzo para cambiar la visión de la forma de enfrentar este problema, la cual considere soluciones preventivas para el control y el aprovechamiento de los mismos.

# RELACIÓN ENTRE LA SATISFACCIÓN LABORAL, EL CONTRATO PSICOLÓGICO, EL TIPO DE VINCULACIÓN Y LA ANTIGÜEDAD EN DOCENTES DE UNA UNIVERSIDAD PRIVADA

Jaime Ferro Ferro Vásquez, Universidad Católica De Colombia  
Gloria Amparo Gómez López, Universidad Católica De Colombia

## RESUMEN

*La presente investigación tuvo como objetivo establecer la relación entre la satisfacción laboral, el contrato psicológico, el tipo de vinculación y la antigüedad en un grupo de docentes de una universidad privada ubicada en la ciudad de Bogotá D.C. La investigación es de tipo descriptivo, con diseño no experimental, ex post-facto. La muestra estuvo conformada por ciento trece docentes de la facultad de ingeniería de una universidad privada. La satisfacción laboral se midió con el cuestionario de Satisfacción laboral de Meliá y Peiró, (1989) S20/23, y el contrato psicológico se midió con el instrumento aplicado por De Sousa (2005). Los resultados obtenidos en este estudio después de aplicar prueba estadística no paramétrica de rangos de Spearman, versión 20 para variables no paramétricas, evidencian que la satisfacción laboral no está asociada a las variables antigüedad, vinculación, contrato psicológico relacional y contrato psicológico transaccional. Los datos muestran que existe relación entre la satisfacción laboral y el tipo de vinculación, y que no existe relación entre la satisfacción laboral con la antigüedad ni entre el contrato psicológico con la vinculación, de igual manera, no existe relación entre la antigüedad y la satisfacción laboral. Estos datos aportan a investigaciones encaminadas a indagar el comportamiento de las variables que afectan el nivel de satisfacción en docentes universitarios.*

**PALABRAS CLAVES:** Satisfacción Laboral, Contrato Psicológico, Antigüedad En El Trabajo, Tipo De Vinculación Laboral

## RELATIONSHIP BETWEEN JOB SATISFACTION, PSYCHOLOGICAL CONTRACT, TYPE OF THE JOB CONTRACT, AND THE YEARS OF SERVICE OF A GROUP OF TEACHERS IN A PRIVATE UNIVERSITY

### ABSTRACT

*The investigation aims to establish the relationship between job satisfaction, psychological contract, type of the job contract, and the years of service of a group of teachers in a private university located in Bogotá DC. The research is descriptive, it's not about experimental design ex post-facto. The sample consisted of one hundred and thirteen teachers who work in an engineering department of a private university. Job satisfaction was measured based on the Job Satisfaction Questionnaire of Meliá & Peiró, (1989) S20/23, and the psychological contract was measured based on the instrument applied by De Sousa (2005). After applying the 20th version of the Spearman rank nonparametric statistical test, for nonparametric variables. It was shown that job satisfaction is not associated with the following variables: years of service, type of the job contract, relational psychological contract and transactional psychological contract. However, the data shows that there is relation between job satisfaction and the type of job contract, there is no relation between job satisfaction and years of service, there is no relation between psychological contract and type of job contract, and there is no relation between years of service and job satisfaction. These data provide*

*foundation to further investigations about the variables that affect the level of job satisfaction of university teachers.*

**JEL:** D21, D23, D29

**KEYWORDS:** Job Satisfaction, Psychological Contract, Years of Service At Work, Type of Contract

## INTRODUCCIÓN

La satisfacción laboral se ha investigado para identificar los factores que impactan aspectos relacionados con el bienestar laboral, la productividad, las relaciones en el trabajo, realización personal y profesional, (Alonso, 2008; Judge & Watanabe, 1993; Robbins, 2004). También se determina por la relación entre el empleado y la organización (Solanes y Zaragoza, 2010; Bravo y Jiménez, 2011). Estudios de satisfacción laboral incluyen la variable contrato psicológico, que identifica la percepción del empleado en cuanto al cumplimiento de los acuerdos que van implícitos en su relación laboral. El término contrato psicológico empezó a incluirse en los estudios desde la mitad del siglo veinte (Herriot, Manning & Kidd, 1977, Argyris, 1960, Leninson et al., 1962, y Schein, 1965; como se citó en Vesga, 2006), y hacia finales de ese siglo, los primeros cuestionamientos se hicieron con base en las percepciones de las personas (Psycones, 2006), no obstante, en las últimas décadas, el concepto de contrato psicológico facilita comprender las relaciones de trabajo en las organizaciones (Vesga, 2011).

Según antigüedad, los empleados con más años de permanencia en el puesto manifiestan mayor insatisfacción debido a la poca variedad en sus tareas Sánchez, Artacho, Fuentes y López-Guzmán (2007), y en la línea de la docencia, los de mayor antigüedad en la institución presentan menor nivel de satisfacción laboral Marque y Marcano (2010); Anaya (2006), no obstante, los docentes que logran estabilidad laboral después de un determinado tiempo en la universidad, manifiestan aumento en la satisfacción (Plácido, Cortés y Silva, 2012). De igual manera se ha evidenciado que el tipo de vinculación laboral puede afectar los niveles de satisfacción laboral (Sánchez, et al., (2007). El presente artículo indaga sobre el nivel de satisfacción laboral, en docentes universitarios de una facultad de ingeniería, se estudia el grado de asociación de las variables contrato psicológico, tipo de vinculación y antigüedad laboral, lo cual aporta conocimiento a la psicología organizacional en el ejercicio de las buenas prácticas como gestión encaminada a fortalecer la relación profesor universidad, impactando positivamente la calidad de vida del docente universitario.

## REVISIÓN DE LITERATURA

La satisfacción laboral se presenta como la sensación que el empleado tiene hacia el trabajo y con el trabajo, de agrado o desagrado, de buenas o malas relaciones humanas, en cuanto a las condiciones del medio laboral (López, 2009), también se entiende como un estado emocional, de sentimientos o respuestas afectivas (Alonso, 2006; Hellriegel y Slocum, 2004), y como una orientación laboral afectiva positiva hacia el empleo, (Alonso, 2006; López, 2009; Rivas y López, 2011. Los factores intrínsecos llevan al individuo a un estado de satisfacción con el puesto y con las necesidades de desarrollo psicológico, y los factores extrínsecos como supervisión, administración y las relaciones interpersonales pueden producir satisfacción con el trabajo y cubren las necesidades de la persona, además, el deterioro de los factores intrínsecos y extrínsecos causaría insatisfacción (Robbins, 2004, cita a Herzberg, 1959; Alonso, 2008; Martínez, 2007a). El grado de satisfacción en el puesto de trabajo debe ser tenido en cuenta en las organizaciones Robbins (2004) ya que, se evidencia en empleados insatisfechos más ausencias al trabajo que el resto de los compañeros, y los trabajadores satisfechos tienen mejor salud y viven más años, (Judge & Watanabe, 1993; Robbins, 2004). Con una buena comprensión de actitudes y aspectos, ya sean positivos o negativos

que se deban tratar en el ambiente de trabajo, se puede establecer el grado de ajuste entre lo que ofrece un ambiente de trabajo (Robbins, 2004; Galaz, 2002).

La satisfacción laboral en docentes se puede entender como el resultado de comparar la propuesta de trabajo que le ofrece la institución para efectos de su quehacer docente o investigativo, frente a lo que el mismo docente considera que debería ser, según sus intereses, por otro lado, manifiesta insatisfacción laboral según perciba las instalaciones físicas y el clima organizacional (González, 2008).

En cuanto a vinculación laboral y promoción en docentes Maldonado (2012) informa satisfacción baja en los docentes estudiados, Herranz, Reig, Cabrero, Ferrer y González (2007) manifiesta que docentes de tiempo completo reportan más satisfacción con la labor docente; aún así, los docentes hacen juicio de valor positivo hacia la satisfacción, a pesar de encontrarse que la satisfacción en relación con la vinculación no presenta diferencia (Rojas, Zapata y Grisales, 2008). Según antigüedad los docentes que tienen más tiempo de vinculación con la institución presentan menor nivel de satisfacción laboral, y los que tienen menor tiempo de vinculación presentan mayor nivel de satisfacción laboral (Marques, et al., 2010), pero los docentes que tienen vinculación igual o menor a 10 años presentan mayor satisfacción laboral debida a factores como, políticas administrativas, desarrollo personal, desempeño de tareas y relación con la autoridad (Rodríguez, Núñez & Cáceres, 2010).

El contrato psicológico lo define Vesga (2011) como el establecimiento de acuerdos entre empleado y empleador sobre las condiciones de la relación del trabajo, y como el conjunto de expectativas y creencias sobre promesas implícitas en los compromisos de la relación que superan los acuerdos formales manifiestos (Soria, 2008). El contrato psicológico se genera a partir de las características individuales y cognoscitivas del empleado, de los mensajes enviados por la organización y las señales sociales (Rousseau, 2000; Dabos, y Rousseau, 2004); se genera permanentemente durante el tiempo que se mantenga la relación laboral con el empleado, es dinámico e inicia desde el proceso de reclutamiento y de selección (Reyes & Martínez, 2007). Las creencias se pueden establecer también, en términos de intercambio recíproco entre empleado y empleador como resultado de la serie de promesas realizadas mucho antes de la firma del contrato escrito (Newton & Nowak, 2010; Caldwell, Floyd, Atkins, y Holzgrefe, 2011). Se tiene como primer componente del contrato psicológico, es el desempeño del empleado que va a contribuir al logro de los objetivos de la empresa. El segundo componente es la percepción que el empleado tiene en cuanto a lo que la empresa le ofrece en términos de capacitación y oportunidad ascender en la compañía (Vesga, 2011).

Los tipos de contrato psicológico se pueden dar desde varias perspectivas, uno de ellos es el transaccional, es de corto plazo y se enfoca en el intercambio económico, con derechos específicos, otro es el contrato relacional que se refiere a los términos de confianza mutua y lealtad (Rousseau, 2000; Tena, 2002; Dabos y Rousseau, 2004; Solanes y Zaragoza, 2010; De Sousa, 2005). En el contrato balanceado se presentan acuerdos de empleo dinámicos (De Sousa, 2005). Y el contrato de transición es un estado que se da como consecuencia del cambio organizacional (Rousseau, 2000; De Sousa, 2005), y el contrato psicológico relacional se caracteriza por la lealtad que el empleado tiene hacia la organización (Rousseau, 2000; Tena, 2002; Dabos y Rousseau, 2004; Solanes & Zaragoza, 2010).

El contrato psicológico en docentes se ha investigado desde la relación laboral. El estudio de renegociación del contrato psicológico como consecuencia del cambio organizacional y de la apertura de espacios transnacionales, evidencia la urgencia de las instituciones de educación superior –IES– de adoptar medidas administrativas que neutralicen los efectos adversos, como es la tendencia a la ruptura de contrato psicológico por parte de los trabajadores debido a la sobrecarga de tareas y al ajuste de procedimientos que demandan más dedicación laboral (Topa y Morales, 2008). A pesar que la antigüedad se asocia con la edad, los estudios que tratan esta variable la diferencian, ya que no necesariamente quien ha permanecido por mucho tiempo en el mismo puesto es el de mayor edad, puede ser que éste haya cambiado en varias

ocasiones de empleo y en el actual lleve poco tiempo (Gamero, 2010). Topa, Morales y Palacino, (2005) expone que el empleado de mayor antigüedad manifiesta mayor satisfacción laboral ya que cree haber logrado un ajuste entre sus necesidades personales.

El tipo de vinculación que contraiga el trabajador con la organización no hace que se difiera de los compromisos percibidos de la misma organización hacia el empleado en cuanto al cumplimiento de las labores asignadas y el comportamiento ético (Vesga, 2006). Actualmente se han modificado las relaciones contractuales de las empresas con los trabajadores, se les asigna mayor carga laboral y se está manifestando una transición de la sociedad del empleo hacia la sociedad del subempleo, o de la sociedad del salario hacia la sociedad del subsalario (Uribe, Garrido, & Rodríguez, 2011). Se resalta la necesidad urgente, que las organizaciones al momento de establecer la relación laboral escrita formal, tengan en cuenta las condiciones y compromisos de la relación que establecen con el empleado, ya que esto lo afecta en aspectos de actitud y de motivación afectando la satisfacción laboral (Tena, 2002, De Sousa, 2005).

## MÉTODOLÓGIA

Los participantes fueron docentes de la Facultad de Ingeniería de una Universidad Privada de la ciudad de Bogotá D.C., la cual contaba con un total de 169 docentes vinculados en modalidad de hora cátedra y de tiempo completo, la muestra estuvo conformada por 113 docentes. Teniendo en cuenta la revisión teórica en cuanto a conceptos y herramientas se escogieron dos instrumentos adecuados para el estudio propuesto, los cuales se presentaron a los participantes en un único cuestionario. El primero, cuestionario de satisfacción laboral de Meliá, Pradilla, Martí, Sancerni, Oliver y Tomás (1990) S20/23, establece una medida global de la satisfacción laboral que incluye los factores: i) satisfacción con la supervisión y participación en la organización, ii) satisfacción con la remuneración y las prestaciones, iii) satisfacción Intrínseca, las satisfacciones que da el trabajo por sí mismo, iv) satisfacción con el ambiente físico de trabajo, v) satisfacción con la cantidad de producción y con la calidad de producción. Y el segundo cuestionario, contiene una herramienta psicométrica para evaluar el tipo de contrato psicológico, fue propuesto por De Sousa (2005) que tuvo como referente el cuestionario de Rousseau (2000) y (Dabos y Rousseau, 2004).

## RESULTADOS

Después de recolectados los datos se codificaron las respuestas asignando un número a cada ítem, diseñando posteriormente una matriz de datos: las filas representan a cada uno de los individuos, y las columnas contienen códigos de las variables de estudio. En razón a la progresión de las medidas y la proporción de la muestra, para las variables categóricas se utilizó la prueba no paramétrica de rangos de *Spearman*; las variables del estudio que se diseñaron por rangos se convirtieron a escala ordinal para facilitar los análisis de correlación y el grado de asociación entre las variables de los sujetos estudiados. Para el cálculo de las variables numéricas se les hace un análisis con pruebas paramétricas debido a que al aplicar la prueba *Kolmogorov – Smirnov* (K-S) se evidencia una distribución normal, así es que se decidió aplicar la prueba de correlación de *Pearson*. La distribución de la población encuestada estuvo compuesta por 79 hombres y 34 mujeres. Según edad, el número de docentes encuestados de acuerdo al rango registrado fue de: 11 para 20 a 30 años, 37 para 31 a 40 años, para 34 para 41 a 50 años, 22 en rango 51 a 60 años, y 9 para más de 60 años. En cuanto al nivel educativo, el 54,0% (f=61) reportó posgrado; el 34,5% (f=39) reportó maestría, el 8,8% (f=10) informó pregrado, y el 2,7% (f=3) doctorado. Se registró antigüedad según rango de años de permanencia en la universidad así: 36 de 1 a 5 años; 9 de 16 a 20 años, 12 de 21 a 30 años, y 2 para más de 30 años. El tipo de vinculación estuvo representado por 71 docentes de cátedra y 42 de tiempo completo.

Al correlacionarse las variables tipo de vinculación frente al tipo de contrato psicológico se reportó para el contrato relacional una correlación positiva de 0,044 y una significancia de 0,64, y la vinculación con el

contrato transaccional reportó correlación positiva de 0.10 y significancia de 0,28, esto permite determinar que no existe relación entre el tipo de vinculación y el tipo de contrato psicológico.

La correlación antigüedad y tipo de contrato psicológico informó los siguientes datos: para contrato relacional correlación negativa de -0.186 con significancia de 0,049; para contrato transaccional, correlación negativa, de -0,150 y significancia de 0,113, eso es, que docentes con menor antigüedad laboral reportan mayor contrato psicológico relacional. Para tipo de vinculación y satisfacción laboral se encontró una correlación negativa de -0.231 con significancia de 0,014, es decir que los docentes de tiempo completo manifestaron menor nivel de satisfacción que los docentes de cátedra. La satisfacción y la antigüedad reportaron correlación de 0,111 y significancia de 0,243, indicando que no hay relación entre la antigüedad con la satisfacción en el trabajo.

Lo anterior permite establecer que la hipótesis general se verifica de manera parcial, es decir, no existe relación entre el tipo de vinculación y el contrato psicológico; así mismo, el tipo de vinculación y la satisfacción laboral presentan relación inversa, lo que implica que la hipótesis primera no se verifica al encontrarse que no existe relación entre la antigüedad y el contrato psicológico transaccional, y la antigüedad con la satisfacción laboral. De la misma forma se halla que los docentes de cátedra manifiestan mayor satisfacción que los docentes de tiempo completo no validándose la hipótesis segunda.

Como criterio de clasificación se registran los rangos de antigüedad que al correlacionarlos con la satisfacción laboral frente al contrato psicológico relacional y el contrato psicológico transaccional como se verifica en la Tabla 1. Se encuentra que las hipótesis quinta y séptima no se verifican, se sugiere que la satisfacción laboral relacionada con el contrato psicológico relacional y con el contrato psicológico transaccional, frente a los rangos de antigüedad, no presenta ningún tipo de efecto.

Tabla 1: Correlación. Nivel de Satisfacción, Contrato Transaccional Según Tipo de Vinculación

Tipo de Vinculación		Contrato Transaccional	
Tiempo Completo	Nivel de Satisfacción	Correlación de Pearson	0.029
		Sig. (2-tailed)	0.854
		N	42
Cátedra	Nivel de Satisfacción	Correlación de Pearson	-0.145
		Sig. (2-tailed)	0.227
		N	71

De la misma forma la hipótesis octava no se verifica como se observa en la Tabla 2, la relación entre la satisfacción laboral y las variables tipo de vinculación, contrato psicológico relacional arroja relaciones nulas, por lo tanto, se manifiesta que el docente de tiempo completo que reporta contrato psicológico transaccional no afecta la satisfacción en el trabajo por estas variables.

Tabla 2: Correlación. Nivel de Satisfacción, Contrato Relacional Según Tipo de Vinculación

Tipo de Vinculación		Contrato Relacional	
Tiempo Completo	Nivel de Satisfacción	Correlación de Pearson	-0.051
		Sig. (2-tailed)	0.748
		N	42
Cátedra	Nivel de Satisfacción	Correlación de Pearson	0.082
		Sig. (2-tailed)	0.495
		N	71

No se verifica la hipótesis tercera al no reportarse relación entre el contrato psicológico relacional y la satisfacción laboral, de igual manera no se verifica la hipótesis cuarta al no hallarse relación entre el contrato psicológico transaccional y la satisfacción laboral. La hipótesis quinta tampoco se verifica se reporta relación casi nula entre la satisfacción laboral, el contrato psicológico relacional y la categoría antigüedad; la hipótesis sexta no se verifica debido a que la relación entre la satisfacción laboral, el contrato psicológico transaccional y la categoría antigüedad es casi nula.

## CONCLUSIONES

Los resultados de este estudio manifiestan que la vinculación laboral no afecta el contrato psicológico, no obstante, el tipo de vinculación laboral no hace que el trabajador difiera de los compromisos percibidos por la empresa en cuanto al cumplimiento de sus labores y su comportamiento ético (Vesga, 2006), es decir, que el contrato psicológico es una variable de corte individual, no una tendencia compartida con los trabajadores (Newton y Nowark, 2010). Los docentes nuevos tienden a tener contrato psicológico relacional, a diferencia del docente antiguo en el que no se presenta una clara tendencia al respecto, en este sentido, Rousseau, (2000); Coyle y Parzefall, (2008), aseguran que es de esperarse que a menos tiempo de contrato laboral con la universidad, la relación de confianza, lealtad mutua y recompensas se encuentren en desarrollo. El nivel de satisfacción en el docente no presenta dependencia con la variable vinculación, sea de cátedra o de tiempo completo. Sin embargo, algunos estudios arrojaron resultado contrarios a los de esta investigación, como se presentó en el encuentro de profesores de cátedra de universidades públicas en la ciudad de Bogotá D.C., Zapata y Salgado (2006) en el que se recomendó que los consejos superiores de la universidades emitieran políticas para vincular a los docentes en modalidad de tiempo completo. La antigüedad en el trabajo no afecta el nivel de satisfacción laboral, el hallazgo de este estudio es contrario al resultado de las investigaciones de Sánchez, et al. (2007); Manfredi y Tovar (2004); Anaya (2006) que reportan mayor insatisfacción en el trabajo en empleados que han permanecido mucho tiempo en la organización.

Esta investigación no arroja relación entre las variables contrato transaccional y tipo de vinculación; al ser el contrato transaccional de corto plazo, centrado en el intercambio económico (Rousseau, 2000) y en los beneficios directos e inmediatos (Dabos y Rosseau, (2004; Topa et al. 2004)). No se reporta relación entre el tipo de vinculación con la satisfacción laboral, sin embargo se encuentra mayor explicación por la variable antigüedad, este resultado difiere de los hallazgos de Sánchez et al. (2007); Gamero (2005) que informan impacto negativo de la satisfacción en el trabajo por el tipo de vinculación temporal. A pesar que algunas investigaciones reportan mayor satisfacción en el trabajo en empleados de mayor antigüedad en la empresa Alonso (2008); Marques y Marcano (2010), el resultado de este estudio encuentra que los docentes de antigüedad laboral entre 21 y 30 años perciben mayor satisfacción laboral; cabe resaltar que se mejora la calidad de vida en general cuando el trabajador recibe más apoyo de sus directores generando que la antigüedad en el trabajo aumente (Alcover y Pérez, 2011).

En esta investigación se encuentra en docentes de tiempo completo menor nivel de satisfacción en el trabajo y en docentes de cátedra mayor nivel de satisfacción; sin embargo Herranz- Bellido et al. (2007) y Maldonado (2012) encuentran que los docentes de tiempo completo están satisfechos con el trabajo; pero en una investigación efectuada en universidades de Medellín, Colombia, los resultados no reportan diferencia en la relación satisfacción laboral docente con el tipo de vinculación. La presente investigación reporta que la satisfacción laboral en docentes no se afecta por la antigüedad, el contrato psicológico, ni el contrato psicológico relacional. Para la relación propuesta en esta investigación, cabría preguntarse qué elementos que conforman el contrato psicológico se deben tener en cuenta, y si su revisión se hará desde el contenido, o las características y/o las evaluaciones (Rousseau, 2000).

Este estudio encuentra que el contrato psicológico relacional no afecta la satisfacción laboral en docentes de tiempo completo. Dabos y Rousseau (2004) afirman que la coherencia laboral entre empleado y empleador alinea con más facilidad los compromisos adquiridos entre las partes, y más aún, si han sido aceptados en el contexto del contrato psicológico. La satisfacción laboral en docentes de tiempo completo no se afecta por el contrato psicológico transaccional, sin embargo las investigaciones de Dabos y Rousseau (2004); Rousseau (2000); Solanes y Zaragoza (2010) informan algún tipo de afectación de la satisfacción laboral en docentes frente al contrato psicológico.

# CARACTERÍSTICAS DEL CAPITAL HUMANO QUE PERMITEN UN DESEMPEÑO PRODUCTIVO EN LAS EMPRESAS MAQUILADORAS DE MAGDALENA Y SANTA ANA, SONORA, MÉXICO

Maritza Dolores Félix Gallego, Universidad Estatal de Sonora

Gladys de la Puerta Pérez, Universidad Estatal de Sonora

Ernesto González González, Universidad Estatal de Sonora

## RESUMEN

*El recurso humano es un activo intangible que puede considerarse como uno de los principales elementos dentro del proceso de transformación en una empresa maquiladora, pues en gran medida determina el éxito de las empresas, generado por su desempeño productivo, impactando con esto en una ventaja competitiva, por lo que es necesario determinar las características que permiten la formación de capital humano que impactan de manera directa en ese desempeño productivo y en la competitividad, para lograr que la economía de la región se fortalezca. En los municipios de Magdalena y Santa Ana, Sonora, no se han realizados estudios al respecto, siendo necesario tener conocimiento sobre lo que sucede en este ámbito, en cuanto a capacitación y desarrollo, motivación, evaluación y comunicación efectiva, del recurso humano.*

**PALABRAS CLAVE:** Productividad, Capital Humano, Empresa Maquiladora, Capacitación y Desarrollo de Personal, Motivación, Evaluación, Comunicación Efectiva

## HUMAN CAPITAL PROPERTIES THAT ALLOW A PRODUCTIVE PERFORMANCE IN THE MAQUILADORA BUSINESS IN MAGDALENA AND SANTA ANA, SONORA, MEXICO

## ABSTRACT

*The human resource is an intangible asset that can be considered one of the main elements in the process of transformation in the maquiladora business, the success of businesses, is generated by their productive performance, impacting with a competitive advantage in this, so it is necessary to determine the characteristics that allow the formation of human resource, that directly impact on the productive performance and competitiveness, to ensure that the region's economy strengthens. In the municipalities of Magdalena and Santa Ana, Sonora, have not done studies on this, being necessary to have knowledge about what happens in this area, in terms of training, development, motivation, evaluation and effective communication of human resource.*

**JEL:** E24

**KEYWORDS:** Productivity, Human Resource, Maquiladora Business, Training, Development, Motivation, Evaluation, and Effective Communication

## INTRODUCCIÓN

La población total del estado de Sonora al año 2010 de acuerdo al Instituto Nacional de Estadística y Geografía (INEGI), asciende a la cantidad de 2'662,480 habitantes, con una tasa de crecimiento de 1.8%

anual; la población económicamente activa en cuanto al número de personas al 2013 es de 1'332,322. De ese total un porcentaje determinado labora en la industria manufacturera. Siendo el 2.7% de esa población económicamente activa la que labora y vende su fuerza de trabajo a la industria maquiladora del corredor industrial del norte de Sonora, conformado por las ciudades de Nogales, Imuris, Magdalena, Santa Ana, Sonora, México. Existen pocos estudios que demuestren el interés por investigar acerca del recurso humano en relación a factores o elementos como son la capacitación, desarrollo, motivación, evaluación, y comunicación efectiva, que inciden en su desempeño productivo, en el sector de maquiladoras de las poblaciones de Magdalena y Santa Ana, Sonora México. La actividad económica de la región tiene estrecha relación con la productividad en las empresas, de acuerdo a lo que establece la evolución y modificación de las actividades productivas en la región, anteriormente enfocadas a la industria primaria como la ganadería y la agricultura principalmente, actividades que cada vez se realizan en menor medida, pues por la observación misma se puede decir que en la actualidad se tienen más empresas dedicadas a la producción de bienes de consumo igualmente a la producción y venta de servicios.

En la región el auge de la industria maquiladora surge a partir de los años 60's, extendiéndose en cuanto a cantidad, tipo de empresa maquiladora y ubicación. *“En el caso de México, la maquiladora toma el nombre de Industria Maquiladora de Exportación y nace en el año de 1965, con el establecimiento de la política de Fomento a la Industria Maquiladora de Exportación, por medio del Programa de Industrialización de la Frontera Norte. Surge como satisfactor de una intersección de necesidades entre la zona fronteriza del norte de México y el encarecimiento de la mano de obra en los Estados Unidos de América”.* (Vázquez Veloz Lambert, 2011). Mendoza Cota determina que *“El impacto de las diferencias entre industrias regionales de la maquiladora y de las diferencias en el grado de capitalización y calificación de la fuerza de trabajo, se convierten en un factor importante en la determinación del proceso de convergencia o divergencia en la productividad del trabajo de la Industria Maquiladora de Exportación”*, (IME).

La empresa maquiladora en esta época enfrenta una gran competencia debido a la globalización de los mercados, para subsistir en el mercado tienen que generar una ventaja competitiva, según Michael Porter: *“la base del desempeño sobre el promedio dentro de una industria es la ventaja competitiva sostenible”*. Dentro de los determinantes para lograr el desempeño productivo y la ventaja competitiva se considera el recurso humano como una parte que impacta y que es una interrogante a resolver. Kofman por su parte asevera que *“cómo organizan los seres humanos sus percepciones, construyen una imagen del mundo y actúan en consecuencia”*, con lo cual debe iniciarse la formación de capital humano para que pueda desarrollarse a su máximo potencial, al mismo tiempo que atender las necesidades del personal, desarrollando ciertas características que lleven a un mejor desempeño productivo y competitividad empresarial.

## DESARROLLO

El investigar sobre lo que influye para que el recurso humano, en este sector de Sonora, México, se considera necesario para generar conocimiento, analizar y determinar cuáles son las características que se asocian o relacionan de manera directa, para que se desarrollen las funciones para las cuales se contrata a las personas que venden su fuerza de trabajo, que se convierten en empleados en las empresas, elevando la productividad; seres humanos que han contribuido a esos logros y le han permitido permanecer en el mercado, ser competitivos, considerando la globalización económica, los cambios en los hábitos de consumo de los clientes, entre otras causales. Se reflexiona que la formación de capital humano debido a la capacitación, desarrollo, motivación, evaluación y comunicación efectiva, impacta en el éxito de las mismas, si se genera un desempeño productivo que les permite producir a bajo costo y con calidad. Si estos factores tienen relación entre sí, entonces cuáles son, en qué medida influyen de manera directa al recurso humano para un mejor desempeño y por tanto ser una empresa productiva. La cultura y el clima organizacional, genera un comportamiento organizacional que puede llegar a influir en el recurso humano

que labora de manera individual formando a la vez grupos de trabajo, que se convierten en uno de los principales activos con los que cuenta la empresa hoy en día, haciendo que se logre o no las metas trazadas, lo propuesto en la filosofía empresarial incluida en ella su misión, visión y los principios establecidos, logrando la capacidad de respuesta necesaria, creando una organización sin fronteras que pueda hacer cualquier cosa en el tiempo y el espacio. Ese recurso humano debe ser capacitado, motivado, evaluado, contar con una comunicación eficiente para ser altamente productivo, ocasionando la competitividad en la empresa.

*“En años recientes la Administración de Recursos Humanos es una función estratégica vital a medida que las organizaciones intentan competir a través de la gente. La planeación estratégica y la administración estratégica en las firmas, pueden crear una ventaja competitiva cuando poseen o desarrollan recursos que son valiosos, raros, inimitables y organizados. Podemos utilizar el mismo criterio para hablar del impacto estratégico de los recursos humanos”.* (Bateman Thomas, 2001). Se pretende que los resultados de la investigación beneficien a aquellos miembros de la organización que intervienen en la toma de decisiones a través del buen uso del recurso humano, apoyar a las empresas para fortalecer la formación de capital humano. Los conocimientos se van transmitiendo de generación en generación y esto permita a su vez la evolución de los sistemas de producción junto a un desarrollo paralelo de la tecnología aplicada, debido a los recursos humanos.

Los países que se consideran en la actualidad como países desarrollados o industrializados, presentan una gran base de recursos de capital así como de una elevada cantidad de recursos humanos con los conocimientos necesarios para operar un sistema de producción avanzado, en contraposición a los países en vías de desarrollo cuyos recursos de capital, así como los recursos humanos carecen o se tienen una deficiencia de la preparación científica, teórica y técnica para la acumulación de capital y por tanto de deficiente capacidad tecnológica. Entre los conceptos teóricos de las variables de estudio, se ha encontrado una diversidad en la literatura consultada, desarrollando de manera general los conceptos descritos en el presente trabajo. El Sistema de Clasificación Industrial de América del Norte, (SCIAN), México 2002 define a la industria manufacturera como se describe a continuación: *“Este sector comprende unidades económicas dedicadas principalmente a la transformación mecánica, física o química de materiales o substancias con el fin de obtener productos nuevos.*

*También se consideran manufacturas las actividades de maquila; el ensamble de partes y componentes o productos fabricados; ...”.* Capital Humano, se entiende como el conjunto de capacidades y habilidades que son adquiridos o desarrollados a través de los conocimientos, la experiencia, la educación formal, la capacitación, y las condiciones de trabajo que afectan directamente la salud y la productividad de las personas. Este, hace referencia a los procesos de gestión del talento humano, tanto desde las políticas públicas para el desarrollo de la sociedad con sistemas productivos y su relación con el desarrollo de las personas. *“El capital humano, que son todos los activos en los cuales la organización invierte y se evidencia en: experiencia, salud, salarios, vivienda, calidad de trabajo, y educación. La inversión realizada por la organización justifica el capital intelectual que posee, y cuan valioso es el talento para la organización”.* (Moreno B Fidel, 2012). La motivación es un elemento considerado como característica para el desempeño productivo, Bateman supone *“Que se refiere a las fuerzas que dan energía, dirigen y sostienen los esfuerzos de una persona”*, aunado a esto *“La conducta de una persona en un momento dado depende del estímulo y también sus mecanismos biológicos, de sus experiencias pasadas, del ambiente en que se encuentre en ese momento y, en general, de su personalidad”.*

(Arias Galicia, 1998). La capacitación y el desarrollo como parte del desarrollo de la fuerza de trabajo, en una economía basada en el conocimiento, produce y tiene como resultado las competencias y habilidades para un mejor desempeño, la capacitación permite enseñar a las personas que laboran en la empresa a realizar mejor su trabajo. Identificar las necesidades de capacitación de acuerdo a las personas y puestos

son útiles para el logro de los objetivos empresariales. La evaluación de acuerdo con Bateman (2001), es la medición del desempeño del trabajo realizado por un empleado en tres vertientes principalmente las características del trabajo, el comportamiento y los resultados obtenidos, que aportan información en cuanto a decisiones de salarios, sueldos, promociones, despidos entre otros pero principalmente por el desempeño de actividades realizadas. La compensación y los beneficios están respaldados por un sistema legal buscando la equidad en el trabajo, las recompensas otorgadas es una retribución adicional para atraer y motivar al recurso. La comunicación efectiva se refiere a la transmisión de la información de la forma apropiada para que se realicen las actividades encaminadas a lograr que por parte de los recursos humanos tenga un entendimiento de lo que deben realizar y lo que se espera de ello, logrando mejorar el desempeño productivo, afectando con ello de manera positiva la competitividad.

## CONCLUSIONES

El trabajo a desarrollar permitirá desarrollar un análisis de la situación actual en cuanto al recurso humano que labora en la empresa maquiladora de la región. Se generara conocimiento respecto de la formación de capital humano, de la relación entre la productividad con la capacitación, el desarrollo, la motivación, la evaluación y comunicación efectiva.

## **TURISMO SUSTENTABLE COMO ALTERNATIVA DE APOYO A LAS COMUNIDADES RURALES Y BOSQUES DEL DISTRITO FEDERAL, MÉXICO**

Zeltzin Minerva Gutiérrez Rivera, Universidad Nacional Autónoma de México

### **RESUMEN**

*México es un país con una interesante historia, costumbres, tradiciones y cultura que trascienden fronteras; desde un enfoque turístico, México ofrece sus cualidades y riqueza natural a todos sus visitantes. Un destino turístico destacado de México ha sido el Distrito Federal gracias a las ventajas con las que cuenta, tales como infraestructura hotelera, comunicaciones, transportes, y patrimonio histórico, artístico y cultural, la actividad turística representó en 1999 un gran aporte en la generación de empleos directos e indirectos, contribuyendo con el 7% del PIB local, y situando a la ciudad como la principal receptora de turistas del país con 8.9 millones anualmente. En el año 2000 se recibieron 9.1 millones de turistas en los hoteles capitalinos, de los cuales 2.1 fueron internacionales. Aunque al referirse al Distrito Federal se piensa en la Gran Ciudad de México, también podemos encontrar que más del 50% del territorio del Distrito Federal son zonas rurales y bosques donde existe un enorme potencial para crear espacios de turismo sustentable en distintas modalidades, dirigido tanto al turista nacional como al extranjero y que dicha actividad turística contribuiría al mismo desarrollo sustentable del Distrito Federal. Sin embargo, las repercusiones estructurales que conlleva el no tener políticas y acciones dirigidas al turismo sustentable, tienen gran impacto en la sociedad: la pobreza, desmontes y deforestación, la degradación ambiental, sobreexplotación de los recursos naturales, contaminación de la atmósfera y del agua, destrucción de suelos, de la biomasa y de la biodiversidad. Dichas repercusiones, día a día se agudizan, la mancha urbana va en crecimiento y con ello destruyendo los bosques y zonas rurales que aún existen al sur del Distrito Federal. Si el turismo no se planifica y se lleva a cabo adecuadamente, puede destruir vegetación, contaminar, eliminar espacios abiertos, crear problemas de aguas negras, causar problemas de vivienda e ignorar las necesidades y la estructura de la comunidad anfitriona.*

**PALABRAS CLAVE:** Turismo Sustentable, Comunidades Rurales, Bosques, Aspecto Social, Aspecto Económico, Medio Ambiente

## **SUSTAINABLE TOURISM AS AN ALTERNATIVE TO SUPPORT RURAL COMMUNITIES AND FORESTS IN MEXICO CITY**

### **ABSTRACT**

*Mexico is a country with an interesting history, customs, traditions and culture that transcend borders, from a tourism focus; Mexico offers its qualities and natural wealth to all its visitors. A prominent tourist destination in Mexico has been the Federal District, thanks to all of the resources it has such as hotel infrastructure, communications, transportation, and historical, artistic and cultural heritage, tourism*

*activity in 1999 represented a major contribution in generating direct and indirect jobs, contributing 7% of local GDP, and placing the city as the main receiving country tourists with 8.9 million annually. In 2000 Mexico received 9.1 million tourists at all Mexico City's hotels 9.1 million tourists in the capital's hotels and 2.1 million were international tourists. While referring to the Federal District we will think of the big city of Mexico, we also find that over 50 % of the territory of the Federal District are rural areas and forests where there is huge potential to create opportunities for sustainable tourism in different modalities, intended for both national and foreign tourists and tourism said it would contribute to the sustainable development of the Federal District. However, the structural implications involved not having policies and actions aimed at sustainable tourism have great impact on society: poverty, deforestation and deforestation, environmental degradation, overexploitation of natural resources, pollution of the atmosphere and water, destruction of soil, biomass and biodiversity. These implications are sharpened daily, the urban growth and will thus destroying forests and rural areas that still exist south of Mexico City. If tourism is not planned and is carried out properly it can destroy vegetation, pollute, eliminate open spaces, create problems of sewage, causing housing problems and ignore the needs and structure of the host community.*

## INTRODUCCIÓN

En décadas recientes se ha visto el surgimiento de problemas como el calentamiento de nuestro planeta y el deterioro ambiental de tierras y océanos; estas circunstancias ahora más que nunca pueden conjugar todos los esfuerzos para tratar de resolverlos mediante la concientización, la ciencia y la tecnología. Lo anterior obliga a dar un mayor peso de importancia a la actividad de la investigación no solo como generación de conocimiento si no también como sustento para dar pie a la toma de decisiones resolutivas y preventivas ante este tipo de situaciones que está viviendo el planeta. No se trata de destruir lo establecido, si no de enfocarlo de manera distinta para lograr un desarrollo vigoroso en temas de sustentabilidad. Es necesario investigar los beneficios que se producen al fomentar e implementar prácticas de turismo sustentable en las zonas rurales y bosques, en este caso del Distrito Federal para determinar si realmente el turismo sustentable es una alternativa de apoyo a las mismas.

Para crear nuevos proyectos y programas encaminados al desarrollo sustentable de la Ciudad de México, se debe fomentar una intervención responsable tanto de oferentes de servicios turísticos en la localidad mencionada, gobierno y visitantes que se interesan por su diversión, esparcimiento y recreación valorando su relación con el medio ambiente. Se pretende reestructurar el pensamiento de los participantes del sector turismo para ayudar a que no solo se vea la actividad turística de manera lucrativa, sino que también sea planificada con visión a largo plazo y prevalecer los recursos existentes para que la actividad siga dando frutos a futuras generaciones y beneficios tanto a oferentes de los servicios turísticos, residentes de las zonas rurales y bosques de la ciudad, y a los turistas.

El desarrollo de prácticas de turismo sustentable puede ser generador de nuevas fuentes de empleo para las personas que viven y son originarias de estas zonas rurales y los bosques en el Distrito Federal, se puede generar una visión de los logros y alcances que propicien el cuidado y protección de estas zonas por la necesidad de iniciar un proceso de apropiación y contexto del suelo de conservación por los pobladores del mismo, para lograr su compromiso para el desarrollo sustentable de estos espacios. A pesar de que ya se ha hablado mucho sobre el tema de turismo sustentable alrededor del mundo, en el Distrito Federal es un tema que aún requiere exploración. La siguiente investigación es sustentada en información de diferentes fuentes confiables y de la investigación de campo.

La siguiente investigación se enfoca en demostrar si realmente el turismo sustentable es una alternativa de apoyo a las comunidades de las zonas rurales y bosques del Distrito Federal mediante la planeación y ejecución de la actividad turística pero de manera sustentable, es decir, protegiendo los recursos naturales generando un bajo impacto sobre el medio ambiente y preservando la cultura de esta población, al mismo tiempo se contribuye a generar ingresos y empleo para la población local.

Esta investigación se presenta organizada de la siguiente manera: en la sección de revisión literaria se plantean los argumentos que sustentan la ejecución de programas de turismo sustentable como apoyo a las comunidades de las zonas rurales y bosques del Distrito Federal. Posteriormente se presenta la metodología utilizada, en donde se identifican los beneficios y las razones de cómo las actividades de turismo sustentable pueden apoyar a esta población, seguidamente de los resultados y conclusiones.

## REVISIÓN LITERARIA

El desarrollo sustentable puede ser considerado como un nuevo paradigma teórico y un proceso que empieza a ser elaborado a partir de la década de los setenta por la comisión Brundtland. Dicha comisión de la ONU presidida por la entonces ministra del Medio Ambiente de Noruega, Gro Harlem Brundtland, a finales de los años ochenta emite sus conclusiones y expone un diagnóstico preocupante sobre el estado del planeta en su dimensión ambiental. Durante los últimos años, particularmente después de la Cumbre de Río en 1992, el concepto de Desarrollo Sustentable empieza a adquirir mayor importancia, incorpora como centralidad de su análisis y problemáticas, tres dimensiones de gran importancia: la económica, la social y la ambiental, y se define como la capacidad de las generaciones presentes para atender y satisfacer sus necesidades legando a las generaciones futuras un ambiente sano y limpio, con recursos naturales suficientes para enfrentar y cubrir sus propias necesidades de desarrollo y de bienestar (Comisión Mundial sobre Ambiente y Desarrollo, Comisión Brundtland, 1987).

Entonces, el Desarrollo sustentable es un término aplicado al desarrollo económico, social y ambiental que permite hacer frente a las necesidades del presente sin poner en peligro la capacidad de las futuras generaciones para satisfacer sus propias necesidades. El turismo sustentable puede ser definido como el turismo que tiene plenamente en cuenta las repercusiones actuales y futuras, económicas, sociales y medioambientales para satisfacer las necesidades de los visitantes, de la industria, del entorno y de las comunidades anfitrionas (Organización Mundial del Turismo, OMT, 1994).

Entendiéndose que el turismo sustentable son aquellas actividades turísticas respetuosas con el medio natural, cultural y social, y con los valores de la comunidad, que permite disfrutar de un positivo intercambio de experiencias entre residentes y visitantes, donde la relación entre el turista y la comunidad es justa y los beneficios de la actividad es repartida en forma equitativa, y de donde los visitantes tienen una actitud verdaderamente participativa en su experiencia de viaje. El turismo sustentable debe reportar también un alto grado de satisfacción a los turistas y representar para ellos una experiencia significativa, que los haga más conscientes de los problemas de la sustentabilidad y fomente en ellos prácticas turísticas sustentables. La carta de Lanzarote (Canarias, 1995) producidas por los asistentes a la Conferencia Mundial de Turismo Sustentable, expresa que siendo el turismo un potente instrumento de desarrollo, puede y debe participar activamente en la estrategia de Desarrollo Sustentable. Una buena gestión de turismo exige garantizar la sustentabilidad de los recursos de los que se depende.

La Organización Mundial del Turismo (OMT, 2013) menciona que las directrices para el desarrollo sustentable del turismo y las prácticas de gestión sustentable se aplican a todas las formas de turismo en todos los tipos de destinos, incluidos el turismo de masas y los diversos segmentos turísticos. Los principios de sustentabilidad se refieren a los aspectos medioambiental, económico y sociocultural del desarrollo turístico, habiéndose de establecer un equilibrio adecuado entre esas tres dimensiones para garantizar su

sustentabilidad a largo plazo. La Organización Mundial del Turismo (OMT, 2013) menciona los siguientes objetivos del turismo sustentable:

Dar un uso óptimo a los recursos medioambientales, que son un elemento fundamental del desarrollo turístico, manteniendo los procesos ecológicos esenciales y ayudando a conservar los recursos naturales y la diversidad biológica. Respetar la autenticidad sociocultural de las comunidades anfitrionas, conservar sus activos culturales y arquitectónicos y sus valores tradicionales, y contribuir al entendimiento y la tolerancia intercultural. Y, asegurar unas actividades económicas viables a largo plazo, que reporten a todos los agentes, unos beneficios socio-económicos bien distribuidos, entre los que se cuenten oportunidades de empleo estable y de obtención de ingresos y servicios sociales para las comunidades anfitrionas, y que contribuyan a la reducción de la pobreza.

Gracias a las ventajas con que cuenta el Distrito Federal tales como infraestructura hotelera, comunicaciones, transportes, y patrimonio histórico, artístico y cultural, la actividad turística representó en 1999 un gran aporte en la generación de empleos directos e indirectos, contribuyendo con el 7% del PIB local, y situando a la ciudad como la principal receptora de turistas del país con 8.9 millones anualmente. En el año 2000 se recibieron 9.1 millones de turistas en los hoteles capitalinos, de los cuales 2.1 fueron internacionales. Sin embargo, esta actividad ha visto mermado su potencial debido a la imagen de inseguridad pública, elevados índices de contaminación, insuficiente promoción, así como ausencia de una estrategia integral que desarrolle un complejo turístico ciudadano para diferentes estratos y niveles socioeconómicos (Secretaría del Medio Ambiente DF, 2009).

Aun cuando existe un gran potencial turístico, en el Distrito Federal, éste se ha desarrollado solo en la forma convencional antes citada, pero dadas las características de la zona sur del D.F., existe un enorme potencial para crear espacios de turismo alternativo en sus distintas modalidades, dirigido tanto al turista nacional como al extranjero y conducidas al desarrollo del turismo sustentable. El Distrito Federal cuenta con zonas rurales y bosques, especialmente en las delegaciones Tlalpan, Xochimilco, Cuajimalpa, Álvaro Obregón, Tláhuac y Magdalena Contreras. En el Distrito Federal se requiere una serie de cambios fundamentales en las formas de concebir el desarrollo. Se requieren transformaciones conceptuales metodológicas y de valores para avanzar a la transición del llamado desarrollo sustentable. Especialmente es necesario tener formas democráticas en el ejercicio del poder y garantizar posibilidades reales de participación social. Las repercusiones estructurales que conlleva el no tener políticas y acciones dirigidas al desarrollo sustentable, tienen gran impacto en la sociedad: la pobreza, desmontes y deforestación, la degradación ambiental, sobreexplotación de los recursos naturales, contaminación de la atmósfera y del agua, destrucción de suelos, de la biomasa y de la biodiversidad.

Dichas repercusiones, día a día se agudizan, tan solo en la Ciudad de México la mancha urbana va en crecimiento y con ello destruyendo los bosques y zonas rurales que aún existen al sur del Distrito Federal. Gran parte de este problema es causado a falta de la concientización de la población y su falta de responsabilidad ante el medio ambiente. La Ciudad de México tiene desarrollado un turismo convencional lleno de servicios, sin embargo, si el turismo no se planifica y se lleva a cabo adecuadamente, puede destruir vegetación, contaminar, eliminar espacios abiertos, crear problemas de aguas negras, causar problemas de vivienda e ignorar las necesidades y la estructura de la comunidad anfitriona.

## METODOLOGÍA

Al hablar de turismo sustentable, es difícil imaginarlo en las grandes ciudades donde la urbanización y los ciudadanos, por su mismo ritmo de vida que llevan, no interactúan mucho con el medio ambiente y el entorno suele verse lleno de edificios, pavimento, autos, viviendas, etcétera. En el caso de la Ciudad de México, cuenta aún con zonas rurales y bosques, y lo importante no es sólo saber que están ahí, si no preservarlos y

buscar alternativas de apoyo a estas zonas, se pretende determinar si el turismo sustentable es una alternativa viable que genere beneficios en estas zonas del Distrito Federal.

Se está realizando una investigación con el objetivo de determinar si hay beneficios al fomentar e implementar prácticas de turismo sustentable como una alternativa viable para apoyar a las comunidades de zonas rurales y bosques del Distrito Federal, analizando las actividades económicas y sociales en el espacio de acuerdo con la capacidad de los ecosistemas en estas zonas, principalmente en comunidades donde ya se han generado proyectos de turismo sustentable. El análisis sólo se enfocará a la práctica de actividades de turismo sustentable en ciertas comunidades rurales y bosques del Distrito Federal, en este caso de las Delegaciones de Tlalpan y Milpa Alta, describiendo el estado, las características, factores y procedimientos de fenómenos y hechos que ocurren acerca del turismo sustentable. Existen algunos residentes de las zonas rurales y bosques del Distrito Federal en las delegaciones de Tlalpan y Milpa Alta, que ya se encuentran organizados implementando actividades de turismo sustentable, ya sea como propietarios de las tierras, oferentes de los servicios y productos que apoyan la actividad turística o desempeñando algunas otras funciones para la misma. Así como también existen los que tiene las posibilidades de implementar actividades de turismo sustentable pero que por alguna razón no lo hacen.

Figura 1: las Delegaciones del Distrito Federal Donde se Cuenta Con Zonas Rurales y Bosques

*En el sur del Distrito Federal se encuentran las delegaciones de Magdalena Contreras, Parte de Cuajimalpa, Tlalpan, Xochimilco, Tlahuac y Milpa Alta, en las cuales el 70% de su territorio es zona rural o boscosa. Y principalmente en las delegaciones con más extensión territorial (Tlalpan y Milpa Alta) es donde ya se están desarrollando algunos proyectos de turismo sustentable.*

## RESULTADOS

Los resultados de la investigación permitirán determinar si el turismo sustentable es una alternativa de apoyo a las comunidades de las zonas rurales y bosques del Distrito Federal, basado en el análisis de las Delegaciones Tlalpan y Milpa Alta donde actualmente existen intentos de desarrollo de turismo sustentable a través de algunos proyectos ecoturísticos. También podremos ver aspectos importantes al generar estrategias de proyectos de turismo sustentable a partir de una planeación, para lograr la distribución armónica de las actividades económicas y sociales en el espacio de acuerdo con la capacidad de los ecosistemas en las comunidades de zonas rurales y bosques del Distrito Federal. Dependiendo de los

resultados de la investigación se podrá elaborar una propuesta para implementar actividades de turismo sustentable y analizar sus efectos en dichas comunidades para ver el impacto que genera.

## CONCLUSIONES

Crear proyectos de turismo sustentable es una alternativa de impulso al desarrollo sustentable de los países, ya que busca generar ingresos económicos que intervengan positivamente en el nivel de bienestar de la población, promover la organización comunitaria, fortalecer el vínculo de las comunidades rurales con sus territorios, y propiciar la revaloración, la conservación y el aprovechamiento sustentable de los recursos y atractivos naturales, así como del patrimonio cultural de comunidades rurales y zonas boscosas. Es posible establecer la conformación de circuitos y rutas de ecoturismo para mejorar el posicionamiento de estas actividades en el contexto del mercado turístico; y fortalecer las capacidades de las comunidades para que realicen el proceso de reconversión productiva (nuevas habilidades para la operación, administración y comercialización de productos y servicios) y que tengan condiciones de convertir al ecoturismo en una opción para el desarrollo.

Con los proyectos de turismo sustentable las comunidades rurales y comunidades de zonas boscosas del Distrito Federal, pueden avanzar con un impacto económico como generador de empleos, fuentes de ingresos al recibir visitantes; así mismo se genera un impacto social al compartir con los visitantes su riqueza natural y cultural, se apoya a la conservación de costumbres y tradiciones además de darles difusión para no perder lo que es parte de nuestras raíces, historia y recursos. En cuanto a los recursos naturales, se tiene menor impacto sobre el medio ambiente, protegiendo y generando una consciencia de importancia y responsabilidad ante estos lugares. Los proyectos de turismo sustentable en comunidades rurales y zonas boscosas del Distrito Federal pueden incluir actividades de turismo ecológico y turismo indígena, así como contar con la infraestructura para desarrollarlos y fomentar las actividades económicas necesarias para la actividad turística y así coadyuvar al desarrollo sustentable que hoy en día se busca no solo en el Distrito Federal, si no en el resto del país y en otros muchos países alrededor del mundo.

# **SATISFACCIÓN LABORAL EN DOCENCIA, INVESTIGACIÓN Y EXTENSIÓN, DE LOS PROFESORES DE EDUCACIÓN SUPERIOR EN LA GUAJIRA COLOMBIA**

Marlenis Ucrós Brito, Universidad de la Guajira  
José Sanchez González, Universidad de la Guajira  
Charles J. Blanco Martes, Universidad del Zulia

## **RESUMEN**

*El objetivo de la presente investigación fue analizar los niveles de satisfacción en las funciones sustantivas de: docencia, Investigación y extensión en docentes de la Universidad de la Guajira-Colombia. El estudio se sustenta en las teorías de autores como: Maslow, Herzberg, Adelfer y Mc Clelland entre otros. La investigación es descriptiva, bajo un enfoque cuantitativo. Los resultados evidencian que los niveles de satisfacción en las actividades de docencia, generan factores de insatisfacción tales como: recursos bibliográficos, ayudas educativas, espacios para el desempeño docente, adecuación del espacio físico, carga académica, horario de trabajo, dotación de espacio físico, reconocimiento y capacitación. También se evidencia en las actividades de investigación, factores que causan insatisfacción, tales como: tramitología interna, reconocimiento, disponibilidad y dotación de espacio físico, capacitación, descarga académica. De la misma manera, en las actividades de extensión, existen factores que generan insatisfacción tales como: Tramitología interna, acceso a eventos nacionales e internacionales, trabajo con la comunidad y reconocimiento. Finalmente, se concluye que existen varios factores que afectan los niveles de satisfacción en las actividades de docencia, investigación y extensión los cuales causan insatisfacción en los profesores universitarios de La Guajira.*

**PALABRAS CLAVES:** Satisfacción Laboral, Docencia, Investigación, Extensión, Educación Superior, La Guajira Colombia

## **JOB SATISFACTION IN TEACHING, RESEARCH AND EXTENSION EDUCATION OF TEACHERS IN HIGH EDUCATION IN LA GUAJIRA - COLOMBIA**

## **ABSTRACT**

*The objective of this research was to analyze the levels of satisfaction in the substantive functions: teaching, research and extension faculty of the University of the Guajira-Colombia. El study is based on the theories of authors such as Maslow, Herzberg, Adelfer Mc Clelland and others. The research is descriptive, based on a quantitative approach. The results show that levels of satisfaction in teaching activities generate dissatisfaction factors such as library resources, educational aids, spaces for teacher performance, adequacy of physical space, academic assignment, work schedule, provision of physical space, recognition and training. Also evident in the research, factors that cause dissatisfaction, such as internal paperwork, awards and recognition, availability and provision of physical space, training, reduction of class hours. Similarly, extension activities, there are factors causing dissatisfaction such as internal paperwork, transfers to national and international events, community work and awards and recognition. Finally, it can be concluded that there are several factors that affect levels of satisfaction in the activities of teaching, research and extension which cause dissatisfaction among teachers of University of La Guajira.*

**JEL:** I2, I23

**KEYWORDS:** Job Satisfaction, Teaching, Investigation, Extension, University Professors, La Guajira Colombia

## INTRODUCCION

La satisfacción laboral en el trabajo es una dimensión de gran importancia en el proceso motivacional que refleja el grado hasta el cual el individuo percibe positiva o negativamente sus carencias y necesidades están cubiertas por el cargo que desempeña y lo relacionado con él. (Planteada por Herzberg, citada por Hellriegel, 2002). Los autores como Herzberg, Maslow y Adelfer y Mc Clelland han investigado sobre la satisfacción en el trabajo es tan significativa para las organizaciones como para el individuo porque afecta directamente la conducta de los empleados. Los postulados de la teoría de Herzberg que soportan a esta investigación, demuestra como los factores motivacionales e higiénicos afectan la satisfacción laboral de los docentes encuestados en la Universidad de la Guajira en el ejercicio de las funciones sustantivas de docencia, investigación y extensión. El propósito de esta investigación fue analizar los niveles de satisfacción en las funciones sustantivas de: docencia, Investigación y extensión en docentes de la Universidad de la Guajira, con la finalidad de proponer lineamientos para su mejoramiento.

Esta investigación está organizada como sigue: En la sección de revisión de literatura se plantean los argumentos que sustentan el análisis de los niveles de satisfacción en las funciones sustantivas de: docencia, Investigación y extensión en docentes de la Universidad de la Guajira-Colombia. Posteriormente se presenta la metodología utilizada, donde se describe el procedimiento tratado para el cálculo de la muestra, el cuestionario diseñado y validado por jueces expertos, con determinación de validez y confiabilidad utilizado como técnica para recolección de la información y los resultados procesados con la ayuda del software DYANE (Diseño y Análisis de Encuestas) de Miguel Santesmases Mestre, versión 4. Seguidamente se presentan los resultados y conclusiones.

## REVISION LITERATURA

De acuerdo a las teorías relacionadas con la satisfacción laboral, es necesario el análisis del comportamiento humano con base en las teorías motivacionales, por estar estrechamente ligada con la satisfacción, reafirmado por Diez de Castro (2001), el cual plantea que la satisfacción, es el bienestar que se experimenta cuando un deseo es satisfecho. Algunas de las teorías motivacionales están ligadas con la satisfacción laboral, debido a que la motivación se refiere a un impulso y esfuerzo para satisfacer un deseo o meta y la satisfacción tal como se planteó anteriormente, es el bienestar donde el individuo percibe cuando logra lo que desea o alcanza una meta. A este respecto, los enfoques teóricos que intentan explicar la satisfacción laboral, así como los factores e implicaciones asociadas con el grado de satisfacción laboral, están las teorías de contenido y las teorías de procesos.

Por otra parte, *la teoría de los dos factores* propuesta por Frederick Herzberg (1957), conocida también teoría de los factores higiénicos y de motivación, están relacionados estrechamente con la jerarquía de las necesidades planteadas por Maslow, los factores higiénicos (contexto del cargo: condiciones de trabajo, salarios y premios de producción, beneficios y servicios sociales, políticas de la organización, relaciones con los jefes y compañeros), es decir cómo se siente la persona en relación con la empresa, corresponden con las necesidades más bajas de Maslow. En síntesis, jerarquía de las necesidades de Maslow simplificada por Adelfer y los hallazgos de Herzberg relacionados con la satisfacción en el trabajo, no es un concepto unidimensional que varía del sí al no. Sus conclusiones indican

que la satisfacción e insatisfacción son conceptos bidimensionales, los cuales se pueden resumir en Tabla 1.

Tabla 1: Factores de Insatisfacción y de Satisfacción, Según la Teoría de los dos Factores

Factores	Presencia	ausencia
Motivadores	satisfacción	No satisfacción
Higiénicos	No insatisfacción	Insatisfacción

*En el Cuadro 1. Muestra el concepto bidimensional, basado en la teoría de los dos factores de Herzberg., Fuente: investigadores.*

En relación con las implicaciones de la teoría de los dos factores, planteada por Herzberg, está orientada hacia el comportamiento humano en el trabajo, sin embargo los gerentes en las organizaciones pueden utilizarla con facilidad. Su efecto en la práctica administrativa no se debe subestimar, muchas de sus aplicaciones son útiles en las organizaciones, independientemente porque es empírica.

## METODOLOGIA

El presente artículo emana de una investigación científica con diseño descriptivo, no experimental, ya que describe y no pretende modificar o manipular la realidad actual de las variables. Así mismo, el objetivo estuvo orientado a indagar los valores en que se manifiesta en un momento único. Hernández (2010:289). Por otra parte, se observó cómo se presentaron las variables en estudio, con el fin de establecer el nivel satisfacción e insatisfacción en los docentes de planta, catedráticos y ocasionales en el ejercicio de las funciones docencia, investigación y extensión. Luego con la ayuda del software DYANE (Diseño y Análisis de Encuestas) de Miguel Santesmases Mestre, versión 4. El cuestionario diseñado y validado por jueces expertos, se aplicó la prueba piloto a un grupo de docentes universitarios escogidos aleatoriamente objeto de estudio, con similares características, categorizado y valorando en la escala Total desacuerdo, mediano acuerdo, indiferente, mediano acuerdo, total acuerdo mostrando pertinencia y objetividad en la medición de la Variable y sub-variables del instrumento aplicado. Finalmente se codifica y se da entrada de datos en el computador, se tabula con la ayuda del DYANE (Diseño y Análisis de Encuestas) de Miguel Santesmases Mestre, versión 4. y se presenta en forma conjunta la información obtenida en la investigación de campo; al finalizar este proceso, los datos obtenidos se incorporan en cuadros simples, los cuales detallan los hallazgos de los niveles de satisfacción en las funciones sustantivas de los docentes objeto de estudio en la Universidad de la Guajira.

## RESULTADOS

Los resultados en este apartado, han sido calculados en base a los datos obtenidos con la ayuda del paquete estadístico, DYANE (Diseño y Análisis de Encuestas) de Miguel Santesmases Mestre, versión 4. Aplicados a la muestra objeto de estudio. Para facilitar el análisis se procedió a identificar por separados las variables relativas a los factores que generan insatisfacción en los profesores en sus actividades de docencia, investigación y extensión. En la tabla 4, se presentan los factores que generan insatisfacción para el desempeño en las actividades de docencia en su orden: recursos bibliográfico, 7.81%; ayudas educativas, 7.34%; espacios para el desempeño docente, 7.34%; adecuación espacio físico, 7.81% como lo confirma el 45% y el 48% de los docentes. Les siguen en su orden carga académica, 6.56%; horario de trabajo, 6.88%; dotación de espacios físicos, 6.88%; reconocimiento, 6.56% y capacitación, 6.88%, como lo ratifica el rango que oscila entre 40% y 42% de los docentes.

De acuerdo con el logro del objetivo, determinar cuáles son los niveles de satisfacción en los docentes en las funciones de docencia y los resultados obtenidos anteriormente, la docencia comprende la relación entre el docente y el estudiante en un acto pedagógico formalmente establecido mediante la asignación de la carga académica, horario de trabajo, ayudas educativas, recursos bibliográficos, espacios

para desempeño académico, adecuación de espacios físicos, dotación de espacios físicos, autonomía, reconocimiento, ascenso, salario, capacitación, autorrealización y formación postgraduada.

*En esta tabla se muestran los factores que generan insatisfacción en las actividades de docencia, el mayor grado de presencia son: Recursos bibliográficos, ayudas educativas, espacios para el desempeño docente y adecuación del espacio físico.*

En relación con las implicaciones de la teoría de los dos factores, planteada por Herzberg, está orientada hacia el comportamiento humano en el trabajo basada en los factores motivacionales que generan satisfacción o insatisfacción, pudiéndose establecer como aspectos del contenido del trabajo y el contexto organizacional que generan esas sensaciones positivas o negativas, donde se evidencia ausencia de no satisfacción en ayudas educativas, recursos bibliográficos, espacios para el desarrollo académico y adecuación de espacios físicos en mayor grado y representatividad que en los demás factores objeto de estudio. Sin embargo, es importante resaltar el desafío del mismo trabajo de los docentes, la responsabilidad, el logro, progreso y crecimiento que los motiva.

No obstante se observa presencia de satisfacción, porque ellos se sienten autorrealizados desarrollando esta función y estos factores motivadores podrían conducirlos a un desempeño superior solo si no hay insatisfacción presente. De la misma manera, los factores higiénicos que evidencian presencia de no insatisfacción, tales como autonomía, reconocimiento, salario, formación postgraduada en menor grado, están presentes en el ejercicio de la docencia, al menos en cierta medida para evitar la insatisfacción. En consecuencia, según Herzberg, los empleadores deben motivar a los empleados de la misma manera, asegurando la presencia de factores motivacionales e higiénicos, porque la ausencia de insatisfacción sola no motiva a los docentes a alcanzar mayor grado de satisfacción, es decir, no genera sensación de emoción por el trabajo y la organización.

Tabla 5: Factores de Insatisfacción en las Actividades de Investigación Variable 2: en la Siguiente Lista Señale Cuales Son los Factores Que Usted Cree Que Generan Insatisfaccion de los Profesores Para Hacer Investigación

	Total frecuencias	483	100,00	468,93
	Total muestra	103		

*En esta tabla se muestran los factores que generan insatisfacción en las actividades de investigación, el mayor grado de presencia son: tramitología interna, apoyo económico, reconocimiento disponibilidad de espacio físico y dotación de espacio físico.*

En la tabla 5, se evidencian que los principales factores que generan insatisfacción para el desempeño en las actividades de Investigación en su orden: tramitología interna, 14.70%; reconocimiento, 10.14%; disponibilidad y dotación de espacio físico, 9.73 %; capacitación 9.32%, descarga académica 8,90% como lo confirma el 45% y el 48% de los docentes. Les siguen en su orden carga académica, 6.56%; horario de trabajo, 6.88%; dotación de espacios físicos, 6.88%; reconocimiento, 6.56% y capacitación, 6.88%, como lo ratifica el rango que oscila entre 50% y 70% de los docentes. Ver tabla 5. De acuerdo con el logro del objetivo, determinar cuáles son los niveles de satisfacción en los docentes en las funciones de investigación y los resultados obtenidos anteriormente, la investigación como finalidad la generación y comprobación de conocimientos orientados al desarrollo de la ciencia, de los saberes, de la técnica, es fuente del saber, soporte del ejercicio docente y parte del currículo, se observó mediante los indicadores de medición: Descarga académica,

Apoyo económico, tramitología interna, disponibilidad de espacio físico, dotación del espacio físico, autonomía, reconocimiento, ascenso, salario, capacitación y autorrealización. En relación con las implicaciones de la teoría de los dos factores, planteada por Herzberg, se evidencia ausencia de no satisfacción en apoyo económico, tramitología interna y reconocimiento en mayor grado y representatividad que en los demás factores objeto de estudio. Sin embargo, es importante resaltar que en todas las facultades se evidencia presencia de no satisfacción que no motiva a los docentes a investigar más y ser crítico al respecto. Los factores motivadores se ven afectados por la ausencia de satisfacción que podrían conducirlos a un desempeño menor solo si no hay insatisfacción presente. De la misma manera, en los factores higiénicos se evidencia presencia de insatisfacción, tales como reconocimiento, capacitación, autorrealización, están presentes en el ejercicio de la investigación. En consecuencia, según Herzberg, los empleadores deben motivar a los empleados de la misma manera, asegurando la presencia de factores motivacionales e higiénicos, porque la ausencia de insatisfacción sola no motiva a los docentes a alcanzar mayor grado de satisfacción, es decir, no genera sensación de emoción por el trabajo y el alcance de los indicadores en investigación en la organización.

Tabla 6: Factores de Insatisfacción en las Actividades de Extensión Variable 3: de la Siguiete Lista Señales Cuales Son los Factores Que Usted Considera Generan Insatisfaccion Para Hacer Extensión

Código	Significado (Respuestas Múltiples)	Frecuencias	% S/ Total Frec.	% S/ Muestra
1	Apoyo Económico	69	14,94	66,99
2	Tramitología Interna	70	15,15	67,96
3	Acceso a Eventos Nacionales e Internacionales	55	11,90	53,40
4	Trabajo Con La Comunidad	27	5,84	26,21
5	Consultoría y Asesoría	48	10,39	46,60
6	Autonomía	31	6,71	30,10
7	Reconocimiento	50	10,82	48,54
8	Ascenso	16	3,46	15,53
9	Salario	28	6,06	27,18
10	Capacitación	39	8,44	37,86
11	Autorrealización	29	6,28	28,16
	Total frecuencias	462	100,00	448,54
	Total muestra	103		

*En esta tabla se muestran los factores que generan insatisfacción en las actividades de Extensión, el mayor grado de presencia son: Tramitología interna, apoyo económico, acceso a eventos nacionales e internacionales, consultoría y asesoría, reconocimiento.*

En la tabla 6, se evidencian que los principales factores que generan insatisfacción para el desempeño en las actividades de Extensión en su orden: tramitología interna 15,14%, apoyo económico 15.15%, acceso a eventos nacionales e internacionales 11.90%, consultoría y asesoría 10.39% y reconocimiento 10.82% como lo ratifica el rango que oscila entre 50% y 68% de los docentes. De acuerdo con el logro del objetivo, determinar cuáles son los niveles de satisfacción en los docentes en las funciones de extensión y los resultados obtenidos anteriormente, Se entiende por extensión, aquellas actividades que están orientadas a lograr la interacción de la Universidad y la comunidad para promover la difusión del conocimiento. Se observó mediante los indicadores de medición: apoyo económico, tramitología interna, acceso a eventos internacionales, trabajo con la comunidad, consultoría y asesoría, autonomía, reconocimiento, ascenso, salario, capacitación y autorrealización.

En relación con las implicaciones de la teoría de los dos factores, planteada por Herzberg, se evidencia ausencia de no satisfacción en tramitología interna, apoyo económico, acceso a eventos nacionales e internacionales, consultoría y asesoría y reconocimiento en mayor grado y representatividad que en los demás factores objeto de estudio. Sin embargo, es importante resaltar que en todas las facultades se evidencia presencia de no satisfacción que no motiva a los docentes a hacer estas funciones con motivación. Los factores motivadores se ven afectados por la ausencia de satisfacción que podrían conducirlos a un desempeño menor solo si no hay insatisfacción presente. De la misma manera, en los factores higiénicos se evidencia presencia de insatisfacción, tales como reconocimiento, autorrealización, están presentes en el ejercicio de la extensión. En consecuencia, según Herzberg, los empleadores deben motivar a los empleados de la misma manera, asegurando la presencia de factores motivacionales e higiénicos, porque la ausencia de insatisfacción sola no motiva a los docentes a alcanzar mayor grado de satisfacción, es decir, no genera sensación de emoción por el trabajo y el alcance de los indicadores en extensión en la organización objeto de estudio.

## CONCLUSIONES

Para finalizar esta investigación, luego de haber indagado, conocido y estudiado la percepción que tienen los docentes a las funciones sustantivas de docencia, investigación y extensión en el contexto de la Universidad de la Guajira, se puede concluir que: Del total de los encuestados, el tiempo de antigüedad oscila entre los rangos de 11- 41 años de vinculación con la institución, se encuentran adscritos a las

siguientes facultades: Ciencias Económicas y Administrativas 49.51%, Ciencias Sociales y Humanas 10.68%, Educación 5%, Ciencias Básicas 11.65% e Ingenierías 22.33% respectivamente, de los cuales el 53% son hombres y 56% mujeres. Al analizar la variable satisfacción laboral relacionada con la docencia, se observó que los factores de mayor rango de insatisfacción fueron ayudas educativas, recursos bibliográficos, espacio para el desempeño académico y dotación de espacios físicos. La satisfacción laboral relacionada con las actividades de investigación, se observó que los factores de mayor rango de insatisfacción fueron tramitología interna, apoyo económico, disponibilidad de espacio físico, reconocimiento, capacitación, autorrealización.

La satisfacción laboral relacionada con las actividades de extensión, se observó que los factores de mayor rango de insatisfacción fueron tramitología interna, apoyo económico, consultoría y asesoría, reconocimiento, autorrealización. En síntesis, se evidenció que en las actividades de investigación y extensión, los factores tramitología interna, apoyo económico, reconocimiento y autorrealización, hacen presencia en ambas actividades, en la generación de la insatisfacción de los docentes objetos de estudio. En consecuencia, la teoría de los dos factores, planteada por Herzberg, demuestra la ausencia de no satisfacción en las funciones sustantivas de docencia, investigación y extensión en mayor grado y representatividad por docentes en las diferentes facultades. Sin embargo, es importante resaltar que en todas las facultades se evidencia presencia de no satisfacción que no motiva encuestados a realizar las funciones de docencia, investigación y extensión y ser crítico al respecto. Los factores motivadores se ven afectados por la ausencia de satisfacción que podrían conducirlos a un desempeño menor solo si no hay insatisfacción presente. De la misma manera, en los factores higiénicos se evidencia presencia de insatisfacción, tales como reconocimiento, capacitación, autorrealización, están presentes en el ejercicio de docencia, investigación y extensión por parte de los docentes encuestados. En consecuencia, según Herzberg, los empleadores deben motivar a los empleados de la misma manera, asegurando la presencia de factores motivacionales e higiénicos, porque la ausencia de insatisfacción sola no motiva a los docentes a alcanzar mayor grado de satisfacción, es decir, no genera sensación de emoción por el trabajo y el alcance de los indicadores en la organización para el logro de la calidad en la educación que se imparte.

# DIAGNÓSTICO DE LA PRODUCTIVIDAD EN MICROEMPRESAS EN EL SECTOR COMERCIO EN TOLUCA, ESTADO DE MÉXICO, 2013

Elizabeth Adriana Santamaria Mendoza, Universidad Autónoma del Estado de México  
Elías Eduardo Gutiérrez Alva, Universidad Autónoma del Estado de México

## RESUMEN

*El Gobierno Federal de México ha convocado a construir un acuerdo nacional para impulsar la productividad que se refleje en los mayores ingresos de las familias mexicanas, alcanzando así su potencial y compita con éxito en esta era global (Aranda, 2013). Por lo anterior, surge el interés de conocer la contribución que hacen las microempresas del sector comercio en la productividad que impulsan el crecimiento económico del país, que se puede traducir en el mejoramiento de las condiciones de vida de la población en su conjunto, que forma parte del Plan Nacional de Desarrollo (PND) 2013-2018. El objetivo de este trabajo es proporcionar un diagnóstico de la productividad en microempresas en el sector comercio en Toluca, Estado de México, 2013. El diseño de la investigación está conformado por el antecedente microempresarial en Toluca, Estado de México; el marco teórico de la productividad, el diagnóstico de la productividad en microempresas en el sector comercio en Toluca; para esta parte se proporcionan los resultados de la aplicación de un instrumento de investigación a una prueba piloto de 40 microempresas del sector comercio localizadas en la Ciudad de Toluca, elegidas de manera aleatoria; y las conclusiones.*

**PALABRAS CLAVE:** Productividad, Micro Empresas, Diagnostico

## DIAGNOSIS OF PRODUCTIVITY IN SMALL ENTERPRISES IN THE SECTOR COMMERCE IN TOLUCA, STATE OF MEXICO, 2013

### ABSTRACT

*The Federal Government of Mexico has called for building a national agreement to boost productivity is reflected in the higher income Mexican families, reaching their potential and compete successfully in this global era (Aranda, 2013). Therefore, there is the interest to know the contribution that micro trade sector productivity that drive economic growth, which can translate into improved living conditions of the population as a whole, which is the National Development Plan (NDP) 2013-2018. The objective of this work is to provide a diagnosis of micro productivity in the retail sector in Toluca, State of Mexico, 2013. The research design consists of microenterprise antecedent in Toluca, State of Mexico, the theoretical framework of productivity, diagnosis productivity in micro-enterprises in the retail sector in Toluca, for this part of the results of the application are provided a research tool to a 40 pilot microenterprises in commerce located in Toluca, randomly chosen test, and conclusions.*

**JEL:** D24

**KEYWORDS:** Diagnosing Micro Productivity in the Retail Sector in Toluca, State of Mexico, 2013

## INTRODUCCIÓN

Hoy en día las microempresas están cada día más preocupadas de cómo mantenerse en el fenómeno de la globalización, es decir, cómo incrementar su productividad, problemática que también ha detectado el

Gobierno Mexicano, por lo que uno de sus ejes de acción es impulsar a las microempresas a través de capacitación y financiamiento principalmente, mencionado en el Plan Nacional de Desarrollo 2013 – 2018. Sin embargo, es preciso conocer el diagnóstico de las microempresas, para esta investigación se consideraron las del sector comercio por ser las que más aportan a la economía nacional en PIB y en generación de empleos, que coadyuven al mejoramiento del nivel de vida del individuo. La productividad en el sector comercio se aprecia en el nivel de ventas, aunque, el periodo de vida es corto, a los 2 años de su apertura la cierran por no tener los ingresos necesarios para su administración, otro problema es la falta de capacitación de empleadores y empleados. Por lo que el objetivo de esta investigación es generar un diagnóstico de la productividad en microempresas en el sector comercio en Toluca, Estado de México, 2013, que contribuya a proporcionar alternativas para incrementar la productividad. El diseño de la investigación es descriptivo, que se conformará de las siguientes partes, antecedentes microempresarial en Toluca, Estado de México; marco teórico de la productividad, diagnóstico de la productividad en microempresas en el sector comercio en Toluca, para esta parte se dan a conocer los resultados de la aplicación de un instrumentos de investigación a una prueba piloto de 40 microempresas del sector comercio localizadas en la Ciudad de Toluca, elegidas de manera aleatoria, discusión y conclusiones. Por la limitante del tiempo se aplicó una prueba piloto en una próxima investigación se aplicará la muestra real para el estudio que formalice y precise los resultados de esta investigación.

#### Antecedente Microempresarial en Toluca, Estado de México

Los problemas económicos, los resuelve la sociedad capitalista a través de unidades económicas, es decir, las empresas, para este trabajo las MIPYMES, a partir de la figura del emprendedor. Al analizar los niveles de los problemas económicos se aprecia su interdependencia: ¿Qué producir? y ¿cuánto producir?; es conocer las necesidades del individuo y la cantidad que está dispuesto a consumir; ¿cómo producir? es el proceso productivo, la tecnología no implica sólo maquinaria, sino nuevas formas de pensar al resolver los problemas como reducción de costos, incrementar utilidades; ¿para quién producir? son los diferentes mercados que conforman la economía nacional; y por último ¿Dónde producir? que son las zonas geográficas en las que se producen los insumos a transformar para crear los productos que demanda la sociedad. Para este trabajo en la clasificación de las empresas sólo se retoma el tamaño: Micro, Pequeñas y Medianas Empresas (MIPYMES), puesto que no se considera el origen de ellas, ni el monto de capital destinado. En la clasificación de empresas por número de trabajadores (Figura 1), se observa el número de empleos que puede generar cada tamaño de empresa, en función de los sectores económicos, de aquí radica la importancia de las MIPYMES, que en promedio generan 132 empleos directos como rango mínimo y máximo 630; si se consideran que son más de 4 millones de unidades económicas, se puede estimar que se pueden crear al menos la misma cantidad de empleos con las empresas establecidas, el problema radicaría en el tiempo de vida de ellas, a falta de capacitación en los rubros que se encuentre más deficiente la microempresa.

Figura 1: Clasificación de las Empresas Por Número de Trabajadores

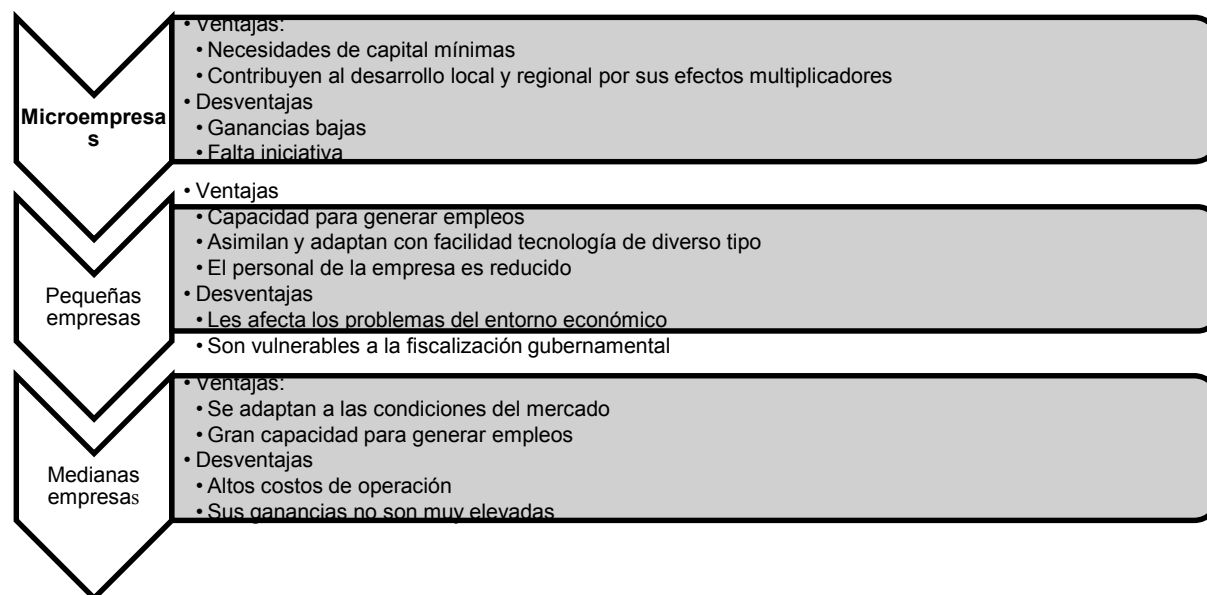

Tamaño	Industria	Comercio	Servicios
Microempresa	0-30	0-5	0-20
Pequeña empresa	31-100	6-20	21-50
Mediana empresa	101-500	21-100	51-100
Grande empresa	501 en adelante	101 en adelante	101 en adelante

\*Pueden existir microempresas funcionando con el propietario y no tener ningún empleado.

Fuente: Secretaría de Economía. Decreto publicado en el Diario Oficial de la Federación el 30 de marzo de 1999.

La importancia de la micro, pequeña y mediana industria radica en su capacidad para generar empleos, en su flexibilidad para aumentar la oferta de satisfactores además de su habilidad para adaptarse a regiones. Por lo que es necesario promover un programa que tome en cuenta el desarrollo geográfico equilibrado (Nafinsa, 1987).

Figura 2: Ventajas y Desventajas de las MIPYMES

Fuente: Méndez (2011).

Se tiene que una microempresa tiene entre 0 y 10 trabajadores, independientemente del negocio al que pertenezca su actividad económica, ya sea comercio o servicio. Ese tipo de empresa constituye un motor de crecimiento económico y de empleo fundamental para el país, ya que, de acuerdo a resultados del último censo económico del INEGI (2012), de cada 100 empresas mexicanas, 96 son microempresas, contribuyen con el 40.6% del empleo y aportan el 15% del PIB. Actualmente, las microempresas a nivel nacional son 4,000,943, del sector comercio al menudeo son 1,914,611, que representan el 48%. En el Estado de México son 262,386 microempresas, es decir, el 14%; mientras que en Toluca se ubican 18,669; el 7% del total estatal, esto se debe a que la población del Estado de México es de 13 096 686, y en Toluca son 819 561, que representa el 6.3% de los habitantes mexiquenses (Santamaria et Gutiérrez, 2013). Por lo anterior, se aprecia en las estadísticas que la economía mexicana depende de las MIPYMES, puesto que tienen ideas innovadoras que son aceptadas por el mercado, el problema que se detecta, es su prematuro cierre derivado de la forma de administración en la medición de su productividad para la toma de decisiones, el Gobierno al percibir estas deficiencias, debería impulsar más la capacitación en cursos ventas y administración. Una limitante, es que los empresarios no están dispuestos a invertir en ellos, así como la limitada visión que tienen de sus negocios.

## REVISION LITERARIA

### Marco Teórico de la Productividad

La productividad es una medida de eficiencia económica que muestra qué tan efectivamente los insumos utilizados en la producción son convertidos en bienes finales. La productividad es una razón de lo que se produce con los medios que se utilizan para producirlo. (Saavedra, 2000). La productividad empresarial se relaciona con la eficiencia del sistema económico. Al elevar la productividad de las empresas se incrementa el crecimiento económico del país, lo que posibilita el desarrollo económico sustentable para mejorar las condiciones de vida para la población en su conjunto. Desde el punto de vista microeconómico, la productividad es una forma de medir la eficiencia empresarial (Méndez, 2011).

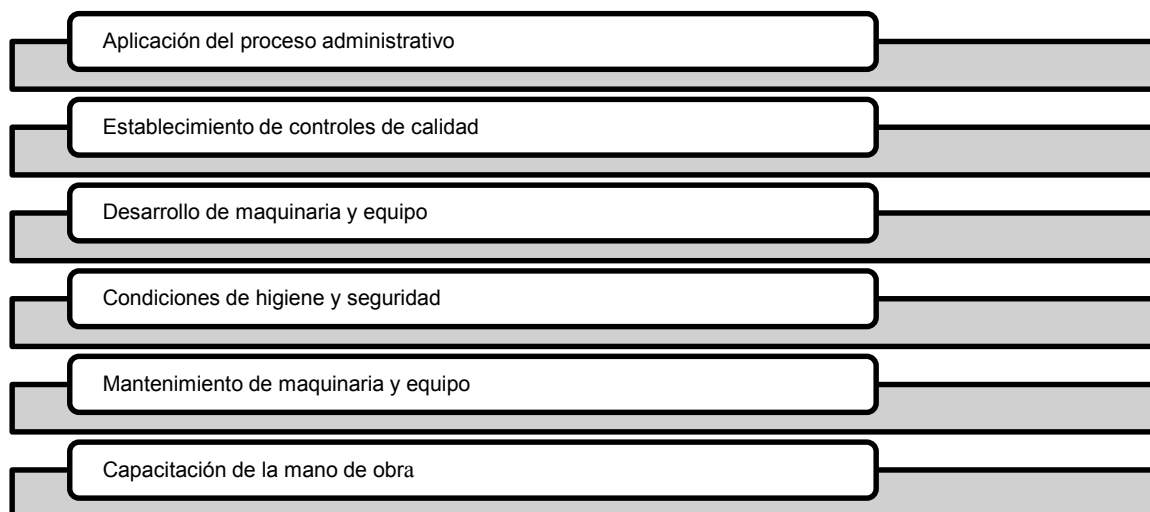

La productividad empresarial se liga con la eficiencia del sistema económico. Al elevar la productividad de las empresas permite incrementar el crecimiento económico del país, lo que posibilita el desarrollo económico sustentable para mejorar las condiciones de vida para la población en su conjunto. Desde el punto de vista microeconómico, la productividad es una forma de medir la eficiencia empresarial (Méndez, 2011). La Organización Internacional del Trabajo (OIT) señala que productividad es la relación que existe entre los bienes y servicios producidos y los recursos invertidos en su producción (Dorantes, 1958). Es decir, la productividad está en función de la cantidad de los bienes producidos y los factores de producción empleados., así como el periodo de producción (año, mes, semana, día, hora).

La productividad refleja la forma en que se aprovechan o se usan los recursos productivos, es decir la eficiencia empresarial. A mayor y mejor aprovechamiento de los recursos, mayor productividad. En otras palabras al elevar la productividad, si se explotan mejor los factores de producción, entonces la empresa se vuelve más eficiente (Méndez, 2011). Algunos autores consideran que sólo el trabajo es productivo y que los demás factores de producción contribuyen a incrementar o disminuir la productividad del mismo. La productividad es igual a la producción total entre el número de trabajadores (Méndez, 2011). Para Saavedra (2000) la productividad es una medida de eficiencia económica que muestra qué tan efectivamente los insumos utilizados en la producción son convertidos en bienes finales. La productividad es una razón de los que se produce con los medios que se utilizan para producirlo.

Algunos de los elementos que las empresas deben considerar para incrementar su productividad son: la incorporación de sistemas de calidad que busquen la satisfacción de las necesidades de los clientes, el uso de los factores económicos en forma eficiente, de tal manera que todos ellos aumenten su rendimiento y su productividad, la eficiencia en el proceso productivo y en el aprovisionamiento de recursos e insumos que posibiliten obtener productos, así como los servicios de calidad que satisfagan las necesidades de los consumidores, la oportunidad para colocar los productos y servicios en el mercado, el aprovechamiento óptimo de los recursos humanos, materiales, financieros y técnicos, como: capacitación de la mano de obra, reconversión de materiales e innovaciones tecnológicas. Los factores determinantes de la productividad se presentan en la Figura 3. Una capacitación y un adiestramiento eficientes de personal a todos los niveles repercuten en una mayor y mejor utilización del equipo, así como en una mejor realización de las operaciones. A partir de la capacitación y el adiestramiento, es posible un mejor aprovechamiento de las capacidades de los recursos humanos. Además, la capacitación ayuda al mejor control de la producción sobre todo en los casos de nuevo empleo, reubicación laboral o modificaciones por nueva tecnología (Molinar, 1981).

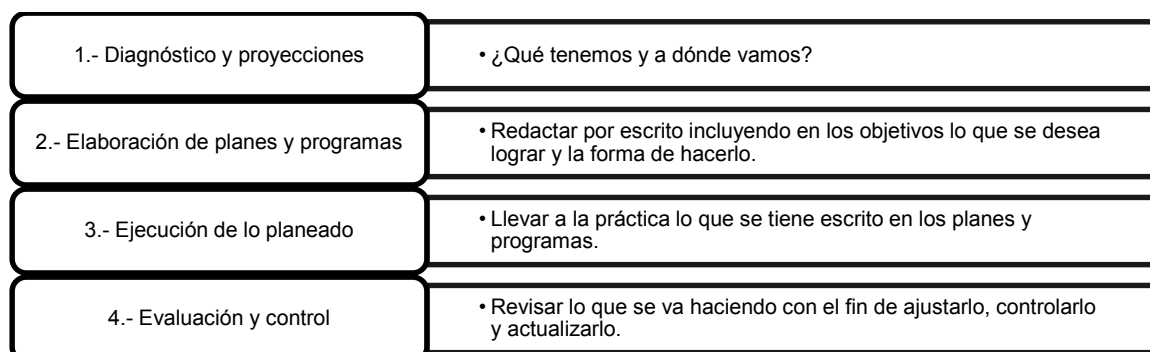

Figura 3: Factores Determinantes de la Productividad

Fuente: Méndez (2010).

Otro elemento a considerar para incrementar la productividad es el establecimiento de controles de calidad. Estudios han comprobado que la práctica demuestra que las empresas que cuentan con control de calidad aumentan su productividad y sus márgenes de ganancia son mayores, con la ventaja de que el público consumidor les otorga su confianza. Para incrementar la productividad es preciso llevar un proceso administrativo en toda empresa, que posea las cuatro etapas fundamentales (Figura 4):

Figura 4: Proceso Productivo

Fuente: Méndez (2010).

Para determinar el nivel de productividad se debe generar un diagnóstico para que el microempresario conozca que tiene y hacia dónde va, para poder realizar planes y programas, que después pondrá en práctica, posteriormente realizará su evaluación y control para revisar los avances y ajustes en caso de ser necesario.

Figura 5: Otros Factores de la Productividad

Fuente: Méndez (2010).

Los factores internos de la productividad son la estructura organizativa y tecnología, la comunicación de objetivos y expectativas y la dirección de recursos humanos. Los factores externos de la productividad son las barreras de entrada al mercado: dificultan la productividad, la competitividad: va ligada a la productividad, los clientes, los productos sustitutos, es decir, las innovaciones constantes ante la proliferación de nuevos y mejores productos, los proveedores: desarrollo de cadena de proveedores, los grupos estratégicos en la rama: son las firmas líderes y mediante estrategias conservan su hegemonía, los factores de producción del país: cantidad y calidad suficiente para los requerimientos y la política económica del país: El Estado debe promover, apoyar, difundir y desarrollar todos los esfuerzos a todos los niveles para incrementar la productividad de las empresas de los sectores y de toda la economía en su conjunto a través de la política económica. Las formas de elevar la productividad son el mejoramiento de las técnicas de producción, el incremento de la división del trabajo y la capacitación de la mano de obra: progreso tecnológico. El adiestramiento consiste en la creación y formación de hábitos logrados por el ejercicio práctico y sistemático de alguna actividad productiva, lo cual permite tener mayor experiencia y habilidad y mayor especialización que repercute en una productividad mayor (Méndez, 2010).

Actualmente se habla de competencias laborales y profesionales que es el conjunto de conocimientos, habilidades, actitudes y profesionales, la productividad de las empresas puede elevarse, a través de la capacitación, el adiestramiento y el desarrollo de competencias debe tener dos fines sociales (Marroquín, 1978): Mejorar la cantidad y la calidad de los bienes y servicios producidos por la sociedad al costo más bajo. Optimizar las condiciones de bienestar de los trabajadores que ayuden a elevar la productividad. Con base en el incremento de la productividad y la competitividad, pueden lograrse otros objetivos como: calidad y servicio, precios competitivos, permanencia en el mercado, establecimiento del negocio en el largo plazo, seguridad y mejor nivel de vida para quienes laboran en la empresa, estabilidad empresarial y personal, dignificación del trabajo, desarrollo y mejora personales, todos lo que se traduce en progreso continuo y elevación de la productividad.

#### Diagnóstico de la Productividad en Microempresas en el Sector Comercio en Toluca

El jefe del Ejecutivo federal señaló que con el transcurso del tiempo y con la aplicación de las políticas económicas que impulsa su gobierno, se logrará que México sea más productivo. El Gobierno Federal pretende democratizar la productividad como eje transversal de su política económica, que tiene como fin

incrementar el nivel de vida de las familias mexicanas, donde a mayor productividad, mayor prosperidad, y esto aplica a un individuo, a una empresa o a toda una nación. Al elevar la productividad puede llegar a ser tan complejo como innovar tecnologías o diseñar una planta industrial, aunque también puede ser sencillo al contar con espacios laborales adecuados, seguros y óptimos para el buen rendimiento de los trabajadores. Es decir, que cada empresario, pequeño o mediano, que cada persona que tenga su propio negocio cuente con las condiciones óptimas para realizar su trabajo, teniendo acceso a créditos, al uso de nuevas tecnologías, a nuevas capacidades para producir y a capacitación, lo que permitirá que cada trabajador tenga un mejor ingreso.

El Gobierno Federal mencionó los cuatro ejes de acción para impulsar la productividad a partir del PND: Las empresas que trabajan en la informalidad pasen a la formalidad, el acceso a los créditos bancarios más baratos. Elevar la productividad en las empresas con la inversión en capital humano, ciencia y tecnología. Intensificar la competencia entre las grandes empresas prestadoras de servicios del país (particularmente en el área de telecomunicaciones), en beneficio de las pequeñas y medianas empresas.

Cerrar las brechas que existen en el país en materia de productividad entre los estados más y menos productivos. El Índice de Productividad México es la primera medida de productividad a nivel estatal que se realiza tomando en cuenta todos los sectores económicos. Mide la Productividad Total de los Factores (PTF) para cada estado, tomando en cuenta prácticamente toda la actividad económica (90%). La PTF es una medida sumamente útil, eficiente y robusta para el cálculo de aquellos factores, independientes del trabajo y capital, que impactan la producción. En particular, la PTF ha sido señalada como el factor tecnológico o de productividad al interior del proceso productivo.

De esta forma el Índice de Productividad México sirve para los estados y municipios como herramienta para: analizar la eficiencia de sus recursos a nivel sector, subsector, rama, subrama y clase de actividad económica, evaluar y comparar la productividad y desarrollo económico de los estados, municipios y regiones, comparar la productividad de los municipios y entidades con regiones internacionales así como extraer mejores prácticas, identificar fortalezas y debilidades productivas, señalar potenciales encadenamientos productivos (ayudado por la información que ya dispongan en cada entidad), realizar análisis de vocaciones económicas, identificar zonas de rezago de capital y rezago productivo y establecer áreas de oportunidad y fortalezas de acuerdo a la planeación establecida en los Planes Estatales y Nacional de Desarrollo. Algunos resultados del Índice de Productividad México son:

Los estados con mayor productividad, como el Distrito Federal, son los que tienen mayor remuneración. Finalmente, la investigación proporciona un análisis sectorial y regional que permite entender las diferencias en la naturaleza productiva de cada estado. Algunos resultados del análisis por sector y regiones son: En los últimos cinco años la productividad laboral del sector manufacturero a nivel nacional creció 31%, y no fue el sector que más creció. El que más creció fue construcción con un incremento del 72%. El comercio al por menor emplea a 1 de cada 4 mexicanos y su productividad laboral en cayó 14% en los últimos 5 años. Un trabajador empleado en comercio al por menor es 12% menos productivo que hace 5 años. La región de Toluca, la más productiva en del Estado de México.

El Gobierno de la entidad mexiquense se ajusta a estos ejes por lo que, se aplicó un instrumento de investigación a 40 microempresarios del sector comercio en Toluca, Estado de México, para conocer que percepción se tiene de la productividad de las microempresas, es decir dar un diagnóstico, destacando lo siguiente: La antigüedad de las microempresas es de 3 meses a 20 años, número de trabajadores oscila entre 1 a 7 personas, inversión que realizan los microempresarios abarca un rango de 2 mil a 200 mil pesos. Las ventas que generan los microempresarios son de 3mil a 200 mil pesos mensuales y trabajan en un horario de 12 a 14 horas diarias, en este punto se aprecia improductividad demasiado tiempo y pocos ingresos. Un 95% de las microempresas encuestadas afirma que se consideran eficientes y productivas, creen que el personal con el que cuentan es suficiente para sus actividades, además de que cuentan con conocimientos

y habilidades necesarias para las actividades que desarrollan. Los microempresarios lo manejan de esta manera para que sus empleados se mantengan igual y no permitan mayor eficiencia en sus actividades, lo que implicaría un incremento salarial, es decir, un incremento en costos que el empresario no está dispuesto a invertir.

Los microempresarios no consideran que la motivación sea un factor determinante para la incrementar la productividad de sus trabajadores, los sueldos que manejan están en función del salario mínimo, en este punto se puede propiciar otra línea de investigación desde el punto de vista del recurso humano. Consideran que las nuevas reformas emitidas el Gobierno Federal afectarán la productividad de sus actividades, puesto que desconocen el contenido y su aplicación, es por ello que la mayoría de las microempresas permanecen en la informalidad, para evadir sus impuestos. Los microempresarios consideran importantes la capacitación en ventas y técnicas de administración, la reducción de impuestos; sin embargo, solicitan que los cursos sean gratuitos. Por último el Gobierno Mexicano debe invertir en la capacitación, si se le proporciona de forma sencilla y concreta la información que requiere conocer el microempresario, estará dispuesto a pagar sus impuestos, ser una empresa formal, administraría eficientemente su empresa, y al paso del tiempo incrementaría su productividad, que se traduciría en mejoras para sus empleados y de la sociedad.

## CONCLUSIONES

Partiendo del sector microempresarial donde se generan empleos y aportan el 40.6% del PIB, se debe incrementar su productividad para fortalecer el aparato económico productivo; las formas para elevarla son: mejoramiento de las técnicas de producción, incremento de la división del trabajo y capacitación de la mano de obra. Se cumplió con el objetivo de la presente investigación al proporcionar un diagnóstico de la productividad de las microempresas del sector comercio en Toluca, Estado de México, 2013; a partir de la prueba piloto aplicado a 40 microempresarios de la actividad económica ya mencionada. Por lo que, en el siguiente reporte de investigación se aplicarán los instrumentos de investigación a la muestra indicada a partir de la población de este trabajo. Dos de los principales problemas detectados fueron capacitación y desconocimiento de las reformas impulsadas por el Gobierno Federal. La capacitación repercute en una mayor y mejor realización de las operaciones, siendo posible un mejor aprovechamiento de las capacidades de los recursos humanos. Con base en el incremento de la productividad y la competitividad, pueden lograrse otros objetivos como: calidad y servicio, precios competitivos, permanencia en el mercado, establecimiento del negocio en el largo plazo, seguridad y mejor nivel de vida para quienes laboran en la empresa, estabilidad empresarial y personal, dignificación del trabajo, desarrollo y mejora personales, todo lo que se traduce en progreso continuo y elevación de la productividad. El Gobierno Mexicano ante la necesidad de incrementar la productividad para estimular el crecimiento económico, para mejorar el nivel de vida de sus ciudadanos ha emitido nuevas reformas a partir de su PND, destacando la inversión en capital humano, que es lo que demanda la sociedad microempresarial.

## RESUMEN

*En sociedades con altos niveles de corrupción, inseguridad pública y desempleo resulta complicado que la población tenga confianza y que las instituciones proyecten credibilidad. En este contexto, las instituciones tienen retos importantes que enfrentar para recuperar la confianza tanto de las personas que en ellas participan, como de la sociedad. Las instituciones educativas de nivel superior tienen un papel preponderante en esta situación ya que en ellas recae directamente la función de formar profesionistas seguros de sí mismo y comprometidos con la sociedad. Sin embargo, vale la pena reflexionar hasta dónde los modelos de organización que éstas adoptan facilitan u obstaculizan los procesos de generación de confianza entre su comunidad y entre la sociedad. El presente artículo reporta los resultados de una investigación exploratoria de carácter documental cuyo objetivo fue identificar hasta dónde dichos modelos cuentan con elementos que faciliten los procesos de generación de confianza. Las principales contribuciones del artículo son, una propuesta original de conceptualización de confianza, aplicable al ámbito escolar de nivel superior y que toma como punto central a la persona; así como la identificación de elementos en los diferentes modelos de organización de las instituciones educativas que pueden contribuir al proceso de generación de confianza.*

**PALABRAS CLAVE:** Institución, Organización, Universidad, Juventud

## CONFIDENCE TO THE INTERIOR OF THE INSTITUTIONS OF HIGHER EDUCATION WOULD FAR DIFFERENT ORGANIZATION THAT THESE MODELS ADOPT CONTRIBUTE TO IT?

## ABSTRACT

*In societies with high levels of corruption, public insecurity and unemployment is complicated that the population has confidence and that the institutions project credibility. In this context, the institutions have important challenges what face to regain the trust of both society and persons involved in them. Top-level educational institutions have a role in this situation because therein lies directly the function of forming professionals secure and committed to society. However, it is worth reflecting where models of organization which they adopt facilitate or hinder the process of confidence building between their community and society. This article reports the results of an exploratory investigation of documentary character whose objective was to identify up to where these models feature elements that facilitate the processes of building trust. The main contributions of the article are, an original proposal of conceptualization of confidence, applicable to schools of higher level and which takes as its focal point*

*the person; as well as the identification of elements in different models of organization of educational institutions that can contribute to the process of confidence building.*

## INTRODUCCIÓN

Uno de los problemas centrales que enfrentan las sociedades actuales es la falta de confianza en general y la falta de credibilidad en las instituciones en particular. Aun cuando esta situación se podría percibir de manera más o menos generalizada en el ámbito mundial, en países en desarrollo el entramado de elementos para la construcción de confianza parece ser cada vez más débil, entre otras causas por la falta de equidad en las oportunidades para la población y por la polarización de su nivel socio económico, así como por la corrupción. Las universidades como instituciones receptoras de la población juvenil que aspira a convertirse en profesionista con la esperanza de lograr un mejor nivel de vida, tienen un compromiso inmediato con ese segmento de la población en diferentes sentidos, entre ellos en su proceso de construcción de confianza y de diseño de perspectivas a futuro; por ejemplo, lograr que los jóvenes confíen en los resultados favorables que tendría en su proyecto de vida el ingresar a una institución de educación superior. Para que esto ocurra, se requiere en gran parte que la población confíe en la institución educativa; dicho en otros términos, que ésta haya desarrollado la capacidad de ser confiable para los demás. Sin embargo, es preciso reconocer que en ese logro intervienen múltiples actores y circunstancias, entre otras que las personas integrantes de la comunidad universitaria hayan desarrollado habilidades para ser confiables, partiendo de su propia autoconfianza y de haber aprendido a confiar en los demás. Derivado de lo anterior, el concepto de confianza que se ha concebido no se refiere a un proceso unilateral en el cual la responsabilidad de generar confianza recae en uno sólo de los actores, sino que cada uno de los participantes se involucra asumiendo su responsabilidad en el proceso.

El presente artículo muestra los resultados de la primera etapa de una investigación en curso, la cual está interesada en identificar el vínculo que hay entre los estilos de dirección de las instituciones educativas de nivel superior y el nivel de confianza que logran en la comunidad universitaria y en la sociedad. El alcance de esta primera etapa fue identificar, en los distintos modelos organizacionales que se han tipificado para las universidades, elementos que podrían facilitar u obstaculizar el proceso de generación de confianza, concebido en los términos descritos en el párrafo anterior, así como identificar hasta dónde toman en cuenta las características esenciales de las instituciones educativas de nivel superior y a la persona como eje principal de sus acciones. La estructura del artículo consta de cinco apartados, después del apartado introductorio, se presenta la problemática general que motivó el interés en el tema; en seguida se aborda el marco teórico que ha brindado sustento a la investigación, específicamente la literatura que ha sido útil en esta primera etapa; como tercer apartado se indica la metodología aplicada; posteriormente se señalan los resultados obtenidos y la discusión de los mismos; y por último se presentan las reflexiones finales y las acciones de investigación futuras.

### Problemática

En general se podría decir que actualmente existe una crisis de confianza a escala mundial. En lo que se refiere a países latinoamericanos se observa, con base en resultados de percepción publicados por la World Values Survey (WVS, 2005 y 2006), que la confianza que las personas sienten hacia los demás es baja; por ejemplo, el promedio de confianza que la población de México, Argentina, Chile y Brasil (por citar sólo algunos países), tiene hacia otras personas es apenas de un 13.5%, siendo el índice de México del 15.60% de acuerdo con dicha encuesta (respuesta a la pregunta “Generalmente hablando ¿podría usted decir que

puede confiar en la mayoría de las personas o que se necesita ser muy cuidadoso en el trato con ellas?”). En México, situaciones recientes como la violencia, la inseguridad pública o los escándalos políticos y religiosos, parece que han tenido repercusiones importantes en el sentir de la población. Revisando los resultados de la WVS relativos a confianza institucional en el año 2005, “las instituciones religiosas (iglesias) y las fuerzas armadas (en este caso, el ejército) son las que gozan de mayor confianza entre los mexicanos, mientras que la burocracia y los partidos políticos son las instituciones en las que menos confianza se tiene en el país. Según estos datos, 38% de la muestra entrevistada dijo tener mucha confianza en las iglesias, frente a 9% que dijo no confiar nada en ellas, en tanto que 27% manifestó mucha confianza en el ejército y 13% dijo no confiar nada en esa institución militar” (Moreno, 2010: 30). Considerando el nivel de las cifras, a estas instituciones no se les puede ver como las que inspiran más confianza, sino como las que generan una menor desconfianza.

Si en México el panorama es complicado, en la esfera mundial las perspectivas no son diferentes; sobre todo si se considera que en el futuro inmediato las expectativas de empleo y estabilidad social no son muy favorables para la población joven. De acuerdo con la Organización Internacional del Trabajo (OIT) “alrededor de 73 millones de jóvenes se encontraban desempleados en el mundo en el 2013 [...], la tasa fue del 12.7% [y] en la región latinoamericana la tasa era de 13.2 %; en estos países [...] los trabajos que hay son malos, los jóvenes ganan poco dinero, se incrustan en la informalidad [o en la delincuencia][...]. Los datos duros indican que la educación no necesariamente les sirve para fines laborales. La OIT advierte que se trata de una generación en riesgo [y que] las proyecciones hacia el 2018 indican que la situación no va a mejorar” (Muñoz, 2013: s/p).

Los efectos de la falta de confianza en las instituciones y las difíciles perspectivas que ofrece la economía, podrían estarse observando en fenómenos sociales tales como el elevado número de jóvenes que no estudian y tampoco trabajan; que son reclutados por la delincuencia organizada o que tienen que migrar, incluso desde niños a Estados Unidos, y podrían interpretarse como su respuesta a la falta de expectativas en las instituciones o en la sociedad en general.

Considerando este panorama de la juventud no sólo en América Latina sino a escala mundial, vale la pena cuestionarse ¿cuál es el papel de las universidades ante este problema? ¿colaboran en el proceso de generación de confianza entre los jóvenes o lo obstaculizan? Y considerando que en México y otros países en vías de desarrollo el actuar de las instituciones educativas de nivel superior se encuentra estrechamente ligado al sector político y la burocracia, también cabe la pregunta de ¿hasta dónde su propia organización les permite insertarse en la solución de este problema? El presente artículo retoma ésta última pregunta bajo los enfoques teóricos que a continuación se señalan.

## REVISIÓN DE LITERATURA

Al realizar la revisión de literatura, se decidió tomar dos puntos de partida fundamentales para la investigación: identificar una tipología de modelos de organización aplicados en las universidades y hacer una búsqueda de literatura relativa a confianza y trato hacia las personas en ambientes escolares y de preferencia relativos a educación superior. Respecto al primer punto se eligió la tipología de modelos de organización propuesta por Porter (1988) porque abarca una descripción incluyente de posibilidades de modelos. Además, la elección de este autor tiene que ver con el hecho de que sus estudios siguieron de cerca la trayectoria de la situación mexicana y algunos de sus argumentos relativos a la calidad de la educación superior ponen de relieve las actitudes de las personas, más que los instrumentos, la infraestructura o los métodos. El autor citado propuso una tipología de cinco modelos organizacionales que pueden ser identificados en las instituciones educativas de nivel superior. La Tabla 1 muestra algunas de las características distintivas de cada modelo (por razones de espacio se presentan sólo algunas de ellas).

Tabla 1. Modelos Organizacionales Adoptados Por Las Universidades ModeloCaracterísticas

Modelo	Características
Normativo racional	Establecimiento de normas para una toma de decisiones racional. Reconocimiento de una estructura de valores, contenida en la misión. La premisa fundamental es el proceso de decisión.
Burocrático	La administración está basada en documentos escritos. Los administradores se guían por las reglas generales. La estructura jerárquica y sus rutinas sistematizadas son las determinantes de los procesos de decisión.
Colegial	Inherente al tipo de organización de la universidad. Idealmente, la universidad es dirigida por una comunidad integrada por el cuerpo académico, el personal administrativo y representantes del alumnado. La decisión colegiada reposa en el valor de la responsabilidad compartida.
Político	Presencia de intereses mutuamente excluyentes, la divergencia de objetivos, fuertes influencias externas y conflicto entre los varios participantes en un proceso de decisión. La autoridad está limitada y los administradores deben realizar un balance entre los intereses de los grupos de presión, incluyendo las fuerzas externas.
Anárquico	Se basa en la noción de que los grupos de interés están mal definidos y son transitorios. Los valores son vagos y el proceso de decisión no puede ser reconocido. Una determinante del resultado de la elección es la presencia de un actor que se muestra interesado en un proceso de decisión.

Anárquico Se basa en la noción de que los grupos de interés están mal definidos y son transitorios. Los valores son vagos y el proceso de decisión no puede ser reconocido. Una determinante del resultado de la elección es la presencia de un actor que se muestra interesado en un proceso de decisión. Fuente: Citado por Arechavala y Solís (1999). Porter señaló en su análisis que ninguna institución universitaria refleja de manera consistente una “forma pura” de los cinco modelos presentados, sino que se identifican combinaciones de los diferentes modelos. Desde cierto punto de vista, cada uno de ellos da mayor o menor importancia a los diferentes recursos que conforman una organización, aspecto por el cual se identificó la posibilidad de conocer qué tanto fomentan o no la confianza a través de considerar a la persona como eje principal.

Con relación al segundo punto de partida fundamental, el de revisar la literatura relativa a confianza y a la importancia del trato a las personas, se llegó a la conclusión de que primero era necesario acotar el concepto de confianza en varios sentidos, sobre todo para que fuera aplicable al ámbito universitario y no a otros ámbitos como el político, el de mercadotecnia, o el social; y se consideró literatura que se enfocara en la esencia de las instituciones educativas, es decir, en las personas, como los agentes principales con quienes y para quienes generar confianza.

En este sentido, se descartaron las posturas relativas a confianza institucional que se enfocaran específicamente al proceso de rendición de cuentas y al de información transparente como únicos medios de generación de confianza. Este enfoque administrativo-financiero a partir del cual la unidad de dirección

o las unidades de coordinación deben demostrar que su gestión fue confiable, bajo la perspectiva de la investigación son acciones necesarias pero, sólo como partes del proceso. Éste se concibe bajo un enfoque mucho más integral y que no debe dejar de lado la percepción de confianza de las personas y su corresponsabilidad en el proceso de generarla en el día a día, no sólo en el momento en que se haga la rendición de cuentas.

Bajo estas premisas, se identificaron enfoques educativos y posturas que de manera integral consideran a las personas como eje rector sobre el cual recaen las acciones de la institución, incluida su corresponsabilidad en la construcción de confianza. Particularmente se identificó que las contribuciones de Touraine (1977 y 1998), en cuanto a su visión de “escuela del sujeto” en la que se hace alusión a recuperar a la persona (“personalizar” la escuela), resultaban muy valiosas para construir el concepto de confianza en el contexto de la investigación. Se logró identificar en dicho enfoque tres elementos fundamentales: i) el reconocimiento de que las sociedades son multiculturales, es decir, no debe caerse en la imposición de una cultura universal, por encima de regionalismos y evitando las desigualdades y segregación de las comunidades minoritarias; ii) la escuela es una “escuela del sujeto”, laica, orientada hacia el pluralismo, la libertad del alumno, la individualización del aprendizaje, y que da capital importancia al diálogo, el reconocimiento del otro y la gestión democrática de los problemas; iii) la escuela se concibe como un fin en sí mismo, ya que el alumnado asiste para ser, para construirse.

Con base en el enfoque de Touraine, la escuela de hoy debe atender a los estudiantes en su individualidad y considerar en sus esquemas de funcionamiento a jóvenes cuya finalidad es llegar a ser un humano completo, independiente, capaz de aprender por sí mismo, de aprenderse y de crear. Este es el enfoque que subyace a la propuesta conceptual de confianza que plantea este artículo, complementada con algunas puntualizaciones de Porter (2012) en lo referente a la calidad de la educación. De acuerdo con éste autor, la calidad se debe esencialmente al trato entre las personas, reflexión a la cual llegó a partir de su propia experiencia como estudiante de prestigiosas instituciones como el MIT y Harvard; en tales instituciones destaca el trato que todo integrante de sus comunidades otorga a los demás, excepcional y difícil de duplicar, el cual es un trato de diálogo continuo que él define como “eye contact”, o “soul contact”, que le da a toda relación académica una dimensión y profundidad humanas, que forma parte de una atmósfera que también toca a los colegas, a la comunidad en su conjunto, incluyendo los no-universitarios” (Porter, 2012: 2), ese “soul contact, que sale de la mirada, y no necesita palabras” (Porter, 2012: 2).

Un puente que ayudó a enlazar los elementos esenciales de los enfoques de Touraine y las apreciaciones de Porter con el constructo de confianza que se propone en la investigación, fueron algunos estudios empíricos relativos a confianza en países latinoamericanos, particularmente el trabajo de Herreros (2004) del cual se retomaron dos elementos particulares: i) que la confianza se puede construir, es decir es el resultado de la participación en colectivo, lo que se puede lograr a través de vías diferentes a partir de la generación de confianza individual –personal-; ii) su propuesta de modelo de generación de confianza a través de señales que permiten confiar en alguien o algo que no se conoce.

Finalmente, al indagar en los pronunciamientos relativos a la visión para el siglo XXI de educación superior en el país se encontraron elementos del “enfoque centrado en el cliente” de Rogers (2005), aplicado al ámbito educativo en particular (ANUIES, 2001; López et al 2012), en el cual se rescata el papel del alumnado en el proceso de enseñanza-aprendizaje (Vallejo, 2006), situación que evidencia que en México el enfoque de la educación centrada en la persona no es algo ajeno y muchos menos desconocido. Con base en la literatura hasta ahora mencionada, el concepto de confianza propuesto está relacionado con las acciones que se realizan a partir del liderazgo ejercido por la Dirección del espacio educativo en cuestión y que involucra a todos los actores de la comunidad tanto interna como externa; haciéndoles partícipes en el ámbito que a cada uno corresponda, del proceso de confiar y ser confiables, a través del mantenimiento de una comunicación clara y asertiva y de un trato que denote empatía, amabilidad y calidez. Bajo este enfoque,

se comprende la relevancia de las personas en el actuar de la institución educativa, independientemente de su estatus de estudiante, egresado, académico, trabajador o directivo, y se entiende que son las personas quienes generan para sí mismas y para los demás un ambiente propicio para la comunicación y el diálogo. En esta propuesta, la comunicación clara de las expectativas que se tienen de los integrantes de la comunidad universitaria, es un elemento fundamental, así como el reconocimiento de los logros obtenidos y también la indicación precisa de lo que no se haya cumplido. Este concepto sirvió de base para el análisis de los elementos de cada uno de los modelos de organización considerados por la investigación, atendiendo la siguiente metodología.

## METODOLOGÍA

A través de investigación documental se analizaron en primera instancia los elementos de los cinco modelos organizacionales de la tipología de Porter (1988), identificando aquellos a los que cada modelo da mayor importancia (Tabla 1). En otro sentido, con base en la propuesta de concepto de confianza y atendiendo a la pregunta de investigación, ¿hasta dónde los modelos de organización de las universidades les permiten o no incidir en el proceso de generación de confianza en los jóvenes?, se compararon dichos elementos esenciales de cada modelo contra los tres elementos cruciales del enfoque de la escuela del sujeto de Touraine y con el constructo de confianza propuesto, llegando a los siguientes resultados.

## RESULTADOS Y DISCUSIÓN

Ninguno de los modelos señalados en la tipología de Porter (1988) facilitarían en su totalidad la aplicación de los elementos esenciales del enfoque de la “escuela del sujeto” de Touraine, ni favorecerían el proceso de construcción de confianza concebido en los términos propuestos por la investigación; sin embargo, algunos de ellos cuentan con elementos que podrían brindar condiciones favorables para desarrollarlos, mientras que otros definitivamente representarían un obstáculo (Tabla 2).

Tabla 2: Elementos a Favor y en Contra del Proceso de Generación de Confianza en Cada uno de los Modelos Modelo Característica Analizada a Favor de Generación de Confianza Obstaculiza la Generación de Confianza

Modelo	Característica Analizada	A Favor de Generación de Confianza	Obstaculiza la Generación de Confianza
Normativo racional	Las decisiones se toman con base en normas que faciliten procesos racionales controlables; en este contexto se supone que las decisiones y las acciones son susceptibles de predecirse.	Sólo cuando se aplique a procesos u acciones iterativos que se llevan a cabo en toda institución educativa y no caiga en el terreno del modelo burocrático.	Porque no considera una peculiaridad de las instituciones de educación en general y de las de nivel superior en particular, en las cuales difícilmente se pueden tomar decisiones estricta y siempre sustentadas en las normas, debido a la esencia impredecible de su razón de ser: la formación de personas, por la cantidad innumerable de circunstancias que rodean el proceso y las interacciones que las personas realizan desde sus diferentes roles, ya sea como empleados, estudiantes, académicos, directivos, etc.
Burocrático	Rutinas sistematizadas con base en la experiencia de la institución; las decisiones se limitan a ese historial de rutinas que son conocidas y es en la manera en que éstas se realizan que sustenta su actuar.	- - -	Dado que este enfoque se centra totalmente en la eficiencia con la que se desarrollan las acciones más que en las acciones mismas, es evidente que las personas no son el foco de su interés; de la misma forma que se mencionó en el enfoque normativo

			racional, las situaciones que se generan al interior de una institución educativa rebasan las limitadas posibilidades que el modelo considera.
Colegial	Las principales decisiones se toman de manera colegiada, considera la co-responsabilidad de los actores.	Porque propicia la autogestión de la institución, la responsabilidad compartida y la inclusión de los diferentes actores en las principales decisiones que les atañen.	Puede generar desconfianza cuando se abusa de la inclusión de los actores en todas las decisiones de la institución, debido a que podría verse diluida la figura de autoridad al interior de la misma.
Político	El actuar de la institución está sujeto a un conjunto de intereses internos y externos que son discordantes y ejercen presión sobre las principales decisiones de la institución.	- - -	Este modelo transcurre en el sentido opuesto al planteamiento que esta investigación hace. La desconfianza que generan las pugnas entre los grupos discordantes limitaría varios elementos del concepto de confianza propuesto.
Anárquico	Existe ambigüedad y confusión de los valores e intereses en el proceso de toma de decisiones, éstas se toman cuando la situación a resolver entra en el área de interés de alguno de los grupos que conforman la institución.	- - -	La ambigüedad de sus valores genera confusión y por tanto desconfianza entre los actores que no se encuentren en posibilidad de decidir.

*Normativo racional* Las decisiones se toman con base en normas que faciliten procesos racionales controlables; en este contexto se supone que las decisiones y las acciones son susceptibles de predecirse.

Sólo cuando se aplique a procesos u acciones iterativos que se llevan a cabo en toda institución educativa y no caiga en el terreno del modelo burocrático. Porque no considera una peculiaridad de las instituciones de educación en general y de las de nivel superior en particular, en las cuales difícilmente se pueden tomar decisiones estricta y siempre sustentadas en las normas, debido a la esencia impredecible de su razón de ser: la formación de personas, por la cantidad innumerable de circunstancias que rodean el proceso y las interacciones que las personas realizan desde sus diferentes roles, ya sea como empleados, estudiantes, académicos, directivos, etc. Burocrático Rutinas sistematizadas con base en la experiencia de la institución; las decisiones se limitan a ese historial de rutinas que son conocidas y es en la manera en que éstas se realizan que sustenta su actuar. Dado que este enfoque se centra totalmente en la eficiencia con la que se desarrollan las acciones más que en las acciones mismas, es evidente que las personas no son el foco de su interés; de la misma forma que se mencionó en el enfoque normativo racional, las situaciones que se generan al interior de una institución educativa rebasan las limitadas posibilidades que el modelo considera.

**Colegial** Las principales decisiones se toman de manera colegiada, considera la co-responsabilidad de los actores. Porque propicia la autogestión de la institución, la responsabilidad compartida y la inclusión de los diferentes actores en las principales decisiones que les atañen. Puede generar desconfianza cuando se abusa de la inclusión de los actores en todas las decisiones de la institución, debido a que podría verse diluida la figura de autoridad al interior de la misma. **Político** El actuar de la institución está sujeto a un conjunto de intereses internos y externos que son discordantes y ejercen presión sobre las principales decisiones de la institución. Este modelo transcurre en el sentido opuesto al planteamiento que esta investigación hace. La desconfianza que generan las pugnas entre los grupos discordantes limitaría varios elementos del concepto de confianza propuesto.

Anárquico Existe ambigüedad y confusión de los valores e intereses en el proceso de toma de decisiones, éstas se toman cuando la situación a resolver entra en el área de interés de alguno de los grupos que conforman la institución. La ambigüedad de sus valores genera confusión y por tanto desconfianza entre los actores que no se encuentren en posibilidad de decidir. Fuente: Elaboración propia con base en las características de cada modelo señaladas por Arechavala y Solís (1999). Revisando los resultados obtenidos, se puede precisar que los únicos modelos que podrían hasta cierto punto tener elementos a favor de la generación de confianza en los términos que propone la investigación son el Normativo racional y el Colegial, mientras que los modelos Burocrático, Político y Anárquico no presentan elementos a favor de ese proceso. Sin embargo cabe matizar este hecho en el sentido de que al no haber una aplicación “pura” de cada modelo, sino una combinación de ellos, es posible que en ciertas circunstancias los modelos que aparentemente no contribuyen al proceso de generación de confianza pudieran aportar ciertos elementos para que así ocurriera. Así mismo hay que hacer notar que los elementos que integran el diseño organizacional, es decir, estrategia, estructura y cultura (Arechavala y Solís, 1999), específicos en cada institución educativa podrían brindar también ciertos matices a los resultados que aquí se muestran.

## CONCLUSIONES

Los planteamientos de Touraine (1977 y 1998) y Porter (2012) abarcan factores que van más allá del proceso de enseñanza-aprendizaje y de aspectos relativos a la gestión de las instituciones; suponen más bien una postura o estilo generalizado de conducirse que implica el “personalizar la escuela” y generar un alto grado de empatía entre los actores de cada institución, tanto hacia la comunidad universitaria como hacia toda persona que entre en contacto con ella. Por lo tanto, la propuesta conceptual de confianza que se presenta en este artículo, sustentada en tales enfoques, no tendría cabida de manera total en ninguno de los modelos organizacionales señalados en la tipología de Porter (1988), lo que en primera instancia llevaría a concluir que los cinco modelos organizacionales señalados en ella contienen elementos que obstaculizan el proceso de generación de confianza centrado en la persona y que sólo dos de ellos cuentan con elementos a favor de dicho proceso. Sin embargo se deben considerar las “combinaciones” de elementos de cada modelo que cada institución educativa aplique, así como los tres elementos del diseño organizacional específicos en cada institución o espacio académico. Esta precisión da pauta a la siguiente etapa de la investigación que consiste en identificar de manera concreta las acciones que han emprendido las instituciones educativas, lo que permitiría identificar las distintas “combinaciones” de los elementos de cada modelo y hasta dónde son generadoras o no de confianza. Una última etapa estaría encaminada a identificar elementos que permitan medir la confianza generada en los actores, situación que sería muy útil, sobre todo para identificar la presencia o ausencia del “soul contact” que menciona Porter y que sólo se pudo conocer preguntando a las personas involucradas en el proceso.

# PERFIL DE LA EMPRESARIA DE MICRO EMPRESAS EN PUERTO RICO

Elizabeth Robles Maldonado, Universidad de Puerto Rico

## RESUMEN

*Durante las últimas tres décadas se incrementó de manera notable la participación de las mujeres en el mercado laboral y empresarial. Aún así la atención de los especialistas en el tema se centra en la participación de las asalariadas y no en las que se dedican a las actividades como promotoras empresariales. Los escasos estudios dedicados al tema ponen énfasis en las razones que argumentan las mujeres para iniciarse en dichas actividades: la necesidad de independencia al desempeñar su trabajo, la frustración ante la desigualdad que enfrentan en su carrera profesional y la falta de un trabajo con flexibilidad de horario que les permita atender sus actividades domésticas. Esta investigación tiene como objetivo identificar el perfil de mujeres emprendedoras en San Juan, Puerto Rico. La metodología empleada fue auto administrar el instrumento, adaptado de una tesis doctoral defendida en ESADE, España a 89 mujeres empresarias en San Juan, Puerto Rico, en el período comprendido de octubre del 2013 a febrero del 2014. Las encuestas se procesaron en el software SPSS. Entre los principales resultados se encuentran los siguientes: la edad promedio para emprender predomina en mujeres de 31 a 55 años, 95% poseen educación universitaria, 65% tiene dependientes económicos, 56.2% desarrollan planes de negocios y 48% pertenecen a asociaciones profesionales. El sector que predomina es el de servicio seguido por el de comercio. Éstas emprenden motivadas por la conjunción de la necesidad y la oportunidad.*

**PALABRAS CLAVES:** Mujer Empresaria, Empresarismo, Microempresaria

## PROFILE OF THE MICRO BUSINESSWOMAN IN PUERTO RICO

### ABSTRACT

*During the last three decades the participation of women in the labor market and business has increased significantly. Yet the attention of specialists in this field focuses on the participation of employed and not engaged in activities as business promoters. The few studies on this topic emphasize the reasons that women argue to start in such activities are: the need for independence in carrying out its work, the frustration with the inequality they face in their careers and the lack of a job with a flexibility schedule that allows them to meet their domestic activities. This research aims to identify the profile of women entrepreneurs in San Juan, Puerto Rico. The methodology used was a self-administered instrument, adapted from a doctoral thesis defended at ESAD, Spain, on 89 women entrepreneurs in San Juan, Puerto Rico, in the period of October 2013 to February 2014. Surveys were processed in the SPSS software. The main results are the following: the average age to undertake predominates in women of 31 to 55 years, 95% have university education, 65% have dependents, 56.2% develop business plans and 48% belong to professional associations. The predominant sector is the service followed by trade. They undertake motivated by the conjunction of need and opportunity.*

**KEYWORDS:** Women Entrepreneur, Entrepreneurship, Micro Businesswoman

## INTRODUCCIÓN

Durante las últimas tres décadas se incrementó de manera notable la participación de las mujeres en el mercado laboral y empresarial. Aún así la atención de los especialistas en el tema se centra en la participación de las asalariadas y no en las que se dedican a las actividades como promotoras empresariales. Los escasos estudios dedicados al tema ponen énfasis en las razones que argumentan las mujeres para iniciarse en dichas actividades: la necesidad de independencia al desempeñar su trabajo, la frustración ante la desigualdad que enfrentan en su carrera profesional y la falta de un trabajo con flexibilidad de horario que les permita atender sus actividades domésticas.

El interés por estudiar la participación de las mujeres en actividades empresariales cobró auge en la década de los ochenta en países industrializados como Gran Bretaña, Suecia, Canadá y Estados Unidos. Un pionero en este tema es el estudio de Coffee y Scase (1983, citado en Serna, 2003), sobre empresarias de Gran Bretaña, donde por primera vez se analizan sus características, experiencias y las razones por las cuales comenzaron sus negocios.

El propósito de esta investigación es crear por primera vez en Puerto Rico un perfil de la mujer empresarial donde se determine y analice sus características, experiencias y las razones por las cuáles comenzaron sus negocios. Esto con la intención de ver cuáles son sus necesidades para ayudarlas a establecer estrategias de negocios que incrementen su eficiencia y efectividad en el mercado.

Los resultados obtenidos revelan aspectos que no eran conocidos sobre las micro empresarias en San Juan, Puerto Rico. Los mismos se muestran adelante en la siguiente estructura: una revisión de literatura para mostrar los antecedentes bibliográficos más significativos localizados, la metodología empleada, la caracterización obtenida en dos dimensiones: la emprendedora: características sociodemográficas; entorno y organización, resultados económicos y aspectos motivacionales y sociales. Al final se muestran las Limitaciones, Conclusiones, Referencias Bibliográficas y Agradecimientos.

### Revisión de Literatura de Empresarismo en y Fuera de Puerto Rico

Según información de la Organización Internacional del Trabajo (OIT), existe una tendencia al incremento de mujeres en la actividad empresarial en los países desarrollados. En Estados Unidos la esfera de mujeres empresarias ha crecido: en la actualidad son propietarias de 25% de las empresas; en Canadá las mujeres establecen dos tercios de las nuevas empresas; en Finlandia se tiene registrado que a ellas corresponden 30% de las empresas, y en Suecia y Francia 25% y 21% respectivamente (Zabludovsky, 2,001).

La “National Foundation for Women Business Owners” (NFWBO), con sede en Maryland, Estados Unidos, señala que existe una importante cantidad de empresas propiedad de mujeres que ya participan en el mercado mundial, con actividades de importación y exportación de bienes y servicios. Sus estudios, auspiciados por IBM, se basan en información proporcionada por asociaciones empresariales de Brasil, Canadá, Irlanda, México y Estados Unidos. Las cifras de participación en los mercados globales son: 38% en Irlanda, 25% en Brasil, 21% en la ciudad de México y 13% en Estados Unidos.

El Consejo Empresarial Nacional de la Mujer (National Women Business Council, NWBC) se estableció como un órgano consultivo de las mujeres empresarias como parte de la Ley de Negocios de Mujeres de 1988 en Estados Unidos. El Consejo identifica las barreras para el éxito de las empresas de las mujeres e informa anualmente al presidente y al Congreso de sus conclusiones. De acuerdo al Consejo, las mujeres son propietarias del 30% de un total de 7.8 millones de empresas que generan \$1,200 millones en ventas al año. El 55% de las empresas propiedad de mujeres recibió entre \$100,000 a \$500,000, aproximadamente, con empleos constantes entre los años 2007-2009 con \$1,200 millones de ventas al año. Además, las

mujeres son propietarias del 30% de todas las empresas, pero sólo capturan el 11% de todos los ingresos. El 33% de todas las marcas otorgadas a las personas y a las empresas individuales fue a mujeres.

El número de mujeres que recibió patentes en las últimas tres décadas fue mucho más alto que las cifras informadas anteriormente. De acuerdo al Consejo:

El porcentaje de las marcas otorgadas a las mujeres se duplicó. Las mujeres tienen una mayor representación entre los titulares de marcas de los titulares de patentes. En el 2010, 18% de todas las patentes concedidas fue a las mujeres, mientras que el 33% de todas las marcas comerciales concedidas a personas físicas y empresas individuales fue también a mujeres.

En América Latina, la actividad empresarial femenina registra desde 1990 una creciente importancia y un ascenso: entre 25% y 35% de los patronos son de este género (Navarro y Gómez, 2006). En México, aunque su participación es menos significativa que en países desarrollados, también se ratifica una tendencia hacia el incremento. La Encuesta Nacional de Empleo del 2004 informó que durante el 1995 la correlación de empresarios y patronos era 89.5% hombres y 10.5% mujeres; para el año 2004 fue, 84.2% hombres y 15.8% mujeres. En este estudio se destaca el incremento de la participación femenina en el sector empresarial, a pesar de los numerosos obstáculos que enfrentan para lograr el desarrollo de sus actividades económicas. Los estudios de Zabludovsky (2001), Serna (2003), Inmujeres (2003) y Navarro y Gómez (2006) coinciden en señalar que dichas dificultades están relacionadas con:

La falta de aceptación de los hombres de sus posiciones de jefatura y su rechazo a participar en áreas no tradicionales. La falta de oportunidades para adiestrarse y capacitarse, su escasa experiencia en la gestión pública, la desconfianza de la comunidad financiera y, por ende, la dificultad para la obtención de créditos para sus empresas. Mención especial merece el problema del financiamiento porque es un obstáculo que reiteradamente se señala en distintos estudios.

Según un estudio de Santiago-Castro y Pisani (2011) por lo general, el entorno económico en Puerto Rico es propicio para la creación de empresas. Además, el Banco Mundial (2011) clasificó a la isla en el año 2010 como el lugar más fácil en América Latina para iniciar un negocio y la decimosexta (de 183 países), más fácil para las empresas de nuevo comienzo “start-up” a nivel mundial (World Bank, 2011).

En Puerto Rico, el porcentaje de mujeres empresarias está aumentando dramáticamente. Según el Censo (2010), hay 38.000 mujeres empresarias o auto empleadas. Esto representa el 22% de todas las personas que trabajan de esta manera (Censo de 2010). De acuerdo a Santiago-Castro (2010), las mujeres propietarias de empresas en Puerto Rico, en general, son los propietarios únicos, tienen muchos competidores, y no exportan fuera de Puerto Rico. La razón principal para la consecución de los negocios consiste en tomar ventaja de una oportunidad y el motivo más importante para la consecución de esa oportunidad es obtener una mayor independencia, seguido por el aumento de los ingresos personales.

## METODOLOGÍA

Esta investigación es cuantitativa. Se utilizó como base para la misma un estudio previo realizado para la ciudad de Torreón en el que se aplicó el Cuestionario que propuso la tesis doctoral defendida en ESADE, titulada: “Factores que influyen en las nuevas empresas creadas por mujeres” (Valencia Silva, 2009). Se utilizó el programa Excel para el procesamiento y obtención de gráficos univariados. Posteriormente esta base de datos se exportó al programa estadístico SPSS Statistics 19, a fin de recategorizar los datos y de realizar otros análisis estadísticos. Para el análisis de Resultados, de los 15 indicadores que califican en “éxito” o que afectan los resultados de las nuevas empresas creadas por mujeres emprendedoras, se utilizó un análisis descriptivo de las variables que contempla el instrumento de trabajo; un procesamiento de las variables que nos permitan implementar correlaciones bivariadas de “Pearson,” en particular con las

variables continuas – familia, resultados de las empresas y objetivos empresariales; además de la validación y factibilidad de la correlación de estas variables, el cual justifica el tratamiento de su análisis en forma grupal promediando su resultados y con ello obtener fiabilidad en el tratamiento de la información de los ítems por medio del “ $\alpha$ ” Alpha de Cronbach.

## DISCUSIÓN DE LOS RESULTADOS

### La Emprendedora: Características Demográficas.

Esta muestra de San Juan tiene un promedio de edad de 45.7 años. El representativo de mujeres con rango de edad de 31 a 55 años son las que predominan con el 70% de las mujeres analizadas, el segundo sector es el de 56 años y más que corresponde al 21%. Las mujeres jóvenes con edades entre 20 y 30 años fueron sólo 8, el equivalente al 9%. (Tabla 1).

Tabla 1 – Perfil de la dimensión emprendedora en empresarias de San Juan

CARACTERÍSTICA	SAN JUAN
Edad Promedio	Promedio de edad – 45. 770% de 31 a 55 años, 21% 56 a 67 años y 9% de 20 a 30 años
Educación	95% tiene estudios universitarios, superando los niveles de comportamiento de los países de altos ingresos.
Motivaciones	Predomina en un 47% la conjunción de motivos, seguida de la oportunidad (37%)
Sector De Sus Empresas	Servicios (57%), Industria (29 %) Comercio (11%).
Dependientes Económicos	El 61% de las mujeres emprendedoras tienen dependientes económicos. (Hijos menores, mayores o familiares mayores).

Tabla 1. Muestra el comportamiento de las características observadas de la dimensión emprendedora de San Juan

Los estudios socio demográficos sobre la inserción de la mujer en la vida laboral, demuestran que en los años 80 la participación de las mujeres era de jóvenes y solteras. Aunque en la actualidad se ha producido un cambio, pues son las mujeres de mayor edad, casadas y con hijos las que han incrementado su incorporación al trabajo extra doméstico (García, B.; M. Blanco & E. Pacheco, 1998).

En la ciudad de San Juan el 45% de las mujeres encuestadas son casadas o viven en pareja, el 29% son solteras, el 21% son separadas o divorciadas mientras que el 2% son viudas. Esto corresponde en general con el perfil que tienen los emprendedores, casados y con hijos (Valencia Silva M. M., 2009). Los resultados de este estudio coinciden con otros en afirmar que el nivel de educación tiene un impacto positivo sobre la entrada inicial de una empresa y su resultado futuro y con el estudio de referencia ya que en ese estudio, el 65 % de las empresarias tienen Educación Superior coincidiendo con la media española (Valencia Silva M. M., 2009). En San Juan, el 95% de la muestra analizada tiene estudios universitarios, lo que demuestra el nivel de preparación de la mujer Puertorriqueña seguido de estudios medios que sólo alcanzó el 2%. Esto concuerda con el alto nivel educativo expuesto por Santiago-Castro (2011) en su estudio de las características de los empresarios potenciales.

Las mujeres emprendedoras en Chile presentan un perfil general de mayor edad comparado con otros países del entorno GEM. En su mayoría éstas tienen estudios universitarios y son casadas o viven en pareja. Tal parece que el emprendimiento de mujeres pudiera estar relacionado con la propia estabilidad familiar (Amorós & Pizarro, 2006). Valencia Silva afirma que en general el motivo de las empresarias para crear una empresa es para aprovechar una oportunidad de negocios, siendo una minoría las que lo hacen por necesidad, aunque se observa en los países de bajos ingresos, un incremento en el porcentaje de emprendedores por necesidad. Su estudio en España reveló que un 29% crean empresas tanto por necesidad como por oportunidad, y sólo un 8% lo hace por necesidad (Valencia Silva M. M., 2009).

La realidad en Latinoamérica es totalmente diferente. Así lo confirma un estudio realizado en el 2010 para América Latina, donde se reconoce que en su mayoría, las mujeres se convierten en empresarias más por necesidad que por vocación. El mayor reto que enfrentan es superar el rezago en diversas áreas, fundamentalmente en la conciliación entre familia-trabajo, por lo que se considera que el tipo de políticas públicas debe ser diferenciado para impulsar las PYMES de hombres y mujeres.” (Secretaría Permanente del SELA, 2010).

Para la ciudad de San Juan los motivos de las participantes para emprender fueron el 11% para el campo de Necesidad y el 37% para la Oportunidad. Algunas características personales como su estado civil o si existen personas que dependen de ellas son factores que también afectan sus motivaciones. El 61% de las 89 mujeres encuestadas tienen algún dependiente económico mientras que el 39% no lo tienen.

### Entorno y organización.

En esta dimensión cobra especial importancia el análisis de la accesibilidad y disponibilidad de capital. Algunos estudios plantean que las mujeres son discriminadas por las instituciones bancarias y otros que no. La mayor evidencia parece indicar que bien sea por ser mujer o porque sus empresas son generalmente muy pequeñas y no cumplen con los requisitos para el crédito, no acceden con facilidad a éste.

Otro aspecto crucial son las redes de relaciones en que se apoyan las mujeres empresarias tanto formales como informales, con múltiples actores desde familiares hasta organizaciones consolidadas, tales como asociaciones, cámaras, etc. Un mentado estudio de “Women Networks Eurochambres” revela que tanto la simple participación como los puestos ocupados por mujeres en asociaciones profesionales son mínimos, y que a pesar de que han crecido las mujeres empresarias, existe una tendencia demostrada a la homofilia en todas las asociaciones, tanto de hombres como de mujeres; que las mujeres se afilian más por motivos afectivos y los hombres por motivos más instrumentales; y además, las mujeres tienen falta de tiempo para dedicarse a esto por el asunto de conciliar la atención a los hijos, etc. (Valencia Silva M. M., 2010).

Rosa y Hamilton (1994), que en el caso de emprendimientos de mujeres, es usual que el número de socios sea menor y que, además, busquen en parientes sus primeros socios. Los resultados de este estudio coinciden en general con hallazgos anteriores, ya que las empresarias se apoyan mayoritariamente en la pareja, padres, hermanos e hijos (en ese orden). En cuanto a la afiliación a asociaciones profesionales en San Juan, 43 de las 89 mujeres encuestadas (48%) manifestaron pertenecer a alguna Asociación profesional. Esto demuestra que la mujer Puertorriqueña está interesada en el entorno empresarial.

Global Entrepreneurship Monitor considera que las empresas que sobrepasan los 3 años de operación ya pueden considerarse como consolidadas. La muestra de la ciudad de San Juan queda representada por 86 mujeres ya que tres no contestaron la pregunta, de esas 86 empresas donde encontramos a 47 empresas (54.6%) de 3 años o menores, es decir, empresas que están apenas constituyéndose; 39 empresas (45.3%) consolidadas con más de 3 años y 8 micro empresas consolidadas con más de 20 años de trayectoria en el mercado que constituyen el 9.3% de la muestra.

Por último, en este aspecto se analizan las actividades que se llevan a cabo previamente a la creación de la empresa. Un elemento crucial es la creación de un plan de negocios o empresa, y está ampliamente demostrado en la literatura, que en general las mujeres emprendedoras no desarrollan este plan. Otro aspecto estudiado en el proceso es la definición de objetivos empresariales en lo que existe el consenso al plantear que las mujeres priorizan objetivos de tipo no económico. En el caso de San Juan, el 56.2% de las 89 mujeres encuestadas, indican que sí elaboraron un plan de negocios, mientras que el 41.6% no lo elaboró.

La justificación del presente estudio en cuanto a los resultados que se obtengan en la conclusión, será confiable al tener la valoración con sus respectivos ítems contrastados en sus correlaciones en la tabla 2.

Tabla 2. Referencia comparativa del Alfa de Cronbach con respecto a los resultados.

Resultados	Económicos:	Individuales:	Sociales:
	<b>** Estos resultados están conformados por los 5 ítems: “Ventas”; “Beneficio”; “Cuota de mercado”, “los productos o servicios ofertados” y “Resultados globales”.</b>	<b>** Estos resultados están conformados por los 6 ítems: “Satisfacción personal”; “Autoestima”; “Calidad de vida personal”; “Relación con la familia”; “Relación afectiva” y “Conciliación vida profesional”.</b>	<b>** Estos resultados están conformados por los 3 ítems: “Relaciones sociales”; “Visibilidad pública” y “Contribución a la sociedad”.</b>
*Alfa de Cronbach en el procesamiento de San Juan	0.892	0.875	0.836

*\*El alfa de Cronbach por debajo de 0.5 muestra un nivel de fiabilidad no aceptable; si tomara un valor entre 0.5 y 0.6 se podría considerar como un nivel pobre; si se situara entre 0.6 y 0.7 se estaría ante un nivel débil; entre 0.7 y 0.8 haría referencia a un nivel aceptable; en el intervalo 0.8-0.9 se podría calificar como de un nivel bueno, y si tomara un valor superior a 0.9 sería excelente., en cuanto a correlación de Pearson entre los ítems. \* La correlación es significativa al nivel 0.01 (unilateral). \*\* La correlación es significativa al nivel 0.05 (unilateral).*

Los resultados obtenidos en la ciudad de San Juan demuestran que sí existe justificación (ver tabla 2). Al poder obtener la correlación entre los 14 ítems agrupados en los tres tipos de resultados: Económicos, Individuales y Sociales, con la validación promediada del Alfa de Cronbach, se puede inferir que tienen un nivel bueno por estar en el intervalo de fiabilidad de 0.8 - 0.9 y es significativa.

Los niveles de facturación no se analizaron en detalle pues los datos recabados no resultaron confiables, sin embargo, en el análisis de la evolución de la facturación de sus empresas desde su fundación, el 40.4% de las mujeres indican que el nivel de facturación evolucionó satisfactoriamente, el 12.4% responden que fue negativo y el 17% que es irregular.

### Indicadores o Desempeño Económicos, Aspectos Motivacionales y Sociales

En cuanto a los indicadores económicos, se justifica el tratamiento de su análisis por ser confiables de acuerdo al Alfa de Cronbach mayor de .8 (Tabla 3).

Tabla 3: Estadísticos totales. Resultados económicos. Estudio de San Juan, Puerto Rico.

	Media de la escala si se elimina el elemento	Varianza de la escala si se elimina el elemento	Correlación elemento-total corregida	Correlación múltiple al cuadrado	Alfa de Cronbach si se elimina el elemento
LAS VENTAS	18.95	23.855	.858	.736	.839
EL BENEFICIO	18.80	26.863	.755	.584	.864
LA CUOTA DE MERCADO-PARTICIPACIÓN/PORCENTAJE DEL MERCADO	19.25	28.984	.669	.498	.883
LOS PRODUCTOS O SERVICIOS OFRECIDOS	18.25	31.841	.659	.498	.887
LOS RESULTADOS GLOBALES (EN CONJUNTO)	18.75	27.016	.767	.604	.861

*Esta Tabla 3 muestra en los Estadísticos total-Resultados Económicos que si se presenta un valor significativo en el Alfa de Cronbach, ya que se reconoce que mayor de (.800) es factible la correlación de estas variables de los resultados económicos y con ello se justifica el tratamiento de su análisis en forma grupal promediando sus resultados y con ello tener fiabilidad en el tratamiento de la información de los ítems.*

Los resultados de las empresas fueron valorados por sus propietarias. Ellas consideraron cómo habían sido en los últimos tres años a través de 14 ítems, los cuales fueron distribuidos en tablas de frecuencias, para con ello, poder obtener la correlación entre los 14 ítems agrupados en las tres categorías: Económicas, Individuales y Sociales con la validación de Alfa de Cronbach. Para las empresarias los factores individuales, la satisfacción personal, la autoestima, su independencia y sobre todo poder conciliar la familia con su trabajo son sumamente importantes (Tabla 4).

Tabla 4: Aspectos motivacionales y sociales, San Juan Puerto Rico

		Satisfacción Personal	Autoestima, Confianza En Sí Misma	Calidad De Vida Personal	Relación Con La Familia	Relación Afectiva	Conciliación Vida Profesional Y Personal
N	Válidos	80	81	80	80	77	79
	Perdidos	9	8	9	9	12	10
Media		5.61	5.84	5.16	5.53	5.44	5.28
Desviación típica		1.571	1.436	1.657	1.312	1.552	1.467
Varianza		2.468	2.061	2.745	1.721	2.408	2.152
Rango		6	6	5	4	6	5
Máximo		7	7	7	7	7	7

En esta Tabla 4 se determinan los descriptivos con respecto a las medidas correspondientes de los indicadores de los resultados individuales en el cual se tiene un promedio de 6.21 con respecto a la escala de Likert de 1 al 7, con una mínima desviación de .688 y como máxima de 1.193 con respecto a los 6 indicadores. (7 = extremadamente importante, 1= nada importante).

Este estudio corrobora que para las empresarias son mucho más importantes los factores individuales y sociales que los económicos (Tabla 5). En otras palabras priorizan otros resultados diferentes a los económicos. Las relaciones sociales tienen una tendencia clara positiva.

Tabla 5. Estadísticos Totales. Resultados sociales. Estudio de San Juan, Puerto Rico.

	Media de la escala si se elimina el elemento	Varianza de la escala si se elimina el elemento	Correlación elemento-total corregida	Correlación múltiple al cuadrado	Alfa de Cronbach si se elimina el elemento
RELACIONES SOCIALES	10.75	7.241	.632	.406	.838
VISIBILIDAD PÚBLICA	10.99	6.908	.711	.546	.758
CONTRIBUCIÓN A LA SOCIEDAD	10.65	7.231	.755	.585	.720

Se muestra en esta tabla el análisis global de los Resultados de la Empresa donde se observa claramente y se confirma que las emprendedoras priorizan otros resultados diferentes a los económicos. En los resultados del ámbito social sí se ve una clara tendencia positiva.

## LIMITACIONES DEL ESTUDIO

El estudio tiene una muestra pequeña. Las mujeres empresarias tienen poco tiempo disponible. Fue muy difícil que respondieran a las llamadas telefónicas, citas para entregar los cuestionarios y que a su vez lo contestaran. Además, esta es una muestra seleccionada por disposición, no probabilística, por lo tanto, los resultados se ciñen a la misma.

## CONCLUSIONES

El propósito de esta investigación es crear por primera vez en Puerto Rico un perfil de la mujer empresarial donde saber sus características, experiencias y las razones por las cuáles comenzaron sus negocios para ayudarlas a establecer estrategias de negocios que incrementen su eficiencia y efectividad en el mercado. Investigar el emprendimiento de las mujeres es un indicador de crecimiento económico y de desarrollo social, por lo que el presente estudio empírico contribuye a comprender el rol de la mujer emprendedora y mostrar datos que son de utilidad tanto para las personas que estudian el emprendimiento en su conjunto, así como para las instituciones públicas, educativas o sociales, que tratan de impactar a través de políticas, programas o iniciativas que fomenten y apoyen la actividad emprendedora de las mujeres y mejorar los indicadores de equidad de género en el país y las regiones.

La edad promedio de estas empresarias es de 31 a 55 años, 95% poseen educación universitaria, 65% tiene dependientes económicos, 56.2% desarrollan planes de negocios y 48% pertenecen a asociaciones profesionales. El sector que predomina es el de servicio seguido por el de comercio. Éstas emprenden motivadas por la conjunción de la necesidad y la oportunidad. Este comportamiento sí es típico de los países subdesarrollados pues otros estudios corroboran que cuando las economías se desarrollan las mujeres emprenden más por oportunidad. Los resultados de este estudio coinciden con otros en afirmar que el nivel de educación tiene un impacto positivo sobre la entrada inicial de una empresa y su resultado futuro. Comparado con otros estudios el nivel de educación de esta muestra es muy superior. Es altamente positivo que más de la mitad prepara planes de negocios. Estos comportamientos se asemejan más a los observados en los países desarrollados. Aunque el resultado económico es importante, las empresarias consideran sumamente importantes la autoestima, la satisfacción personal, la calidad de vida personal, la relación familiar, la conciliación de su vida personal con su vida profesional y su relación afectiva. El ser empresarias les da la independencia de poder realizarse como mujeres sin perder de vista lo más preciado, su aspecto familiar. Otro aspecto similar a investigaciones anteriores es la prevalencia de dependientes económicos en las mujeres emprendedoras.

Este estudio se limitó a la ciudad de San Juan, se recomienda hacerlo en otras ciudades dentro y fuera de Puerto Rico. En futuras investigaciones se recomienda profundizar en las desigualdades de género que se dan dentro de los sectores empresariales y ampliar el contexto a las mujeres que ocupan cargos de directivos en los sectores prioritarios en cada una de las regiones del Caribe y de América Latina. Para buscar generalizaciones se requiere ampliar las muestras de forma probabilística por sectores, abarcando otras ciudades de la isla. No obstante los resultados aquí expuestos son de gran utilidad. Por otra parte se corrobora un comportamiento, en general coincidente con otros estudios previos analizados.

## **RESUMEN**

*El extensionismo ha sido un instrumento que se ha utilizado para generar desarrollo rural en México desde mediados de la década de 1950, formando parte de las políticas públicas de desarrollo rural. El extensionista, es el agente responsable de llevar a cabo la ejecución de la actividad, en un principio al servicio del Estado, recibiendo un pago fijo por nómina, y actualmente como agente privado con pago de recurso público; el mismo juega un papel muy importante en el logro de los objetivos que se plantean en la política pública de desarrollo rural. Debido a ello, en el presente documento se determina el grado de adiestramiento y experiencia que tiene el PSP y su coherencia con el perfil productivo del grupo con servicios autorizados, esto dentro del Programa de Desarrollo de Capacidades, Innovación Tecnológica y Extensionismo Rural de la SAGARPA, en el Estado de Baja California Sur durante el año 2013; permitiendo conocer si el PSP cuenta con lo necesario para desarrollar adecuadamente el servicio.*

**PALABRAS CLAVE:** Extensión, Prestador de Servicios Profesionales, Desarrollo Rural

## **PROFILE OF THE PROVIDER OF PROFESSIONAL SERVICES IN THE PRACTICE OF RURAL EXTENSION FOR THE STRATEGY OF AGRICULTURAL AND LIVESTOCK. AN ANALYSIS IN BAJA CALIFORNIA SUR, MEXICO**

## **ABSTRACT**

The extension work has been an instrument that has been used to generate rural development in Mexico since the mid- 1950s as part of public policies for rural development. The extension has been responsible for carrying out the execution of the activity , initially to serve the state, receiving a fixed payment for payroll agent, and now as a private agent paying public resource, it plays a very important in achieving the objectives proposed in the rural development policy. Because of this, in this paper the degree of training and experience that the PSP and its consistency with the production profile of the group with authorized services is determined, that within the Capacity Building Program , Technological Innovation and Rural Extension SAGARPA , in the State of Baja California Sur in 2013, allowing to know if the PSP has what it takes to properly develop the service.

**JEL:** Q10

**KEYWORDS:** Extension, Provider Services, Rural Development

## INTRODUCCIÓN

En el siglo XXI la humanidad enfrenta el reto fundamental de orientarse hacia formas de desarrollo más justas para la gran mayoría y amigables con la naturaleza; fenómenos como el cambio climático, el incremento de la pobreza y la degradación de recursos, son cada vez más complejos, de impacto global y que afectan más a aquellos seres de mayor vulnerabilidad, la cual, se da sobre todo en el medio rural, espacio donde los Gobiernos han emprendido esfuerzos para abatirla mediante iniciativas de desarrollo rural. En América Latina, el extensionismo ha sido un instrumento que se ha utilizado para generar dicho desarrollo desde inicios del siglo XX; un tipo de actividad dirigida a desarrollar capacidades técnico productivas en los productores rurales que ha formado parte de las políticas públicas de desarrollo rural. Aguilar, Altamirano y Rendón (2010) sostienen que se le conoce a dicha actividad como extensión ya que con ella se busca extender el conocimiento desarrollado en la investigación, asociándose a acciones de promoción de nuevas tecnologías y de capacitación a los productores para mejorar su desempeño productivo; el extensionista, es el agente responsable de extender dicho conocimiento, jugando un papel de suma importancia para el logro de los objetivos que se plantean en la política pública de desarrollo rural; su importancia radica en que es el puente entre el área de investigación y desarrollo con los productores rurales. En México, a mediados de la década de 1950 se empezó a configurar un modelo de extensión adoptando algunas características de los servicios de extensión comunitarios prevalecientes en Estados Unidos (Aguilar, Altamirano y Rendón, 2010), en dicha configuración los servicios eran operados por extensionistas al servicio del

Estado, los cuales brindaban atención a las unidades de producción rural con un pago fijo por nómina (Menocal y Pickering 2005); a mediados de la década de 1980, se inició el adelgazamiento de instituciones y con ello desmantelamiento del cuerpo de extensionistas que trabajaban en la Secretaría de Agricultura y Recursos Hidráulicos (SARH), esto debido a los procesos de liberalización comercial que se suscitaron a partir de dicha época, alejando al Estado del papel protagónico de la economía. Dichas reformas provocaron la creación de un mercado de extensión privado en todo el país que apoyaría la ejecución de los programas gubernamentales en el nivel local (McMahon y otros, 2011). Los extensionistas, se contrataron mediante convocatoria pública y abierta donde se les convocaba a participar en la actividad con un pago mensual y por cuenta y orden de los productores a través de distintos que programas que se formularon bajo la Secretaría de Agricultura, Ganadería y Desarrollo Rural (SAGARPA) antes SARH; así en el año 2002, la SAGARPA inició el Programa de

Desarrollo de Capacidades en el Medio Rural (PRODESCA), estableciendo una red privada de prestadores de servicios profesionales que brindaban servicios a los productores en un mercado abierto, pagándose con recursos públicos (Menocal y Pickering, 2005), llamándose a partir de entonces al extensionista “Prestador de Servicios Profesionales” (PSP). En el 2011, la SAGARPA estableció el Programa de Desarrollo de Capacidades, Innovación Tecnológica y Extensionismo Rural, consistiendo en efectuar pagos para el desarrollo de servicios de extensión privados, con recurso público a través de concurrencia SAGARPA-Gobierno de cada Estado; esto como una forma de apoyo brindada al productor, a quien no se le otorga el recurso, sino que se utiliza para el pago de los servicios proporcionados por los PSP. No obstante, a pesar de las acciones encaminadas a generar desarrollo rural a través de la extensión rural por más de 60 años, el sector rural ha tenido un ritmo de crecimiento menor al de la economía nacional. En 1950, la participación del PIB primario en el PIB nacional era de 16.1% y en el 2012 fue del 3.4%. (SAGARPA, 2013). Baja California Sur (BCS), uno de los 32 estados de la

República mexicana, presenta un sector rural con un estancamiento en la productividad, competitividad y rentabilidad de las unidades de producción rural, las cuales en su mayoría carecen de un manejo sustentable de los recursos naturales; debido a lo anterior, de acuerdo al SIAP en el 2012 las actividades agropecuarias en BCS generaron un valor de 5,155 millones de pesos, ubicándose en el lugar 29 de 32 Estados en total,

en cuanto a generación de valor; se presentan limitantes para la producción, como acceso a los recursos naturales y servicios ambientales, así como acceso a la biodiversidad. Otro tipo de limitantes se refieren a condiciones que elevan los costos de producción, tal es el caso de la logística, la cual está desarrollada sin planeación. Una limitante adicional se refiere a los precios de venta de los productos con tendencia hacia la baja, ya sea por la falta de valor agregado o la reducción en la capacidad de negociación de los productores rurales de BCS; además de que existe una resistencia fuerte hacia la organización para el trabajo anteponiendo el individualismo. Por estas razones y considerando que la extensión ha sido utilizado como mecanismo de política pública para mitigar dichas problemáticas a través de la labor que realiza el Prestador de Servicios Profesionales, siendo estos, elementos clave en la estrategia para acelerar el desarrollo rural que se busca, es que se hace necesario identificar el grado de adiestramiento y experiencia que estos poseen para realizar los servicios de extensión debido a la importancia que juegan en la práctica.

## REVISIÓN DE LITERATURA

La extensión ha sido definida por cuantiosos autores como un instrumento indispensable para el desarrollo rural. Grondona y otros (2012) la definen como un proceso de intervención de carácter educativo formal e informal, de intercambio de información, conocimientos y prácticas para el desarrollo y fortalecimiento de las capacidades de aprendizaje e innovación permanente de las comunidades. Su finalidad es contribuir a la competitividad, la sustentabilidad y la equidad social. Sánchez de Puerta (1996), argumenta que es el conjunto de acciones que envuelven la utilización de información y conocimiento, en la que intervienen agentes externos e internos con la población rural y cuyo objetivo es el desarrollo de esta última. Rodríguez (2009), sostiene que mediante el extensionismo se busca ayudar a los productores a mejorar la productividad además de desarrollar sus capacidades para dirigir su desarrollo futuro; Da Silva (2006) manifiesta que desde la adopción del extensionismo en México se han venido probando una serie de modificaciones en el diseño de las instituciones y políticas para el desarrollo rural a través de ello. En el año 2002, surgió La Ley de Desarrollo Rural Sustentable, definiendo el desarrollo rural sustentable como el mejoramiento integral del bienestar social de la población y de las actividades económicas en el territorio comprendido fuera de los núcleos considerados urbanos. Al respecto Valcárcel, (1992) sostiene que es un proceso localizado de cambio social y crecimiento económico sostenible, que tiene por finalidad el progreso permanente de la comunidad rural y de cada individuo integrado en ella; de igual manera Gómez (2002), lo define en un sentido básico como la mejora de las condiciones de vida de los habitantes de los espacios rurales.

Di Franco (1966) argumenta que los extensionistas deben de ser expertos en trabajar con personas, requiriendo un adiestramiento especial el cual demuestra que la extensión no puede llevarla a cabo cualquier persona. Cano (2004) visualiza al extensionista como un diseñador, promotor, facilitador y acompañador de estrategias frente a los cambios en los entornos locales con visión global, describiéndolo con capacidad para dar acompañamiento a los actores sociales y productivos frente a las señales de dichos entornos, muy especialmente a las de los mercados internacionales y locales, antes que un especialista en aspectos técnicos; en este sentido la preparación de los Prestadores de Servicios

Profesionales (Extensionistas) debe de ser muy completa, Di Franco (1962) dice que la preparación académica de los extensionistas es de enorme importancia para que puedan desempeñar un trabajo adecuado, sostiene que si están limitados en su formación, tendrán dificultades en cumplir los objetivos que persigue el servicio; por su parte Cano (2004) argumenta que concibe al extensionista como un profesional con formación académica en algún campo de la educación superior, con capacidades básicas formadas en la educación media, como las de interpretar textos, expresarse claramente por medio de la palabra, así como las bases en ciencias y matemáticas. Por ello se coincide con Gallaher (1967) que define el papel del extensionista como profesional que lleva a cabo acciones para provocar cambios en los productores rurales

a través de un proceso educativo planificado; donde dicho agente tiene que vincular el conocimiento generado en la investigación y desarrollo con las necesidades reales de los productores rurales y sus familias, y que si no se llega a cumplir lo que se busca, se puede considerar que su intervención ha sido no errática; en este sentido Thorton (2004) reconoce que en los tiempos actuales la demanda exige profesionistas graduados para desarrollar el extensionismo con nuevas capacidades, no prima entonces el conocimiento técnico sino la facilitación de diagnósticos, de interrelación de mediaciones, de la búsqueda de oportunidades, de la experimentación y de la formulación de propuestas. La realidad laboral, sin embargo, parece indicar que el profesional de extensión, público o privado, debe responder con ofertas diseñadas para cada actor social que atiende o con el que se relaciona.

El Programa de Desarrollo de Capacidades, Innovación Tecnológica y Extensionismo Rural fue implementado por la SAGARPA a partir del año 2011 señalando como objetivo fortalecer las capacidades técnicas y administrativas de las unidades económicas agropecuarias, pesqueras y acuícolas para que mejoren sus procesos productivos y organizativos a través del otorgamiento de apoyos en servicios de asistencia técnica, capacitación, extensionismo; en proyectos de investigación y transferencia de tecnología y en fomentar el desarrollo gerencial de las organizaciones sociales y de los comités sistema producto. El programa se integro con tres Componentes: Apoyos para la Integración de Proyectos (Comités Sistemas Producto); Desarrollo de Capacidades y Extensionismo e Innovación y Transferencia de Tecnología; todos estos componentes se encuentran enmarcados en el desarrollo de capacidades del sector rural, cuya principal acción es elevar el aprendizaje y realizar cambios sustanciales en la manera de producir lo cual impacte en la rentabilidad y por ende en la competitividad de cualquier cadena productiva agropecuaria. El desarrollo de capacidades es planeado en conjunto por SAGARPA-Gobierno del Estado, aunque este último genera la propuesta la cual es aprobada en la Comisión Estatal de Desarrollo de Capacidades, Innovación Tecnológica y Extensionismo Rural.

## METODOLOGIA

La investigación es del tipo descriptiva ya que, siguiendo a Hernandez y Otros (2008), lo que se busca es especificar propiedades, características y rasgos importantes de cualquier fenómeno que se analice, describiendo tendencias de un grupo o población. El valor de este instrumento radica en mostrar con precisión los ángulos o dimensiones de un fenómeno, suceso, comunidad, contexto o situación, al mismo tiempo que permite asociar variables mediante un patrón predecible para un grupo. Se utilizó un sistema que permitiera obtener datos en forma rápida para ello se entrevistaron a los PSP en el las reuniones que estos tienen dentro de los grupos técnicos de asesoría a consejos, ya que en ese seno se reúnen periódicamente, resolviendo las preguntas referentes a la edad y tiempo de dedicación a la actividad. Adicionalmente con la información contenida en la Base de Datos Única (BDU), la cual es la base de datos de los serbios que maneja el gobierno del Estado y que es registrada a nivel nacional en el Sistema de Información Virtual para el seguimiento de los servicios, la información contenida en el expediente de cada servicio y la información del Plan Estratégico, se realizó el análisis de la formación académica, la experiencia y el análisis de coherencia de perfiles con el grupo de trabajo beneficiario, considerando principalmente la formación académica y el perfil productivo del grupo a atender.

## RESULTADOS

Aplicando la metodología descrita se obtuvo que para el ejercicio 2013 se autorizaron 45 servicios en total para las estrategias de Asistencias técnica agrícola y pecuaria, 11 servicios (24.44%) para la agrícola y 34 servicios (75.56%) para la pecuaria, con un total de 40 PSP responsables de ejecutarlos (11 agrícolas y 29 pecuarios); el presupuesto aprobado para pago de dichos servicios fue de un total de 4.416 millones de pesos, con una distribución de 1.425 millones de pesos para PSP con servicios agrícolas (33 %) y de 2.9637

millones de pesos para servicios proporcionados por PSP pecuarios. A continuación se describen los resultados obtenidos en cuanto al grado de dedicación, adiestramiento y experiencia que poseen los PSP.

### Dedicación en el Desarrollo de Servicios

El tiempo máximo de ejecución del servicio es de aproximadamente siete meses, en este tiempo los PSP deben de ser capaces de desarrollar su programa de trabajo planificado realizando actividades para el desarrollo de capacidades técnicas, productivas y organizativas con los productores. Considerando el presupuesto asignado a los servicios agrícolas de 1.425 millones de pesos, se calcula en promedio con el número de servicios con PSP asignado, les da un ingreso mensual de 18,505.49 pesos, un pago promedio por servicio de 129, 545.45 pesos; de los 11 PSP solo el 18% se dedica de tiempo completo a la actividad, es decir nada más dos extensionistas; el 82% restante cuenta con otro tipo de trabajo y complementa sus ingresos realizando esta actividad. En los servicios pecuarios el 66% de los PSP argumenta que la práctica es una actividad complementaria a una principal generando ingresos de esta forma adicionales; en ellos consideran el presupuesto autorizado de 2.9637 millones de pesos y considerando los 34 servicios recalando que existen PSP que cuentan con más de un servicio perciben en promedio por servicio 87,167.65 pesos, aproximadamente 14,452.52 pesos por mes.

Tabla 2: Distribución de Dedicación al Servicio

Total De PSP Con Servicios		Dedicación Exclusiva	%	Dedicación Parcial, Complementaria A Otra Actividad	%
Agrícolas	11	2	18	9	82
Pecuarios	29	10	34	19	66

### Distribución de Edades y Sexo

Los PSP entre 31 y 40 años de edad son mayoría ya que representan el 27% en servicios agrícolas y el 31% en servicios pecuarios; este rango de edad puede ser considerado como el óptimo para desarrollar la actividad considerando la vida laboral de cada persona que oscila entre los 25 y 60 años de edad. Es importante mencionar que el 24% de los PSP pecuarios cuentan con menos de 26 años, este rango de edad está relacionado con personas que son recién egresados de las Instituciones de Educación Superior, por lo que su experiencia en el medio puede ser limitada o casi nula. En cuanto al género se tiene que en los servicios agrícolas, no se encuentran mujeres trabajando; mientras que el 34% de los PSP pecuarios son mujeres.

Tabla 3: Distribución de Edades

Edad, Años	Psp Agrícolas	%	Psp Pecuarios	%
Menos de 26	0	0	7	24
26 a 30	1	9	5	17
31 a 40	3	27	9	31
41 a 50	1	9	5	17
51 a 60	2	18	0	0
61 a 70	1	9	0	0
Sin datos	3	27	3	10
Total	11	100	29	100

### Formación Académica

En cuanto a la formación académica, el 100% de los PSP de servicios agrícolas cursó como último nivel de estudios la licenciatura, encontrándose todos titulados en la carrera de Ingeniero Agrónomo; en lo que respecta a los PSP para servicios pecuarios el 86%, representando a 25 PSP cuenta con nivel de licenciatura,

contando con los títulos de Ingeniero Zootecnista (48%), Ingeniero en Producción Animal (24%), la carrera de Médico Veterinario Zootecnista (24%) y la carrera de Ingeniero Agrónomo Especialista en Zootecnia (4%). De los tres PSP que cuentan con estudios de maestría tienen las carreras de Ingeniero Zootecnista, Médico Veterinario e Ingeniero Agrónomo. Además dentro de los 29 PSP hay uno que no tiene el nivel de licenciatura.

Tabla 4: Último Nivel de Estudios de los PSP

Total de PSP Con Servicios		Técnico	Licenciatura	Maestría	Doctorado
Agrícolas	11	0	11	0	0
Pecuarios	29	1	25	3	0

### Experiencia en el Servicio

Para considerar la experiencia en el servicio se tomó como referencia el estatus de desempeño de cada PSP; el 64% y 69% de PSP respectivamente con servicios agrícolas y pecuarios, son de estatus nuevo, esto quiere decir que es la primera vez que participan en este tipo de servicios; en los PSP agrícolas solamente un PSP se encuentra acreditado y seis en los pecuarios; así mismo tres de cada tipo se encuentra en proceso de acreditación.

Tabla 5: Experiencia de los PSP en el Servicio

Estatus en el Servicio	PSP Agrícolas	%	PSP Pecuarios	%
Nuevo	7	64	20	69
En proceso de acreditación	3	27	3	10
Acreditado	1	9	6	21
Condicionado	0	0	0	0
No aceptable	0	0	0	0

### Coherencia los Perfiles PSP y Unidad de Producción

Debido a la formación académica que en el caso de los servicios en la estrategia agrícola, 10 de los 11 PSP con servicios cuentan con formación de Ingeniero Agrónomo, y verificando la organizaciones que recibirán el servicios, en su totalidad son grupo de productores que realizan como actividad productiva principal la agricultura, por lo que existe una coherencia de perfiles del 91%; en este caso resultó que un PSP tiene formación académica de Ingeniero Zootecnista, por lo cual se considera que no cuenta con el perfil adecuado para brindar un servicio de extensión a productores agrícolas. En los servicios de la estrategia pecuaria el 97% de los PSP tiene coherencia con el perfil productivo de los grupos beneficiarios, la formación profesional de los PSP se considera idónea curricularmente para ejecutar el servicio; en estos servicios se considera una incongruencia y esto debido que el PSP no cuenta con formación profesional, contando solamente con estudios a nivel técnico.

Tabla 6: Coherencia los Perfiles, PSP y Unidad de Producción

Total de PSP con servicios		Existe coherencia	%	No existe coherencia	%
Agrícolas	11	10	91	1	9
Pecuarios	29	28	97	1	3

## CONCLUSIONES

El trabajo de extensión requiere de un conocimiento profundo de la comunidad, las personas, los problemas, los recursos, las costumbres y la estructura social, es decir se necesita mucho más que de solo un perfil

profesional para ejecutar de buena forma el servicio de extensión. Di Franco (1962) argumenta que sin el conocimiento amplio de toda la estructura a la que se le brindará el servicio es casi imposible desarrollar una máxima efectividad; así mismo sostiene que algunos expertos opinan que un extensionista no logra mucho en sus primeros tres años de la labor, y que los años más productivos llegaran después de los cinco años de experiencia. En este sentido en BCS el 64% y 69% de PSP respectivamente con servicios agrícolas y pecuarios, son de estatus nuevo en la actividad, es decir es la primera vez que ejecutan la práctica, la cual al llevarse a cabo, es imprescindible que el agente responsable de ejecutarla no solo cuente con el perfil académico necesario sino además con un conocimiento amplio y profundo del sujeto y su ambiente al que se le proporcionará el servicio, así como la forma en sensibilizarle e influirle para lograr los cambios que se desean con la extensión, siendo esto difícil de lograr al dedicarle tiempo parcial a la actividad; el 82% de los PSP agrícolas y el 62% de los PSP pecuarios se dedican en forma parcial a la práctica. Por lo que considerando los argumentos para el caso y los resultados del análisis, se puede decir que en BCS la mayoría de los servicios que se llevan a cabo estarán en dificultades para la obtención de los resultados que se buscan mediante la extensión, los cuales buscan el desarrollo y fortalecimiento de las capacidades técnicas, productivas y organizativas permanentes en los productores con finalidad generar competitividad, sustentabilidad y la equidad social en sus actividades.

# ESPECIALIZACIÓN Y PRODUCTIVIDAD DEL SECTOR TURÍSTICO EN MÉXICO

Karla Susana Barrón Arreola, Universidad Autónoma de Nayarit

Ulises Castro Álvarez, Universidad Autónoma de Nayarit

## RESUMEN

*Se realiza un análisis de la actividad turística en los estados de la República Mexicana donde se localizan los destinos más visitados, con el propósito de identificar la estructura económica regional asociada al sector, la especialización en el empleo y los índices de productividad. A partir de información de las Estadísticas Turísticas de los Censos Económicos, se estima un Análisis Envolvente de Datos, el Índice de Especialización de Empleo Normalizado y el Coeficiente de Empleo a nivel de ramas para las nueve entidades federativas cuya ocupación del empleo en el sector turístico es mayor al 20% del total de la ocupación estatal. Los resultados documentan la ausencia de un comportamiento homogéneo en el número de establecimientos y empleos, así como en relación a las ramas de actividad, éstos pueden coadyuvar al diseño de políticas públicas orientadas hacia la promoción del desarrollo del turismo con mayor eficiencia en el sector.*

**JEL:** O14, O41, R11

**PALABRAS CLAVE:** Turismo, Empleo, Productividad Y Especialización

## INTRODUCCIÓN

El turismo se ha convertido en un sector de importancia económica y en crecimiento a nivel internacional, la Organización Mundial del Turismo (OMT) señalaba que para 2012 la actividad a nivel mundial contribuyó con el 9% del Producto Interno Bruto (PIB), generó al menos 1 de cada 11 empleos, en tanto que los ingresos fueron el equivalente al 6% de las exportaciones internacionales (OMT, 2013). Existe una amplia literatura sobre los pros y contras de la actividad turística en las economías, encontrando coincidencia en la importancia que tiene para la generación de empleo, sin embargo, desde la agenda económica son pocos los trabajos que han abordado la relación existente entre el turismo, la eficiencia del sector y la contribución puntual a la generación de empleo. Este documento busca hacer una primera aproximación a esta relación en aquellos estados de la república mexicana donde la participación del empleo turístico es mayor al 20% de la población ocupada. El documento se encuentra estructurado en cuatro apartados, el primero corresponde a la revisión de la literatura sobre la relación turismo y empleo; los datos y desarrollo de los indicadores a estimar se presentan en el apartado segundo; en el tercero apartado se presentan los resultados de las estimaciones del Análisis Envolvente de Datos, Coeficiente de Empleo y el Índice de Especialización del Empleo Normalizado; por último, se presentan las reflexiones finales.

## REVISIÓN DE LITERATURA

El turismo es un sector de actividad que no se ajusta a los criterios de las cuentas nacionales, al ser una industria heterogénea con una amplia variedad de negocios, tipos y tamaños (Pena-Boquete y Pérez-Dacal, 2012), que combina diferentes actividades de los sectores y subsectores clasificados por las cuentas nacionales, siendo las más importantes las relacionadas con servicios de alojamiento y alimentación; agencias de viaje y servicios de transporte; entretenimiento, venta curiosidades y artesanías; entre otros (Pais, 2006). Al proveer bienes y servicios, tanto para la población como para los turistas, resulta difícil la contabilización de estos últimos (Kumari, 2012). El turismo se considera una industria intensiva en empleo, que se basa en el movimiento de personas y consumo de los viajeros (Shuifa *et al*, 2011), además esta

heterogeneidad permite la existencia de flexibilidad en el empleo, a partir del desplazamiento de trabajadores entre una y otra, donde los salarios se ajustan por los conocimientos, la experiencias y antigüedad en el empleo (Aykac, 2010).

Becerra (2009) señala que la industria turística puede ser gestionada por unidades de diferentes tamaños, cubriendo diferentes servicios a partir de empresas familiares, qué al existir una expansión del turismo, los ingresos llegan a la población de manera rápida. Aykac (2010) establece que la importancia de la empresa familiar, puede estar asociada a la informalidad existente en el sector, tanto por el trabajo no remunerado o por la prestación de bienes y servicios en los hogares. Toader (2011), apunta que para generar desarrollo turístico es necesario emplear más gente, lo cual puede traducirse en mayores ingresos y mayores gastos por parte de las familias; es precisamente bajo esta premisa que el turismo en zonas deprimidas, se ha convertido en estrategia de desarrollo nacional y estatal, en algunas regiones del país. No obstante, Tinocco (2003) establece que existe desigualdad de ingresos entre diferentes comunidades, el desplazamiento de trabajadores a la actividad turística en detrimento de sectores tradicionales y los bajos niveles salariales asociados al trabajo en el sector, aunque el turismo también genera empleo para todos los niveles y habilidades.

Mathienson y Wall (citado por Bosch *et al*, 2004) identifican tres tipos de empleos generados por la actividad turística: a) Directos, resultado de los ingresos generados por la prestación de servicios turísticos básicos y complementarios del turismo; b) Indirectos, conformado por los puestos de trabajo generados en actividades de los proveedores de servicios básicos y complementarios; y c) Inducidos, se generan como consecuencia del efecto multiplicador del gasto turístico en el centro receptor, que es realizado por los trabajadores del sector. Becerra (2009) agrega una cuarta categoría denominada empleos temporales, definiéndolos como aquellos generados durante la construcción de infraestructura del destino. Lanza *et al* (2003), señalan que se ha prestado poca atención a las implicaciones de largo plazo de la especialización en el turismo y el desarrollo económico, a pesar de que las perspectivas de crecimiento de la productividad en el turismo en comparación con la manufactura pueden ser limitadas.

En este sentido, Blake *et al* (2006) argumentan que la relación entre competitividad y productividad, es un campo virgen en el sector turístico, aunque en otros sectores, ha sido altamente explorado; estos autores señalan que el turismo, al igual que en el resto de los sectores, la productividad se refiere a la eficiencia con la que se utilizan los recursos, relacionando la cantidad de insumos, como el empleo de mano de obra y el capital, al producto. En el mismo tenor, Maroto-Sánchez (2012) define la productividad como un concepto de eficiencia, que ahora se ve cada vez más como una eficiencia y el concepto de eficacia, así como la efectividad. En México, se encuentran estudios de carácter regional, que han sido abordados desde la calidad del empleo, condiciones laborales y a partir de casos específicos como son los trabajos de Márquez, 1996; Leyva, *et al*, 2010; Cruz, *et al*, 2014.

En virtud de ello, en este trabajo se busca contribuir a los trabajos que se han hecho para la economía mexicana, relacionando la eficiencia, entendida en el sentido de Blake *et al* (2006) y Maroto-Sánchez (2012); en segundo lugar, explorar la demanda de empleos con respecto a la generación del producto y finalmente, analizar la especialización del empleo. El sector turístico en México, definido a partir de la información de los Censos Económicos, muestra que entre 2003 y 2008, la aportación relativa del sector turístico al total nacional en relación al número de unidades económicas registró un aumento del 6.2% y del 2.9% con respecto al personal ocupado; respecto a la aportación que hace el sector en remuneraciones y valor agregado sólo fueron del 0.9% y 0.1% respectivamente. El sector que registró la mayor participación fue el relacionado con los servicios de alojamiento temporal y preparación de alimentos y bebidas, representando en 2003 aproximadamente el 50% del total nacional en las variables, aumentando esta participación en 2008 al 67%, lo cual puede ser explicado, por la mayor presencia en estas unidades económicas en sitios turísticos. La estructura económica del sector recae en micro y pequeñas empresas

constituyendo un porcentaje cercano al 99%, y ocupan entre el 60 y 70% del personal, sin embargo, en relación a las remuneraciones sólo aportaban en 2003 el 33% y en 2008 el 45%; generando en promedio el 48% del valor agregado.

## DATOS Y METODOLOGÍA

A fin de determinar la productividad de las entidades federativas con vocación turística, se seleccionaron aquellas en las que el empleo en el sector turístico fuera igual o mayor al 20% del total de ocupación estatal. Tomando como base la información de las Estadísticas Turísticas con Base en los Resultados de los Censos Económicos (ETBRCE) de INEGI (2009), las entidades seleccionadas fueron: Baja California Sur, Colima, Guerrero, Jalisco, Morelos, Nayarit, Oaxaca, Quintana Roo y Sinaloa.

Alberca y Parte (2013) utilizan el Análisis Envolvente de Datos (DEA), en el cual se determina cual es el productor más eficiente y las deficiencias en el resto, bajo la premisa que la producción de cada productor estará dada por una cesta de insumos distintos y por lo tanto genera cantidades diferentes del resto de los productores. Vargas *et al* (2013), establecen que el DEA puede ser visto como un vector de insumos en la  $DMU_i, X_i$ , en tanto que  $Y_i$  representa el vector de insumos correspondiente. Donde  $X_0$  son los insumos dentro de la  $DMU$  en la cual se quiere determinar los niveles de eficiencia y  $Y_0$  sean los niveles de producción; en ese caso, las  $X$ 's y las  $Y$ 's son los datos con los que se hace la estimación. A partir de un problema de programación lineal, se establece la medida de eficiencia para la  $DMU_0$  dada por:

$$\begin{aligned} & \text{Min} \quad \theta \\ & \text{s.t.} \quad \sum \lambda_i X_i \leq \theta X_0 \\ & \quad \sum \lambda_i Y_i \leq Y_0 \\ & \quad \lambda \geq 0 \end{aligned} \tag{1}$$

En el que  $\lambda_i$  es la ponderación dada a la  $i$ -ésima  $DMU$  en su esfuerzo por dominar a  $DMU_0$  y  $\theta$  representa la medida de eficiencia de  $DMU_0$ . Teniendo en cuenta lo anterior,  $\lambda$  y  $\theta$  son las variables; asimismo, debido a que  $DMU_0$  aparece del lado izquierdo del sistema de ecuaciones, el valor óptimo de  $\theta$  no puede ser mayor a 1. La estimación del Análisis Envolvente de Datos se realizó tomando la información disponible en las ETBRCE 2003 y 2008. Como insumos se utilizó el Personal Ocupado, Consumo Intermedio, en tanto que la Producción Bruta Total, se consideró como el producto. Se realizaron estimaciones para determinar cuál es el estado de la República Mexicana más eficiente de los nueve seleccionados y al interior de los estados se realizaron estimaciones que permitirán identificar en que estrato de personal ocupado se encuentra la mayor eficiencia, donde se incluyó como insumo la Formación Bruta de Capital Fijo como proxy de capital.

A fin de contar con una estimación respecto a la capacidad que tiene el sector turismo en cada entidad federativa, se estima el Coeficiente del Empleo (Pais, 2006), que es la tasa entre el empleo (número de trabajos) y el producto generado. El coeficiente es derivado como un promedio ponderado de los coeficientes de los sectores y subsectores en los cuales el empleo es generado como resultado del turismo. Se utilizó la ponderación con respecto a las remuneraciones pagadas a los trabajadores en cada una de las ramas de actividad (4 dígitos del Sistema de Clasificación de América del Norte, SCIAN), del sector turismo, lo anterior asociado a la disponibilidad de información para la economía mexicana. Las variables proxy el producto fue la producción bruta total y para el empleo se utilizó el total del personal ocupado. La estimación se realiza para 2003 y 2008, a fin de hacer comparables los resultados, los datos fueron usados a precios constantes de 2003. La estimación está dada como sigue, si  $n$ , es el número de trabajadores empleados en el sector  $i$ , y  $v$  es la producción bruta total, entonces el coeficiente del empleo del sector  $i$  es:

$$ec_i = n_i/v_i \quad (2)$$

En tanto, que el coeficiente del empleo agregado está dado por:

$$EC = \sum_{i=1, \dots, m} w_i ec_i \quad (3)$$

donde  $m$  es el número total de subsectores que conforman el sector y  $w_i$  es la ponderación del sector  $i$  para este caso se deriva de la participación en las remuneraciones totales a los trabajadores. Los principales supuestos de los cuales parte esta estimación se asume que todos los bienes y servicios provistos a los turistas fueron producidos en el país; y que el coeficiente del empleo estimado es igual para todas las empresas por igual. Una herramienta que ayuda a distinguir al interior de las economías estatales el ritmo en el que se generan los empleos con respecto a la dinámica nacional, es la estimación del Índice Especialización del Empleo Normalizado (Dalum *et al*, 1999), cuya forma es la siguiente:

$$IE_i^* = \{[(L_{iE}/L_{SE})/(L_{iN}/L_{SN})] - 1\} / \{[(L_{iE}/L_{SE})/(L_{iN}/L_{SN})] + 1\} \quad (4)$$

donde los subíndices  $i$  y  $S$  se refieren a la actividad y al sector, mientras que  $E$  y  $N$  hacen alusión al total estatal y total nacional de la información respectivamente. La estimación se realizó con información de las ETBRCE 2004 y 2009 de INEGI, a un nivel de desagregación de 2 y 4 dígitos.

## RESULTADOS Y DISCUSIÓN

El Análisis Envolvente de Datos (DEA), se utilizó para intentar entender cuál es el comportamiento de la eficiencia en la producción del sector turístico en los estados de la República Mexicana seleccionados. La estimación se hace bajo el supuesto de la existencia de retornos constantes a escala, obteniéndose sólo en aquellos estados donde el análisis los considera eficientes, siendo para 2003 Jalisco y Quintana Roo. El análisis para 2008, muestra que los estados eficientes en términos de los insumos son

Baja California Sur, Jalisco y Quintana Roo, en tanto que, el resto de las entidades exhiben rendimientos crecientes a escala (Tabla 1). La siguiente etapa del DEA consiste en la determinación del exceso de insumos, lo que significa determinar a partir de los valores de productos actuales, qué proporción de insumos debería ser utilizada. Para 2003, en el caso de Jalisco y Quintana Roo, al estar consideradas en la frontera de eficiencia, no tienen insumos en exceso. Los resultados indican que Baja California Sur podría encontrarse en este nivel de eficiencia relativa. Para el resto de los estados, para mantener el mismo volumen de producción bruta total, el consumo intermedio no tendría que ser aumentado o disminuido, sin embargo, en relación al número de empleos, los resultados indican que los estados muestran en términos de eficiencia un exceso de empleos en el sector (Tabla 2).

Fuente: Elaboración propia

Finalmente el DEA, establece cuales son los valores de los insumos que tendrían que utilizarse a fin de tener una producción bruta total en términos de eficiencia. En la tabla 4, se presentan los valores observados y los predichos por el análisis, mostrándose en el caso de los estados no eficientes exceso en la utilización del empleo y del consumo intermedio, para producir el valor observado de producción bruta en términos de eficiencia (Tabla 3).

Tabla 3: Insumos y productos objetivo eficiente, 2003 y 2008

Fuente: Elaboración propia. Nota: Todos los datos de la tabla están en miles de pesos de 2003.

Adicionalmente a éste análisis, se realizó el DEA teniendo como unidades de decisión, en cada uno de los estados, los estratos de personal ocupado a fin de determinar en qué tamaño de empresa se encuentra la mayor eficiencia relativa. Los resultados muestran un comportamiento diferenciado entre las entidades, mismos que se muestran en la tabla 4.

Fuente: Elaboración propia. Nota: Los resultados indican el tipo de rendimiento que exhiben las empresas por tamaño, pudiendo ser Constantes (Cons), Crecientes (Cre) y Decrecientes (Dec). N/A indica que no existen empresas con ese número de empleados.

Los resultados de la estimación del Coeficiente del Empleo (CE) a nivel agregado ponen de manifiesto el número de puestos de trabajo necesarios en el sector turístico para la generación de \$1000 de Producción Bruta Total (PBT), encontrándose que en 2003 en promedio los nueve estados seleccionados necesitaban 620 empleos, mientras que, para ese mismo valor en 2008, éstos aumentaban a 757.

Los valores máximos de empleos requeridos se encontraban en Morelos donde eran necesarios 747 empleos y el valor mínimo correspondía a Quintana Roo con 406. En 2008, los valores extremos se encontraban en Oaxaca con 1167 y Quintana Roo con 394. Los resultados del CE de manera agregada, son consistentes con resultados previos obtenidos por los autores (Barrón *et al*, 2014), en los que encuentran que a nivel nacional se necesitaban en 2003, 1850 empleos y 2437 en 2008, para generar \$1000 de Valor Agregado (VA), es decir, en términos de las variables utilizadas, los valores aproximados de VA representan el 50% de la PBT. Los valores del Índice de Especialización del Empleo Normalizado (IEEN), se encuentran en el rango de -1 a 1, el primero indicaría que la actividad no es significativa en la entidad federativa en cuestión, por el contrario, el segundo valor indica que la actividad sólo está presente en esa entidad. Los valores intermedios a  $\pm 1$  son indicio de un proceso de especialización asociado a un (de) crecimiento más lento de la actividad en el estado.

Tabla 5: Estimación del Coeficiente del Empleo, Estados Seleccionados 2003-2008

Estado	Porcentaje unidades económicas turísticas		Porcentaje personal ocupado unidades turísticas		EC ponderado por remuneraciones

Fuente: Elaboración propia con información de las Estadísticas Turísticas con Base en los Censos Económicos (INEGI 2004, 2009).

Los resultados indican que el Sector 46 Comercio al por menor, presenta una especialización negativa en todas las entidades federativas, excepto Oaxaca y Sinaloa; en lo que corresponde al Sector 48 Transportes, correo y almacenamiento, todos los estados de la República que han sido seleccionados presenten valores negativos en ambos periodos, sin embargo, se nota una reducción entre 2003 y 2008. El Sector 52, Servicios financieros y de seguros, tiene un comportamiento diferenciado entre los estados seleccionados, presentando desespecialización absoluta en Baja California Sur en ambos periodos; Morelos y Quintana Roo tienen valores negativos en ambos periodos, siendo más marcada la desespecialización en 2008; en el resto de los estados se presenta un aumento de la especialización de 2003 a 2008. En el Sector 53, de Servicios inmobiliarios y alquiler de bienes muebles, se presenta desespecialización en ambos periodos, haciéndose más evidente hacia 2008; la excepción en este sector, la hace Sinaloa, con un desempeño similar al promedio nacional.

En el Sector 54, Servicios profesionales, científicos y técnicos, se encuentra que el empleo en la mayor parte de los estados sufre una disminución con respecto a la evolución nacional entre 2003 y 2008, a excepción de Baja California Sur y Quintana Roo. En el sector relacionado con Servicios de apoyo a los negocios, manejo de desechos y servicios de bioremediación (56), a excepción de Quintana Roo, prácticamente este sector en los estados del país seleccionados para este estudio se observa desespecialización, lo que podría estar dejando de manifiesto la importancia que han tenido las tecnologías de la información y la accesibilidad que tienen los turistas para la planificación y reservas de viajes, afectando a la actividad 5615 (Agencias de viajes y servicios de reservaciones).

Los Servicios educativos (Sector 61), en 2003, sólo se observaba un comportamiento similar al nacional en Jalisco y Nayarit; en el resto de los estados se muestra que presentan comportamiento más lento que el nacional, presentando valores negativos; sin embargo, en Oaxaca y Sinaloa se presentó un aumento entre 2003 y 2008. El Sector 71, Servicios de esparcimiento, culturales y deportivos, Morelos, Quintana Roo y Sinaloa presentan un comportamiento superior al nacional. El Sector de Servicios de alojamiento temporal y de preparación de alimentos y bebidas (72), exhibe un comportamiento muy similar al comportamiento nacional en ambos años, cabe destacar una ligera caída entre 2003 y 2008, en Guerrero, Jalisco y Morelos. Finalmente en el Sector 81 (otros servicios), a excepción de Oaxaca y Sinaloa, se presenta una tendencia más lenta que la nacional.

## CONCLUSIONES

El estudio realizado permite concluir que en diversos sectores y actividades de la estructura económica, el turismo como fenómeno económico que incorpora diferentes sectores y actividades, se caracteriza por una estructura basada en las Micro, Pequeñas y Medianas Empresas (MiPyMe's), lo que condiciona los niveles de especialización, eficiencia en el uso de los recursos y por tanto de la productividad. A escala regional, la especialización en el empleo, la eficiencia del uso de los insumos y por tanto la productividad, se ven condicionados por los espacios donde se desenvuelve la actividad turística (Alberca y Parte, 2013), cada entidad federativa y destino turístico cuenta con determinados recursos que los hacen heterogéneos en la conformación de sus estructuras económicas.

A pesar de esta heterogeneidad, como resultado de este estudio, se observan comportamientos similares en cuanto a la especialización del empleo normalizado en ciertas ramas de actividad vinculadas con el turismo, de esta manera, es evidente que la mayoría de los estados de la República Mexicana seleccionados para estudiarse registran desespecialización durante los años 2003 y 2008, en las ramas de actividad relacionadas al Comercio al por menor, Servicios inmobiliarios y alquiler de bienes muebles, Servicios profesionales y técnicos y Servicios de apoyo a los negocios, pasando a una especialización fundamentalmente en las ramas de actividad relacionadas con Servicios de alojamiento temporal y preparación de alimentos y bebidas, actividades características del turismo, lo que sugiere un crecimiento de éste en estas regiones y por tanto la consolidación de los destinos que ahí se encuentran.

Sin embargo, al relacionar la especialización con la eficiencia del uso del empleo como insumo para la producción, puede concluirse que en los estados turísticos de México, es justamente la rama de actividad clasificada como Hoteles, moteles y similares la que requiere de mayor número de empleos para generar \$1000 de producción bruta, lo que significa poca productividad de este factor. Como se menciona en el texto, es esta rama la que mayor cantidad de personal ocupado registra, siendo ello un indicador de la existencia de empleos con muy bajos niveles de sueldo.

En relación a la eficiencia en el uso de insumos y tamaño de las empresas, la conclusión a la que se puede llegar a partir de lo encontrado en el estudio, puede expresarse señalando que durante el 2003 y 2008, en los estados mexicanos considerados como turísticos, se ha mantenido el comportamiento en una evidente polarización. En el primer año en cuestión, prevalecía mayor eficiencia relativa en las empresas clasificadas

como pequeñas y grandes ya que el 55% de los estados del país analizados manifestaron este resultado, para el siguiente año la proporción se incrementó al 66%, la polarización puede explicarse a partir de los segmentos de demanda que atienden las empresas; la pequeñas empresas generan bienes y servicios para segmentos turísticos de bajos niveles adquisitivos y para la población local, mientras que las grandes empresas se orientan principalmente hacia la atención de turistas de gran impacto en la demanda. Las microempresas aparecen con niveles eficientes de operación solamente en el estado de menor nivel relativo de desarrollo económico como Oaxaca, en las entidades de mayor dinamismo, no aparecen como entidades de decisión con niveles de eficiencia en el uso de insumos, cuestión que podría explicarse con base a la escala y niveles de operación que generalmente registran y su competitividad es baja. Los resultados obtenidos sugieren la necesidad del diseño e instrumentación de políticas públicas relacionadas con el turismo, que involucren de manera diferenciada a las regiones donde se desarrolla este fenómeno, principalmente debido a la heterogeneidad de las estructuras económicas, promoviendo instrumentos programáticos que favorezcan la eficiencia y productividad, debe ser prioritario atender este aspecto en la rama relacionada con Hoteles, moteles y similares que se encuentra entre las ramas características del turismo y que es la que mayor personal ocupado registra. De igual manera, debe estimularse el desarrollo de las micro y pequeñas empresas que tienen un peso importante en la conformación de la estructura empresarial del turismo mexicano y generan una proporción significativa de empleos.

# LOS ECOSISTEMAS Y SUS SERVICIOS DESDE UNA PERSPECTIVA ECONOMICA. MODELOS Y REALIDADES

José Isabel Urciaga García, Universidad Autónoma de Baja California Sur  
Claudia Lorena Lauterio Martínez, Universidad Autónoma de Baja California Sur

## RESUMEN

*Los ecosistemas son sistemas complejos altamente relacionados donde se producen interacciones no lineales entre las variables a diferentes escalas espacio temporales. Desde una perspectiva económica, los ecosistemas proveen servicios ecosistémicos (SE) que mejoran el bienestar humano y normalmente están en condiciones de bienes públicos y recursos comunes, y aparentemente nadie paga por ello, con graves consecuencias en la degradación de los ecosistemas, por ello la valoración económica y monetización de los SE son acciones que deben estar presentes en el análisis y gestión de los recursos naturales como métodos claves para insertar al capital natural en la ecuación de desarrollo económico y en la agenda de la formulación de políticas. Hasta ahora los SE tienden a caer en las categorías de acceso abierto y servicios públicos puros, como nadie posee o tiene derechos a estos servicios, nadie puede ser excluido de utilizarlos. En efecto, los SE no están comprendidos en el ámbito de los mercados y tienden a ser invisibles en el análisis económico.*

**PALABRAS CLAVE:** Servicios Ecosistémicos, Bienestar Humano, Capital Natural, Modelos

## ECOSYSTEMS AND THEIR SERVICES FROM AN ECONOMIC PERSPECTIVE. MODELS AND REALITIES

### ABSTRACT

*Ecosystems are complex systems highly related where nonlinear interactions occur between the variables at different temporal and spatial scales. From an economic perspective, ecosystem provide ecosystem services (SE) to improve human welfare and usually are available as public goods and common resources, and apparently no one pays for it, with serious consequences for ecosystem degradation, thereby economic valuation and monetization of SE are actions that must be present in the analysis and management of natural resources as key methods for inserting the natural capital in the equation of economic development and on the agenda of formulating policies. Until now, SE tends to fall into the categories of open access and pure public services, as no one owns or has rights to these services, no one can be excluded from use. Indeed, the SE are not within the scope of markets and tend to be invisible in the economic analysis.*

**KEYWORDS:** Ecosystem Services, Human Well-Being, Natural Capital, Models

**JEL:** 010, 020, 021, 029, 044, P2

## INTRODUCCIÓN

Desde una perspectiva económica se definen como bienes a aquellos recursos naturales o ambientales que se agotan en su consumo. Por el contrario, son servicios ecosistémicos todas las funciones de los ecosistemas

utilizadas por las personas y comunidades en su beneficio y que no se agotan, gastan o se transforman en el proceso de utilización por el consumidor. Desde esta perspectiva, la característica fundamental que distingue los bienes de los servicios ecosistémicos es que mientras los primeros se agotan en su consumo, los segundos no (Martínez de Anguita, 2006) En el ámbito de la ciencia económica se denominan recursos a todos aquellos medios que contribuyen a la producción y distribución de los bienes y servicios de los cuales los seres humanos hacen uso. En concreto se denominan recursos naturales a aquellos bienes y servicios que proporciona la naturaleza sin alteración por parte del ser humano; y que son valiosos para las sociedades por contribuir a su bienestar y desarrollo de manera directa o indirecta. Así, desde esta perspectiva económica, tanto bienes como servicios son recursos naturales. Adicionalmente los recursos se pueden clasificar en bióticos (recursos vivos que su tasa de extracción es inferior a su tasa de reproducción) y abióticos (recursos no vivos: combustibles fósiles, minerales, agua, suelo, energía solar) (Urciaga, 2009).

Al analizar las razones bajo las cuales el mercado falla para asignar óptimamente los recursos en la economía, destaca la condición de existencia de bienes públicos, recursos comunes y la presencia de externalidades. La exclusión es un concepto legal que permite al propietario del recurso excluir de su disfrute al resto de los agentes. La rivalidad se refiere a una característica inherente a ciertos recursos en el sentido que su consumo excluye al resto de los agentes del mismo o su uso reduce la disponibilidad para el resto. Si los servicios se pueden excluir y son rivales caen en la clasificación de bienes privados, si son no excluibles pero rivales se consideran bienes comunes, si son no excluibles y no rivales se definen como bienes públicos puros. Es decir, como el recurso es de todos y de nadie, los derechos de propiedad del mismo son indefinidos, y todos utilizan el recurso bajo consideraciones privadas de maximizar su bienestar y nadie puede ser excluido de utilizarlo, en cierto tiempo esta situación conduce necesariamente a la degradación y agotamiento de no modificar las reglas o los derechos de propiedad. (Urciaga, 2012)

Los conceptos de exclusión y rivalidad dan contenido a muchos ecosistemas y sus servicios que tienden a caer en las categorías de recursos comunes y bienes públicos, con el agravante de presentar la condición de libre acceso al mismo, situación que los coloca en la denominada “Tragedia de los comunes”, es decir, una condición que de no atenderse oportunamente mediante nuevas reglas de funcionamiento, el recurso natural, ecosistema y sus servicios se degradan y en el extremo se agotan. En efecto, los servicios de los ecosistemas están comprendidos en el ámbito de los recursos comunes o bienes públicos y el mercado no resuelve su óptima utilización social. De hecho, el mercado dejado a su libre juego de oferta y demanda no internaliza los servicios de los ecosistemas porque no establece precios y tienden a ser invisibles en el análisis económico, el beneficiario directo e indirectos del funcionamiento de los ecosistemas y de los servicios que proveen a la sociedad no paga por el mismo y su conducta estratégica de gorrón genera mayor uso del recurso hasta las cercanías del agotamiento en donde la sociedad considera al servicios escaso e inmediatamente surgen los precios como indicadores asignativos (Urciaga, 2009.). Además hay pocos incentivos para que los beneficiarios directos de los ecosistemas gestionen los servicios ecosistémicos de manera sostenible (Dasgupta *et al.*, 2000)

La integración de la economía y la ecología en un sistema común e integrado de apoyo al análisis científico y la definición de políticas y decisiones operativas, es un paso clave hacia la conservación y la sostenibilidad (MEA, 2005). El mercado debe reconocer la escasez de los recursos antes de que se agoten, circunstancia que demanda la internalización de las externalidades negativas al sistema de mercado. La internalización de externalidades ambientales genera un costo social mayor al costo privado justamente en la misma externalidad, lo que hace menor la ganancia privada pero mayor a la ganancia social, lo que hace viable todas las consideraciones de conciencia social de la degradación ambiental y de la pérdida del capital natural. Tales argumentos apoyan el equilibrio y la armonía entre la actividad económica y el medio ambiente, compatibles a través del progreso en la comprensión científica y en la técnica del manejo de los ecosistemas y sus servicios (Fisher *et al.* 2009).

El papel crucial que desempeñan los sistemas naturales en el sustento de la actividad económica y el bienestar humano es motivo de creciente preocupación, ya que aumenta la evidencia de las crecientes presiones que se instalan en este tipo de sistemas por la actividad humana (MA 2005). Los modelos económicos y ecológicos se hacen necesarios para representar apropiadamente los ecosistemas, sus servicios y los impactos en el bienestar humano. La modelización apropiada del flujo de servicios nos permite cuantificar el acervo de capital natural. Los ecosistemas y sus servicios son la base del capital natural. Los servicios de los ecosistemas se identifican como el conjunto de servicios proveídos por un ecosistema al que se le confieren un valor antropogénico y propio, denominado valor económico total (VET), que se divide en dos categorías: valor de uso (VU) que es el derivado de la utilización del bien o servicio ecosistémico, ya sea de forma directa (alimentos o recreo) y valor de no uso (VNU) el cual corresponde con el valor atribuido a la sola existencia del elemento ambiental valorado, independientemente de si es utilizado o no como el valor de herencias, valor de legado y valor de existencia. El valor de uso directo (VUD) es el valor derivado de la utilización directa del servicio ambiental y el valor de uso indirecto (VUI) que engloba los beneficios derivados de las funciones del ecosistema para la producción y consumo actuales (Urciaga, 2009).

El objetivo del presente documento es analizar el papel que desempeñan los servicios ecosistémicos y la capacidad de los modelos económicos de representar apropiadamente el flujo de servicios y cuantificar el capital natural de los ecosistemas, para lograr este objetivo, el documento esta estructurado en cinco secciones, la primera, introductoria describe la relación que existe entre los servicios de los ecosistemas, el mercado, los valores y el sustento que representa el capital natural para el bienestar social, la segunda sección revisión de la literatura, analiza como la importancia de representar mediante modelos la interacción entre el capital natural y la sociedad es clave para entender su interacción. La tercera sección indica la metodología que se siguió para ejemplificar el modelo, en la sección de resultados, se demuestra por medio de mapas como han afectado los cambios en el uso de suelo y que áreas son las más sensibles a dichos cambios, se representan también las actividades turísticas más importantes, los zonas de pesca y la tendencia de crecimiento para Baja California Sur. Para concluir, se destaca la importancia de los ecosistemas en el bienestar humano y la necesidad de proponer políticas para la preservación, conservación y restauración de los ecosistemas

## REVISIÓN DE LITERATURA

El problema central en la aplicación de las herramientas económicas clásicas para la provisión de servicios de los ecosistemas, ya sea indirectamente a través de la regulación o, directamente, por medio de la provisión pública, es el establecimiento de un valor monetario sobre ellos. La información costo/beneficio raramente está disponible debido a que esos servicios no presentan mercados bien establecidos y no se intercambian usualmente en los mercados. Muchos de los servicios proveídos por los ecosistemas carecen de mercado (aire limpio, biodiversidad o posibilidad de recreo), por lo que no tienen un precio que indique cual es su valor. Por este motivo, dado que no existe un reflejo de su escasez o de los impactos generados por la actividad humana, se producen situaciones de asignación ineficiente de recursos, es decir, su degradación, sobreexplotación y contaminación (Urciaga 2009, Sanjurjo e Islas-Cortés 2007). La economía valora monetariamente en términos de utilidad y escasez los bienes y servicios que previamente pueden ser cuantificados biofísicamente.

En mercados competitivos y completos, el precio de mercado es una buena aproximación del valor económico otorgado por la sociedad a un bien o servicio de acuerdo a la teoría económica. El sistema de precios representa la escasez del bien en la economía y su valor social. Sin embargo, existen fallas de los mercados que no permiten que el sistema de precios represente de forma adecuada el valor económico de un bien o servicio desde el punto de vista social (Baumol y Oates, 1988). La cuantificación económica de la presencia de externalidades, la redefinición de los derechos de propiedad y el establecimiento de reglas

que modifique el libre acceso a los recursos comunes y bienes públicos, permite incluir el costo social al valor económico que una sociedad reconoce en los producción y distribución de los servicios de los ecosistemas. Este reconocimiento social de los límites del mercado y la introducción de mecanismos de mercado para alinear la utilización el capital natural, los ecosistemas y sus servicios al sistema económico permitirá alcanzar un uso sustentable de nuestros recursos naturales.

### Modelos y Realidades

Un modelo es una representación simplificada de la realidad expresada a nivel conceptual, mediante símbolos matemáticos o de cualquier otra manera, cuando el modelo se relaciona con la economía y la ecología, se habla de representar estados de la naturaleza mediante la integración de modelos económicos y ecológicos, los cuales integren procesos naturales (biofísicos y ecológicos) y sistemas socioeconómicos (valores de mercados, precios, demanda), con el objetivo de brindar herramientas que permitan proponer acciones de manejo que sean reflejadas en el establecimiento de políticas para la preservación, restauración y conservación del capital natural, clave para el bienestar natural (van den Bergh *et al* 2001).

Al parecer ambas disciplinas tienen representaciones sobre la realidad económica y ecológica. En un mundo donde el crecimiento económico está restringido por límites ecológicos y especialmente por la creciente degradación de los ecosistemas y de sus servicios para satisfacer el bienestar humano se hace necesario establecer modelos integrados ecológicos y económicos que den cuenta de tales restricciones. Establecer un modelo sostenible en el sentido de considerar la capacidad del medio ambiente para sostener la vida humana y los niveles actuales de actividad económica sin degradar la calidad de los servicios de los ecosistemas, es el desafío de mayor importancia.

La implementación y creación de estos modelos orientados a los recursos naturales se debe a que el desarrollo y explotación de los mismos tiene lugar en un mundo finito, que empieza a tomar forma sobre la base de los conceptos de sustentabilidad y capital natural. La concepción de la base de recursos naturales y servicios suministrados por el ecosistema como un acervo que proporciona un flujo de servicios ha permitido vincular el concepto de sustentabilidad con el de acumulación de capital, ya que tanto el capital natural como el capital físico o capital manufacturado rinden un ingreso que se define como “la cantidad máxima que una comunidad puede consumir en un periodo dado y continuar en posibilidad de consumir la misma cantidad al final del periodo”. Ello significa que el acervo de capital disponible debe rendir el mismo flujo de ingreso al año siguiente. En otras palabras, el acervo de capital debe permanecer constante (Hicks, 1946; Daly, 1994). La importancia de proporcionar a los creadores de políticas las estimaciones de valor y los beneficios de los ecosistemas es apremiante, ya que esta acción permitirá revertir las tendencias de cambio por factores de presión que afectan a los ecosistemas y sus servicios, por medio de mejores y nuevas políticas públicas transversales, para hacer efectivas la conservación y restauración del capital natural y su uso sustentable.

### **METODOLOGÍA**

En las últimas dos décadas se han realizado numerosas investigaciones que han tenido efectos positivos en el manejo sustentable y la conservación de los recursos naturales renovables (TEEB, MEA, CDB, entre otras). El reto actual consiste en fortalecer y fomentar esta investigación que genera conocimiento en temas estratégicos para la conservación del capital natural y el uso sustentable de los ecosistemas y sus servicios ambientales. Un modelo que represente la restricción ecológica del crecimiento económico debe reconocer cuatro aspectos básicos del funcionamiento de los ecosistemas y sus servicios:

La degradación ambiental como resultado de la creciente complejidad del sistema económico

La degradación de los ecosistemas y sus servicios presentan nuevas oportunidades para la acción humana

La complejidad institucional en que opera el sistema ecológico económico.

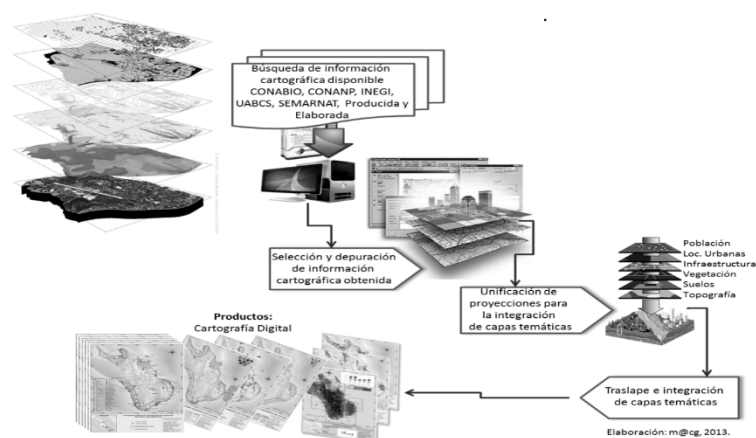

La arena política del sistema económico ecológico.

Por lo que el sistema contiene al menos cuatro elementos a modelizar: la economía, la ecología, la política, y el medio sociocultural. El modelo debe permitir generar los análisis de los impactos que genera el sistema económico y sus mecanismos de transmisión al resto del los sistemas. Para la implementación y definición de este modelo en el caso de ecosistemas costeros y sus servicios nos concentramos en el estudio, análisis y valoración de los servicios culturales utilizados por el turismo en los ecosistemas marinos y costeros, los cuales abarcan aspectos tangibles (pesca, observación de especies) e intangibles (seguridad, belleza, espiritualidad, recreación cultural y social para las poblaciones); también incluye el conocimiento, las percepciones y los sistemas de clasificación de su entorno natural (Balvanera y Prabhu 2004; De Groot *et al.* 2005).

Modelar los flujos y los ecosistemas utilizando distintas metodologías (económicas, ecológicas o ambas) se hace necesario para promover la conservación y la restauración de los mismos. A manera de representar un modelo, se realiza el análisis en Baja California Sur, el cual interacciona las dos disciplinas con la finalidad de representar como se realizan las presiones de los ecosistemas a causa de actividades como el turismo. Para la implementación y definición de este modelo nos apegaremos al estudio de la zona costera de Baja California Sur, cuyo análisis para la identificación de los servicios culturales utilizados por el turismo en los ecosistemas marinos y costeros, abarcan aspectos tangibles (pesca, observación de especies) e intangibles (seguridad, belleza, espiritualidad, recreación cultural y social para las poblaciones); también abarcan el conocimiento, las percepciones y los sistemas de clasificación de su entorno natural (Balvanera y Prabhu 2004; De Groot *et al.* 2005).

En el caso particular de los ecosistemas culturales utilizados por el turismo en Baja California Sur, es clave considerar las variables más representativas como uso de suelo, establecimiento de infraestructura turística en ecosistemas frágiles, adaptación de especies de flora y fauna, efectos en el bienestar de la población vulnerable y capacidad de restauración de los ecosistemas. Para llevar a cabo el estudio y obtener el modelo que represente los cambios en el uso de suelo y principales ecosistemas utilizados, se utilizaron herramientas de información cartográfica (SIG) y se integraron distintas variables: población, infraestructura, vegetación y tipos de suelos, que permitieron reflejar en la modelación del cambio de uso de suelo los efectos que estas tienen (Figura 1).

Figura 1: Metodología Propuesta Para la Identificación de Cambios en los Ecosistemas

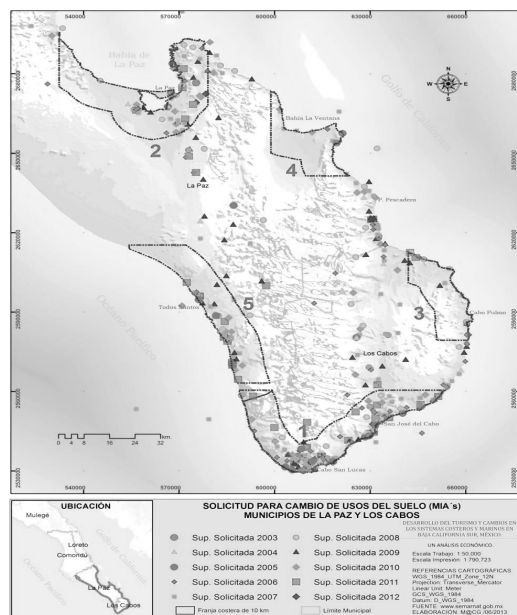

La figura 1, muestra el proceso metodológico que se llevó a cabo para desarrollar el presente estudio, el cual incluye variables representativas y herramientas de georeferenciación. Fuente: Proyecto Desarrollo del Turismo y cambios en los Ecosistemas Costeros y Marinos en Baja California Sur. Un análisis económico.

## RESULTADOS

Para Baja California Sur, se proyectan cinco áreas principales para el desarrollo de infraestructura turística ya que cuenta con ecosistemas que permiten que dicha actividad se desarrolle, sin embargo como muestra la Figura 2, a partir de los últimos años se han solicitado cambios de uso de suelo (CUS), la mayoría de estos, han sido promovidos por la iniciativa privada con la finalidad de explotar los recursos, construir infraestructura para promover el turismo y aprovechar los flujos de los ecosistemas para generar riquezas. Los datos arrojados por el modelo demuestran claramente las áreas con mayor solicitud para CUS, los cuales indican que la franja costera es la que tiene mayor demanda por los flujos de los ecosistemas que ofrecen entre los que se destacan paisaje, recreación, actividades en el área marina que brindan los ecosistemas (playa, pesca, surf, veleo, dunas).

Para identificar los CUS se analizaron distintas solicitudes de CUS que fueron realizadas durante distintos años (2003-2012) mediante las manifestaciones de impacto ambiental (MIA's) obtenidas a través de la Secretaría de Medio Ambiente y los Recursos Naturales (SEMARNAT). Donde resaltan los años 2006 con una autorización para CUS de 75,155.257 Ha. Y el año 2007 con 22,756.670 Ha. CUS autorizados para modificación, instalación y transformación del suelo con diversos fines.

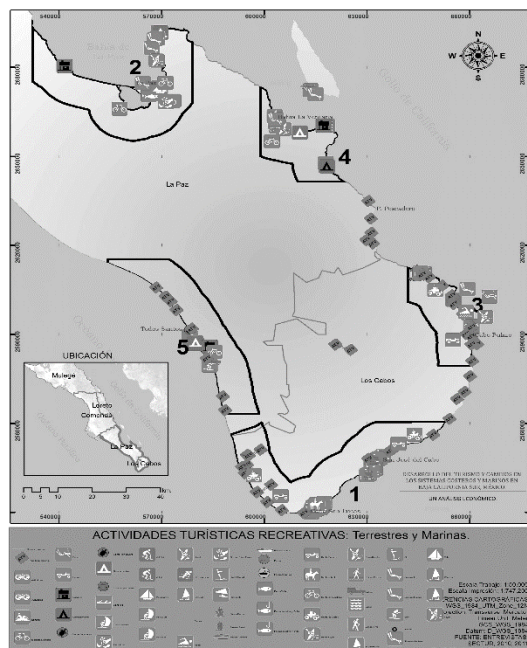

Figura 2: Solicitud Para Cambio de Uso de Suelo

La figura 2, muestra demuestran mediante el modelo representado de manera clara las áreas con mayor solicitud para CUS, los cuales indican que la franja costera Fuente: Proyecto Desarrollo del Turismo y cambios en los Ecosistemas Costeros y Marinos en Baja California Sur. Un análisis económico.

Para analizar los ecosistemas culturales en la costa (10 km de la playa hacia el mar y 10 km hacia el área costera-orilla de playa), donde se están llevando a cabo los CUS, para satisfacer las necesidades turísticas, se identificaron las principales actividades recreativas, así como también el área donde se realizan, (Figura 3), las actividades se realizan en la franja costera, y entre las principales se encuentran: buceo, ski, snorkel, buceo, hiking, campamentos, entre otros importantes.

Figura 3: Actividades Turísticas Realizadas en la Zona Costera de Baja California Sur

La figura 4, muestra las principales actividades realizadas por el turismo, así como también representa el área donde estas se llevan a cabo, saturando la franja costera y ejerciendo presión que pone en peligro el flujo de los ecosistemas para el bienestar humano. Fuente: Proyecto Desarrollo del Turismo y cambios en los Ecosistemas Costeros y Marinos en Baja California Sur. Un análisis económico

## CONCLUSIONES

Las modificaciones en el uso de suelo de las zona costera afecta la capacidad de los ecosistemas para proveer servicios ecosistémicos. Destacan los servicios de los ecosistemas marinos y costeros localizados en Baja California Sur, los cuales han resultado especialmente sensibles al cambio ocasionados por la presión humana sobre el uso de la zona costera. La gestión apropiada de los sistemas costeros ha sido un reto permanente debido a su propia complejidad que conecta mar y tierra. Estas dificultades de gestión se agudizan por el crecimiento comercial, urbano y turístico de la franja costera.

Las perspectivas de utilizar los ecosistemas marinos y costeros del Golfo de California basándose en los servicios de recreación para el desarrollo económico son muy amplias ya que Golfo registra importantes sitios con atractivos turísticos derivados de su condición de riqueza biológica y composición de especies así como la presencia de áreas importantes de reproducción de aves marinas migratorias y mamíferos marinos. Por ejemplo, las Islas del Golfo, es posible desarrollar muchas de las actividades de turismo de naturaleza porque registran atributos que le dan una belleza paisajística única que posibilitan su utilización como servicios de recreación.

Percibir el valor de los servicios ambientales y buscar soluciones para integrarlos en la toma de decisiones mediante modelos económico-ecológicos y las políticas es una necesidad latente. Hay una amplia gama de herramientas para tener en cuenta los valores de la naturaleza, las cuales pueden incluir la regulación y planificación del uso del suelo, los cambios en las subvenciones y los incentivos fiscales, las tarifas de acceso y uso, los pagos por servicios de los ecosistemas, el fomento de la biodiversidad en la reducción de la pobreza, las estrategias de adaptación/mitigación, la creación y el fortalecimiento de los derechos de propiedad y de responsabilidad civil. La elección de las herramientas dependerá del contexto y habrá de tener en cuenta los costos de implementación

## **CONECTIVIDAD ENTRE SERVICIOS ECOSISTEMICOS Y TURISMO, IMPACTO DEL DESARROLLO EN BAJA CALIFORNIA SUR.**

Claudia Lorena Lauterio Martínez, Universidad Autónoma de Baja California Sur  
José Isabel Urciaga García, Universidad Autónoma de Baja California Sur

### **RESUMEN**

*Los impactos del turismo son resultado de proceso complejos de interacción entre turistas, comunidades y ecosistemas y sus servicios ecosistémicos (SE) presentes en un destino determinado. La recreación y el turismo son componentes importantes de muchas economías nacionales y locales, que contribuyen de manera importante a la calidad de vida, sentido de pertenencia, identificación y conexión social, bienestar físico y otros beneficios intangibles. En ese sentido, Baja California Sur (BCS) es un destino turístico emblemático a nivel nacional e internacional debido a los ecosistemas naturales y sus servicios que provee para recreación y turismo. El objetivo del presente trabajo, es destacar algunas áreas de importancia turística en BCS, las cuales atraen un número considerable de turistas por lo que se ha establecido infraestructura, servicios, resorts, entre otras amenidades para cubrir la demanda turística, por ello analizar y determinar el valor de las distintas áreas, así como destacar los SE presentes en cada una de ellas (Cabo San Lucas- San José del Cabo, La Paz, Cabo Pulmo, Todos Santos y El Sargento- La Ventana) e identificar los ecosistemas y sus servicios así como los usos turísticos responsables de cada servicios es un aspecto clave para determinar y proponer políticas que permitan la conservación y el desarrollo económico que beneficie a los usuarios y las comunidades, en ese sentido se describe y propone un modelo donde se analiza la interacción de los ecosistemas y los usuarios del turismo.*

## **CONNECTIVITY BETWEEN ECOSYSTEM SERVICES AND TOURISM, IMPACT OF DEVELOPMENT IN BAJA CALIFORNIA SUR.**

### **ABSTRACT**

*Tourism impacts are the result of complex processes of interaction between tourists , communities , ecosystems and ecosystem services (SE ) present in a given destination. Recreation and tourism are important components of many national and local economies , contributing significantly to the quality of life , sense of belonging , identification and social connection , physical well being and other intangible benefits. In that sense, Baja California Sur (BCS ) is an emblematic tourist destination nationally and internationally due to natural ecosystems and their services provided for recreation and tourism. The objective of this paper is to highlight some areas of tourist importance in BCS , which attracts a considerable number of tourists that is why the development of infrastructure, services, resorts , among other amenities to meet the tourist demand has been established, thereby analyzing and determining the value of the different areas, as well as highlighting the SE present in each ( Cabo San Lucas , San Jose del Cabo , La Paz, Cabo Pulmo , Todos Santos and Sergeant - Window ) and identify the ecosystems, their services and responsible tourism uses for each service is key to identify and propose policies for the conservation and economic development that benefits users and communities in this sense describes and proposes a model where the interaction between ecosystems and tourism users is analyzed.*

## INTRODUCCIÓN

La idea central de que la naturaleza brinda bienes y servicios de forma gratuita y que éstos son utilizados por los seres humanos para el desarrollo de sus actividades cotidianas, productivas, de recreación o de esparcimiento, proviene de la época de Platón (Mooney y Ehrlich, 1987). El concepto de servicio ecosistémico surge a finales de los años 60 como una forma de dar a conocer y relevar ante la sociedad y quienes toman las decisiones, el vínculo directo que existe entre el bienestar humano y el mantenimiento de las funciones básicas del planeta (Balvanera y Cottler, 2007).

Los servicios ecosistémicos se han abordado tanto desde el punto de vista de la ecología como de la economía y la política, existiendo una amplia variedad de métodos para su estudio. Con el concepto de servicio ecosistémico, y sus muchas definiciones, se dio un nuevo nombre a una antigua idea que como ahora, ha sido motivo de interés y preocupación creciente por la disminución en la capacidad que se percibe de la naturaleza para brindar estos beneficios a una población cada vez mayor (Brauman *et al*, 2007). Un ecosistema esta compuesto de factores bióticos y abióticos que interactúan a través de flujos, como energía y nutrientes, gracias a dicha interacción que origina el funcionamiento de los ecosistemas y los diversos procesos que en ellos ocurren, se derivan ciertas funciones ecosistémicas las cuales pueden transformarse en bienes y servicios ecosistémicos al momento de ser utilizadas o valoradas por el hombre (Urciaga, 2014; De Groot *et al*, 2002).

Varias clasificaciones para los servicios ecosistémicos han surgido a través de su estudio, autores como Daily (1997), Constanza (1997), De Groot *et al* (2002), la Evaluación de los Ecosistemas del Milenio (MEA, 2005), destacan la importancia y la relación que existe entre los servicios de los ecosistemas y el bienestar humano, enfatizando que un servicio ecosistémico depende de la estructura y de los procesos que componen un ecosistema en particular (Balvanera y Cotler, 2007). Al respecto FAO (2009) señala que un servicio ecosistémico es suministrado por una unidad proveedora (ecosistema) y la calidad de este servicio depende del estado de conservación de estas unidades, concluyendo que el concepto de servicio ecosistémico resulta esencialmente antropocéntrico ya que es la presencia de los seres humanos como agentes de valoración los que permiten que los procesos y estructuras ecológicas básicas se transformen en entidades de valor (De Groot *et al*, 2002).

Se utilizará la clasificación propuesta por MEA (2005) en el desarrollo del presente artículo, la cual define los servicios ecosistémicos como aquellos beneficios que los seres humanos obtienen de funciones del ecosistema, y los clasifica en las siguientes categorías: a) de provisión, tal como la producción de materias primas, de agua y combustibles, utilizadas directamente por los seres humanos; b) de regulación, c) de soporte, relacionado con procesos que afectan el clima, los ciclos hidrológicos, ciclos biogeoquímicos, la formación de suelos; y d) de servicios culturales, referido a beneficios educativos, científicos, estéticos y artísticos (MEA, 2005) (Tabla1).

Estará centrado este documento en el objetivo de destacar la conectividad entre los servicios ecosistémicos culturales y la relación que existe con el turismo presente en las zonas costeras de Baja California Sur, la importancia que tiene el mantenimiento y conservación de los ecosistemas y los impactos que causa el mal manejo de los recursos naturales. El presente artículo esta estructurado en cinco secciones, donde la primera sección introductoria describe que son los servicios ecosistémicos, sus principales estudios a nivel internacional y su interacción entre los recursos naturales y el bienestar humano. La segunda sección describe la importancia de valorar los servicios otorgados por los ecosistemas con la finalidad de integrarlos a la política pública y destacar sus beneficios para el bienestar humano. La sección tres, orientada a la estructuración de la metodología de valuación del capital natural y describe el área de estudio donde se

aplicó esta.

La sección cuarta, correspondiente a los resultados que muestra un modelo cartográfico que representa los valores en la zona estudiada (1) malo, (2) regular y (3) malo respectivamente, demostrando también las regiones donde hay mayor densidad de actividades turísticas y los efectos en el cambio de uso de suelo que ello a provocado. La quinta y última sección concluye que Baja California Sur debe captar el valor de la biodiversidad y los ecosistemas, usando mercados, precios e incentivos para influir en la estructuración de políticas para la preservación de los ecosistemas.

Tabla 1: Servicios Ecosistémicos y sus Vínculos con el Bienestar Humano

Tipo De Servicio	Definición	Servicios
Servicios de Provisión	Servicios más fácilmente reconocibles son los de provisión. Se trata de bienes tangibles, también llamados recursos naturales o bienes.	Alimentos
		Leña
		Fibras
		Bioquímicos
Servicios de Regulación	Servicios que regulan el clima, las inundaciones, enfermedades, desperdicios y la calidad del agua, menos fáciles de reconocer	Recursos genéticos
		Regulación del clima
		Regulación de enfermedades
		Regulación y purificación del agua
Servicios culturales	Servicios que disponen beneficios recreativos, estéticos y espirituales para el bienestar humano. Pueden ser materiales o no materiales, tangibles o intangibles.	Espirituales y religiosos
		Recreación y ecoturismo
		Turismo
		Estéticos
Servicios de Sustento	Servicios que mantienen un proceso ecológico esencial y sistemas de apoyo a la vida; son los procesos ecológicos básicos que aseguran el funcionamiento adecuado de los ecosistemas y el flujo de servicios de provisión, de regulación y culturales.	De inspiración
		Educacionales
		Formación del suelo
		Ciclos de los nutrientes
		Producción primaria: que es la conversión de energía lumínica en tejido vegetal
		Provisión de hábitats
		Mantenimiento de la biodiversidad.

*Esta tabla muestra los tipos de servicios ecosistémicos, la definición correspondiente y los productos para el bienestar humano. Fuente: Adaptado la Evaluación de los Ecosistemas del Milenio y dentro de los cuales se resaltan los servicios culturales por la importancia económica que generan (2005)*

## REVISIÓN DE LITERATURA

En los últimos años, y especialmente desde la Evaluación de Ecosistemas del Milenio (MEA, 2005), el término servicios de los ecosistemas se ha considerado el concepto clave para construir una nueva ciencia capaz de relacionar la interacción entre naturaleza y sociedad, así como también la dependencia de la sociedad en el funcionamiento de los ecosistemas y su biodiversidad (Díaz *et al*, 2006) El concepto de servicios ecosistémicos teóricamente debe incorporar los aspectos ecológicos, culturales y socioeconómicos de los ecosistemas en las políticas actuales de conservación (Daily *et al*, 2009); sin embargo, el concepto aún presenta limitaciones en su aplicación sobre la política de toma de decisiones (de Groot *et al*, 2010 ). Estos servicios se mencionan a menudo pero rara vez son totalmente integrados en las evaluaciones siguiendo el marco propuesto por el MEA (2005), ya que se caracterizan con frecuencia por ser intangibles y difíciles de cuantificar en términos biofísicos o monetarios. Es por ello que los estudios de valoración e identificación de los servicios de los ecosistemas se hacen necesarios, ya que permiten estimar el valor de las características o atributos particulares detrás de una demanda de servicios de los ecosistemas (por ejemplo, la importancia de los paisajes, tradiciones o actividades recreativas del turismo), y además brindan la oportunidad de explorar soluciones de compromiso entre los atributos, indicadores y

calidad de los ecosistemas de cada región (Bateman *et al*, 2002).

Algunas técnicas de valoración económica como los métodos de costo de viaje, precios hedónicos, valoración contingente, los experimentos de elección, entre otros pueden ser utilizados para estimar los valores de los servicios culturales de los ecosistemas no comerciales que los mismos proveen a los seres humanos (Hanley y Barbier 2009). Cabe destacar que los ecosistemas tienen valores intrínsecos que no se pueden capturar en cantidades monetarias, sin embargo, la identificación y asignación de valor al flujo de servicios de los ecosistemas es una medida eficiente que permite cuantificar los valores de los mismos en unidades monetarias, lo cual es útil para que los tomadores de decisiones integren políticas de conservación que cuantifiquen cuales serían las pérdidas monetarias de la sobre explotación y mal manejo de los ecosistemas (Nunes y van den Bergh 2001).

Además el análisis que muestre los efectos causados por la pérdida y disminución de los flujos de los ecosistemas en el bienestar humano, mediante la modelación de factores que evalúen los costos y beneficios asociados con el uso de los ecosistemas son necesarios ya que dichos modelos tienen como objetivo vincular e integrar el análisis físico y económico, incorporando los valores ambientales no comerciales y de mercado. Los desafíos que implica la integración del análisis biofísico y económico, sigue siendo un reto para la sociedad, sin embargo el desarrollo y aplicación de modelos, cuantificación de servicios de los ecosistémicos y el establecimiento de políticas para la preservación de los mismos es un paso clave para el bienestar humano y la conservación de los ecosistemas (Nunes y van den Bergh 2001).

## METODOLOGÍA

### Área de Estudio

Baja California Sur (BCS) es un estado costero ubicado al noroeste de México, es un destino turístico emblemático a nivel nacional e internacional debido a los ecosistemas naturales y los servicios culturales que estos proveen, dentro de los que destacan la belleza escénica y recreación, dos de los servicios ecosistémicos más apreciados por los turistas. Servicios que fungen como promotores de cambio directo sobre el uso de suelo, degradación ambiental, sobre explotación de ecosistemas, eliminación de hábitats y agotamiento de recursos ambientales, los cuales se encuentran en una situación de creciente vulnerabilidad por externalidades derivadas de políticas públicas promovidas desde otros sectores (turístico y productivo) que no consideran los costos asociados a los impactos que generan ni las repercusiones en el bienestar social de la población en el mediano y largo plazos.

### Material y Métodos

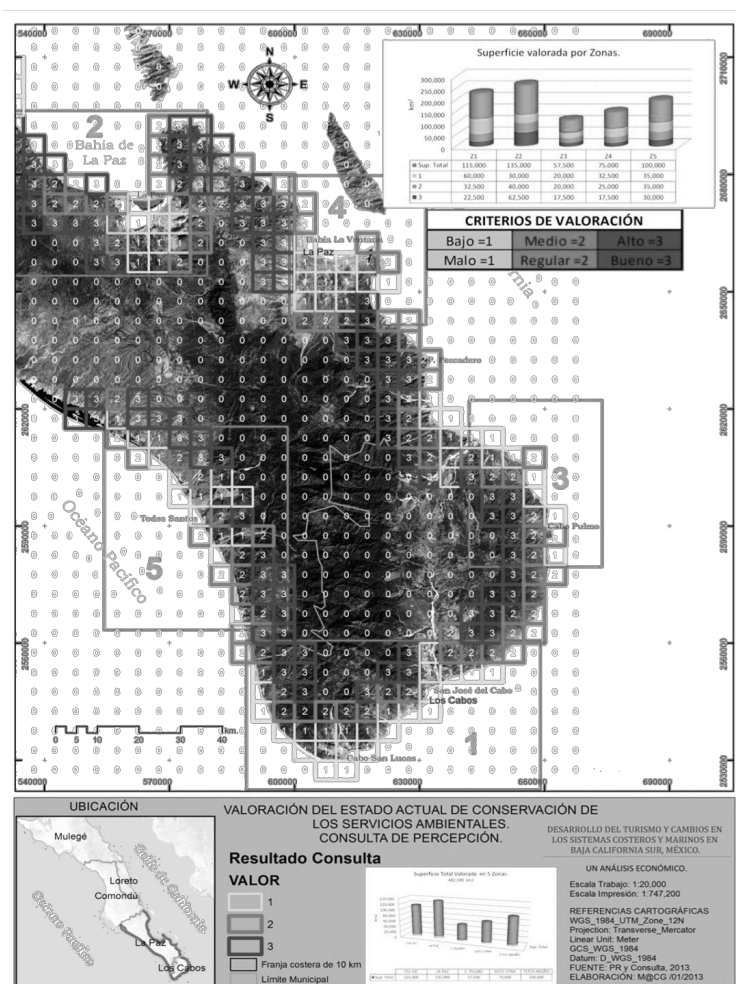

Para el desarrollo del estudio se seleccionaron cinco áreas ubicadas dentro del estado de BCS, las cuales destacan a nivel internacional por los ecosistemas únicos que en esta región se encuentran y por lo cual es posible realizar actividades turísticas exclusivas de dichos ecosistemas marinos y costeros. Estas zonas fueron: (1) Cabo San Lucas-San José del Cabo, (2) La Paz, (3) Cabo Pulmo, (4) Todos Santos y (5) El Sargento-La Ventana. Delimitándose el estudio a la franja costera de 10 km, de las cinco zonas ya mencionadas. Se aplicó la metodología de la valoración al potencial natural, la cual propone realizar el diagnóstico del potencial natural y para ello, la construcción de dicho indicador partirá de la valoración del capital natural existente en cada municipio, en términos de disponibilidad. Los ecosistemas evaluados fueron matorral, dunas y playas, ya que en estos hay una gran variedad de flora, fauna e interacciones de los ecosistemas, que permiten que en las zonas costeras se desarrollen actividades asociadas a la recreación, ecoturismo y educacionales. Para identificar los atributos relevantes e identificar la conexión entre los servicios de los ecosistemas y el turismo entrevistas semi-estructuradas se llevaron a cabo con actores claves de la zonas, incluyendo a los residentes, turistas, gestores e investigadores, en el período de marzo-abril de

2013, el objetivo principal de estas reuniones fue valorar e identificar los factores más importantes del cambio detectado. En la consulta de se utilizó una malla reticular con cuadrantes de 5 km x 5 km, en la cual le fue asignado un valor, utilizando los valores (1) malo, (2) regular y (3) malo. De manera sistemática se incluyeron también herramientas para el análisis de geomática (SIG) y las técnicas de percepción remota (PR), lo que permitió determinar, cuantificar, analizar los principales ecosistemas presentes en la franja costera delimitada.

## RESULTADOS

Los ecosistemas costeros en Baja California Sur son los más preciados, principalmente el terciario, debido a sus atributos naturales y paisajísticos. Siendo los ecosistemas terrestres los que están bajo una fuerte presión, principalmente por el desarrollo inmobiliario, infraestructura, crecimiento de la mancha urbana y vías de comunicación. La presión ejercida sobre estos ecosistemas, ha afectado los servicios que los mismos proveen, debido a los conflictos e intereses de cada sector. Entre los principales atributos naturales presentes de estos ecosistemas, destacan su alta productividad y su gran diversidad biológica, así como su variedad de especies de flora y fauna. Se obtuvo una superficie total valorada para las 5 zonas de 482,500 km<sup>2</sup>, correspondiendo para la Zona de La Paz la de mayor superficie con 135,000 km<sup>2</sup> (28%), seguida de Cabo San Lucas y San José del Cabo con 115,000 km<sup>2</sup>, (24%); Todos Santos 100,000 km<sup>2</sup>, (21%); El Sargento-La Ventana con 75,000 km<sup>2</sup>, (15%) y Cabo Pulmo con 57,500 km<sup>2</sup>, (12%) respectivamente (Figura 1).

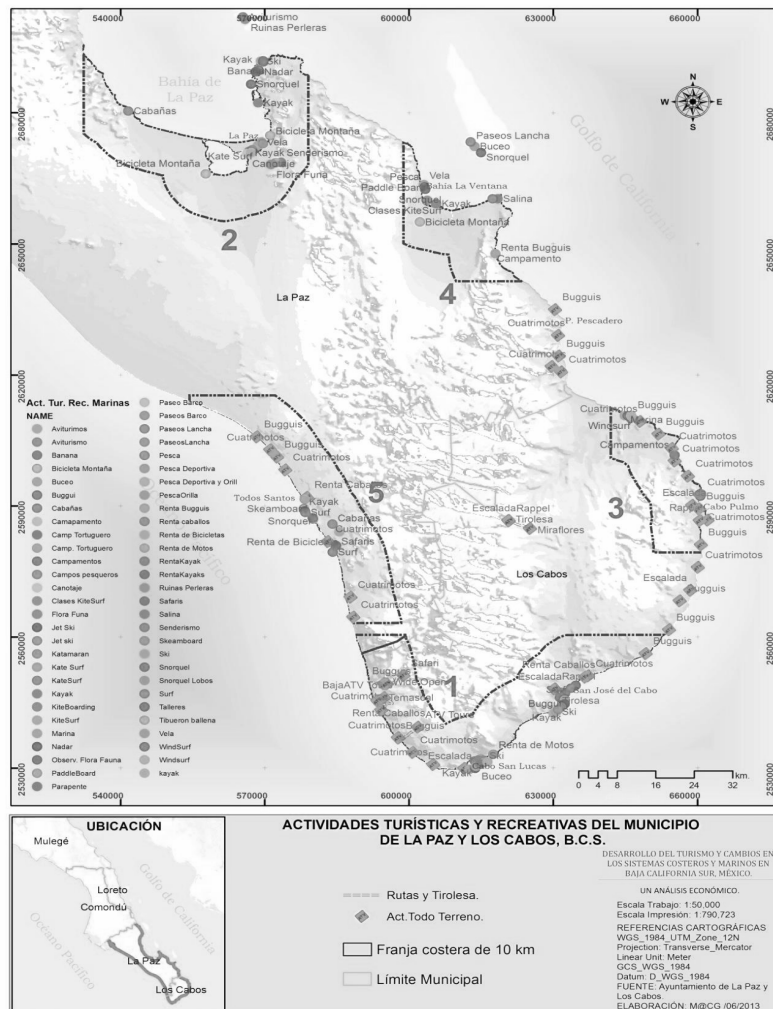

Figura 1: Valoración de las Cinco Zonas de BCS

La Figura 1, muestra la valoración otorgada a las zonas más impactadas de la zona estudiada (1) malo, (2) regular y (3) malo respectivamente, demostrando también las regiones donde hay mayor densidad de actividades turísticas Fuente: Proyecto Desarrollo del Turismo y cambios en los Ecosistemas Costeros y Marinos en Baja California Sur. Un análisis económico.

Se identificaron las principales actividades turísticas y recreativas que brindan en las cinco zonas los servicios ecosistémicos culturales, destacan más de treinta actividades (buceo, pesca, pesca deportiva, campamentos tortugueros, observación de aves, ballenas, flora endémica, entre otras) todas ellas realizadas en áreas y ecosistemas frágiles, donde se ha acrecentado el riesgo de eliminación de hábitats, explotación de recursos, transformación del uso del suelo, ligados directamente con el desarrollo de actividades turísticas no controladas, lo que ha provocado cambios en la estructura de las comunidades bióticas (Figura 2). Estas consecuencias, han afectado en muchos de los casos a los sectores más pobres de las comunidades mencionadas, ya que se reduce el acceso a la provisión de servicios como abastecimiento de agua, restricción de pesca de algunas especies, prohibición de acceso a ciertas regiones, entre otras acciones que implican la marginalización de los sectores más pobres y vulnerables de las zonas analizadas.

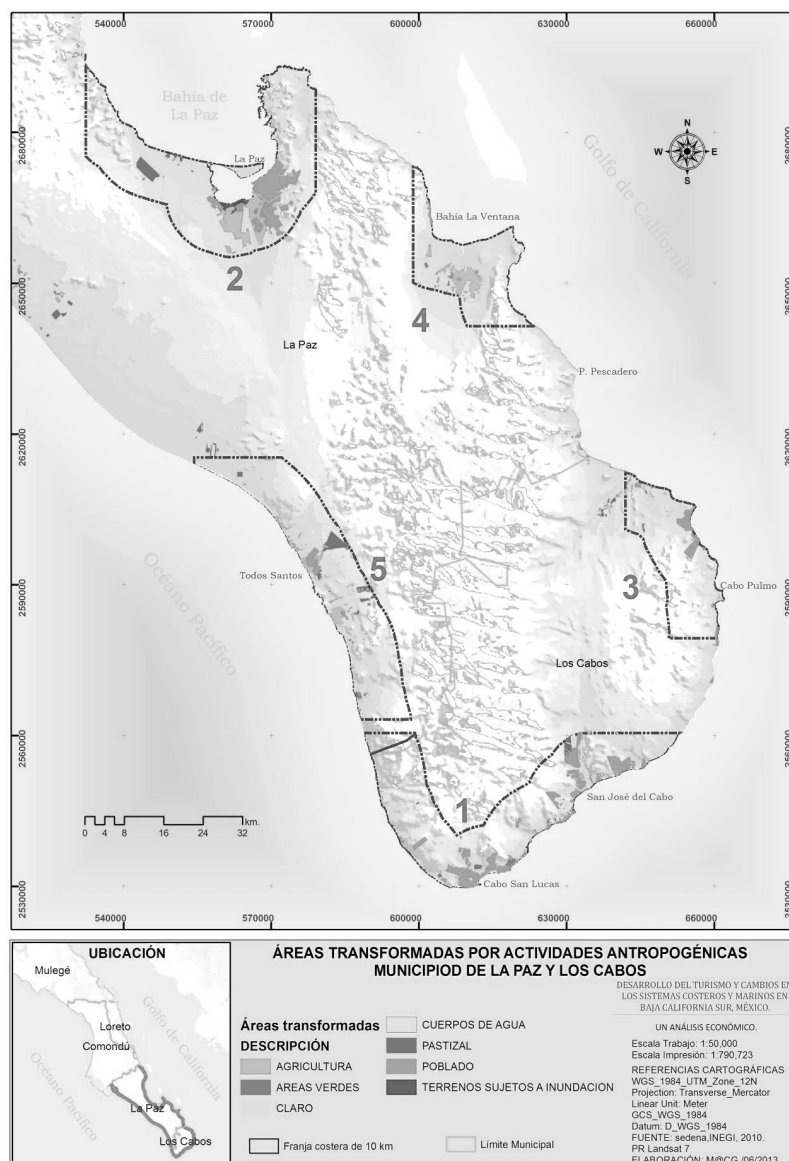

Figura 2: Actividades Turísticas y Recreativas Realizadas en BCS

La Figura 2 Muestra Todas Las Actividades Realizadas En Áreas Y Los Ecosistemas Frágiles, Donde Se Ha Acrecentado El Riesgo De Eliminación De Hábitats, Explotación De Recursos, Transformación Del Uso Del Suelo, Ligados Directamente Con El Desarrollo De Actividades Turísticas Fuente: Proyecto Desarrollo Del Turismo Y Cambios En Los Ecosistemas Costeros Y Marinos En Baja California Sur. Un Análisis Económico

Se identificaron también las áreas con mayor transformación, cuyos efectos los posicionan entre los más amenazados por las actividades antropogénicas, no solo por las actividades locales que han impulsado la pérdida del hábitat sino también por los efectos distantes de la actividad industrial, agrícola y minera. Se observa en la figura 3 que la zona uno correspondiente al municipio de Cabo San Lucas representa la mayor superficie transformada a poblado o áreas urbanizadas con 8,602.442 Has. Para la zona dos que corresponde al municipio La Paz, se observa que la población o áreas urbanizadas ocupa 7014.085 has.

Figura 3: Áreas Transformadas Por la Actividad Antrópica

La figura tres, muestra las áreas con mayor transformación, cuyos efectos los posicionan entre los más amenazados por las actividades antropogénicas, demostrando las áreas más impactada son los municipios de Los Cabos y La Paz. Fuente: Proyecto Desarrollo del Turismo y cambios en los Ecosistemas Costeros y Marinos en Baja California Sur. Un análisis económico

## CONCLUSIONES

Entender el desarrollo de manera integral, con sus dimensiones ambiental, social, cultural y económica, considerando las escalas de tiempo involucradas es un aspecto clave para reconocer el valor del capital natural e integrarlo para la ejecución de políticas que permitan la protección de los flujos de los ecosistemas. Para valorar económicamente los servicios de los ecosistemas es necesario tratarlos como bienes económicos, es decir como mercancías, lo que en cierto modo significa que hay que mercantilizarlos y además, crear mercados hipotéticos para servicios que al día de hoy no tienen mercado. Sin embargo, el mercado es incapaz de suministrar la cantidad óptima de bienes públicos (la biodiversidad lo es), se requiere la intervención pública para garantizar la equidad en el uso y disfrute de los recursos biológicos.

Sin embargo poner precio a la biodiversidad y a los ecosistemas permite valorar (monetizar) aquellos procesos de los mismos que nos proporcionan beneficios, no garantiza la protección y conservación de la biodiversidad “per se” ni a largo ni a corto plazo, sin embargo la información que brindan los indicadores influye en las decisiones. Para el caso de Baja California Sur, captar el valor de la biodiversidad y los ecosistemas, usando mercados, precios e incentivos que influyen en la conducta económica de los consumidores de los ecosistemas y sus servicios es un paso clave para la conservación de los ecosistemas, pero el aspecto más relevante es mantener un nivel de vida óptimo para los usuarios de estos servicios. Las acciones a realizar para alcanzar estos objetivos a nivel local, deben considerar la creación de modelos económicos, territoriales y sociales los cuales generen acciones que solucionen la sobre explotación de los flujos de los ecosistemas, mediante, la implementación nuevos sistemas de desarrollo. Por ejemplo el aumento de impuestos sobre construcciones, instalaciones y obras, con la finalidad de frenar nuevos desarrollos turísticos que degradan las zonas costeras y promover de alguna manera el uso de construcciones o establecimientos que no alteren el medio natural, entre otras acciones que darían pie a la rehabilitación de ecosistemas dañados y la conservación y preservación de otros.

## RECONOCIMIENTO

Los autores desean reconocer y extender su agradecimiento al Consejo Nacional de Ciencia y Tecnología por su apoyo financiero mediante el proyecto de investigación en curso “Desarrollo del Turismo y cambios en los Ecosistemas Costeros y Marinos en Baja California Sur. Un análisis económico”, proyecto del Fondo Sectorial SEP-CONACYT 99636-2008 Ciencia Básica y cuyo responsable técnico es el Dr. José Isabel Urciaga García.

## BIOGRAFÍA

Claudia Lorena Lauterio Martínez, Es estudiante de Doctorado en Ciencias Marinas y Costeras de la Universidad Autónoma de Baja California Sur (UABCS), Maestra en Ciencias Marinas por la UABCS. Sus líneas de investigación son: servicios ecosistémicos marinos y costeros, desarrollo, manejo integrado de la zona costera. Correo-e: clauterio@uabcs.mx.

José I. Urciaga García. Es Doctor en Ciencias Económicas y Empresariales por la Universidad Autónoma de Barcelona. Profesor-investigador adscrito al departamento de Economía de la Universidad Autónoma De Baja California Sur (UABCS). Miembro del Sistema Nacional de Investigadores Nivel II. Se le puede contactar en UABCS, Carretera al Sur, km 5.5. La Paz, Baja California Sur, México. Correo electrónico: jurciaga@uabcs.mx.

# **RELACIÓN ENTRE EL PERFIL PSICOSOCIAL Y SU CORRELACIÓN AL RENDIMIENTO LABORAL EN EMPLEADOS DE EMPRESAS MANUFACTURERAS DE LA INDUSTRIA DE AUTOPARTES EN CD. JUÁREZ CHIHUAHUA MÉXICO**

José Ramón Martínez Núñez, Universidad Autónoma de Cd. Juárez

Ricardo Melgoza Ramos, Universidad Autónoma de Cd. Juárez

## **RESUMEN**

*Actualmente resulta evidente que el trabajo es parte fundamental de la vida de millones de personas en el mundo. La mayoría pasan más horas en sus lugares de trabajo que en sus hogares. Pero desafortunadamente el trabajo es considerado como una obligación o una necesidad para ellas. La mayor de las veces los puestos de trabajo son diseñados exclusivamente en obtener beneficios para la organización y no para el trabajador. Por eso es importante que puestos de trabajo clave estén ocupados por individuos con perfiles psicosociales acorde a sus necesidades y no solo de las empresas. Los estudios del perfil psicosocial en las empresas muestran claramente una tendencia creciente en los últimos años. Sin embargo, no se encontraron estudios que relacionen el perfil psicosocial de los trabajadores de la industria automotriz y cómo éste afecta su rendimiento laboral. El trabajo que aquí se presenta tiene como objetivo determinar la correlación entre el rendimiento laboral y el perfil psicosocial de los trabajadores. Se hace uso de los cuestionarios del Dr. Achenbach que pertenecen al auto reporte y cuestionario del comportamiento de adultos 18 a 59 años. Se emplean las evaluaciones para medir el rendimiento laboral desarrollado por la empresa Delphi Corporation.*

**PALABRAS CLAVES:** Rendimiento Laboral, Trabajadores, Perfil Psicosocial

## **RELATIONSHIP BETWEEN PSYCHOSOCIAL PROFILE AND JOB PERFORMANCE CORRELATION IN EMPLOYEES OF MANUFACTURING COMPANIES OF AUTO PARTS INDUSTRY AT JUAREZ CHIHUAHUA MEXICO**

## **ABSTRACT**

*Currently it is clear that the work is an essential part of the lives of millions of people in the world. Mostly of them spend more hours at their work places than in their homes. But unfortunately the work is considered as an obligation or a need for them. Mostly of the time the jobs are designed exclusively to obtain benefits for the Organization and rarely for the worker. Therefore it is important that key jobs be occupied by individuals with psycho-social profiles according to their needs and not only of the companies. Psychosocial profile studies at companies clearly show an increasing trend in recent years. However, no studies were found that related psychosocial profile of workers in the automotive industry and how this affects their job performance. The work presented here aims to determine the correlation between job performance and psychosocial workers profile. It makes use of Achenbach Ph.D. questionnaires pertaining to the auto report and behavior questionnaire of adults from 18 to 59 years. Assessments are used to measure job performance developed by Delphi Corporation.*

## INTRODUCCIÓN

En la actualidad resulta evidente que el trabajo es una parte fundamental de la vida de millones de personas en todo el mundo. La mayoría de las personas pasan más horas en su lugar laboral que en sus hogares (Gill, 1999). El trabajo, íntimamente relacionado con el capital humano per se, ha transformado la naturaleza y desarrollado la inteligencia de los humanos, su destreza, agilidad física, su entendimiento, socialización y su especie (Engels, 1988). Este capital humano es el valor que representa el conocimiento que posee cada individuo para desempeñar un trabajo. A medida que cada individuo incrementa sus conocimientos el capital humano también se verá incrementado (Naredo, 1987). El capital humano visto desde la perspectiva de la psicología Industrial/ Organizacional es de gran importancia ya que es un factor determinante en el crecimiento económico de las empresas (Pérez & Serrano, 1998). Sobre la base de todo capital humano se encuentran las actitudes, en ellas se ven reflejadas las conductas de las personas. Y debido a que la mayoría de las conductas pueden ser modificables, se adentra pues en un área de la psicología que se ocupa de la conducta del individuo en situaciones laborales (Muchinsky, 2002).

Es el psicólogo polaco-alemán Hugo Münsterberg considerado el padre de esta nueva rama de la psicología. Fue él quien dio origen a un sistema de pruebas para medir de las diferencias psicológicas del capital humano (Sosa, Ponce, & Contreras, 2010). Posteriormente, George Elton Mayo y Fritz Roethlisberger continuaron aportando al campo de la psicología Industrial/Organizacional con estudios sobre la conducta humana en el trabajo. Trabajaron en un experimento conocido como el “Efecto Hawthorne” para comprobar la posibilidad de aumentar el rendimiento de sus trabajadores aumentando o disminuyendo las condiciones de iluminación ambiental (Muchinsky, 2002). Para la segunda mitad del siglo XX se habla de la psicología Industrial /Organizacional como una ciencia con interés básico y aplicado que buscaba comprender y explicar el comportamiento humano en las organizaciones (Ponce, 1999). Es una ciencia con un componente práctico que busca de forma equitativa la resolución de los conflictos en las organizaciones e incrementar el bienestar y la calidad de vida de los trabajadores (Landy & Conte, 2005). Actualmente esta área de la psicología aún y cuando su objetivo principal es aumentar el rendimiento y el bienestar del capital humano (Pérez & Serrano, 1998), se concentra en dos enfoques.

El primero es el enfoque industrial que se refiere a determinar las competencias necesarias para la realización de un trabajo. El segundo es crear una estructura y una cultura de liderazgo que motiva a los empleados a desempeñarse y proporcionarles información para trabajar en condiciones seguras y en un ambiente laboral satisfactorio (Sosa et al., 2010). Con estos dos enfoques, los estudios sobre padecimientos psicosociales del capital humano en las organizaciones muestran claramente una tendencia creciente en los últimos años (Guardia, Però, & Barrios, 2008). Los distintos factores causantes de estos padecimientos psicosociales están íntimamente relacionados tanto con la organización como con la actividad laboral (Meseguer, Soler, García-Izquierdo, Sáez, & Sánchez, 2007). Pero a pesar del interés en esta área, no se encontraron estudios que relacionen el perfil psicosocial de las personas y cómo esta variable afecta su rendimiento laboral. En el estudio que aquí se presenta se pretende conocer si existe alguna correlación entre el rendimiento laboral de los trabajadores y su perfil psicosocial.

La investigación se realiza en la Industria maquiladora que ha representado el motor económico de la frontera norte de México, principalmente en Tijuana y Cd. Juárez en donde este tipo de industria ha evolucionado de diversas maneras. (Carrillo & Hualde, 1996) Señalan que dicha evolución ha ido desde las primeras plantas que solo realizaban ensambles simples con alto contenido de mano de obra hasta las maquiladoras que han escalado procesos productivos con alto nivel tecnológico. Algunas multinacionales

han integrado a sus operaciones en Cd. Juárez la innovación y el desarrollo de productos y procesos. La empresa Delphi estableció en la década de los 90's del siglo XX un centro de desarrollo tecnológico que le ha permitido obtener una ventaja competitiva sustancial haciendo uso del talento de los ingenieros mexicanos (Melgoza, 2012). En Cd. Juárez la Industria maquiladora emplea cerca de 226,305 trabajadores entre obreros, técnicos y profesionistas y solamente la industria de autopartes representa el 29% del total de esta población, lo anterior de acuerdo con los datos que presenta la Asociación de Maquiladoras A.C.(AMAC, 2013), de ahí que se haya decidido realizar el presente trabajo en este tipo de empresas.

### Planteamiento del Problema

Existe una búsqueda constante para incrementar el desempeño laboral de los trabajadores a pesar de su propio bienestar. Desde los inicios del humanismo se ha buscado el efecto que las percepciones, actitudes y emociones del trabajador tienen en el rendimiento laboral. Sin embargo el problema existente es debido a que las estrategias que se han implementado hasta la fecha han observado de forma superficial el perfil psicosocial de los empleados al medir constructos de manera individual como la satisfacción, el liderazgo, etc. Por lo tanto, es importante abordar de forma integral y más profunda éstas características del perfil psicosocial de los trabajadores para determinar los posibles efectos con su rendimiento laboral. Debido a que este rendimiento laboral es multifactorial y puede estar afectado por determinantes que son difíciles de medir en la industria. Es difícil lograr la anuencia de las empresas para obtener indicadores de producción y aceptar estudios que permitan delimitar los problemas psicosociales de sus trabajadores de forma integral. Por lo tanto, en la propuesta que aquí se presenta se pretende determinar la posible correlación del rendimiento laboral con el perfil psicosocial de los trabajadores en empresas dedicadas a la fabricación de partes automotrices dentro de la vocación manufacturera de Cd. Juárez. De tal forma que a pesar de la complejidad de las medidas que aquí se proponen, existe una gran oportunidad para poder recolectar información que permita a las empresas poder seleccionar trabajadores con alto desempeño laboral conociendo previamente su perfil psicosocial.

### Objetivos

#### Objetivo general

Determinar la correlación entre el rendimiento laboral de los trabajadores y su perfil psicosocial en empresas manufactureras de autopartes automotrices de Cd. Juárez Chihuahua México

#### Objetivos específicos

Determinar si existe o no una correlación entre el desempeño laboral de los trabajadores y el perfil psicosocial que los empleados presentan.

Determinar la posible correlación del perfil psicosocial de los trabajadores con el rendimiento laboral por género, grupos de edad, puesto, turno, etc.

### Justificación

Hoy en día el trabajo es una parte fundamental de la vida de millones de individuos en todos los rincones del planeta. Es un factor primordial a la hora de analizar la estructura de la vida de los seres humanos en la edad adulta. Por eso la importancia que en las organizaciones los puestos de trabajo estén ocupados por trabajadores con perfil psicosocial sano acorde a las necesidades propias y no solamente para las Organizaciones. Sin embargo, aún y cuando el factor humano es un factor determinante para el éxito de la mayoría de las organizaciones. Hasta hoy en día no se han abordado las estrategias para observar de manera

profunda el perfil psicosocial que los trabajadores presentan. Por lo tanto es importante conocer si existe alguna relación entre éste y el rendimiento laboral. Respecto a los principales impactos de esta investigación se tiene: El impacto científico. Se ha estudiado poco el efecto del perfil psicosocial de los empleados en su rendimiento laboral, por lo que este estudio permitirá saber si existe o no un efecto. Dependiendo de los resultados, éstos podrían ser usados. El impacto Social. Dependiendo de los resultados: debido a que la mayoría de los problemas psicosociales pueden ser modificables, este estudio permitirá sugerir a los trabajadores posibles comportamientos que quizá ellos no conocen. El impacto Económico. Dependiendo de los resultados: este estudio permitirá que las empresas puedan saber si existe un efecto entre el rendimiento laboral y el perfil psicosocial que presentan sus trabajadores y en caso de que así sea, la empresa podrá decidir si realiza una intervención.

## REVISIÓN DE LITERATURA

Desde los orígenes mismos del ser humano, el trabajo ha sido una necesidad básica (Engels, 1988). Se ha caracterizado por la producción de bienes necesarios para su subsistencia haciendo uso de instrumentos de producción (Gil-Monte & Peiró, 1997) los cuales le han permitido crecer y desarrollarse moldeando su mano y cerebro (Meda & de Michelena, 1998). El trabajo, íntimamente relacionado con el capital humano per se ha transformado la naturaleza y ha desarrollado la inteligencia del propio ser humano, su destreza, agilidad física, entendimiento, su socialización y su especie (Engels, 1988). El capital humano se refiere al valor que representa el conocimiento que posee cada individuo, por lo que a medida que cada individuo incrementa sus conocimientos el capital humano también se verá incrementado (Naredo, 1987). Este capital humano visto desde la perspectiva de la psicología industrial/organizacional, la cual es un área de la psicología que se ocupa de la conducta del individuo en situaciones laborales (Spector, 2002). Y es además un campo legítimo de investigación científica comprometido con el conocimiento sobre las personas en el trabajo (Muchinsky, 2002). En la Figura 1 se muestra la influencia de la psicología industrial en el desempeño de los individuos.

Sin embargo, para Porter desde el punto de vista de la escuela de posicionamiento la esencia del capital humano está íntimamente ligada a la de la estrategia, consiste en la elección de una posición muy específica, cuya plataforma se encuentra en el sistema de actividades especiales que una compañía lleva a cabo (Porter, 1991). Por medio de la innovación y el mejoramiento continuo, resulta posible la integración cruzada por funciones o actividades. De acuerdo con Porter para lograr una ventaja sostenible en una compañía, ésta debe integrar múltiples actividades para crear un posicionamiento único en el cual se involucren mecanismos de compensación en la estructura de interacción competitiva con los rivales (Porter, 2009). Algunos autores como Hatten sugieren la participación de dos elementos esenciales en un modelo de dirección estratégica: una red de funciones y procesos que permitan crear una plataforma para generar alineamiento de recursos, y el ajuste en relación con la identificación de oportunidades que permitiría mejorar el desempeño económico de la empresa, y el desarrollo de capacidades para que se traduzcan en competencias y generen nuevas alineaciones particulares de recursos (Hatten, 1999).

Desde la perspectiva cognitiva, se sugiere que los directores contribuyan a reducir la complejidad e incertidumbre asociada con las decisiones estratégicas, pues poseen experiencia valiosa en la resolución de problemas, aplicada a contextos distintos. Las contribuciones cognitivas de los gerentes a la toma de decisiones mediante el desarrollo de tareas como la búsqueda, la interpretación y la elección desarrollan habilidades individuales para hacerle frente a la incertidumbre y los costos que ésta genera (Maroto, 2007). Aquí el propósito es comprender el conocimiento humano para entender la mente del estratega.

Utiliza el campo de la psicología cognoscitiva para entender la visión estratégica y de cómo se crean las estrategias en la esfera del conocimiento humano. Posee dos principales ramas, la rama subjetiva y la rama positivista (Mintzberg, Ahlstrand, & Lampel, 2005). Por su parte, el psicólogo polaco-alemán Hugo

Münsterberg a principios del siglo XX quien es considerado el padre de la psicología industrial/Organizacional estableció las bases de esta nueva rama de la psicología (Sosa et al., 2010). Fue él quien dio origen a un sistema de pruebas y medidas de las diferencias psicológicas dirigido al capital humano (Brennan, 1999). Proponía el estudio científico de la conducta humana para encontrar patrones generales y explicar diferencias individuales (Robbins & De Cenzo, 2009). Münsterberg recomendaba que se llevaran a cabo pruebas psicológicas para mejorar la selección de empleados así como la teoría del valor del aprendizaje para desarrollar métodos de capacitación (Hurtado, 2008).

George Elton Mayo junto con el científico social y administrador teórico Fritz Roethlisberger continuó aportando al campo de la psicología Industrial/Organizacional con estudios referentes a la conducta humana en el trabajo. Desarrollaron el experimento conocido como el “Efecto Hawthorne” cuya finalidad era comprobar la posibilidad de aumentar la productividad de sus trabajadores aumentando o disminuyendo las condiciones de iluminación ambiental (Muchinsky, 2002). En el experimento quedó manifiesto el efecto emocional/psicosocial de los trabajadores en la producción, el cual es una respuesta inducida por el conocimiento de los participantes de que están siendo estudiados (Pallás & Villa, 2004).

Para la segunda mitad del siglo pasado la psicología Industrial/Organizacional es conformada como una ciencia con interés básico y aplicado que busca comprender y explicar el comportamiento del capital humano en las organizaciones (Ponce, 1999). Su propósito es aumentar la dignidad y el rendimiento de los seres humanos así como de las organizaciones para las que trabajan (Sosa et al., 2010).

Su característica principal se refiere a la amplitud de su campo de estudio, ya que incluye análisis de procesos individuales que son necesarios para la comprensión y explicación del comportamiento humano en el trabajo (Fernández, 2004). Por tanto lo apunta no sólo a la psicología social si no que incluye también a otras ramas más básicas de la psicología, como es la psicología de las diferencias individuales (Muchinsky, 2002). Hoy en día la psicología Industrial/organizacional aún y cuando su objetivo principal es aumentar el rendimiento y el bienestar del capital humano (Pérez & Serrano, 1998), se concentra en dos enfoques. El primero, es el enfoque industrial que se dirige a determinar las competencias necesarias y el perfil psicosocial de los trabajadores para la realización de un trabajo (Sosa et al., 2010). El segundo, crea una estructura y una cultura que motive a los empleados a desempeñarse y les proporcionarles información para hacer su trabajo en condiciones seguras que resulten en un ambiente laboral satisfactorio (Sosa et al., 2010). En lo que respecta al rendimiento laboral, que se refiere al valor total que una empresa espera que un trabajador realiza en un período de tiempo determinado (Motowidlo, 2003).

En donde dicho valor puede ser alto o bajo, dependiendo de que el trabajador presente un buen o mal rendimiento, supone la contribución que ese trabajador hace a la consecución de la eficacia de su organización (Motowidlo, 2000). Al adentrarse más en el concepto del rendimiento, se puede visualizar que existe una doble perspectiva. La primera es que algunos autores y profesionales consideran el rendimiento en términos de resultados o salidas del trabajador en donde la eficacia de un individuo se refiere a la evaluación de los resultados de su rendimiento (Campbell, McCloy, Oppler, & Saer, 1993).

Desde una perspectiva histórica, la conducta del trabajador ha sido considerada una de las causas de estas salidas, siendo éste uno de los medios para evaluar la eficacia del rendimiento (Waldman, 1994). En las organizaciones se emiten juicios sobre la eficacia de los trabajadores en función de los resultados que alcanzan o las salidas que producen. Por ello, se podría decir que medir el rendimiento es cuantificar lo que el trabajador ha hecho y su evaluación consiste en asignar un juicio del valor o la calidad de esa medida cuantificada del rendimiento (Williams, 2002).

La otra perspectiva es que para otros especialistas lo correcto es considerar el rendimiento como un conjunto de conductas en el entorno laboral, en vez de definirlo como el resultado de las mismas (Spencer & Spencer, 1993). Desde esta perspectiva, los términos productividad, excelencia, eficiencia o eficacia se

refieren a los resultados, mientras que el rendimiento se refiere a los comportamientos que se dirigen a la consecución de dichos resultados (Motowidlo, 2003).

De estas dos perspectivas de la evaluación del rendimiento históricamente parece haber dominado la perspectiva conductual, particularmente en norte América. Lo que ha generado una gran cantidad de investigaciones en las formas conductuales de valorar el rendimiento (Administration, 1952). Pero aún desde este punto de vista conductual, si bien el definir el rendimiento en términos de conductas ayudaría a ver la relación entre conductas y sus resultados, sin excluir a estos últimos. Los modelos conductuales precisan justamente que los resultados proporcionan el contexto del rendimiento, aclarando a los trabajadores hacia dónde debe dirigirse su conducta (Morf, 1986).

De la misma manera, el quedarse en el extremo contrario, centrándose única y exclusivamente en el resultado tampoco es eficaz. Por ello, al gestionar el rendimiento es necesario tanto los resultados como las conductas, y ésta es precisamente la tendencia actual en las organizaciones a la hora de evaluar el rendimiento de sus trabajadores (Kirkman, Lowe, & Young, 1999). Siguiendo con la perspectiva conductual, otra vía de acercamiento al rendimiento laboral se hace desde el modelo de competencias. En este modelo, cualquier característica individual puede medirse o calcularse de forma fiable y puede servir para marcar la diferencia entre los trabajadores buenos y los que no lo son (Spencer & Spencer, 2008). Las competencias se expresan en forma de definición narrativa a la que acompañan algunos indicadores de conductas o formas conductuales específicas de demostrar la competencia en el trabajo (Spencer & Spencer, 1993). Las competencias son un factor que determina o causa el rendimiento, pero no son el rendimiento en sí. En la actualidad muchas empresas en los Estados Unidos, Europa y América Latina han incorporado la gestión de recursos humanos basada en competencias laborales como una herramienta para mejorar la productividad y mantener un clima positivo en las relaciones con sus colaboradores (Spencer & Spencer, 2008). La justificación de estos esfuerzos se encuentra en el intento de mejorar los niveles de productividad y competitividad mediante la movilización del conocimiento y de la capacidad de aprender de la organización. Se hace evidente así, la tendencia de revalorización del aporte humano a la competitividad organizacional (Morf, 1986).

Los enfoques de competencias que se encuentran en la actualidad aparecieron en los primeros estudios de *McBer*, las cuales tienen un determinado número de niveles que reflejan conductas observables y no juicios de valor (Hay/McBer, 2000). Estas competencias de *McBer* se refieren a competencias comunes que son las que todos necesitan para hacer el trabajo con un estándar mínimo aceptable y no diferencian a los trabajadores. Pero también se refiere a competencias diferenciadoras que sí distinguen entre los trabajadores promedio y los que son buenos (Williams & Morand, 2008). Esta definición de *McBer* incluye en su concepción de competencia la idea de causalidad, y hacen referencia a características subyacentes de la persona así como a conductas (Hay/McBer, 2000). El concentrarse demasiado en las salidas o resultados se corre el peligro de dar por hecho los medios por los que se obtienen los resultados. Pero centrarse excesivamente en las conductas puede llevar a olvidar la importancia de lo que el trabajador es (Waldman, 1994). Por ello, es mejor adoptar una perspectiva más amplia de las competencias que reconozca la importancia para el rendimiento de determinados aspectos del individuo, como es su personalidad independientemente de que el rendimiento se defina como conducta o como resultado (Furnham, 2008). Desde esa perspectiva, aunque una competencia se defina como el impulso de obtener unos resultados mediante sus manifestaciones conductuales. Tales conductas son reflejo de una combinación de características personales que podrían fácilmente ser olvidadas si se centran en las conductas exclusivamente (Williams & Morand, 2008).

De manera práctica, se suele definir el rendimiento laboral como una función de la capacidad y la motivación del trabajador (Moorhead & Griffin, 1998). En este sentido, si la motivación es el estado psicológico de activación hacia el trabajo, su resultado conductual es el rendimiento (Williams, 2002).

Sin embargo, no se deben perder de vista las consecuencias y los resultados en el trabajo ya que éstas no están bajo el control total y exclusivo del empleado, sino que pueden existir muchas otras causas de un mal rendimiento que no dependen del trabajador en sí. En el estudio que se presenta, no está exento de esta acción multifactorial, ya que es un hecho que se da también dentro del marco de empresas que ensamblan productos para organizaciones que se encuentran dentro de la cadena de valor de la industria automotriz. Siendo ésta una industria que tiene una participación dinámica en la economía mundial muy grande y el nivel de exigencia en sus procesos es muy alto, lo cual respalda la pertinencia de este estudio, que permitirá a las organizaciones tener más elementos en su proceso de selección y evaluación de trabajadores.

## METODOLOGÍA

Dentro del contexto laboral, surge como pregunta de Investigación si ¿existe una correlación entre el rendimiento laboral y el perfil psicosocial de los empleados en empresas manufactureras de autopartes automotrices?; estableciendo como hipótesis nula que: No existe una correlación entre el rendimiento laboral y el perfil de los trabajadores. En lo referente al tipo de estudio y diseño de investigación se tiene que es un estudio descriptivo de tipo transversal no experimental, cuyo método consiste en la aplicación de los cuestionarios validados del Dr. Achenbach *K005 ASR & L005 ABCL*, los cuales pertenecen al auto reporte del perfil psicosocial de adultos 18 a 59 años y al cuestionario sobre el perfil psicosocial de adultos de 18 a 59 años. Estos cuestionarios contienen un conjunto de 167 y 143 reactivos cada uno divididos en 9 y 6 secciones respectivamente.

Las 9 secciones del auto reporte indagan sobre las amistades, el cónyuge o pareja, la familia, el trabajo, la educación, las enfermedades o padecimientos, las inquietudes, las mejores cosas de sí mismo y una lista de frases que describen a las personas. Respecto al cuestionario sobre el perfil psicosocial, éste únicamente contempla 6 secciones que indagan a las amistades, el cónyuge o pareja, las enfermedades o padecimientos, las inquietudes, las mejores cosas de sí mismo y la lista de frases que describen a las personas. En ambos cuestionarios en la parte de la lista de frases que describen a las personas se tiene una escala del 0 al 2, en donde 0 significa que no es verdad, el 1 significa en cierta manera o algunas veces y el 2 significa cierto o muy a menudo. La aplicación de los cuestionarios se llevará a cabo a una muestra del personal de la empresa maquiladora Delphi Corporation de Cd. Juárez Chihuahua que cuenta con un total aproximado de 13000 empleados, para posteriormente proceder a la captura de los resultados y su posterior análisis. Dicha muestra será tomada en base a la fórmula para estimación de muestras con población finita y muestreo sin reemplazo (Anderson & Sweeney, 2008):

$$n = \frac{Z^2 \sigma^2 N}{\varepsilon^2 (N-1) + Z^2 \sigma^2} \quad (1)$$

Donde:

n = el tamaño de la muestra.

N = tamaño de la población.

$\sigma$  = Desviación estándar de la población.

Z = Valor obtenido mediante niveles de confianza. Es un valor constante que representa un nivel de confianza del 95%.

$\varepsilon$  = Límite aceptable de error muestral.

En el caso de asumir una población aproximada de 13,000 trabajadores con que cuenta la empresa, se tiene que el tamaño de la muestra sería de 374 asumiendo  $N=13000$ ,  $z=1.96$ ,  $\sigma=0.5$  &  $\varepsilon=0.05$ . Dentro del marco de las variables, se tiene como variable dependiente al rendimiento Laboral, y para las variables independientes se tienen: Los grupos de empleados a los que se les realizará el estudio y el tipo de perfil

Psicosocial, género, puesto, antigüedad, turno, permanencia (contratado temporalmente por medio de agencia o contrato permanente sindicalizado). En lo que respecta a la Población de estudio, ésta corresponde a todos los empleados que laboran en la empresa maquiladora Delphi Corporation, ubicada en Ciudad Juárez Chihuahua, México. La muestra serán los empleados que laboran en las líneas de producción de una de las plantas de la división de sistemas térmicos en donde se fabrican productos para los aires acondicionados y sistemas de enfriamiento de los vehículos.

## RESULTADOS

Los resultados de los cuestionarios serán capturados en una hoja de cálculo para posteriormente ser exportados al programa de análisis estadístico SPSS® versión 19. Se empleará estadística descriptiva para obtener frecuencias de variables categóricas por género, puesto, grupo de edad y por turno. Posteriormente haciendo uso de la técnica de análisis de componentes principales se llevará a cabo una reducción de la dimensionalidad de los cuestionarios bajo estudio. Esto con el fin de que una vez que se obtenga una variable de respuesta se podrán correlacionar éstas componentes principales que arroje con la variable dependiente. Así mismo, se compararán estos resultados con los índices de desempeño laboral de los trabajadores en la empresa bajo estudio en donde se podrá verificar si existe una correlación entre el perfil psicosocial y su rendimiento laboral. Sin embargo, a la fecha, aún no se cuenta con resultados para poder emitir un juicio, pero una parte fundamental que se espera obtener con este estudio una vez que se lleve a cabo es precisamente que exista una asociación significativa entre el perfil psicosocial y el rendimiento laboral, sin embargo aún no se puede emitir ningún juicio hasta que la hipótesis sea aceptada o rechazada.

## CONCLUSIONES

Es importante hacer notar el hecho de que se ha estudiado poco el efecto del perfil psicosocial de los empleados y su rendimiento laboral, por lo que este estudio permitirá saber si existe o no un efecto. Dependiendo de los resultados, éstos podrían ser usados en beneficio tanto de la empresa como del trabajador mismo, esto debido principalmente a que la mayoría de los problemas psicosociales pueden ser modificables. Respecto a las teorías en las que se fundamenta este estudio, se pueden mencionar tanto las diez escuelas de Mintzberg así como la Teoría Demanda-Control, formulada por Robert Karazek en el año de 1979. Este modelo en particular, se basa en las características psicosociales del ambiente laboral; las demandas psicológicas que éste plantea y una combinación de control sobre las tareas y uso de las capacidades. Este modelo también predice el nivel de riesgo de enfermedad con relación al estrés y las correlaciones del comportamiento activo-pasivo de los puestos laborales. Sin embargo, un modelo no menos importante es el modelo Interactivo de la etiología de conflictos interpersonales en el trabajo, en el que se avala que una práctica clínica interpersonal laboral ha de basarse en una perspectiva médica personalizada, es decir “la medicina de la persona como un todo” entendida como sujeto singular que tiene varios atributos, capacidades, problemas y experiencias, que es preciso tener en cuenta, y como miembro de un grupo que está sujeto a diferentes influencias familiares, socio laborales y culturales.

Incluye el estudio de la enfermedad y del padecimiento, la percepción y experiencias subjetivas de los trabajadores. Por otro lado, es importante mencionar la manera en que se aplicarán los cuestionarios validados del Dr. Achenbach *K005 ASR & L005 ABCL*, los cuales pertenecen al auto reporte del comportamiento de adultos 18 a 59 años y al cuestionario sobre el comportamiento de adultos de 18 a 59 años. Estos cuestionarios contienen un conjunto de 167 y 143 reactivos cada uno divididos en 9 y 6 secciones respectivamente. Las 9 secciones del auto reporte indagan sobre las amistades, el cónyuge o pareja, la familia, el trabajo, la educación, las enfermedades o padecimientos, las inquietudes, las mejores cosas de sí mismo y una lista de frases que describen a las personas.

Por último, se puede concluir que el evaluar el desempeño de los empleados, es una práctica extendida en el ámbito de los recursos humanos. Es un proceso en el que se intenta determinar las actitudes, rendimiento y comportamiento laboral del colaborador en el desempeño de su cargo. La evaluación del desempeño que se presenta en este estudio, servirá para dirigir y controlar al personal de forma más justa y para comprobar la eficacia de los procesos de selección de personal. Cuando un candidato sea seleccionado, se llevará a cabo una predicción sobre su rendimiento futuro y a través de la evaluación de desempeño se podrá comprobar si esta predicción se ha cumplido o no. También proporcionará datos sobre el clima laboral, cómo mejorar las relaciones entre la persona y el puesto, la adaptación del personal al puesto, un rediseño del puesto, una posible rotación de puestos y sobre todo, se podrán conocer las capacidades individuales, las motivaciones y expectativas de las personas para asignar los trabajos de forma más adecuada.

# ANÁLISIS DE UNA PROPUESTA DE IMAGEN CORPORATIVA PARA EL INSTITUTO MUNICIPAL DE ARTE Y CULTURA DE TIJUANA

Santiago González Velásquez, Universidad Tecnológica de Tijuana

Lucila Villa Pérez, Universidad Tecnológica de Tijuana

Isabel Salinas Gutiérrez, Universidad Autónoma de Baja California

## RESUMEN

*El presente trabajo se desarrolló en el Instituto Municipal de Arte y Cultura de Tijuana, el cual tuvo por objeto elaborar estrategias de comunicación para el posicionamiento dentro del mercado cultural tijuanaense. Para ello se llevó a cabo una investigación no experimental bajo la perspectiva del enfoque de técnicas cualitativas y cuantitativas. El propósito fue describir variables que permitieran analizar una propuesta de imagen corporativa. Para la técnica de recolección de información se utilizó un cuestionario de preguntas de opción múltiple dirigida a un público de entre 20 y 59 años de edad. También se desarrolló un modelo de posicionamiento basado en el cambio de imagen institucional para el Instituto y sus dependencias. Se optó por realizar un cambio en los logos y analizar la aceptación por medio de un grupo de enfoque, lo que permitió arrojar un resultado positivo en el diseño, imagen y recordación.*

**PALABRAS CLAVE:** Marca de Preferencia, Posicionamiento, Imagen Corporativa, IMAC, Tijuana, Logos

## ANALYSIS OF A PROPOSED CORPORATE IMAGE FOR THE MUNICIPAL INSTITUTE OF ART AND CULTURE OF TIJUANA

### ABSTRACT

*This work was conducted at the Municipal Institute of Art and Culture of Tijuana, which aimed to develop communication strategies for positioning within the Tijuana cultural market. It was conducted an experimental investigation of the approach from the perspective of qualitative and quantitative techniques. The purpose was to describe variables that allow analyzing a proposed corporate image. For technical data collection questionnaire multiple choice questions aimed at an audience of 20 to 59 years was used. Positioning a model based on the change of corporate image for the Institute and its dependencies, was also developed. We chose to make a change to the logos and analyze acceptance through a focus group, which was allowed to shed a positive result in the design, image and remembrance.*

**JEL:** M310, M390

**KEYWORDS:** Brand Preference, Positioning, Corporate Image, IMAC, Tijuana, Logos

## INTRODUCCIÓN

Las empresas buscan posicionarse en la mente de un mercado potencial, principalmente en el mercado que ellos han designado como meta. El posicionamiento es sin duda una de las ventajas competitivas fundamentales de toda empresa que busca mantenerse estratégicamente en la preferencia de sus clientes (Porter, 2002). Las instituciones no lucrativas como las Organizaciones no Gubernamentales, casas de

cultura, asociaciones civiles, etc., no están exentas de ello, no pueden permanecer inmóviles y pasivas frente a las estrategias mercadológicas que ofrecen las empresas lucrativas. Hoy en día lo que hace especial a una empresa de otra son sus estrategias de diferenciación y su posicionamiento, ya que cada innovación, cada cambio puede ser imitado e incluso superado por la competencia en muy poco tiempo. Lo importante es que si surgen empresas similares, las personas tendrán presente siempre en su mente; y por tanto en su preferencia, a una o dos compañías con características muy particulares. En el presente trabajo se aborda una de las principales problemáticas que una empresa no lucrativa llega a tener: incorporar estrategias de mercadotecnia, en especial las publicitarias. En el Plan Nacional de Desarrollo se indica que uno de los objetivos a lograr es ampliar el acceso a la cultura como un medio para la formación integral de los ciudadanos. Las estrategias que se mencionan son las que se refieren al impulso, la apreciación, reconocimiento y disfrute del arte, así como las manifestaciones culturales por parte de la población. La política cultural del gobierno ofrecerá y alentará una oferta que promueva la participación de la población no solo como espectadores sino también como participantes que es elemento indispensable del desarrollo humano y social. (Gobierno de la República, 2013)

De acuerdo al informe ejecutivo presentado por el Lic. Carlos Bustamante Anchondo alcalde la ciudad de Tijuana (2010), se menciona que al inicio de su administración se encontró con diversas situaciones importantes como: el desgaste en la infraestructura de institutos culturales, cierre de operaciones por remodelaciones en las diferentes dependencias, falta de orientación de dichas instituciones que dependen directamente del Instituto Municipal de Arte y Cultura con respecto a la operatividad y servicios que se ofrecen a la ciudadanía. Como consecuencia la escasa afluencia y desconocimiento de la existencia de dicha institución. El Instituto Municipal de Arte y Cultura de Tijuana (IMAC) actualmente mantiene una limitada afluencia de visitantes y una escasa participación en el mercado, se desconoce la raíz de estas situaciones por lo que el presente estudio busca identificar las causas para proponer soluciones.

El presente proyecto se desarrolla en el Instituto Municipal de Arte y Cultura de Tijuana, calle Benito Juárez, (2ª), s/n esq. Constitución, Zona Centro de la ciudad de Tijuana Baja California, en una intervención y estadía de alumnos y profesores en esta institución en los meses de abril a mayo en el año 2013. La problemática consiste en que el IMAC no tiene amplia presencia en la comunidad, ya que, según información del propio instituto, existe una ausencia de notoriedad y por lo tanto la población no identifica a la institución, generando baja participación en el mercado. Se considera necesario saber cuáles son los principales motivos de inasistencia de la población, haciendo referencia a las siguientes preguntas de investigación: ¿Cuáles son los factores de comunicación externa actuales que afectan el posicionamiento del Instituto Municipal de Arte y Cultura de Tijuana, B.C.? ¿La falta de estrategias publicitarias afecta los niveles de participación y asistencia a las actividades y eventos culturales que produce IMAC? El presente trabajo busca medir la percepción que tienen los habitantes de la localidad del Instituto Municipal de Arte y Cultura de Tijuana; así como identificar el mercado meta de dicho instituto. Con la información recolectada en la investigación de mercados se creará una propuesta para la imagen corporativa y estrategia publicitaria del instituto.

Para llevar a cabo el estudio mencionado, se desarrollaron las siguientes fases: La primera introduce al lector en el tema, la siguiente conceptualiza las variables de estudio, la fase posterior define el método utilizado que incluye un estudio cuantitativo para identificar el nivel de posicionamiento del IMAC, en la cuarta se muestran los resultados y se hace una propuesta de imagen corporativa; la cual también se mide y la última describe las conclusiones.

## REVISIÓN LITERARIA

### Imagen institucional

*Imagen:* Es el conjunto de creencias y asociaciones que poseen los públicos que reciben comunicaciones directas o indirectas de personas, productos- servicios, marcas, empresas o instituciones. (Schmidt, 1996) El concepto de Imagen ha sido utilizado en el ámbito de las organizaciones de manera especial. Esto puede ser debido a una cuestión histórica, ya que se pueden encontrar definiciones desde finales de la década de los 50 y principios de la década de los 60.

Martineau (1958) consideraba el término “imagen” como la suma de cualidades funcionales y los atributos psicológicos que existen en la mente del consumidor. La palabra Imagen ha sido utilizada para definir gran cantidad de fenómenos y esto ha acabado generando una amplia confusión en su uso. Esto se puede comprobar en los espacios dedicados a imagen en las enciclopedias o diccionarios, así como en los medios de comunicación (Caprioti Peri, 2008). La imagen institucional es la imagen que la empresa como entidad articula en las personas, también suele llamarse también imagen corporativa o de empresa. (Costa, 2001) Debido a la situación existente en el entorno general y competitivo, uno de los problemas más importantes para las organizaciones es que los públicos tienen dificultades para identificar y diferenciar los productos, servicios y organizaciones existentes en un mercado o sector de actividad. Por esta razón, la imagen corporativa (los atributos que asocian a una organización) adquiere una importancia fundamental, creando un valor para la entidad y estableciéndose como un activo intangible estratégico de la misma. La existencia de una buena imagen corporativa en los públicos permitirá a la organización:

Ocupar un espacio en la mente de los públicos, Facilitará la diferencia de la organización de otras entidades, por medio de un perfil de identidad propio, duradero y diferenciado, creando valor para los públicos., Disminuir la influencia de los factores situacionales en la decisión de compra, ya que las personas dispondrán de una información adicional importante sobre la organización. La existencia de la imagen institucional fuerte permitirá que las personas tengan un esquema de referencia previo, sobre el que podrán asentar sus decisiones., Actuar como un factor de poder en las negociaciones entre fabricante y distribuidor., Lograr vender mejor los servicios con un margen superior  
Conseguir mejores trabajadores. (Capriotti Peri, 2009)

### Imagen Corporativa Como una Estructura Mental Cognitiva

El estudio de la Imagen Corporativa es el estudio de cómo un individuo conoce a una organización, del análisis del proceso de adquisición de conocimiento realizado por parte de los individuos acerca de la entidad (Brown & Dacin, 1997). Es el conocimiento de una organización no se elabora como una acción reflexiva o premeditada de análisis de la misma, sino que es un conocimiento espontáneo, fruto de experimentar la presencia de la organización como una persona u objeto más dentro del devenir cotidiano de la vida de un individuo. Así, el conocimiento de las organizaciones por parte de las personas se enmarcaría dentro del conocimiento diario o de sentido común de la vida cotidiana. La Imagen Corporativa de una empresa es una estructura mental cognitiva, que se va formando por medio de experiencias sucesivas, directas o indirectas, que tienen las personas con la organización. Está conformada por un conjunto de propiedades que la identificarían como sujeto social y comercial, y la distinguirían de las demás organizaciones. Es decir, las personas describimos a las empresas por medio de un conjunto de atributos o características. Esta estructura o esquema mental se configura en la mente de los públicos como una gestalt (Villafañe, 2004), resultado de un proceso acumulativo y evaluativo de información de la empresa, el cual es fragmentario; pues se compone de una diversidad de informaciones que llegan a los públicos, las cuales son interpretadas y comparadas.

En la Figura 1, se muestran los elementos cognitivos que integran la imagen corporativa. Estos elementos incluyen: La atención personalizada que recibe el cliente al llevar a cabo una interacción con la empresa. El grado de innovación tecnológica que utiliza la empresa, pues a mayor grado tecnológico ocupado el cliente tiene una imagen empresarial de vanguardia. Liderazgo con respecto al grado en que la organización dirige a la industria. Y por último el cliente determina una dimensión estratégica de la empresa, considerándola positiva o negativa de acuerdo a la experiencia que haya tenido con la compañía.

Figura 1: Esquema Mental de la Imagen Corporativa

La figura muestra la creación de una imagen corporativa en la mente de los clientes, basándose en cuatro factores que el público guarda en su mente. La atención personalizada que recibe de la institución al relacionarse con ella. El grado de innovación tecnológica que la empresa utilice, pues a mayor grado de innovación tecnológica se observa una percepción de profesionalismo. También se revisa el grado de liderazgo que tiene la empresa dentro de la industria, pues se puede observar si la empresa es líder o seguidora. Por último se analiza la dimensión estratégica que tiene la empresa, considerando si tiene un sistema fuerte o débil, dependiendo de la interacción de los otros elementos. Fuente: (Villafañe, 2004)

### Branding Corporativo

**Branding:** es una palabra inglesa utilizada en marketing que hace referencia al proceso de creación y gestión de una marca. Es una herramienta estratégica que versa sobre el proceso de creación y todo lo que implica (etapas de estudio, diseño, posicionamiento y construcción de la marca) y su gestión posterior (etapa de implementación y control). En todas estas etapas lo más importante en relación al *branding* consiste en definir el posicionamiento, que es sobre lo que define a una marca. Los puntos básicos para posicionar la marca, consisten en definir muy claramente quién eres, qué haces y cómo lo haces y transmitirlo al consumidor. La Identidad Corporativa sería aquella vinculada a la Marca Corporativa, que representa el nivel de marca más alto y globalizador a escala organizacional. La identidad de una marca (*brandidentity*) refiere a los atributos esenciales que identifican y diferencian a una marca de otras en el mercado. En este sentido, la Identidad Corporativa sería el conjunto de atributos fundamentales que asume una marca corporativa como propios y la identifican y distinguen de las demás. Por otra parte que trabajan la Identidad Corporativa desde una perspectiva más vinculada a las creencias y valores esenciales y diferenciales de la organización. La personalidad de la organización, la Identidad Corporativa es el “ser” de la organización, su esencia. La Identidad Corporativa como la naturaleza central, duradera y distintiva de una organización, la Identidad Corporativa son aquellos aspectos de identidad que una organización reconoce como los más duraderos y distintivos de la misma, Capriotti y Villafañe (1999) en este enfoque organizacional no son totalmente diferentes, sino que más bien son complementarias y están fuertemente interrelacionadas.

### Comunicación de la Identidad Corporativa

Toda entidad social, con sólo existir y ser perceptible, envía a su entorno un volumen determinado de información (Chaves, 1988) (Bernstein, 1996). Consciente o inconscientemente, voluntaria o involuntariamente, una organización emite en su devenir diario una gran cantidad de información que llega a sus públicos. Para esto, la información sobre una organización está constituida por todos los mensajes efectivamente recibidos por ellos desde la entidad. En muchas ocasiones, los esfuerzos de comunicación de las organizaciones se centran solamente en construir campañas publicitarias, de relaciones públicas, o de marketing directo.

Sin embargo, casi siempre se olvida que esta actividad comunicativa es sólo una parte de todas las posibilidades de “contacto” de una empresa con sus públicos. En una organización no sólo comunican los anuncios publicitarios, las acciones de marketing directo o las campañas de relaciones públicas, sino también toda la actividad cotidiana de la entidad, desde la satisfacción que generan sus productos y/o servicios, pasando por la atención telefónica, hasta el comportamiento de sus empleados y directivos. (Bernstein, 1996) (Capriotti Peri, 2009)

Capriotti (2009) identifica dos conceptos para la comunicación de la identidad corporativa: La Comunicación Comercial y la Comunicación Institucional. La primera es toda la comunicación que la empresa lleva a cabo para llegar a los clientes o usuarios actuales y potenciales, así como a aquéllos grupos que influyen en el proceso de elección de compra, con la finalidad de lograr que éstos prefieran los productos de la empresa logrando una fidelización.

La Comunicación Institucional es el conjunto de actividades de comunicación en la cual la compañía se presenta como empresa, como sujeto social, y muestra argumentos sobre ella. Esta comunicación de carácter institucional realizada por la empresa tiene el objetivo de establecer lazos de comunicación con los públicos con los que se relaciona, no con la finalidad estrictamente comercial, sino más bien con el objetivo de generar una credibilidad y confianza en ellos, logrando la aceptación de la organización a nivel social. Por lo que se puede diferenciar, la Comunicación Comercial y Comunicación Institucional de acuerdo a tres criterios como lo representa la tabla 1: *El “Lenguaje/Discurso” que la organización utiliza para presentarse ante sus públicos El “Objetivo” que se persigue Los “Públicos” a los que se dirigen*

Esta distinción permite comprobar como las “técnicas” no definen una actividad determinada sino que son herramientas utilizables en diferentes formas de comunicación, en función del discurso que adopte la organización, los objetivos que se deseen obtener y de los públicos con los que se desee comunicar. (Capriotti Peri, 2009)

### Marca

Lamb, Hair y McDaniel (2002), definen una marca como "un nombre, término, símbolo, diseño o combinación de estos elementos que identifica los productos de un vendedor y los distingue de los productos de la competencia". Complementando ésta definición, los mencionados autores señalan además que "un nombre de marca es aquella parte de una marca que es posible expresar de manera oral e incluye letras palabras y números. A su vez Laura Fischer y Jorge Espejo (2011), definen la marca como "un nombre, término simbólico o diseño que sirve para identificar los productos o servicios de un vendedor o grupo de vendedores, y para diferenciarlos de los productos de los competidores". Por su parte, Philip Kotler (2003) considera que "ya sea que se trate de un nombre, una marca comercial, un logotipo u otro símbolo, una marca es en esencia la promesa de una parte vendedora de proporcionar, de forma consistente a los compradores, un conjunto específico de características, beneficios y servicios".

Tabla 1: Generalidades de la Comunicación

	Comunicación Comercial	Comunicación Institucional
Lenguaje / Discurso	La empresa se presenta principalmente como un ente económico, que se encuentra en un determinado escenario competitivo.	La empresa se presenta como un ente social, que forma parte de una sociedad, de un grupo social con el que se relaciona.
Objetivos	<ul style="list-style-type: none"> <li>• Conseguir que los públicos identifiquen los bienes y/o servicios de la compañía, sus atributos, aspectos distintivos y sus beneficios.</li> <li>• Crear credibilidad y confianza hacia los bienes/ servicios de la organización, obteniendo una reputación propicia para los mismos.</li> <li>• Conseguir que los clientes usen o consuman los bienes y/o servicios de la empresa, y el mantenimiento en el tiempo de dicha relación o intercambio (la fidelización).</li> </ul>	<ul style="list-style-type: none"> <li>• Lograr que los públicos estén al tanto de la compañía, que conozcan sus valores, principios, forma de actuar y las aportaciones que realiza a la sociedad.</li> <li>• Crear credibilidad y confianza hacia la empresa, obteniendo una reputación de fiabilidad y respetabilidad de la compañía en cuanto tal.</li> <li>• Obtener la aprobación e integración social de la empresa, que los públicos la consideren un miembro “útil” para la comunidad y la integren como un integrante más.</li> </ul>
Públicos	<p>Grupos comprometidos en el proceso de elección y/o compra o consumo de productos o servicios:</p> <ul style="list-style-type: none"> <li>• Consumidores</li> <li>• Recomendadores</li> <li>• Compradores</li> <li>• Influenciadores</li> <li>• Distribuidores y Proveedores</li> </ul>	<p>Grupos que pueden afectar el ejercicio y el logro de los objetivos a nivel corporativo:</p> <ul style="list-style-type: none"> <li>• Empleados</li> <li>• La Comunidad Local</li> <li>• Medios de Comunicación</li> <li>• Entidades Gubernamentales</li> <li>• Inversores y Accionistas</li> </ul>

La tabla muestra una comparación entre los tres aspectos que diferencian a la comunicación comercial de la comunicación institucional. La empresa hace comunicación comercial cuando utiliza un lenguaje promocional, identificándose como ente económico, esto lo hace para dirigirse a los consumidores para que éstos elijan los productos que la compañía vende. La comunicación institucional utiliza un lenguaje más social, con la finalidad de que los públicos acepten a la organización e identifiquen a la empresa con una reputación de fiabilidad y respetabilidad. Fuente: (Capriotti Peri, 2009)

Por lo tanto la marca se describe como un nombre, término, signo, símbolo, diseño o combinación de los anteriores elementos, que sirve para: Philip Kotler (2003) determina que existen diferentes tipos de marcas, entre ellas se pueden mencionar las denominativas. Estas son las marcas que identifican un producto o servicio a partir de una palabra o un conjunto de palabras. Estas marcas deben distinguirse fonéticamente de los productos o servicios de su misma especie. Es decir, no deben tener semejanza con marcas que pertenezcan a productos o servicios de su misma especie o clase. En su mayoría describen el servicio o producto. Otro tipo de marcas son las figurativas, son imágenes o logotipos que distinguen visualmente una marca. Es decir, son figuras distintivas que no pueden reconocerse fonéticamente, sólo visualmente. A veces, el color (o colores) de la imagen o logotipo ayuda a reconocer la marca. Por último existen las marcas mixtas que son el resultado de la combinación de tipos definidos en los dos párrafos anteriores. En la mayoría de los casos son combinaciones de palabras con diseños o logotipos. Un ejemplo vivo de esto podría ser una marca simple con un logotipo. (Kotler, 2003)

**Logotipo:** Es la representación pictográfica de la marca de una empresa u organización, la funcionalidad de un logotipo radica en su capacidad para comunicar el mensaje que se requiere, y para lograrlo se requiere del uso de colores y formas que contribuyan a que el espectador final le de esta interpretación. (Benenson & Neujahr, 2002) El logotipo es la base de la identidad visual de la marca. Un logotipo está compuesto por partes esenciales: el icono; símbolo visual gráfico, el nombre; representación fonética de la marca, la fuente; una fuente original hará que el logotipo sea más auténtico y memorable. Para que un logotipo resulte congruente y exitoso, conforme al principio fundamental del diseño donde «menos es más», la simplicidad permite que sea:

Legible (hasta el tamaño más pequeño)  
 Escalable (a cualquier tamaño requerido)  
 Reproducible (sin restricciones materiales)

Distinguible (tanto en positivo como en negativo)

Memorable (que impacte y no se olvide) (Componentes visuales, 2012)

*Posicionamiento:* La frase “hay que buscar la solución dentro de la mente del cliente en perspectiva” indica que para estar dentro de la mente de los clientes potenciales, es necesario comunicarles de manera sencilla, los atributos o características especiales que se desea que se conozcan y prefieran. (Ries & Trout, 2001) Este punto retoma la importancia de la investigación pues “el posicionamiento consiste en diseñar la oferta de la empresa de modo que ocupe un lugar claro y apreciado en la mente de los consumidores meta.” (Kotler, 2003) También señala que en el posicionamiento la empresa debe decidir cuántas y cuáles diferencias destacar entre los clientes meta. Por otra parte Laura Fischer y Jorge Espejo (2011) señalan que “el posicionamiento es un programa general de mercadotecnia que influye en la percepción mental que los consumidores tienen de una marca, producto, grupo de productos o empresa, en relación con la competencia”. Valiñas (2007) ha identificado cuatro tipos de posicionamiento:

Posicionamiento por diferenciación. Este surge a partir de la pregunta: ¿en qué es mi producto significativo, diferente al resto de los productos de la competencia? Este posicionamiento funciona mientras que la competencia no imite o supere esa característica que hace única a la empresa. Posicionamiento por beneficios; responde la pregunta: ¿qué beneficio ofrece mi producto que el mercado meta considere significativo? Esto involucra un beneficio real para el comprador. Este beneficio se traduce en valor agregado al producto. Posicionamiento por usuarios del producto: busca dirigirse a un grupo de consumidores específicos, haciendo hincapié que el producto ha sido hecho especialmente para ellos. Posicionamiento por uso: es posible lograrlo a partir de la manera y tiempo del uso del producto, es decir, resaltando los usos específicos y adicionales del artículo.

### Instituto Municipal de Arte y Cultura de Tijuana

Actualmente el IMAC se encuentra ocupa el edificio que forma parte del Patrimonio Histórico Cultural de la ciudad ubicado en la calle Benito Juárez, (2ª.), s/n esq. Constitución, Zona Centro de la ciudad de Tijuana Baja California y es uno de los inmuebles más antiguos de Tijuana. Data de 1921, tiempo en que era utilizado para oficinas públicas del gobierno federal y del entonces Distrito Norte. El Instituto Municipal de Arte y Cultura inició la administración en diciembre del 2010, con la primera tarea de rehabilitar los distintos espacios que administra, con el objetivo principal de ofrecer un servicio digno a la ciudadanía. Estas acciones se encaminaron a la mejora y acondicionamiento técnico de los espacios, entre los que destaca el Archivo Histórico de Tijuana, el Teatro de la Casa de la Cultura Tijuana y la Casa de la Cultura, El Pípila. También sobresale, de manera especial, la rehabilitación de espacios de la Casa de la Cultura Playas; algunas de sus áreas se encuentran deshabilitadas por Protección Civil, y en ellas se está trabajando con el propósito de activar y utilizar el 100 por ciento de las áreas.

## **METODOLOGÍA**

La metodología utilizada, es de acuerdo a una investigación no experimental, específicamente dentro de la clasificación se aplicó el diseño descriptivo pues presenta variables y analiza la incidencia e interrelación entre los factores que el mercado cultural de Tijuana supone necesarios para considerar asistir a un evento cultural, es de tipo transeccional pues es basada en la recolección de datos en un tiempo único. Se eligió el modelo de enfoque mixto, lo cual significa que se llevará a cabo esta investigación bajo la perspectiva del enfoque cualitativo y cuantitativo, prevaleciendo el primero y conservando componentes del segundo. Primeramente se analizaron fuentes secundarias del archivo de IMAC e información proporcionada por la dirigente del Instituto. El objeto es conocer antecedentes, trayectoria e imagen actual de la organización. Posteriormente se diseñó un cuestionario para encuestar a un segmento de mercado bien identificado, el propósito es conocer el nivel de posicionamiento que tiene IMAC en la comunidad, la identificación del

servicio que ofrece y la participación y disponibilidad del mercado para asistir a eventos culturales. La Tabla 2 muestra la operacionalidad del cuestionario.

Tabla 2: Preguntas Para La Encuesta

Pregunta	Opciones de Respuesta	Objetivo de la Pregunta
1. ¿Sabe qué significa las siglas IMAC?	Si	Reconocimiento de la marca
2. ¿Qué piensa usted que sea el IMAC?	No	Posicionamiento de la marca
	Fábrica	
	Centro deportivo	
	Institución pública	
	Parque	
3. ¿Qué lugares conoce usted de expresión cultural y artística en Tijuana?	Biblioteca	Posicionamiento de la marca
	CECUT	
	Casa de la cultura	
	El trompo	
	Museo de cera	
	Teatro del IMSS	
	Museo del niño	
	Centro cultural playas	
4. ¿Conoce el Instituto Municipal de Arte y Cultura de Tijuana (IMAC) y sabe dónde está ubicado?	IMAC	Posicionamiento de la marca
5. ¿Sabe qué actividades ofrece el IMAC?	Si	
6. ¿Sabe qué espacios ofrece el IMAC?	No	Identificación de servicio
	Si	Identificación de servicio
7. ¿Ha asistido o participado en eventos Culturales y Artísticos?	Si	
8. ¿Le gustaría participar en actividades culturales y artísticas que desarrolla el IMAC?	No	Participación y disponibilidad del mercado
9. ¿Qué tipo de actividades le son de su interés?	Si	
	No	Participación y disponibilidad del mercado
	Baile	
	Galerías	
	Museos	
	Talleres	
	Obras de teatro	Exhibiciones en general
	Exhibiciones en general	

*El cuestionario incluye 9 preguntas con respuestas cerradas, el objetivo de la primer pregunta es el reconocimiento de la marca IMAC, el objetivo de las preguntas 2, 3 y 4 es identificar el posicionamiento de la marca IMAC en el segmento de mercado analizado, las preguntas 5 y 6 pretenden conocer si el segmento de mercado identifica los servicios que ofrece IMAC, y las preguntas 7, 8 y 9 miden la disposición y la participación del mercado. Fuente: Elaboración propia.*

Se determinó la muestra para la aplicación de las encuestas, los criterios de inclusión de la muestra fueron los siguientes:

Hombres/ Mujeres, Nivel Socioeconómico medio bajo, medio alto., Pertener a un grupo entre 20 a 59 años de edad., Ser residente de la ciudad de Tijuana., Tener alcance de medios de comunicación básico en su entorno., La población de la muestra se determina infinita (mayor de 500,000) 769,728.72 Hombres y mujeres de 20-59 años de edad con un nivel socioeconómico, medio bajo, medio alto en Tijuana. Se utilizó la fórmula para poblaciones infinitas determinada por Laura Fischer (1997).

$$n = \frac{\sigma^2 pq}{e^2}$$

En donde:

$\sigma$  = nivel de confianza. En este caso es de 95%.

p = probabilidad a favor. Como no se tiene información previa se propuso 50%.

q = probabilidad en contra. 50%

e = error de estimación (precisión de resultados). Se determinó en 5%.

n= número de elementos (tamaño de la muestra)

El resultado fue de 384 elementos de la muestra. El siguiente paso fue el análisis de los resultados de la encuesta para justificar el diseño de una propuesta de imagen corporativa para el IMAC así como para las dependencias de éste. Por último se hizo un análisis cualitativo a través de un grupo de enfoque para medir la aceptación de la propuesta de imagen corporativa. El grupo estuvo integrado por 12 personas. La entrevista en grupo proporciona una oportunidad de obtener resultados directamente del mercado objetivo que cumplan con las siguientes características predefinidas como son (edad, delegación en la que reside, uso de determinados servicios). Se determinó un índice de cumplimiento, este índice manifiesta de manera porcentual que los individuos escogidos fueron seleccionados de manera favorable respetando los criterios de selección y que a continuación se presentan por medio de una tabla:

Tabla 3: Índice de Cumplimiento Para Selección de Participantes (Grupo de Enfoque)

Índice de Cumplimiento	Criterios
Heterogeneidad de género	100%
Edad	20 a 59 años
Lugar de residencia dentro de la ciudad de Tijuana	Dentro de las 9 delegaciones
Asistencia a instituciones que ofrezcan servicios de arte y cultura.	Opcional

*La tabla muestra el índice de cumplimiento del grupo seleccionado para llevar a cabo el análisis a través del Grupo de Enfoque. Los criterios identificados fueron: heterogeneidad de género que se cumplió al 100%, la edad de los participantes que fue entre 20 y 59 años, personas que vivieran dentro de las nueve delegaciones de la ciudad de Tijuana y que consideran alguna ocasión asistir a instituciones que ofrezcan actividades culturales. Fuente: Lucila Villa.*

El proceso para llevar a cabo el grupo de enfoque se describe a continuación: Se designa 4 minutos para la presentación del moderador, Se informa a los participantes la duración del sesión que será de aproximadamente 1 hora, Se proporciona información general de la institución, Se informa que su opinión, ideas, puntos de vista y percepción sobre el tema es fundamental, Preguntas previas, Presentación de logos sin letras y preguntas, Presentación de logos con letras y preguntas, Conclusiones La guía para entrevistar a los asistentes fue la siguiente:

¿Conoce el IMAC? ¿Ha asistido o escuchado Hablar de alguna dependencia del Instituto Municipal de Arte y Cultura? ¿Qué piensa usted que sea esta imagen? ¿Qué mensaje cree usted que proyecte? ¿Recordaría esta imagen? ¿Qué le cambiaría al logo? ¿Relaciona usted el logo con el nombre?

## RESULTADOS

El Instituto Municipal de Arte y Cultura es el espacio de concertación entre gobierno y sociedad, dedicado a impulsar la creación y a participar en el proceso cultural de las comunidades.

*Su misión es:* Generar, procurar y articular los procesos y actividades relacionadas con el rescate, fomento, promoción y difusión del patrimonio cultural y artístico del municipio, estimulando y apoyando la organización y fortalecimiento de la sociedad para contribuir al mejoramiento de su calidad de vida.

*Su visión es:* Ser una institución líder y reconocida que posicione a la ciudad de Tijuana como un polo de desarrollo artístico y cultural, mediante la ampliación, la cobertura de infraestructura y servicios culturales, a través de programas que respondan al crecimiento urbano y demográfico, incluyendo la recuperación de espacios y el uso de espacios comunitarios de las zonas marginadas.

## Imagen Institucional

Imagen 1: Dependencias de IMAC

*Las imágenes que se muestran, son los logos actuales que se utilizan como imagen corporativa de las dependencias de IMAC. Las imágenes hacen alusión a sus respectivos centros de cultura. Fuente: Archivo de IMAC.*

El IMAC (Instituto Municipal de Arte y Cultura) cuenta con seis dependencias, y actualmente se utiliza una imagen institucional que no genera un reconocimiento y posicionamiento en el mercado, ya que es poco atractiva y pobre en su tipografía y diseño. Cuenta con colores sólidos y sobrios en contexto al tipo de servicio que brinda y un escudo institucional público del H. Ayuntamiento de Tijuana.

Se muestran a continuación los resultados más relevantes de la encuesta aplicada para identificar el nivel de posicionamiento del Instituto: Un 21% del total de la muestra encuestada, respondió que sí sabe que significan las siglas IMAC, pero el 79% restante lo desconoce. Por otra parte el 77% del total de la muestra encuestada, piensa que las siglas IMAC corresponden a una institución pública, el 7% lo relacionan con un centro deportivo y una fábrica, el 6% lo relaciona con una biblioteca y los restantes con un parque y otros. Un 13% del total de la muestra encuestada conoce al IMAC y su ubicación, el resto desconoce a la institución. El 89% del total de la muestra encuestada desconoce las actividades que IMAC ofrece al público, el 11% sí conoce las actividades que ofrece. El 92% del total de la muestra encuestada desconoce los espacios o dependencias que se encuentran a su disposición en las diferentes zonas de la ciudad, una mínima parte del total sí conoce algunas de estas. El 43% del total de la muestra ha asistido o participado en algún tipo de evento, un 57% no es de su interés o no ha participado en estas actividades. El 75% de la muestra encuesta está interesado en participar en los eventos que desarrolla el IMAC, el resto no está interesado o le es indiferente ser parte de estos eventos.

La información que se mostró en la Imagen 1, genera una escasa identificación en la institución, como ya se apreció en los resultados de las encuestas; así como en sus dependencias, afectando directamente en la baja asistencia, el desconocimiento y la participación de la población en las diferentes actividades que estos ofrecen. Para la problemática en la que se encuentra actualmente la institución IMAC se propone el cambio de imagen institucional principal (Logo), así como de las seis dependencias, ya que es el elemento principal en que se basa toda la imagen corporativa. Es el medio por el que el público le va a reconocer y su propósito será conseguir que se posicione en la mente del cliente; sin embargo para efectos de la presente investigación, sólo se consideró analizar la propuesta para el logo principal de la dependencia, pues las dependencias restantes se abordarán en otro escrito. El rediseño se da en base a la necesidad de representar al IMAC de tal manera que la sociedad se identifique con elementos particulares de cada sub dependencia que les presta un servicio o un espacio de expresión. Se mantienen algunos elementos como los colores morado y gris que son los representativos de esta institución y de esta administración. El tipo de logo a

utilizar es un Imago tipo, este consiste en la combinación de un logotipo y un texto, este puede ser arriba o abajo. La siguiente descripción presenta el logo, tipografía, justificación e interpretación.

G: 255

B: 255

*Justificación:* A través de la encuesta de percepción del cliente que se aplicó sobre el conocimiento del logo de la institución, se encontró que el 90% de los encuestados manifestaron no conocerlo, en su mayoría no lo asociaron con dicha institución. No obstante un pequeño porcentaje lo reconoció por haber asistido a alguna de las dependencias, y se demostró que hay una necesidad de crear una imagen de mayor recordación e igualmente se definió el plan estratégico que se fija como una directriz fundamental para la propuesta de un cambio creativo en la imagen y que refleje un mensaje referente al servicio que este ofrece.

*Interpretación:* Imagen: el patrón principal está elaborado de engranes en diferentes tamaños, lo cual simboliza la unión de varias funciones entrelazados entre sí, ya que la característica de estos componentes es el trabajar juntos para un mismo objetivo, que transmite una estructura sólida y fuerte, abierta a la diversidad de actividades. La nota musical interpreta sonidos, música, danza, el pincel representa la creación del arte, dibujo, el ABC representa la lectura, conocimiento, literatura, aprendizaje, la cara simboliza el teatro, la historia, el arte escénico, la actuación. Son 4 engranes que simbolizan la fuerza motriz de la educación cultural y el empuje industrial de la ciudad de Tijuana. El mismo número de siglas de la dependencia y dentro de cada uno de ellos se muestra algún tipo de expresión cultural, como la pintura, la literatura, el teatro y la música.

*Formas empleadas:* El engrane por sí solo mantiene una forma irregular fuera de él, en el interior se utilizaron círculos para marcar el espacio y diferenciar la imagen principal de cada engrane. Después de la elaboración de la propuesta de logo principal, se realizó un análisis con un grupo de enfoque (como se mencionó en el apartado de metodología) para que se opinara sobre la propuesta de cambio. Los resultados se mencionan a continuación.

¿Conoce el IMAC? 10 de los 12 participantes conocen o han escuchado hablar del IMAC ¿Ha asistido o escuchado Hablar de alguna dependencia del Instituto Municipal de Arte y Cultura? La mayoría de los asistentes dicen que no (11 de ellos), sólo una persona asiente que si ha asistido a las oficinas de la dependencia. ¿Qué piensa usted que sea esta imagen? 10 personas dicen que son engranes entrelazados, dando la sensación de dinamismo, cultura, crecimiento ¿Qué mensaje cree usted que proyecte? Representa cultura asociada principalmente a la lectura, a la música, teatro y pintura, solo lo analizaron 10 personas.

¿Recordaría esta imagen? Nueve personas dicen que si lo recordarían, dos mencionaron que lo harán pues ya saben que es lo que significa. Se mencionó que será fácil recordarlo porque no hay imágenes de ese tipo en Tijuana. ¿Qué le cambiaría al logo? Algunas personas mencionan que le agregarían mas engranes, otros dicen que el engrane lo relacionan con una fábrica. ¿Relaciona usted el logo con el nombre? Los 12 participantes opinaron que en definitiva si consideran que hay una relación entre logo y el nombre

## CONCLUSIONES

Por medio de la investigación para saber si la institución contaba con un posicionamiento dentro del mercado a través de la primera interrogante planteada: Se determinó que la falta de estrategias de imagen corporativa afecta los niveles de participación y asistencia a las actividades y eventos culturales que produce IMAC, una vez hecho este planteamiento se procedió al análisis de la situación de IMAC. La respuesta de ese análisis fue que la institución no ha logrado un posicionamiento de marca claro y un reconocimiento por la población de Tijuana. Se demostró por medio de una muestra de encuestas aplicadas; la mayoría de los encuestados no saben el significado de las siglas IMAC, muchos de ellos no han asistido pues no saben dónde está ubicado. Dichos resultados ayudaron a plantear la estrategia de desarrollar una propuesta de nueva imagen corporativa para el instituto. El cambio de imagen del instituto se analizó en el grupo de enfoque, quienes en su mayoría aceptaron la nueva propuesta como herramienta que ayudará al posicionamiento de la marca IMAC. Se concluye que existen las condiciones adecuadas para el desarrollo de la propuesta de este proyecto, considerando exclusivamente los aspectos de posicionamiento y por ende la propuesta cambio de imagen corporativa, la cual generará información de conocimiento de la marca. Es importante mencionar que el cambio en la imagen de la marca se realizó con el consentimiento previo del Lic. Lizeth García Peña Coordinador de comunicación, Diseño y Relaciones Públicas y solo como una propuesta. El posicionamiento sustentado además por una marca es la clave para el éxito de esta institución.

## RESUMEN

*En la actualidad se presentan algunas circunstancias adversas por las que están pasando muchas empresas sobre todo las pequeñas y medianas, como la crisis económica, la falta de tecnología, de financiamiento y de conocimiento de los emprendedores, por mencionar algunas de estas, que afectan en mayor medida a las organizaciones, su administración y por consiguiente su competitividad. Al estar viviendo en un mundo globalizado se ejerce más presión en los emprendedores que por la general son los dueños de las empresas, pero que también pueden ser trabajadores de estas, para hacer frente a todo lo que esto implica. El ofrecer productos o servicios de calidad y que sean competitivos para sobrevivir por tiempo indefinido en el mercado. El Objetivo General de la investigación es Identificar si las personas al tener las adecuadas y suficientes características del perfil del emprendedor ayudan al desempeño de la organización, su administración y la competitividad con otras empresas. Metodología el proyecto es documental para posteriormente realizar una investigación de campo*

**PALABRAS CLAVE:** Perfil del Emprendedor, Organización, Administrador y Competitividad

## ENTREPRENEUR PROFILE AND ITS RELATION TO THE ORGANIZATION , MANAGEMENT AND COMPETITIVENESS

### ABSTRACT

*Some adverse circumstances that many companies are going especially now presents small and medium , as the economic crisis , lack of technology, finance and knowledge of entrepreneurs , to mention some of these , which affect as more organizations, administration and therefore competitiveness. To be living in a globalized world more pressure is exerted on the entrepreneurs who are usually the owners of the companies , but may also be employees of these to deal with all that that implies . The offer products or services and that are competitive to survive indefinitely in the market. The general objective of the research is to identify whether people have adequate and sufficient entrepreneurial profile characteristics help the performance of the organization , its management and competitive with other companies. Methodology documentary project is later to make a field investigation*

**JEL:** L26

**KEYWORDS:** Profile of the Entrepreneur, Organization, Administrator and Competitiveness

## INTRODUCCION

En términos históricos cabe señalar que la pequeña empresa constituye el primer eslabón en la larga cadena del progreso social y económico que se remonta a los albores de la civilización, cuando el comercio constituía un elemento de capital importancia en el proceso de comunicación entre los pueblos, los estudios y teorías relativas a los factores socioeconómicos que influyen en la pequeña empresa se iniciaron durante la revolución industrial, mientras que las nociones y conceptos importantes en materia de gestión y dirección empresariales empezaron a difundirse a principios del siglo XX. Durante el decenio de 1960 comenzó a reconocerse que el comportamiento individual podía considerarse entre los factores que ejercen una influencia importante sobre la capacidad de dirección y el desarrollo de las pequeñas empresas (Oficina Internacional del Trabajo Ginebra, 1995)

Estas empresas, independientemente de la naturaleza de su actividad principal, presentan las características históricas que identifican a todas las culturas del mundo desde tiempos remotos, prácticamente desde que el hombre se vuelve sedentario, hace aproximadamente 10 000 años. Desde entonces, el mundo ha observado con algunas variantes, los grandes contrastes que aún observamos en la constitución de las economías sociales, antes existían los grandes empresarios (nobles y terratenientes), los pequeños agricultores, productores y artesanos, así como aquellos que se dedicaban a tareas productivas prácticamente de subsistencia, lo mismo que una masa amorfa, a veces difícil de identificar, que se dedicaban a prestar servicios de distinta naturaleza (Barnes, Harry Elmer. 1997)

A nivel mundial la revalorización del sector PYMES y de las PYMES como unidades productivas de pequeña escala se dan a partir de los años 70 debido principalmente a cambios estructurales como el crecimiento de los servicios, es decir que el antiguo paradigma de que solo son empresas aquellas unidades de producción que producen bienes o tangibles cambia rotundamente desde que las facturaciones por servicios de consultorías empresariales, tratamientos clínicos, respaldo o soporte técnico y la valorización del conocimiento como factor de producción de riqueza; empiezan a generar riqueza y valor agregado a los intangibles que con el tiempo se comienzan a valorizar como un activo tanto como las infraestructuras o maquinarias en las principales economías; paralelamente el crecimiento de los productos informáticos en un contexto en que los cambios se dan día a día y que la obsolescencia se cuenta por segundos, las empresas se ven en la necesidad de reducir su tamaño para contar con mayor eficiencia, es decir se hacen pequeños los productos y se hacen pequeñas las empresas.

El panorama competitivo de las principales economías comienza a desarrollar nuevas estrategias para dominar nuevos mercados y ganar nuevos segmentos, esto se refleja en el crecimiento económico de Japón, Alemania, los Tigres del Asia, Canadá y el mismo EEUU. Sin embargo la tasa de paro en muchos de estos países todavía no encuentra una solución coherente, las políticas de subsidios y de seguros contra el desempleo son alguna forma de solucionar temporalmente este problema, en países con menos desarrollo el estado empresario fracasa (Caso Latinoamérica) y trajo consigo un proceso hiperinflacionario de orden continental, la pobreza en estos bloques aumenta y la migración de la población de países pobres hacia países desarrollados crece, convirtiéndose esta población migrante en una mayor carga para estas sociedades, es por tanto que la idea de que cada cual construya su fuente de trabajo es aceptada con mucha algarabía ya que le quedaba tan solo al estado dotar de un mejor y mayor marco de promoción para que aparezca este nuevo sector de empresas familiares de pequeña escala o las denominadas PYMES. En la actualidad, tanto en los países desarrollados como los que se encuentran en proceso de desarrollo o los que están subdesarrollados, encuentran un paralelismo histórico en la composición de sus estructuras económico productivas, hoy existen las macro o grandes empresarios, que se dedican a actividades cada vez más diversificadas en la medida en que la necesidad, la ciencia, la tecnología y la propia sociedad impactan en los grupos sociales regionales, nacionales y mundiales, de distinta manera, transformándolas progresiva y sistemáticamente.

Es importante darse cuenta hoy, como antes, las micro, pequeñas y medianas empresas se complementan, en mayor o menor medida con las actividades productivas de las grandes y macro empresas, estableciendo relaciones directas e indirectas, en medio, por lo general, de precarios equilibrios entre ellas. Sin embargo, hoy las PyMES presentan la tendencia a realizar actividades autónomas que tienen una relación forzosa con los núcleos sociales de su entorno, sufriendo de influencia de las empresas mayores, que por lo general tienden a someterlas, minimizando sus posibilidades de desarrollo.

El amplio núcleo económico y social está formado por la más amplia gama de giros productivos, comercializadores y de servicios que uno podría imaginar; y en gran medida los emprendedores son personas que realizan actividades económicas a nivel de subsistencia que se caracterizan por integrar empresas eminentemente familiares, producto de la necesidad, más que un esfuerzo planificado, presentando problemas para su desarrollo y posicionamiento. Por lo que en reiteradas ocasiones se observa la necesidad de que conozca más sobre el funcionamiento de la organización, como administrarla eficientemente para ser competitiva y lograr mantenerse en el mercado por tiempo indefinido.

## REVISION DE LITERATURA

Las nuevas estrategias para la creación y consolidación de nuevas empresas apuntan a identificar a los actuales y potenciales emprendedores. Es sobre esta base que se puede llevar a cabo programas exitosos orientados a incrementar la productividad y competitividad de las unidades económicas. "El emprendedor exitoso es una persona con un sueño, un objetivo, un deseo de crear, de innovar, que capta una oportunidad de negocio, que es capaz de 'ver' su idea en forma terminada, que no se detiene ante los obstáculos, por lo que la persistencia y la tenacidad con características típicas de su comportamiento. La mayoría de las veces emprende en un área de su especialidad, donde posee un conocimiento previo, donde le gusta trabajar. Su principal motivación es el logro, de allí deriva satisfacción y energía para seguir adelante con su empeño. (Cisneros V, Larissa)

### Características de los Emprendedores Exitosos en Venezuela, en Latinoamérica y en Países Desarrollados

Pasión, energía, previsión, visión, compromiso, confianza en sí mismo, optimismo, perseverancia, determinación, innovación, creatividad flexibilidad, liderazgo, habilidad para tratar con la gente, persuasión, direccionalidad, saber competitivo, conocimiento, pertenencia, solidaridad social, responsabilidad, credibilidad Integridad competitividad, talento, aprendizaje del fracaso, adaptación a momentos críticos, autodirección toma de riesgos calculados, autonomía, independencia, trabajo arduo, visión de oportunidad, iniciativa, orientación a la utilidad y no conformismo. La visión en los emprendedores tiene las siguientes connotaciones:

Una idea clara de lo que quiere lograr con su emprendimiento. Es una idea que despierta en el emprendedor pasión por lograr aquello que se ha propuesto. Es una idea seductora. La capacidad de anticipar con gran exactitud los resultados de sus acciones. El sentido de previsión. Una característica muy importante en los emprendedores exitosos es la confianza en sí mismos. Si ellos son capaces de afrontar riesgos calculados es porque tienen gran confianza en que lograrán sus propósitos. Esta confianza en sí mismos parte de una autoestima sólida, que les permite a su vez establecer relaciones saludables y estables. Un rasgo que se desprende de la confianza en sí mismo es la iniciativa y la autonomía. Se trata de la capacidad de identificar oportunidades de negocios allí donde otros no las ven, y de tomar las acciones correspondientes. La confianza en sí mismo hace que no sea dependiente en sus acciones y que, por ello mismo, pueda concretar sus iniciativas, aunque en un primer momento puedan parecer arriesgadas. La tolerancia al riesgo significa que el emprendedor es capaz de manejarse en circunstancias de incertidumbre. Ha desarrollado la habilidad de aprender de los fracasos, y, por ello mismo, no tiene mayores dificultades para sumir los costos de riesgos calculados. Su sentido de previsión le capacita para no asumir cualquier riesgo, sino aquellos que los puede

manejar más o menos solventemente.

El innovador exitoso no trabaja solo. Ha desarrollado la capacidad de formar equipos, de estimular a otros, de orientar y potenciar sus capacidades y de compartir los éxitos. Es una persona que inspira y desafía a los que trabajan con él. genera liderazgo orientado al logro específico. Finalmente, el emprendedor exitoso dirige sus emprendimientos a áreas en las cuales ya tiene experiencia y conocimientos específicos. Ha desarrollado una orientación específica sobre el producto, el servicio, el mercado y el contexto en el cual ha de moverse. (Cisneros V, Larissa) Estudios sobre emprendedores llevados adelante en Latinoamérica, los emprendedores exitosos atribuyen el desarrollo de las cualidades descritas y hasta aquí a dos factores importantes: La formación inicial en el seno de su familia. Estos emprendedores afirman que en sus hogares les impulsaron a la autonomía, la confianza en sí mismos, el logro de metas concretas, la responsabilidad y la perseverancia. Junto al anterior factor se destacan algunas habilidades que los emprendedores han sabido desarrollar posteriormente como la Innovación, el interés por determinada área y las habilidades de liderazgo. Es decir, el perfil de los emprendedores responde a un proceso saludable de socialización, junto con el desarrollo personal de capacidades adecuadas para el logro de metas específicas.

### Perfil de un Emprendedor en Colombia

Para ser un emprendedor se requiere tener cierto perfil, ciertas aptitudes y ciertas características de personalidad. No es una tarea fácil identificar con claridad cual debe ser el perfil de un emprendedor, pero muchos autores coinciden que los factores mas importantes a tener en cuenta, son los siguientes: Personalidad idealista y astuta, preocupada por hacer dinero pero no obsesionados No les interesa demasiado el poder sino la autonomía, les gusta ponerse a prueba, enfrentar riesgos pero no a lo loco, sino planificados. Les gusta demostrar y demostrarse lo que saben, pueden y valen;

Tienen capacidad de concentración para la resolución y búsqueda de salidas exitosas a problemas, tienen cierto carisma o mística y esperanza respecto a su emprendimiento. No tienen todo absolutamente claro, tienen miedos como todo ser humano, pero a pesar de ello se animan. Son capaces de sacrificarse por su obra pero sin perder la cordura, son ansiosos y buscan ofrecer un producto o servicio de calidad superior, distinto, destacado; Les gusta dejar su marca en la vida a través de su emprendimiento, están convencidos de que el éxito es 99% transpiración y 1% inspiración, Saben que se pueden equivocar pero también saben que el fracaso es no intentarlo de nuevo. (Piedrahita P, Carmen A.)

### Otros Aspectos a Tener en Cuenta

**Autoconfianza:** La autoconfianza es la capacidad del individuo en creer en sí mismo, y en la posibilidad de conseguir sus metas personales. La persona emprendedora tiene que tener confianza absoluta en su proyecto y en que está preparada para sacarlo adelante. Va tomar decisiones y lo tiene que hacer de manera decidida, sin miedo y confiando en sí misma, aunque puedan ser erróneas o el resultado no sea el esperado.

**Orientación al logro:** Se entiende como la persistencia para conseguir metas y objetivos personales en este caso emprender un negocio. El emprendedor tiene que saber dónde quiere llegar y estar en disposición de realizar todo lo necesario para lograrlo

**Asunción de riesgos:** Supone una predisposición a no evitar situaciones que impliquen incertidumbre o riesgo potencial. La persona emprendedora va a asumir riesgos, pero éstos deben ser calculados. El proceso de creación de una empresa no se acomete (o, al menos, nunca debería hacerlo) de manera aleatoria. El emprendedor ha analizado el entorno, ha diseñado su producto o servicio, ha analizado la viabilidad de su negocio y ha establecido unos resultados previsibles para su actividad.

**Expectativa de control:** Se relaciona con la capacidad de la persona para asumir la responsabilidad de sus propias acciones. En ocasiones, la persona emprendedora puede culpar de sus propias decisiones a otras personas o circunstancias. Esto sucede porque su expectativa de control es externa, esto es, considera que el resultado de sus acciones se debe a la suerte o a causas no relacionadas con su conducta.

**Tolerancia a la frustración:** Puede definirse como la capacidad de persistir en la conducta encaminada a obtener un resultado, a pesar de las dificultades o retrasos que hayan de enfrentarse. Esta es una cualidad fundamental en la persona emprendedora, porque va a tener que enfrentarse a retrasos, dificultades o imprevistos que le pueden llevar al desengaño y al fracaso.

**Orientación comercial:** Tiene que ver con la preferencia por las relaciones interpersonales laborales, lo que incluye la capacidad de comunicación y de obtención de la información adecuada para lograr los objetivos que se persiguen, o para la generación de relaciones de colaboración. Las habilidades o competencias más directamente relacionadas con este rasgo son las que tienen que ver con las habilidades de comunicación interpersonal, negociación y venta.

### El Perfil Psicosocial del Emprendedor en España

Las actitudes hacia la conducta emprendedora constituyen el componente del modelo que mayor impacto tiene sobre la intención, tanto en hombres como en mujeres. En esta investigación las actitudes hacia el autoempleo están compuestas a su vez de tres diferentes tipos de actitudes: la actitud general, las funciones actitudinales y las actitudes específicas de dominios relacionados con el autoempleo. La norma subjetiva es el componente más social del modelo, ya que refleja la influencia de las personas importantes para el sujeto en su decisión de desarrollar su carrera profesional a través del autoempleo. De esta forma, la conducta emprendedora no se explica sólo a través de factores personales, sino que la Teoría de la Acción Planificada resalta la presión que ejercen las personas que nos rodean sobre el desarrollo de la conducta. No obstante, esta influencia no es igual para todos, ya que el análisis multigrupo demuestra que la norma subjetiva tiene mucha más importancia para las mujeres que para los hombres.

Por otra parte, el control conductual muestra la importancia que tienen las creencias de la persona sobre sus propias capacidades para crear y gestionar una nueva empresa como predictor de la intención de emprender. Las personas con alta intención emprendedora se caracterizan por un perfil de valores de tipo individualista y, además, se establece una relación positiva entre este tipo de valores y la intención emprendedora. Diferentes estudios han señalado que contar con algún familiar directo empresario influye positivamente en la conducta emprendedora, así como que la experiencia laboral es un aspecto importante en la elección de desarrollar la carrera profesional como autoempleado. Los estudiantes consideran que la dificultad más importante para crear una empresa es la falta de financiación. Por el contrario, la realización de trámites (burocracia) ya no se percibe como una dificultad importante y pasa a ocupar el último lugar entre los principales obstáculos para la creación de un nuevo negocio.

### El Perfil del Emprendedor en México

Emprendedor es un término que tiene múltiples acepciones. En el ámbito de los negocios, el emprendedor es un empresario; es el propietario de una empresa comercial con fines de lucro. Para el académico emprender es un vocablo que denota un perfil, un conjunto de características que hacen actuar a una persona de una manera determinada y le permiten mostrar ciertas competencias para visualizar, definir y alcanzar objetivos. (Alcazar, Rafael, 2000) Existen diversas formas de definir y entender el término emprendedor, sin embargo los más variados autores coinciden en que el vocablo se deriva de la palabra *entrepreneur*, que a su vez se origina del verbo francés *entreprendre* que significa "encargarse de" (Jennings, 1994)

### Características del emprendedor

Alcazar menciona que de acuerdo con John Kao (1989), el emprendedor es una persona con características muy particulares, entre ellas:

Compromiso total, determinación y perseverancia  
Capacidad para alcanzar metas  
Orientación a las metas y oportunidades  
Iniciativa y responsabilidad  
Persistencia en la solución de problemas  
Realismo  
Autoconfianza  
Altos niveles de energía  
Busca de retroalimentación  
Control interno alto  
Toma de riesgos calculados  
Baja necesidad de estatus y poder  
Integridad y confiabilidad  
Tolerancia al cambio

Control Percibido interno clave del perfil emprendedor **¿Qué es Control Percibido Interno y Externo?**. Las personas desarrollan expectativas relativamente estables frente a las nuevas situaciones. Las “expectativas” son definidas como probabilidades subjetivas de que un comportamiento determinado conduzca a un resultado particular o “reforzador”. Estas son moldeadas por las experiencias personales, las cuales irremediabilmente impactan en la personalidad. Teniendo en cuenta esto, se sostiene que en las personas predomina un “control percibido” o “interno” o “externo”. Cuando prevalece el “control percibido externo”, la persona está convencida que los eventos en su vida son determinados en buena medida por terceras fuerzas extrañas a su control, como por ejemplo la “suerte”, el “destino”, las “energías”. Por el contrario, las personas en las cuales predomina un “control percibido interno” se consideran agentes activos de sus vidas.

Huir de la comodidad de trabajar para otro aceptando el desafío de ser tu propio jefe: esta elección da muchos quebraderos de cabeza, pero es el reto que muchas personas afrontan optando por el autoempleo. Y es que el actual panorama del trabajo está cambiando. La estabilidad absoluta en el empleo prácticamente ha desaparecido y muchas veces los emprendedores prefieren crear su propia empresa, con todos los riesgos que ello conlleva, antes de aceptar contratos que no ofrecen ninguna estabilidad. Estos emprendedores, en primer lugar, deben mostrar independencia, ambición y deseo de crear su propio modo de vida. Tienen confianza en una idea y desean darle forma. El perfil del emprendedor es el de una persona de entre 25 y 45 años, con estudios universitarios de titulación media o superior, de talante innovador e interesado por la conservación del medioambiente. Aunque la mayor parte de los emprendedores continúan siendo personas jóvenes que han terminado recientemente sus estudios, también está surgiendo la figura del emprendedor de más edad que quiere establecerse por su cuenta o derivar su negocio en otra nueva fórmula empresarial.

El nuevo emprendedor está muy lejos del empresario prepotente y desconectado de la plantilla, ya que trabaja por y con el equipo de profesionales del que se rodea. Sabe que el humano es el capital más importante de su empresa y por eso lo cuida, porque su éxito depende de sus trabajadores. Eso requiere una actitud y una predisposición especial, tolerante y abierta al diálogo. Los nuevos emprendedores no son como los del siglo pasado, que creaban empresas sin apenas estudios. Formados en diversos campos, cuentan además con una gran variedad de fuentes de información, hoy al alcance de su mano gracias a Internet. La información es muy importante para poder gestionar de una forma óptima la empresa, ya que

ayuda a predecir las circunstancias del mañana para poder tomar decisiones. Esa información, unida a simples soluciones informáticas (hojas de cálculo) y al sentido común, es lo que hace que los emprendedores se puedan adelantar el futuro y adopten las decisiones más adecuadas gracias a sencillos análisis de mercado. En el futuro, el emprendedor podrá trabajar por su cuenta, pero la tendencia indica que cada vez más las empresas necesitarán emprendedores que les proporcionen ideas nuevas y creatividad. Y esta relación entre empresas y emprendedores se establecerá, no sólo por medio de asociaciones empresariales sino también mediante relaciones contractuales, que den al emprendedor la libertad suficiente para realizar sus proyectos. Algunos de los rasgos característicos de los emprendedores, que, en primer lugar, deben cumplir con dos requisitos:

Tener una idea innovadora (fácil)  
Llevarla a la práctica (muy difícil)

El emprendedor puede abordar las funciones de forma individual, pero a menudo se forma un equipo de personas, muy al principio, que se constituyen como “equipo promotor”. Éste concibe, desarrolla y lleva a cabo el plan de empresa, participa en el capital y avala el proyecto con sus trayectorias profesionales, que preferiblemente serán complementarias. La persona emprendedora va a asumir riesgos, pero éstos deben ser calculados. El proceso de creación de una empresa no se acomete (o, al menos, nunca debería hacerlo) de manera aleatoria. El emprendedor ha analizado el entorno, ha diseñado su producto o servicio, ha analizado la viabilidad de su negocio y ha establecido unos resultados previsibles para su actividad.

*Expectativa de control:* Se relaciona con la capacidad de la persona para asumir la responsabilidad de sus propias acciones. En ocasiones, la persona emprendedora puede culpar de sus propias decisiones a otras personas o circunstancias. Esto sucede porque su expectativa de control es externa, esto es, considera que el resultado de sus acciones se debe a la suerte o a causas no relacionadas con su conducta. Cualquier país que pretenda tener un crecimiento sostenible ha de desarrollar una cultura emprendedora. Hay una asociación directa entre la creación de nuevas empresas y el desarrollo de la economía. Este es el fundamento por el que se estudia la figura del emprendedor, cada vez más necesaria en un contexto cambiante y de incertidumbre económica. Según un estudio sobre emprendedores, a partir del Cuestionario de evaluación del Perfil del Emprendedor (CPE) las dimensiones que en mayor medida distinguen al emprendedor del directivo y de la población en general son la motivación y necesidad de logro, la propensión al riesgo y el locus de control interno (la variable de aprendizaje que hace ver al emprendedor que el resultado es fruto de sus actuaciones). Entre las razones que les han motivado, destacan el conocimiento del producto, la capacidad para emprender y el deseo de crear una empresa o nueva actividad, frente a otras como la independencia económica, la imposibilidad de colocarse o alcanzar un mayor estatus social. De ello se desprende que “toda persona que lo desee puede ser emprendedora”. Para ello, es necesario que conjugue la motivación, el conocimiento, la experiencia y un contexto ambiental favorable. Las características personales asociadas al buen emprendedor son: -Motivación y seguridad en sí mismo: personas altamente motivadas con su proyecto y con una ilusión fuerte para ponerla en marcha a pesar de los posibles contratiempos que se puedan producir.

Se necesita una fusión de dos elementos: coraje y conocimiento. Para poder hacer camino rumbo a nuestros sueños, necesitamos coraje. Sólo aquellos que toman fuerza y buscan tener una mejor vida, en este caso a través de la empresa, lo van a lograr; sólo las personas comprometidas con su búsqueda logran resultados. Por tanto, la primera parte de esta fusión se llama coraje. Y la segunda conocimiento. Las personas empresarias que conocen su materia y que cada vez buscan saber cómo mejorar esa materia, ese producto o servicio, son los que podrán unir necesidades con clientes. Esta unión da por resultado lo que las personas no sólo necesitan, sino que valoran, por lo que llevarían su mano al bolsillo y destinarían dinero para la compra. Las personas que suman su conocimiento a su coraje siempre tienen un compromiso inquebrantable para dar soluciones impecables para los que les rodean y esto les da la puerta al éxito, a construir empresas

que hoy cuidarán, empresas que en un futuro cercano cuidaran de los empresarios. Los perfiles de éxito en nuestra cotidianidad se desarrollan por compromiso. Todos los que queramos tener permanencia en la vida empresarial debemos desarrollar coraje, conocimientos, mejorar nuestra forma de aprender, mejorar la forma en que enseñamos, tener una disciplina férrea y la capacidad de soñar. Estos elementos, en suma, realmente engloban el perfil del emprendedor – empresario de éxito.

En México la micro, pequeña y mediana empresa revisten gran importancia como generadoras de empleo y riqueza (Cota y González, 2006) Tomando en cuenta los más de 2 millones de MiPyMES existentes, la principal dificultad de estas es conseguir un financiamiento que les permita tener crecimiento y competitividad en la industria en la que operan. Según la OECD (2007) el funcionamiento de estos tipos de empresas brinda un beneficio macro y micro económico a la economía mexicana porque se generan empleos y mejora la competitividad

### La Organización

Existen diferentes definiciones como: Organización es la coordinación planificada de las actividades de las personas que tienen un objetivo común, en donde existe la división del trabajo y una jerarquía de autoridad y responsabilidad. Organización: entidad social compuesta por personas y recursos, estructurada deliberadamente y orientada a lograr objetivos (Chiavenato) Los seres humanos tienen que cooperar unos con otros, por sus limitaciones individuales y deben conformar organizaciones que les permitan lograr algunos objetivos que el esfuerzo individual no podría alcanzar. Una organización es un sistema de actividades conscientemente coordinadas, formado por dos o más personas, cuya cooperación recíproca es esencial para la existencia de aquélla. Una organización existe sólo cuando:

hay personas capaces de comunicarse;

están dispuestas a actuar conjuntamente (disposición de sacrificar su propio comportamiento en beneficio de la asociación);

para obtener un objetivo común.

### Las Organizaciones Como Sistemas Sociales

Las organizaciones son unidades sociales (o agrupaciones humanas) intencionalmente construidas y reconstruidas para lograr objetivos específicos. Una organización nunca constituye una unidad lista y acabada, sino un organismo social vivo y cambiante. Pueden dividirse en organizaciones con ánimo de lucro y sin ánimo de lucro. Empresa es toda iniciativa humana que busca reunir e integrar recursos humanos y no humanos, cuyo propósito es lograr autosostenimiento y obtener ganancias mediante la producción y comercialización de bienes o servicios. (Chiavenato)

### Las Organizaciones Como Sistemas Abiertos

*Sistema*: un conjunto de elementos (partes u órganos componentes del sistema) dinámicamente relacionados, en interacción que desarrollan una actividad (operación o proceso del sistema) para lograr un objetivo o propósito (finalidad del sistema), operando con datos, energía o materia (insumos o entradas de recursos necesarios para poner en marcha el sistema), unidos al ambiente que rodea el sistema (con el cual se relaciona dinámicamente), y para suministrar información, energía o materia (salidas o resultados de la actividad del sistema). (Chiavenato)

### Administrador

Un administrador es aquella persona dentro de la empresa que soluciona problemas, mide recursos, planea su aplicación, desarrolla estrategias, efectúa diagnósticos de situaciones. A un administrador se le puede enseñar lo que debe de hacer para llevar a cabo el proceso administrativo, por eso no lo capacitara efectivamente para hacerlo en todas las organizaciones, el éxito de un administrador en una organización no está enteramente relacionado con sus conocimientos académicos, eso es un aspecto muy importante sin embargo el administrador debe tener ciertas características de personalidad, de conocimiento tecnológico, para llevar acabo de manera eficiente la administración el administrador debe tener un perfil adecuado.

*El administrador profesional competente posee, y se conduce con, elevada conciencia ética, de servicio, y de responsabilidad social y ecológica.*

### El Futuro Empresario y la Competitividad

La competitividad determina el éxito o el fracaso de las empresas. También establece la conveniencia de las actividades que pueden favorecer su desempeño como innovaciones, una cultura cohesiva o una adecuada implementación. La estrategia competitiva es la búsqueda de una posición favorable dentro de una industria, escenario fundamental donde se lleva a cabo la competencia. Su finalidad es establecer una posición rentable y sustentable frente a las fuerzas que rigen la competencia en la industria. (Porter, Michael E. 2008) Ser competitivo es entrar a disputar un lugar o puesto en el mercado, contar con una clientela y mantenerse vigente. Ser competitivo con su empresa obliga al empresario a reconocer sus capacidades y estar dispuesto a innovar constantemente. El empresario debe garantizar que conoce y entiende los procesos que generan los servicios y productos que su empresa ofrece.

El conocimiento es la suma de todo lo que sabe una persona o empresa, no se hace énfasis en la cantidad de información que se puede tener acumulada en la memoria humana o en los archivos de la empresa, sino en saber hacer, saber pensar, saber ser y saber estar. El conocimiento por formación se adquiere por medio de programas académicos formales o informales, que cuentan con un método de estudio para llegar al dominio de un tema. El conocimiento por experiencia se adquiere de forma vivencial. En este tipo de conocimiento el ser humano graba muchos más datos, deja registrados emociones y percepciones. La competitividad es el centro del análisis para que cada organización se acoja a las necesidades del entorno según los criterios de maximización planeados desde un principio. Existen tres actores principales integrados en los que la competitividad se hace manifiesta, los cuales son: El sistema productivo, el gobierno y los clientes o usuarios finales. El sistema productivo es el que se encarga de generar ventajas competitivas internacionales. El reto de aplicar el conocimiento en una empresa para crear ventajas competitivas se hace aun más desafiante debido a: El mercado es cada vez más competitivo, lo que demanda mayor innovación en los productos. debido a esto, el conocimiento debe desarrollarse y ser asimilado cada vez con mayor rapidez.

Las empresas están organizando sus negocios enfocando sus esfuerzos en crear mayor valor para sus clientes. Las funciones del personal de administración se han ido reduciendo, así como los mismos niveles administrativos. Existe la necesidad de reemplazar la manera informal en la que se gerenciaba el conocimiento en las funciones administrativas por métodos formales dentro de procesos de negocios orientados al cliente. La presión de la competencia está reduciendo el tamaño de los grupos de empleados que poseen el conocimiento de la empresa. Se requiere tiempo para adquirir conocimiento y lograr experiencia a partir de él. Los empleados cada vez tienen menos tiempo para hacer esto. Existe la necesidad de manejar cada vez mayor complejidad en empresas pequeñas y con operaciones trans-nacionales. Cambios en la dirección estratégica de la empresa puede causar pérdida de conocimiento en un área específica. Una decisión posterior que retome la orientación anterior puede requerir ese conocimiento.

## CONCLUSIONES

Actualmente la competencia de los mercados, las condiciones y factores tradicionales, como la mano de obra, el acceso a recursos financieros y la materia prima, ofrecen ventajas competitivas menores que en el pasado. Las tendencias actuales exigen que los ejecutivos superiores de las empresas se planteen nuevos conceptos para sus organizaciones, es necesario que se cambie la actual forma de ver a las organizaciones. Como primer paso es necesario visualizar a la empresa como un conjunto de recursos, capacidades y aptitudes centrales heterogéneos que pueden utilizarse para crear una ventaja con relación a otras empresas del mercado. Lo anterior supone que cada empresa tiene recursos y capacidades que no poseen otras empresas, al menos no en la misma combinación. Los recursos son la fuente de capacidades, algunas de éstas llevan al desarrollo de aptitudes centrales. Utilizando las aptitudes centrales, las empresas pueden desarrollar mejor sus actividades que sus competidores. En esencia, esta nueva panorámica basa la estrategia en términos de una posición competitiva única, mas que en la eficacia operativa. Las organizaciones no funcionan solas ni alcanzan el éxito por azar. Se necesita de administradores que posean diferentes características del emprendedor para hacer que su empresa sea competitiva. Todas las organizaciones son dirigidas por administradores, que distribuyen los recursos para diferentes fines. El administrador a su vez es un recurso social muy importante. El Administrador no debe olvidar en su proceso decisorio para hacer la empresa competitiva, tomar en cuenta la calidad de vida de los colaboradores. Para que la organización pueda llegar a ser competitiva hace falta no sólo un buen funcionamiento interno, sino llevar a cabo transacciones adecuadas con el entorno dirigidas por un Administrador (emprendedor) o bien contar con personas emprendedoras ya que así los trabajadores los tomarán como guía para desempeñar mejor su trabajo y contribuyen al logro de objetivos y la competitividad.

## **PERTINENCIA EDUCATIVA, ELEMENTOS PARA SU EVALUACIÓN A PARTIR DE LA INCURSIÓN LABORAL DE EGRESADOS**

Juan Carlos Román Fuentes, Universidad Autónoma de Chiapas  
Rafael Timoteo Franco Gurriá, Universidad Autónoma de Chiapas  
Ángel Esteban Gordillo Martínez, Universidad Autónoma de Chiapas

### **RESUMEN**

*A partir de los resultados obtenidos al realizar seguimiento longitudinal de egresados, con estudiantes de Administración y Contaduría; este documento socializa los principales indicadores relacionados con trayectorias laborales y ubicación en el mercado laboral, del segundo panel de egresados de la cohorte 2007-2011, entrevistados a dos años de ocurrido el egreso (2013), como insumo para evaluar la pertinencia de los programas ofertados. La información generada permite establecer que dos terceras partes de quienes estudian Administración antes de concluir la carrera, se han incorporado al mercado laboral, en puestos que muestran mediana o total coincidencia con los estudios realizados; posteriormente cuando concluyen los estudios cerca del 75% consigue empleo en menos de un año; debiendo estar titulados como principal requisito para ser contratados (45%); a su vez, en el 70% de los casos los salarios percibidos al egresar, no rebasan cinco salarios mínimos y los puestos ocupados generalmente son empleados, auxiliares, analistas o jefes de oficina. Quienes egresan de Contaduría más del 80% se han incorporado al mercado laboral antes de concluir la carrera, en puestos con mediana o total coincidencia con lo estudiado (77%), al concluir los estudios más del 87% consiguió empleo en menos de un año y el requisito que más influyó para ser contratados fue el de aprobar entrevista formal (67%); en la mayoría de los casos, los salarios percibidos no rebasan cinco salarios mínimos y son contratados a través de contratos por tiempo indeterminado como auxiliares o empleados profesionales.*

**PALABRAS CLAVE:** Egresados, Mercado Laboral, Mejora Continua, Pertinencia

## **CHALLENGES AND OPPORTUNITIES ARISING LEVELS OF SATISFACTION WITH SERVICES RECEIVED IN A UNIVERSITY FROM THE PERCEPTION OF ITS GRADUATES**

### **ABSTRACT**

*From the results obtained by performing longitudinal follow-up of graduates, established a School of Accounting and Administration of southeastern Mexico, the main indicators related to career paths and location in the labor market, the first panel of graduates described herein degrees in Management and Accounting (Generation 2005-2009), interviewed two years of the discharge occurred, as input to assess the relevance of the programs offered. The information generated can establish that two thirds of those studying Administration before concluding the race, have entered the labor market in positions that show average or total agreement with studies; later when studies conclude about 75 % get a job in less than a year; I must be qualified as a primary requirement to be employed (45%); turn in 70 % of cases the wages earned upon graduation, do not exceed five minimum wages and incumbency are generally employees, assistants, office managers or analysts. Accounting leavers over 80% have entered the labor market before the end of the race, in positions that show median or total agreement with studies conducted (77%), to complete the studies more than 87% got jobs within one year and the most influential requirement to be*

*hired was to approve formal interview (67%) in most cases, do not exceed the wages earned five minimum wages and are hired through contracts indefinitely as assistants or professional employees.*

**JEL:** A22, I21, I23

**KEYWORDS:** Graduates, Labor Market, Continuous Improvement, Relevance

## INTRODUCCIÓN

Bajo la premisa de que la importancia de los estudios de egresados reside en que a través de ellos, en las universidades, pueden construirse diagnósticos que permiten determinar fortalezas y áreas de oportunidad, para evitar la oferta de opciones educativas poco pertinentes y por lo mismo alejadas de la realidad en la que habrán de desempeñarse los futuros egresados (Fresán, 1998); en la Facultad de Contaduría y Administración, Campus I (FCA, CI) de la Universidad Autónoma de Chiapas (UNACH), a partir del ciclo escolar Agosto-Diciembre 2009, se realiza seguimiento de quienes concluyen estudios de licenciatura. Se considera como punto de partida el supuesto de que las instituciones de educación superior (IES) que aspiran a ofrecer programas educativos de calidad, deben observar el desarrollo profesional de sus egresados, puesto que ellos al insertarse al mundo laboral, dan cuenta del éxito o fracaso de las opciones curriculares ofrecidas (Lopera, 2005).

Estos estudios, son una herramienta que permite dar cuenta del recorrido laboral de los egresados y ofrecen elementos para analizar la relación educación-trabajo-necesidades sociales, lo que a su vez contribuye con argumentos sólidos y confiables para actualizar, reestructurar o replantear los planes y programas de estudio y en ocasiones aportan elementos para revisar las formas de organización interna, los métodos y procedimientos de trabajo adoptados. Los productos de este tipo de trabajos, combinados con resultados de estudios interrelacionados y complementarios (opinión de empleadores, trayectorias educativas, por citar algunos) así como de las perspectivas de desarrollo, generan elementos fundados para evaluar la pertinencia de la oferta educativa y en general para redimensionar la labor educativa (Fresán, 1998). Sin caer en la visión reduccionista de circunscribir el concepto de pertinencia a las respuestas que la universidad debe dar a las demandas de la economía o del sector laboral o profesional, puesto que sin duda además de atender estos requerimientos deben visualizar a la pertinencia desde una perspectiva amplia que considere integralmente desafíos, retos y demandas que la sociedad impone (Tünnermann, 2001), en este trabajo se coincide con quienes señalan que la pertinencia debe conjugar lo económico, social y cultural, adicionando la crítica permanente como discurso constructor de alternativas de pensamiento nuevo (Dengo, 1995; Grundy, 1998; Malagón, 2003), considerando entonces que el mercado de trabajo, si bien constituye un referente necesario, resulta insuficiente cuando se intenta describir la calidad educativa (Valenti y Varela, 1998).

A pesar de ello, es innegable que el desempeño profesional de los egresados debe analizarse periódica y rigurosamente, puesto que a través de los profesionistas recién egresados se cristalizan los objetivos y se cumple la misión formalmente declarada (Lopera, 2005) y puede valorarse la coherencia entre las prácticas declaradas y las necesidades del entorno. Partiendo de lo anterior, en este reporte se socializan los resultados de las variables: trayectorias laborales y ubicación laboral (30 preguntas en total) de los egresados de los programas educativos de licenciatura en Administración y en Contaduría, que derivan de la aplicación, a dos años de ocurrido el egreso, de encuesta adaptada de la propuesta por la Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES, 1998), cuya información constituyen aportes que deben considerarse al evaluar la pertinencia de los programas educativos involucrados; para ello en seguida a esta introducción, se realiza una breve revisión de los referentes teóricos que sustentan los estudios de egresados; se describen los pasos observados en la realización del proyecto y se presentan los

resultados más representativos de las variables mencionadas; al final se presentan las principales conclusiones derivadas del proyecto.

## REVISION DE LITERATURA

De acuerdo con ANUIES, un seguimiento de egresados, consiste en la evaluación de los egresados en relación con sus estudios realizados, es decir, el procedimiento mediante el cual una institución busca conocer la actividad profesional que éstos desarrollan, su campo de acción, su nivel de ingresos, las posibles desviaciones profesionales que han tenido así como sus causas, su ubicación en el mercado de trabajo y su formación académica posterior al egreso (1998). Otras opiniones sobre el tema señalan que las propuestas metodológicas que tienen por objetivo conocer el destino laboral, ocupacional o escolar de quienes han salido del mismo ciclo, nivel, subsistema, modalidad, institución o programa educativo, se denominan estudios de seguimiento de egresados (Barrón, 2003, citando a Didou & Rodríguez).

Fresán (1998), por su parte, señala que los estudios de egresados más que una simple referencia del proceso de inserción de los nuevos profesionales en el mercado laboral o sólo indicadores de satisfacción de éstos respecto a la formación recibida en la universidad, constituyen poderosos mecanismos de diagnóstico de la realidad, que además tienen implícito el potencial de inducir a las IES a la reflexión a fondo sobre sus fines y valores, puesto que los resultados que arrojan, aportan elementos que ayudan a redefinir el proyecto de desarrollo de aquellas instituciones que se mantienen alerta ante las nuevas necesidades sociales, permitiendo reconocer las nuevas formas de práctica profesional requeridas para sustentar un proceso social menos inequitativo y dependiente; de tal forma que este tipo de trabajos permite analizar entre otras cosas: los caminos que siguen los nuevos profesionales, si dentro de las empresas se estancan en puestos bajos o intermedios, o bien, si gracias a su formación pueden acceder progresiva y rápidamente, a posiciones complejas, si con creatividad y capacidad de identificar problemas y oportunidades, son capaces de encontrar vetas de desarrollo que les permitan generar nuevas alternativas para su propia subsistencia primero, y para ampliar la demanda de trabajo después, etc.

En este sentido, la Secretaría de Educación Pública (SEP, 2010), establece que los estudios de seguimiento de egresados y de empleadores, realizados por las IES deben ser utilizados para actualizar los planes y programas de estudio vigentes, ya que la calidad y pertinencia de los programas educativos, se debe reflejar en una mejora en la formación integral de los estudiantes, destacando las competencias laborales, que les permitan construir con éxito el futuro; ya sea al incorporarse al mundo del trabajo, en las relaciones diarias con la sociedad o al continuar con la preparación académica a lo largo de toda la vida. Para ello se abona a la idea de que los procesos de transformación vividos en las universidades, están expresados en las tensiones que surgen entre las concepciones educativas que se adoptan (tradicionales y emergentes), en las posiciones que demandan mayor funcionalidad de la educación frente al aparato productivo; y las que sugieren mayor compromiso institucional en términos de democracia, interculturalidad y equidad socioeconómica, así como las que buscan mantener una visión pragmática y totalizante de los saberes y en contra parte las que promueven el valor intrínseco del conocimiento y su avance; en el centro de estas discusiones; es posible encontrar una certidumbre: la educación y sus fines deben revisarse y actualizarse periódica y frecuentemente si se pretende dar en cada momento las respuestas más adecuadas a las nuevas circunstancias que se presentan (Sánchez, Ortiz y Gaytán, 2007).

De ahí que este tipo de trabajos, no debe ser una acción aislada y temporal, (Lopera, 2005) sino que debe entenderse como un proceso sistémico y permanente que, combinados con otros estudios relacionados permitan conocer la pertinencia de los programas y se generen elementos para la mejora y actualización de planes y programas de estudio. Es preciso señalar que existen diferencias entre un estudio de egresados y un seguimiento de egresados; el primero consiste en la realización de investigaciones sobre egresados en un momento en el tiempo, que se efectúan en un periodo específico y pueden no repetirse, o bien realizarse

esporádicamente, estos estudios tienen algunas limitaciones; entretanto, un seguimiento de egresados, consiste en seguir longitudinalmente a los estudiantes y entrevistarlos al menos en dos momentos posteriores al egreso, teniendo la particularidad adicional de formar como mínimo dos paneles de estudio, es decir, trabajar con dos generaciones de egreso para obtener mayor contundencia y certidumbre en las afirmaciones respecto a las facilidades y dificultades de los profesionales egresados en el mercado laboral (Valenti y Varela, 2004). Debe reconocerse también, que existen posiciones que afirman que las universidades han de servir a las sociedades, primordialmente respaldando la economía y mejorando las condiciones de vida de sus ciudadanos, sin ocuparse de la función crítica de la universidad, atendiendo otra más pragmática en términos de suministro de recursos humanos calificados y la producción del conocimiento (Gibbons, 1998).

En este proyecto, al definir a la pertinencia, se coincide con quienes afirman que las universidades deben negarse a reducir su formación a los estrechos marcos de un puesto de trabajo, puesto que debe ocuparse en formar para la vida, lo cual exige una formación mucho más integral, más compleja, crítica y transformadora (Malagón, 2007); de ahí que se consideran los ejes planteados por la Organización de las Naciones Unidas para la Educación, la Ciencia y la Cultura (UNESCO, 2005) cuando define las respuestas de la educación superior, y señala que además de la calidad y la internacionalización, se incluye a la pertinencia, definida a través de siete componentes: relaciones con la sociedad en su conjunto, la educación superior y el mundo del trabajo, las relaciones con el estado, las bases de la dirección y gestión de los centros, financiación y gastos compartidos, la renovación de la enseñanza y el aprendizaje: problemas de contenido y pedagogía, fortalecimiento de las funciones de investigación de la educación superior y la responsabilidad de la educación superior con respecto a los otros niveles educativos.

Identificar las características del mercado laboral y las trayectorias laborales que los egresados de Contaduría y Administración desarrollan, tendrá utilidad si desde la propuesta de las dinámicas de pertinencia curricular (Malagón, 2007), las IES son capaces de “pedagogizar” los saberes obtenidos del entorno (laboral en este caso), que implica la transformación de estos saberes a saberes académicos y su integración al currículo, puesto que es importante repensar la formación profesional creando perfiles de egreso más flexibles, que demuestren capacidad de adaptación a los drásticos cambios que el mercado laboral presenta en el corto plazo, complementados con una amplia oferta, también flexible de programas de educación continua (Cordera y Lomelí, 2006).

Un estudio similar, se realizó en la propia FCA, con egresados del primer panel seleccionado (Román, Franco & Gordillo, 2013) y en él se encontró que; más de la mitad de quienes estudian Administración antes de concluir la carrera, se han incorporado al mercado laboral, en puestos que muestran mediana o total coincidencia con los estudios realizados; posteriormente cuando concluyen los estudios cerca del 90% consigue empleo en menos de un año; siendo la entrevista formal el principal requisito para ser contratados (44%); a su vez, en el 70% de los casos los salarios percibidos al egresar, no rebasan cinco salarios mínimos y los puestos ocupados generalmente son empleados, auxiliares, analistas o jefes de oficina. Quienes egresan de Contaduría más del 75% se han incorporado al mercado laboral antes de concluir la carrera, en puestos que muestran mediana o total coincidencia con los estudios realizados (80%), al concluir los estudios más del 90% consiguió empleo en menos de un año y el requisito formal que más influyó para ser contratados fue el de estar titulado (44.%); en 92% de los casos, los salarios percibidos no rebasan cinco salarios mínimos y en su mayoría son contratados como auxiliares o empleados profesionales.

## METODOLOGÍA

Desde la visión positivista, este trabajo se ha desarrollado siguiendo una serie de pasos controlados con la posibilidad de ser manipulados por el investigador y tomando en cuenta solo los datos que aportan evidencias sobre los temas a estudiar (Gil y Rosas, 2010). Partiendo de la clasificación del método científico

propuesta por Eyssautier (2006), al partir de teorías, enfoques y leyes generales para llegar a implicaciones particulares del tema, se recurrió al submétodo deductivo, utilizando el método de observación, a través de las técnicas de observación específica: investigación documental e investigación de campo; de acuerdo con la clasificación propuesta por Hernández, Fernández y Baptista (2007), el alcance de este estudio es exploratorio y descriptivo. De manera general, el desarrollo general del proyecto implicó las siguientes etapas:

Recopilación de datos: consistió en la identificación de los documentos fuente, que incluye la revisión bibliográfica, la lectura selectiva, la formulación de fichas bibliográficas, la realización de fichas de trabajo y el concentrado de las fichas documentales. Se utilizó como procedimiento de recopilación la elaboración de fichas tanto bibliográficas, conceptuales y de trabajo y como instrumentos de recopilación de la información las tarjetas, los ficheros, lápiz y pluma. Procesamiento de datos: concluida la etapa anterior, se procedió a la ejecución del diseño de la investigación planteada y al aplicar los instrumentos de recolección de la información se procedió a la organización de los elementos obtenidos, lo que implicó la estructuración y redacción de los diferentes productos derivados de la investigación. Interpretación de la información obtenida: implicó someter la información obtenida al análisis, lo cual involucró un minucioso examen de la misma, para responder a los cuestionamientos planteados en la investigación y posteriormente intentar explicarlos a través de un proceso mental que requiere encontrar mayor significado a la información obtenida. Comunicación de resultados: etapa que representa la divulgación de los logros obtenidos durante el trabajo de investigación, misma que se cristaliza con la estructuración, redacción y presentación de diversos informes y productos escritos.

### Diseño

Los resultados aquí plasmados, corresponden a la etapa de seguimiento longitudinal que plantea el modelo general del seguimiento de egresados, que implicó la determinación de una muestra representativa del universo de egresados de una cohorte específica (en este caso la egresada en el ciclo Agosto-Diciembre 2011, entrevistada en el periodo Noviembre-Diciembre de 2013). El instrumento empleado parte de la propuesta de la ANUIES (1998), adaptada al entorno de la FCA, lo que generó versión que contempla 78 preguntas cerradas, con los que se trata de medir los indicadores relacionados con:

Datos generales, escolaridad y ocupación del jefe de familia,  
Datos de la institución en donde se estudió y sobre la carrera elegida,  
Razones que influyeron para elegir a la FCA, C1 de la UNACH,  
Trayectoria y ubicación en el mercado laboral,  
Búsqueda de trabajo en el periodo inmediato posterior al egreso de la licenciatura,  
Características del empleo inmediato posterior al egreso de la licenciatura,  
Empleo actual, desempeño profesional, exigencia en el desempeño profesional cotidiano en el trabajo actual,  
Opinión de los egresados sobre la formación recibida,  
Comentarios sobre los contenidos de los planes de estudio,  
Opinión sobre los conocimientos y habilidades aprendidas,  
Opinión sobre la información social recibida,  
Recomendaciones para mejorar el perfil de formación profesional,  
Opinión sobre la organización académica,  
Opinión sobre el desempeño institucional,  
Opinión sobre la organización institucional,  
Satisfacción con la institución y con la licenciatura estudiada.

Es un estudio no experimental y la aplicación de la encuesta fue autoadministrada, mediante entrevistas personalizadas, correo electrónico y llamadas telefónicas; en algunos casos se requirió una segunda visita a cada encuestado, para determinar el tamaño de la muestra se retomaron las sugerencias del Centro Universitario de Ciencias Exactas e Ingeniería de la Universidad de Guadalajara (CUCEI, 2007), atendiendo los criterios ahí contenidos, dando como resultado la muestra que se presenta en la Tabla 1, donde puede apreciarse el número de egresados y el número de encuestados de cada uno de los programas educativos aquí reportados.

Tabla 1: Determinación de la Muestra

	Administración	%	Contaduría	%
Número de egresados:	92	100	101	100
Muestra objetivo:	46	50	51	50
Muestra alcanzada:	44	48	50	50

*Esta tabla muestra la cobertura alcanzada en la aplicación del instrumento al universo de egresados; puede apreciarse que respecto a quienes egresaron de Administración; se planteó como muestra objetivo al 50% de los egresados, alcanzando el 48%, lo cual significó contactar a 44 de los 92 profesionistas; en lo que se refiere a egresados de Contaduría; la muestra objetivo también se planteó una muestra del 50%, que de alguna forma se logró al encuestar a 50 de los 101 egresados; con esta muestra se buscó mayor consistencia en los hallazgos; de manera que en total para este reporte se presentan resultados de 98 profesionales egresados, contactados a dos años de ocurrido el egreso. Fuente: elaboración propia*

Los egresados fueron elegidos en forma probabilística, auxiliados por tabla de números aleatorios, previa numeración del total de egresados que conforman la base de datos de la cohorte elegida, asignando a cada encuestador el total de elementos muestrales seleccionados que conformaron la muestra ideal, estableciendo la posibilidad de reemplazarlos una sola vez.

Para la sistematización de datos se procedió a la captura de las encuestas y con el concentrado obtenido se generaron bases de datos en hojas de *Excel*, para obtener mayor flexibilidad y usabilidad.

## RESULTADOS

Como se ha descrito, el instrumento utilizado para recopilar información, consta de 78 preguntas cerradas, aunque para efectos de este reporte, únicamente se describen los resultados de 30 de ellas, que se relacionan con las variables: trayectoria y ubicación inicial en el mercado laboral (18 preguntas) y ubicación actual en el mercado laboral (12 preguntas), mismos que se describen en las tablas 2 y 3; presentadas en seguida.

Tabla 2: Trayectoria y Ubicación Inicial en el Mercado Laboral de Egresados de los Programas de Licenciatura en Administración y en Contaduría

Variable: Trayectoria y Ubicación Inicial en el Mercado Laboral:	Egresados De:	
	Administración	Contaduría
Frecuencia de egresados que durante el último año de la carrera se había incorporado al mercado laboral	66%	88%
Frecuencia de egresados incorporados al mercado laboral durante el último año de la carrera, cuyo trabajo desempeñado tenía <u>mediana</u> coincidencia con estudios realizados:	41%	32%
Frecuencia de egresados que al incorporarse al mercado laboral durante el último año de la carrera, el trabajo desempeñado tenía <u>total</u> coincidencia con estudios realizados:	34%	45%
Frecuencia de egresados que al concluir sus estudios, buscó trabajo activamente:	73%	50%
Frecuencia de egresados que al concluir sus estudios, buscó trabajo activamente y lo encontró en menos de seis meses:	72%	84%
Frecuencia de egresados que al concluir sus estudios, buscó trabajo activamente y lo encontró en un lapso de seis meses a un año:	16%	4%
Frecuencia de egresados que al enfrentar demoras y dificultades en la búsqueda de empleo, el principal obstáculo fue la <u>escasa experiencia laboral</u> :	60%	33%
Principales medios utilizados por los egresados para buscar empleo:		
Recomendaciones personales	29%	13%
Bolsa de trabajo	21%	13%
Invitación expresa	18%	22%
Recomendación de amigos de licenciatura	7%	17%
Requisito que más influyó en la obtención del empleo:		
Entrevista formal	24%	67%
Estar titulado	45%	25%
Aprobar examen de selección	31%	8%
Principales factores que facilitaron la obtención del empleo:		
Prestigio de la FCA	56%	50%
Coincidencia de la carrera con necesidades de la empresa	61%	48%
Buena aceptación de la carrera en el mercado laboral	61%	50%
Razones argumentadas por quienes no buscaron empleo al concluir sus estudios:		
Porque ya tenían un trabajo	69%	88%
Razones personales	23%	12%
Denominación del puesto ocupado al ser contratado al concluir sus estudios:		
Empleado:	92%	98%
Que implica desempeñarse como:		
Empleo profesional	24%	14%
Auxiliar	27%	62%
Asistente	14%	-
Tamaño de empleadores (de acuerdo al número de empleados):		
Empresas que no sobrepasan 15 empleados	19%	44%
Empresas que tienen más de 250 empleados	51%	26%
Tipo de contratación prevaleciente:		
Contrato por tiempo indeterminado	49%	57%
Contrato por tiempo determinado	35%	34%
Tipo de empresa contratante:		
Privada	68%	77%
Salarios percibidos:		
Entre \$1,000 y \$3,000	19%	31%
Entre \$3,001 y \$6,000	50%	45%
Jornada laboral prevaleciente al ser contratado:		
Entre 31 y 40 horas	35%	44%
Entre 41 y 50 horas	46%	30%
Coincidencia entre estudios realizados y primer trabajo desempeñado:		
Mediana coincidencia	36%	26%
Total coincidencia	42%	52%
Principales sectores económicos en donde se ubican los egresados:		
Comercio	26%	21%
Gobierno	11%	12%
Servicios profesionales y técnicos	3%	37%
Servicios bancarios y financieros	6%	7%

A través de esta tabla se observa que quienes egresan de Administración; durante el último año de estudios, cerca de dos terceras partes se han incorporado al sector laboral, de éstos el 40% en trabajos con mediana coincidencia con el perfil de egreso y 34% señaló total coincidencia; al concluir los estudios 7 de cada 10 egresados buscaron activamente un trabajo y lo encontraron en menos de 6 meses; mientras que 16% lo encontró en el lapso de un año; del total de egresados que buscaron trabajo, el 60% señala como obstáculo la escasa experiencia laboral; estos profesionistas para ser contratados deben cumplir con estar titulados como principal requisito (45%) seguido de aprobar un examen de selección (31%) más de la mitad (51%) se contrata en empresas grandes (más de 250 empleados) a través de contratos por tiempo indeterminado. Respecto a quienes egresan de Contaduría, ; durante el último año de estudios, casi nueve de cada diez egresados se han incorporado al sector laboral, de éstos una tercera parte (32%) en trabajos con mediana coincidencia con el perfil de egreso y 45% señaló total coincidencia; al concluir los estudios la mitad de los egresados buscaron activamente un trabajo y 84% lo encontraron en menos de 6 meses; del total de egresados que buscaron trabajo, 33% señala como obstáculo la escasa experiencia laboral; estos profesionistas para ser contratados deben cumplir con aprobar una entrevista (67%), seguido de estar titulado como principal requisito (25%) 44% de ellos se contrata en empresas pequeñas (menos de 15

empleados) a través de contratos por tiempo indeterminado (57%); en ambos casos, los salarios que perciben al egresar oscilan entre 260 y 460 USD. Fuente: elaboración propia

Tabla 3: Ubicación Actual en el Mercado Laboral de los Egresados de las Licenciaturas en Administración y en Contaduría

Variable: Ubicación Actual en el Mercado Laboral:	Egresados de:	
	Administración	Contaduría
Frecuencia de egresados que actualmente están trabajando:	77%	84%
Denominación del puesto ocupado actualmente		
Empleado:	91%	93%
Que implica desempeñarse como:		
Empleado profesional	29%	40%
Auxiliar	12%	19%
Jefe de Oficina	11%	2%
Analista especializado	9%	7%
Asistente	14%	-
Tamaño de empleadores (de acuerdo al número de empleados):		
Empresas que no sobrepasan 15 empleados	21%	40%
Empresas que tienen más de 250 empleados	70%	35%
Tipo de contratación prevaleciente:		
Contrato por tiempo indeterminado	61%	79%
Tipo de empresa contratante:		
Privada	59%	53%
Salarios percibidos:		
Entre \$1,000 y \$3,000	6%	7%
Entre \$3,001 y \$6,000	30%	38%
Entre \$6,001 y \$9,000	33%	33%
Jornada laboral prevaleciente:		
Entre 31 y 40 horas	34%	35%
Entre 41 y 50 horas	37%	45%
Coincidencia entre estudios realizados y el trabajo desempeñado actualmente:		
Mediana coincidencia	35%	26%
Total coincidencia	45%	54%
Principales sectores económicos en donde se ubican los egresados actualmente:		
Comercio	27%	24%
Gobierno	8%	17%
Industria de la construcción	11%	14%
Servicios bancarios y financieros	14%	4%
Servicios profesionales y técnicos	5%	19%
Principales actividades desempeñadas y su relación con:		
Actividades administrativas	32%	16%
Dirección	5%	-
Análisis Financiero	5%	9%
Otra	5%	23%
Cálculo de impuestos	-	19%
Medio utilizado al ubicarse en el trabajo actual:		
Recomendaciones de amigos o familiares	21%	26%
Periódico	6%	-
Relaciones establecidas en empleos anteriores	15%	16%
Integración a negocio familiar	6%	2%
Bolsa de trabajo	18%	4%
Recomendación de amigos de licenciatura	9%	16%

En esta tabla se observa que a dos años de ocurrido el egreso; 8 de cada 10 egresados de Administración se encuentran trabajando, en labores que muestran mediana relación con el perfil de egreso (35%) y 45% total coincidencia, se mantienen trabajando en empresas grandes (7 de cada 10) mayoritariamente del sector privado y aun cuando 30% percibe salarios que oscilan entre 230 y 460 USD; 33% declaró salarios mensuales entre 460 y 692 USD; más de una tercera parte (37%) declara desempeñar trabajos en jornadas que sobrepasan la legislación laboral; siendo el sector comercial el principal empleador; siendo las recomendaciones de amigos o familiares los que presentan mayor frecuencia como medio para ubicarse en el trabajo actual. Quienes egresan de Contaduría también presentan altas tasas de ocupación a dos años de ocurrido el egreso (84%), en labores que muestran mediana relación con el perfil de egreso (26%) y 54% total coincidencia, se mantienen trabajando en empresas pequeñas (4 de cada 10) aunque una tercera parte (35%) se ha incorporado en empresas con más de 250 empleados; mayoritariamente del sector privado y aun cuando 38% percibe salarios que oscilan entre 230 y 460 USD; 33% declaró salarios mensuales entre 460 y 692 USD; cerca de la mitad de los encuestados (45%) declara desempeñar trabajos en jornadas que sobrepasan la legislación laboral; siendo el sector comercial el principal empleador, seguido de los servicios profesionales y técnicos (19%); siendo las recomendaciones de amigos o familiares los que presentan mayor frecuencia como medio para ubicarse en el trabajo actual. Fuente: elaboración propia

## CONCLUSIONES

Las trayectorias laborales y el proceso de inserción en el mercado laboral observado por quienes egresan de la licenciatura, si bien no son los únicos elementos a considerar para determinar la pertinencia de los programas educativos, resultan un indicador valioso que al combinarse con estudios que recogen la opinión de empleadores, trayectorias escolares, análisis sobre las tendencias disciplinares y perspectivas de desarrollo (por citar algunos) pueden transformarse en importantes mecanismos de diagnóstico, para evaluar la pertinencia de la oferta educativa y en consecuencia las IES están en condiciones de redimensionar su labor y mejorar y actualizar los planes y programas de estudio.

Identificar las características del mercado laboral y las trayectorias que siguen los egresados de las diversas licenciaturas para enrolarse al sector productivo, tiene utilidad si los indicadores que desde ya se atisban, van acompañados de procesos sistémicos de gestión de desarrollo curricular capaces de interpretar e incorporar en planes y programas de estudio, las exigencias planteadas por el entorno profesional en que los egresados habrán de competir; de manera que el currículo, sin descuidar la formación integral y el espíritu crítico que debe caracterizar a los procesos formativos, busquen la necesaria vinculación con las exigencias del sector productivo.

Aún con los matices que se identifican en ciertos casos, los egresados de las dos licenciaturas aquí analizadas presentan grandes similitudes en las trayectorias laborales desarrolladas, dejando entrever que comparado con la situación inicial cuando ocurre el egreso, la ubicación actual dentro del mercado laboral, presenta cierta mejoría; sin embargo, existen dificultades para escalar posiciones dentro de las organizaciones y las remuneraciones salariales que perciben los egresados, apenas son las indispensables para atender las necesidades básicas, asimismo se observa que una buena parte de los egresados recién incorporados al mercado laboral sobrepasan las jornadas establecidas por la legislación y que el número de egresados que ejercen su profesión de manera independiente, no es significativo; con todo, se tienen altas tasas de incorporación al sector productivo en tiempos relativamente breves (menos de un año de ocurrido el egreso) y existe una buena correlación entre las actividades que desarrollan en el trabajo y los conocimientos y habilidades adquiridos durante el proceso de formación profesional.

Se mantienen similitudes con los resultados que arrojó este mismo estudio con egresados del primer panel de egresados (encuestados en 2011), aunque respecto a los requisitos de contratación de egresados de Administración el primer panel señaló con mayor frecuencia a la entrevista formal y en esta ocasión los encuestados manifestaron como principal requisito el estar titulados; se mantiene la misma tendencia en los bajos salarios y en las violaciones a las jornadas laborales; quienes egresan de Contaduría muestran similares resultados y también existe una modificación en los procesos de contratación, ahora señalan como principal requisito el aprobar una entrevista formal (67%); mientras que en el pasado, los encuestados durante 2011 señalaron a estar titulado como el requerimiento con más menciones.

Estos resultados deberán ser objeto de un análisis más riguroso y atenderse de manera integral con las otras variables, de tal forma que puedan generarse conclusiones con ofrezcan mayor certidumbre, alejadas de circunstancias coyunturales, (Valenti y Varela, 2004) por otro lado se planea establecer un contacto adicional con estos mismos egresados en 2015, para precisar con mayor detalle la evolución observada a cuatro años de ocurrido el egreso. Finalmente es conveniente precisar que no es una tarea fácil el responder a las necesidades del mercado laboral puesto que no existe un acuerdo sobre lo que éste necesita, sin embargo, debe insistirse en la necesidad de este tipo de estudios y en la inclusión de los resultados que de los mismos deriven en las agendas de las autoridades que definen las políticas educativas, venciendo la inmediatez de los resultados exigidos, entendiendo que estos estudios suponen resultados de largo aliento que consumen varios años de esfuerzos.

## RECONOCIMIENTO

Los autores agradecen el apoyo financiero recibido por parte del Programa Integral de Fortalecimiento Institucional (PIFI, versiones 2011 y 2012); quien facilitó la operación del Sistema Integral del Seguimiento de Egresados en la Facultad de Contaduría y Administración, Campus I de la UNACH; cuyos resultados parciales, aquí se socializan.

## RESUMEN

*A partir de los resultados que arroja la operación del Seguimiento de Egresados instrumentado en la Facultad de Contaduría y Administración en la Universidad Autónoma de Chiapas, México; se caracterizan a quienes concluyen sus estudios en los cuatro programas educativos que se ofrecen, partiendo de la idea de que los estudios de egresados son fundamentales para construir oportunos y fundados diagnósticos, que permiten determinar las fortalezas y áreas de oportunidad de las instituciones de educación superior, para no incurrir en la oferta y operación de proyectos educativos poco pertinentes y que por lo mismo resultan alejados de la realidad laboral. Al respecto los resultados señalan que al interior de la Facultad deben fortalecerse a la brevedad, acciones orientadas a promover mayor participación de los estudiantes en proyectos de investigación, mejorar sustancialmente el programa de tutorías.*

**PALABRAS CLAVE:** Evaluación, Calidad Educativa, Egresados, Mejora Continua

## CHARACTERIZATION OF GRADUATES, IDENTIFYING FEATURES THREE STUDENTS COHORT OF FCA, CI OF UNACH

### ABSTRACT

*From the results shown by the Graduate Follow-up operation implemented at the School of Accounting and Administration, Campus I, at the Autonomous University of Chiapas, Mexico, are characterized to completed their studies in four educational programs offered, based on the idea that graduate studies are important, since they can be built from diagnostic founded and which determine the strengths and areas of opportunity for higher education institutions, not engaging in the supply and operation of educational projects irrelevant and that at are very far from the reality of work. In this respect the results show that within the Faculty should be strengthened as soon as possible, actions to promote greater student participation in research projects, and substantially improve the tutoring program.*

## INTRODUCCIÓN

Los estudios de egresados adquieren relevancia, puesto que a partir de sus resultados, se generan elementos que permiten construir fundados diagnósticos, a través de los cuales se identifican fortalezas y áreas de oportunidad de las Instituciones de Educación Superior (IES), que evitan incurrir en la oferta y operación de proyectos educativos poco pertinentes y que por lo mismo resultan alejados de la realidad en la que habrán de desempeñarse quienes egresan de las licenciaturas (Fresán, 1998). Bajo esa premisa, en la

Facultad de Contaduría y Administración, (FCA), Campus1 de la Universidad Autónoma de Chiapas (UNACH), con el apoyo financiero del Programa Integral de Fortalecimiento Institucional (PIFI), a partir de la cohorte egresada en el ciclo escolar Agosto-Diciembre 2009, se ha instrumentado el seguimiento de los mismos, abarcando a los cuatro programas educativos de licenciatura que se ofrecen. Resulta innegable que las IES que aspiran a ofrecer programas educativos de calidad, tienen que volver la mirada en el desarrollo profesional de sus egresados, ya que son éstos al insertarse al mundo laboral, los que dan cuenta del éxito o fracaso de las opciones curriculares instrumentadas respecto a la coherencia con la realidad y las necesidades del entorno (Lopera, 2005). Este tipo de estudios constituyen una útil herramienta para dar cuenta del recorrido laboral de los egresados y ofrecen elementos de gran valía para analizar la relación educación-trabajo-necesidades sociales, lo que a su vez contribuye con argumentos sólidos para actualizar, reestructurar o replantear los planes y programas de estudio, incluso para revisar periódicamente las formas de organización interna así como los métodos y procedimientos de trabajo adoptados (Rubio, 1998; Valenti y Varela, 2004; Lopera, 2005).

Al establecer el modelo de seguimiento de egresados en la FCA, CI de la UNACH, dos son los objetivos perseguidos; el primero se relaciona con la necesidad de identificar los rasgos que caracterizan a los egresados de los cuatro programas educativos de licenciatura, en lo relativo a variables socioeconómicas, trayectoria académica, primera inserción laboral, entre otros; para generar indicadores que aporten elementos que permitan instrumentar planes de mejora continua y fundamenten la toma de decisiones académica. El segundo propósito del modelo se relaciona con la realización de un estudio longitudinal a ciertas cohortes que permita identificar las facilidades y dificultades enfrentadas por los egresados, en el proceso de inserción al mercado laboral. Este modelo, junto con los estudios de opinión de especialistas sobre los requerimientos actuales y futuros perfiles de formación en cada una de las disciplinas; los estudios de opinión de empleadores y el propio análisis de la organización académica y de los planes y programas de estudio de la FCA, constituyen en su conjunto los estudios que sustentan el modelo de evaluación de la calidad de la educación propuesto.

En este trabajo se incluyen los resultados relacionados con el primer objetivo del modelo, por ello se incluye la caracterización preliminar de los egresados de las últimas tres generaciones a los que se les ha aplicado la primera etapa del seguimiento; por ello, en seguida a esta breve introducción, se realiza una breve revisión de la literatura que sustenta este tipo de estudios y se describen algunos resultados obtenidos por otras instituciones; se describen los pasos desarrollados para generar los resultados aquí descritos en el apartado de metodología y posteriormente se describen los resultados más relevantes relacionados con los principales rasgos que caracterizan a los egresados de los cuatro programas educativos.

## REVISIÓN DE LITERATURA

En términos de la Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES, 1998) un sistema de seguimiento de egresados, se define como la evaluación de los egresados en relación con sus estudios realizados; es decir, el procedimiento mediante el cual una institución busca conocer la actividad profesional que éstos desarrollan, su campo de acción, su nivel de ingresos, las posibles desviaciones profesionales que han tenido así como sus causas, su ubicación en el mercado de trabajo y su formación académica posterior al egreso. Didou y Rodríguez, citados por Barrón y otros (2003, 31), establecen que “las propuestas metodológicas que tienen por objetivo conocer el destino laboral, ocupacional o escolar de quienes han salido del mismo ciclo, nivel, subsistema, modalidad, institución o programa educativo, se denominan estudios de seguimiento de egresados”.

Fresán (1998), por su parte, señala que los estudios de egresados más que una simple referencia del proceso de inserción de los nuevos profesionales en el mercado laboral o sólo indicadores de satisfacción de éstos respecto a la formación recibida en la universidad, son mecanismos de diagnóstico de la realidad, que

además buscan inducir a las instituciones educativas a la reflexión a fondo sobre sus fines y valores, aportando elementos que ayudan a redefinir el proyecto de desarrollo de aquellas instituciones que se mantienen alerta ante las nuevas necesidades sociales, permitiendo reconocer las nuevas formas de práctica profesional requeridas para sustentar un proceso social menos inequitativo y dependiente. En términos de esta autora, un estudio de egresados, constituye una herramienta importante para analizar:

Los caminos que siguen los nuevos profesionales,  
Si se incorporan a las empresas productivas y de servicios,  
Si dentro de ellas se estancan en los puestos bajos o intermedios, o bien,  
Si, gracias a su formación pueden acceder progresiva y rápidamente, a posiciones complejas,  
Si, con creatividad y capacidad de identificar problemas y oportunidades, son capaces de encontrar vetas de desarrollo que les permitan generar nuevas alternativas para su propia subsistencia primero, y para ampliar la demanda de trabajo después,  
Si la formación recibida en la institución donde cursaron sus estudios superiores les permite desenvolverse en el área del conocimiento que determinó su vocación, o bien,  
Si han requerido prácticamente volver a formarse para desempeñar adecuadamente las actividades profesionales.

Un punto de vista similar, persigue el proyecto Grada2 de la Asociación Columbus (2006), cuando señala que el seguimiento de egresados es un asunto de vital importancia para las universidades, ya que el desempeño profesional y personal de los egresados permite establecer indicadores con respecto a la calidad y eficiencia de las IES. El riesgo de carecer de los diagnósticos que arrojan estos estudios puede “agudizar el rezago que existe actualmente en el nivel de escolaridad de la sociedad mexicana respecto a otros países y ampliar la brecha con naciones que estén en posibilidades de lograr mejores niveles educativos” (Fresán, 1998, 19). En este sentido, el Programa Integral de Fortalecimiento Institucional (PIFI) establecido por la Secretaría de Educación Pública (SEP, 2010), señala que los estudios de seguimiento de egresados y de empleadores realizados en las universidades deben ser utilizados para actualizar los planes y programas de estudio vigentes, ya que la calidad y pertinencia de los programas educativos, se debe reflejar en una mejora en la formación integral del estudiante en cuanto a: conocimientos, metodologías, aptitudes, actitudes, destrezas, habilidades, competencias laborales y valores, que le permitan construir con éxito su futuro; ya sea al incorporarse al mundo del trabajo, en sus relaciones diarias con la sociedad o al continuar con su preparación académica a lo largo de toda la vida.

Un estudio de egresados, no debe ser una acción aislada y temporal, más bien debe entenderse como un proceso sistemático y permanente, que combinado con resultados de estudios sobre opinión de empleadores, índices de satisfacción de estudiantes y perspectivas de desarrollo regional, permitan conocer la pertinencia de los programas educativos ofertados y ofrezcan directrices para la mejora y actualización de los planes y programas de estudio, pues cuando son vistos como estrategia de mercado para reactivar la demanda o como producto de requerimientos legales o de organismos evaluadores y acreditadores, terminan convirtiéndose en procesos improductivos e incontrolables, en bases de datos desactualizadas e inútiles y lo que es peor, creando falsas expectativas ante los egresados, que al responder los diversos instrumentos utilizados esperan o se ilusionan con algo más de su universidad (Lopera, 2005).

Existen diferencias entre un estudio de egresados y un seguimiento de egresados; el primero de acuerdo con Valenti y Varela (2004) consiste básicamente en la realización de investigaciones sobre egresados en un momento en el tiempo, que se efectúan en un periodo específico y pueden no repetirse, o bien realizarse esporádicamente, estos estudios tienen algunas limitaciones, como: poca posibilidad de comparación, débil integración con las políticas académicas de la institución educativa, escasa probabilidad de corroborar la información obtenida, baja posibilidad de observar posibles cambios en la ubicación laboral y de las opiniones recibidas. Entretanto, un seguimiento de egresados, consiste en seguir longitudinalmente a los

egresados y entrevistarlos al menos en dos momentos posteriores al egreso, teniendo la particularidad adicional de formar como mínimo dos paneles de estudio, es decir, trabajar con dos generaciones de egreso con el propósito de obtener mayor contundencia y certidumbre en las afirmaciones respecto a las facilidades y dificultades de los profesionales egresados en el mercado laboral, permitiendo además, la posibilidad de controlar algunos factores externos que pueden incidir en la ubicación y condiciones laborales de los egresados.

Un estudio similar al presentado, realizado en la propia FCA, C1 (Román, Gordillo & Franco, 2011), con las primeras cuatro generaciones a las que se les realizó el seguimiento (2009-2010) mostró que la población estudiantil de los cuatro programas educativos (PE) es mayoritariamente femenino, con excepción de quienes estudian Sistemas Computacionales; la edad que prevalece oscila entre 22 y 23 años; egresando solteros en su mayoría; sostenidos económicamente durante su estancia en la universidad por familiares (padres principalmente); pocos (menos del 15%) gozaron de alguna beca económica durante la realización de sus estudios; durante los estudios de licenciaturas menos de la mitad participaron en algún proyecto de investigación; en promedio tres cuartas partes de los egresados reconocen al menos una participación en congresos, convenciones, seminarios o talleres y solo la tercera parte aceptan participación dentro del programa de tutorías; casi todos (90%) cuando concluye sus estudios ha terminado con el servicio social y menos de la mitad de los egresados declara haber realizado prácticas profesionales; cuando concluyen con sus estudios, 90% han elegido alguna de las opciones de titulación permitidas y en promedio dos terceras partes en algún periodo del proceso estudiantil se incorporaron al sector laboral, siendo los egresados de Contaduría con más menciones; aunque solo 30% reconoce que las actividades desempeñadas tienen relación con su perfil de egreso y es el sector privado el principal empleador; a la institución la valoran con alta aceptación 90% en promedio y cerca del 80% manifiesta que volvería estudiar la misma carrera.

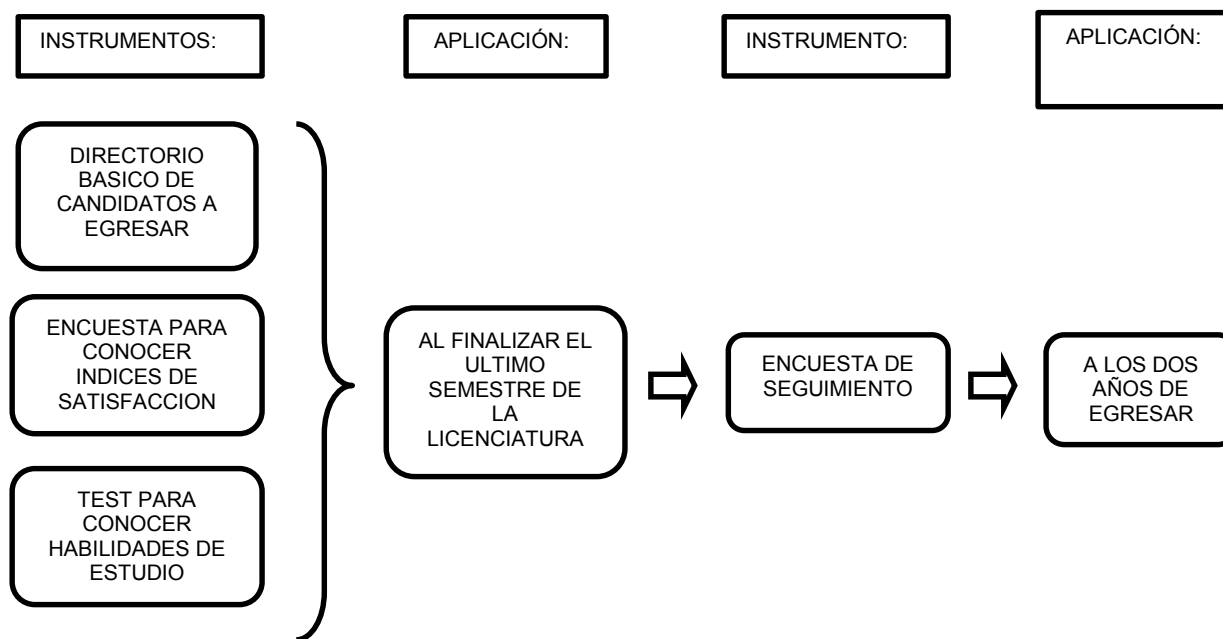

## METODOLOGÍA

Este estudio transversal, descriptivo es producto de los siguientes pasos: Revisión de la metodología propuesta por diversos autores, análisis de experiencias, resultados y trabajos de otras instituciones educativas, y revisión bibliográfica de referentes teóricos que sustentan estudios de egresados, Elaboración de propuesta de modelo de seguimiento de egresados basado en el Esquema Básico para Estudios de Egresados propuesto por la ANUIES (1998) y en algunos lineamientos del Proyecto Gradua2 atendiendo las características y necesidades de la FCA, Instrumentación del modelo (se inicia a partir de la generación Agosto-Diciembre 2009 y a la fecha acumula nueve cohortes). Características del modelo: Del esquema propuesto por ANUIES se retoma la necesidad de hacer un seguimiento y no solo un estudio de egresados y se adopta la necesidad de realizar el estudio utilizando al menos dos paneles que permitan obtener mayores elementos de análisis, trascendiendo aspectos coyunturales que pudieran sesgar los resultados de alguna cohorte específica.

Se consideran las principales variables propuestas en el “Cuestionario Tipo para el Estudio de Egresados”; sin embargo el modelo instrumentado presenta las siguientes características particulares, que desde la óptica de los autores, coadyuvan a responder mejor a las necesidades de la FCA, CI: Amplía los datos a recabar de los egresados en el momento de concluir los estudios y propone un instrumento que no solo permite construir el directorio básico de egresados, sino que recoge la opinión de los mismos respecto a variables relacionadas con rasgos generales y trayectoria educativa, incorporación y ubicación en el mercado laboral durante su etapa estudiantil, valoración de los servicios recibidos, características del proceso de formación y de la institución (resultados que conforman este reporte)., Incorpora dos instrumentos adicionales relacionados con índices de satisfacción estudiantil (que a su vez permitirá responder a requerimientos del PIFI), y hábitos de estudio (como medida diagnóstica para reconocer hábitos de estudio que los alumnos han desarrollado en el momento de egresar, como base para instrumentar medidas remediales en las generaciones posteriores) La segunda etapa del modelo, plantea la aplicación de una encuesta de

seguimiento, que básicamente estará orientada a la caracterización de la trayectoria profesional de los egresados y su desempeño en el campo laboral. La figura 1 muestra las etapas e instrumentos que constituyen las diferentes fases de aplicación, así como el esquema operativo en general.

Figura 1: Modelo Operativo del Seguimiento de Egresados de la FCA, C1

Puede observarse que el modelo básicamente comprende dos etapas; en la primera se utilizan tres instrumentos: el directorio básico de candidatos a egresar (con 52 preguntas); encuesta para identificar índices de satisfacción (88 reactivos) y test para identificar hábitos de estudio (39 ítems) los que se aplican al concluir el último semestre de la licenciatura, en forma autoadministrada a toda la población que egresa de los cuatro programas educativos; la segunda etapa refiere la encuesta de seguimiento a paneles elegidos aleatoriamente, en donde se determina muestra y en forma autoadministrada se aplica encuesta de seguimiento (78 preguntas) enfocada a identificar rasgos de la trayectoria laboral desarrollada. Fuente: elaboración propia.

Los instrumentos se aplican en forma autoadministrada y el periodo de recopilación de datos en cada cohorte comprende los últimos dos meses de cada ciclo escolar. La cobertura en la aplicación de los instrumentos, abarcó al 99% de la población total de egresados. Para la sistematización de los datos se utiliza *software* diseñado específicamente para este proceso que genera, una vez capturadas las respuestas de cada instrumento, bases de datos en hojas de *Excel* de *windows*, lo que permite mayor usabilidad.

*Caracterización de instrumentos del modelo en su etapa inicial:* Directorio Básico de Egresados: encuesta de 52 preguntas cerradas y que atiende a las variables: rasgos generales, trayectoria educativa, primera incorporación en el mercado laboral, ubicación en el mercado de trabajo, opinión sobre servicios recibidos, opinión sobre proceso de formación.

*Índice de Satisfacción:* utiliza una adaptación del SEUE (Cuestionario para estimar la satisfacción de los estudiantes universitarios con la educación) propuesto por Gento y Vivas (2003); contextualizado al entorno de la FCA, conformado por 88 preguntas que en total abarcan diez subdimensiones: cumplimiento a necesidades básicas, servicios ofrecidos, seguridad vital, seguridad económica, seguridad emocional, sentido de pertenencia, sistema de trabajo, progreso personal, reconocimiento del éxito personal, autorrealización personal. Utiliza una escala *Likert* con valoración positiva, conformada de 5 posibles respuestas que van desde “totalmente insatisfecho” hasta “totalmente satisfecho”.

*Hábitos de Estudio*: test adaptado por García-Huidobro, Gutiérrez y Condemarín (2000), con base al denominado Inventario de Hábitos de Estudio, creado por Wrenn, Eagle y Whright, (citados por González, 1985) quienes señalan que factores como hábitos, actitudes y condiciones económicas, inciden en la eficiencia de los estudiantes para aprender. La versión utilizada consta de 39 reactivos con respuestas dicotómicas, a través de los cuales se pretende medir ocho variables relacionadas con: ambiente físico, estado fisiológico, distribución de tiempo, lectura, técnicas de estudio, preparación de pruebas, concentración y actitud hacia el estudio.

## RESULTADOS

Se socializan los principales resultados que generó la aplicación del instrumento “Directorio básico”; la tabla 1 muestra la caracterización a los egresados de los cuatro programas educativos (PE), de las últimas tres cohortes analizadas; en la primer columna de cada cohorte se muestra el promedio global y en seguida se muestra el programa educativo que mostró el comportamiento más alto, así como el más bajo.

Una primera caracterización de los egresados de las cohortes analizadas, muestra que: El sexo que predomina en los estudiantes de la FCA, es el femenino, con excepción de quienes estudian LSC. La edad prevaleciente entre los egresados oscila entre 22 y 23 años. El estado civil de los estudiantes en el momento de egresar es mayoritariamente soltero y en dos de las tres cohortes, quienes egresan de la LC, presentan las tasas más bajas que el promedio general. El principal sostén económico de los egresados durante su estancia en la universidad, son los padres, destacando quienes estudian LGT, que presentan mayor incidencia de esta característica en las tres cohortes. Menos de la mitad de quienes egresan, gozaron de alguna beca económica durante la realización de sus estudios y no existen diferencias significativas entre programas. Durante el proceso formativo, únicamente entre el 35% y el 50% de los egresados, participarán en algún proyecto de investigación, siendo los de LSC, quienes reconocen mayor participación en este rubro. Respecto a participaciones en congresos, convenciones, seminarios o talleres, entre el 80 y el 84% de los egresados reconocen al menos una intervención, destacando los estudiantes de LGT y LSC por ubicarse por encima del promedio general.

En promedio, 45% de quienes egresan reconocen haber recibido tutorías. Entre 94% y 98% de los egresados, al finalizar sus estudios han cumplido con su servicio social. La mitad de los egresados reconocen haber realizado prácticas profesionales, sobresaliendo egresados de LGT (en este PE las prácticas tienen valor en créditos). Entre el 98% y 100% de quienes egresan, han elegido alguna de las opciones de titulación permitidas por la reglamentación universitaria. Entre el 33% y el 35% de quienes egresan, en algún periodo de su vida estudiantil, se incorporaron al sector laboral, destacando quienes egresan de Contaduría, siendo el sector privado el principal empleador. La valoración que los egresados realizan de la institución oscila entre 86% y 89% de aceptación y entre el 76% y 80%, manifiestan que volverían a elegir la misma carrera, destacando con mayores porcentajes los de LC y menores los de LSC.

Tabla 1: Caracterización de Egresados Por Ciclo Escolar

Variable	Ciclo Agosto-Diciembre 2012			Ciclo Enero-Junio 2013			Ciclo Agosto-Diciembre 2013		
	Promedio global	Más alto	Más bajo	Promedio global	Más alto	Más bajo	Promedio global	Más alto	Más bajo

		85%	74%		83%				

\*LC: Licenciatura en Contaduría; LA: Administración; LGT: Gestión Turística; LSC: Sistemas Computacionales. Esta tabla permite visualizar las características de quienes egresan de los PE que se ofertan en la FCA; en donde se muestra que la población escolar mayoritariamente se integra por estudiantes del sexo femenino; con excepción del PE de LSC en donde predominan los hombres; la edad promedio de egreso oscila entre 22 y 23 años y en promedio 9 de cada 10 estudiantes egresa soltero; en su mayoría se sostienen a través del apoyo de familiares (papás fundamentalmente) respecto a becas; no se puede inferir que predomine algún PE en lo específico, y en promedio se alcanza una cobertura de una cuarta parte de la matrícula egresada; aun no es significativa la cantidad de estudiantes que participan en el programa de movilidad académica; en promedio el 42% de los egresados al menos participaron en un proyecto de investigación y son los egresados de LSC, quienes manifiestan mayor participación en este rubro; respecto a congresos, seminarios o talleres 8 de cada 10 egresados, señala haber participado en al menos uno de ellos y quienes egresan de LGT señalan mayor participación; en promedio 45% reconoce haber participado en tutorías; más del 90% de quienes egresan, han cumplido con el servicio social y casi todos han elegido la opción a través de la cual se titularán; cerca de una tercera parte, han tenido contacto con el sector laboral en algún momento de sus estudios; en trabajos del sector privado; en promedio 9 de cada 10 egresados manifiesta que volvería a estudiar en la Facultad y 8 de cada 10 señala que estudiaría la misma carrera. Fuente: elaboración propia

## CONCLUSIONES

A través de los estudios de egresados pueden construirse diagnósticos fundamentados, que permiten determinar las fortalezas y áreas de oportunidad de las instituciones de educación superior, para contribuir a la pertinencia de la oferta educativa. Respecto al estudio realizado con las primeras cuatro cohortes participantes en el modelo de seguimiento (2009-2010) existen similitudes en los datos cuantitativos aunque existe una ligera tendencia hacia la baja en la aceptación institucional (el primer estudio alcanzó en algunos casos 95%) y de igual forma el volver a estudiar la misma carrera, (en el primer estudio alguna cohorte alcanzó 84%) y sigue siendo la LSC quien manifiesta mayor insatisfacción al concluir la licenciatura. Con los resultados obtenidos, deben instrumentarse acciones orientadas a mejorar la incorporación de estudiantes a proyectos de investigación, realización de prácticas profesionales, incrementar la participación en congresos, convenciones y seminarios, mejorar sustancialmente la cobertura y la calidad del programa de tutorías; asimismo como nueva línea de investigación habrán de indagarse los elementos que intervienen en la ligera tendencia que se observa hacia la baja, respecto a la aceptación institucional y a la posibilidad de elegir otra carrera.

## RECONOCIMIENTO

Los autores agradecen el apoyo financiero recibido por parte del Programa Integral de Fortalecimiento Institucional (PIFI, versiones 2011 y 2012); que permitió la operación del Sistema Integral del Seguimiento de Egresados en la Facultad de Contaduría y Administración, Campus I de la UNACH; desde 2009 ha la fecha; apoyando los proyectos que de él se derivan.

# EL CONTROL INTERNO EN LOS INVENTARIOS DE LAS MICRO EMPRESAS

Esther Eduvigis Corral Quintero, Universidad Autónoma de Baja California  
Loreto María Bravo Zanoguera, Universidad Autónoma de Baja California  
Sósima Carrillo, Universidad Autónoma de Baja California  
Ana Cecilia Bustamante Valenzuela, Universidad Autónoma de Baja California

## RESUMEN

*Estudio referido a las Microempresas y el control interno que tienen sobre sus inventarios y el efecto que le genera en su administración y por ende en sus finanzas. En relación con las micro, pequeñas y medianas empresas (Mipymes) se han generado muchos estudios, identificando la importancia que tienen en el desarrollo económico de México al conformar el 99 % de sus empresas formales. El objetivo de esta investigación es plantear entre otros datos, como afecta a las micro empresas del sector comercio ubicadas en Mexicali, Baja California, el control que tiene sobre sus inventarios al ser uno de los principales bienes con que cuenta para poder generar ingresos en forma adecuada. El método que se utiliza es de tipo exploratorio en un primer momento para identificar el control interno sobre el ciclo operacional de inventarios en las micros empresas y, en un segundo momento, se aplica el método descriptivo no experimental transversal para identificar la importancia que las empresas le dan a este renglón dado el impacto que tiene en sus finanzas.*

**PALABRAS CLAVE:** Control Interno, Microempresas, Inventarios

## INTERNAL CONTROL IN INVENTORIES OF MICRO ENTERPRISES.

### ABSTRACT

*Study referred to Micro enterprises and internal control they have over their inventories and the effect that it generates in its administration and thus on their finances. In relation to micro, small and medium enterprises (MSMEs) have generated many studies identifying the importance of economic development in Mexico to form 99% of formal businesses. The objective of this research is to propose among other things, how it affects the micro enterprises in commerce located in Mexicali, Baja California, having control over their inventories to be one of the main assets that account in order to generate income in the form adequate. The method used is exploratory at first to identify internal control over operational inventory cycle in micro enterprises and in a second stage, the cross no experimental descriptive method is applied to identify the importance that companies give this line given the impact on your finances.*

**JEL:** M00, M41

**KEYWORDS:** Internal Control, Micro Enterprises, Inventories

## INTRODUCCIÓN

Sobre las micro, pequeñas y medianas empresas (Mipyme's) se han realizado diversos estudios al ser un elemento importante para el desarrollo económico de los países, tanto por su contribución al empleo, como por su aportación al Producto Interno Bruto (PIB), sin embargo, debe reconocerse que su gestión administrativa y financiera no funciona dentro de los paradigmas de eficiencia empresarial ya que cuentan

con sistemas administrativos obsoletos, así como la falta de controles en su operación, falta de preparación gerencial y una contabilidad orientada sólo al cumplimiento de la norma tributaria, siendo estos algunos de los factores que las afectan. (Mosqueda, 2008). Las empresas en general participan en el desarrollo económico y social de cualquier país, al generar empleos y pagar impuestos. En México, la participación de las Mipymes es de gran relevancia ya que de acuerdo con el Instituto Nacional de Estadística, Geografía e Informática (INEGI) en base al censo económico 2009, el 99.0 % pertenecen a este grupo. Las Mipyme en Mexicali guardan similar comportamiento que en el resto del país y también tienen la misma expectativa de creación de empresas y generación de empleos; por lo que es importante que tengan una adecuada administración que les permita permanecer y en un futuro y crezcan.

Anzola (2010) señala que las Mipymes presentan algunos problemas como lo son: la falta de control de inventarios, control inadecuado de créditos, liquidez y bajo volumen de ventas, los cuales si no son tratados con cuidado ponen en riesgo a la operación de la empresa al no contar con el efectivo suficiente y por tanto no cumplir en tiempo con los compromisos adquiridos o bien un inadecuado financiamiento, una sobre inversión en activo fijo, existencias de inventarios inmovilizadas y obsoletas, irregularidades en los cobros, pagos imprevistos, cálculos equivocados de los ingresos, costos o utilidades así como los gastos excesivos en que incurrir los propietarios de estas empresas por un mal manejo y control de sus recursos. Dentro de la administración se debe dar lo que se conoce como proceso administrativo el cual contempla las fases de planeación, organización, dirección y control. En las empresas, no importando su estructura, tamaño o complejidad de sus operaciones, requieren de un sistema de control que le permita administrar de forma adecuada sus bienes y servicios y que para este fin genere información tanto administrativa como financiera con las características de veracidad, confiabilidad y oportunidad, con miras a una buena y efectiva toma de decisiones.

Las mipymes tienen grandes ventajas de conocimiento de su entorno económico así como su facilidad para ser administradas dado que sus actividades y operaciones no son complejas. Sin embargo, también tiene grandes desventajas ya que al no contar con recursos económicos suficientes, no pueden en ocasiones planear para crecer, poniendo en riesgo su existencia. En la generalidad, este tipo de empresas es administrada por el dueño el cual no cuenta con conocimientos formales sobre administración, por lo que ésta la desarrolla de acuerdo a su experiencia y de manera empírica. (Treviño, 2004) En la actualidad, las mipymes requieren de mayores conocimientos y sobre todo de información que les permitan identificar ventajas competitivas sobre las demás. Esto es generado por el entorno cada vez más globalizado y con cambios constantes, que deben provocar una nueva cultura empresarial sobre todo en lo que se refiere a la asertividad en la toma de decisiones, para lo que requiere de información confiable y oportuna que coadyuven en esa toma de decisiones y que le permitan controlar sus actividades para el logro del cumplimiento de sus objetivos. (Zorrilla, 2007) El objetivo de esta investigación es determinar el impacto que tendría en la administración de las microempresas, el establecimiento de un sistema de control interno acorde a sus características muy particulares; y dentro de este, el control que se tiene sobre sus inventarios al constituir en la mayoría de los casos el activo más importante con el que se cuenta.

## REVISIÓN LITERARIA

### Entidad Económica

Una empresa o entidad es una organización o institución dedicada a actividades que tienen como fin principal el económico. Existen diversas definiciones del término entidad o empresa, una de ellas es la emitida por la Comisión de la unión europea: “Se considerará empresa toda entidad, independientemente de su forma jurídica, que ejerza una actividad económica. En particular, se considerarán empresas las entidades que ejerzan una actividad artesanal u otras actividades a título individual o familiar, las sociedades de personas y las asociaciones que ejerzan una actividad económica de forma regular”. Otro concepto de

aceptación general es que “una empresa es un sistema que interacciona con su entorno materializando una idea, de forma planificada, dando satisfacción a demandas y deseos de clientes, a través de una actividad económica”. Una empresa requiere de objetivos definidos en una misión, visión, estrategias, objetivos, tácticas, es decir de una planeación estratégica. El Diccionario de la Real Academia Española (RAE) señala que entidad es “cualquier corporación, compañía, institución etc., que es tomada como persona jurídica”, y del término empresa menciona que es “unidad de organización dedicada a actividades industriales, mercantiles o de prestación de servicios con fines lucrativos”.

Por otra parte, las empresas se pueden clasificar de acuerdo al sector al que pertenezcan, al giro que desarrollen y a su tamaño y estructura. Así se tienen los sectores comerciales, industriales y de servicios, dentro de esta clasificación por sector, se tienen diversos giros, principalmente en las empresas dedicadas al comercio. En el año 2002, se da a conocer la Ley para el desarrollo y competitividad de la micro, pequeña y mediana Empresa, a través de su publicación en el Diario oficial de la federación (DOF), teniendo como objetivo principal el promover el desarrollo económico nacional a través del fomento a la creación de micro, pequeñas y medianas empresas y el apoyo para su viabilidad, productividad, competitividad y sustentabilidad, así como incrementar su participación en los mercados, en un marco de crecientes encadenamientos productivos que generen mayor valor agregado nacional.

Dentro de este marco legal, se consideró importante señalar los factores que permitieran identificar o clasificar los distintos estratos en que se encuentran las empresas mexicanas, por lo que en la mencionada ley determina dicha clasificación partiendo de la base del número de empleados que contratan las empresas; sin embargo no siendo suficiente estos datos, en junio del 2009 se publicó modificación a la ley en el DOF, ampliando las características que las identificaban añadiendo el elemento de las ventas que generaban, quedando entonces de la siguiente forma:

*Microempresa:* Sectores comercial, industrial y de servicios, las que cuenten con hasta 10 trabajadores y ventas anuales de hasta \$ 4 millones de pesos (mdp) y un tope máximo combinado de 4.6.

*Pequeña empresa:* Sector comercio, que tengan de 11 hasta 30 trabajadores y ventas anuales de \$ 4.01 hasta \$100 mdp, tope máximo combinado de 94. Sectores industrial y de servicios, que tengan de 11 hasta 50 trabajadores y ventas anuales de \$ 4.01 hasta 100 mdp, tope máximo combinado de 95.

*Mediana empresa:* Sector comercio, que tengan de 31 hasta 100 trabajadores y ventas anuales desde \$ 100.01 hasta \$ 250 mdp, tope máximo combinado de 235. Sector servicios, que tengan desde 51 hasta 100 trabajadores, con el mismo rango de ventas tope máximo combinado que el anterior. Sector industrial, que tengan de 51 hasta 250 trabajadores y ventas anuales desde \$ 100.01 hasta \$ 250 mdp y tope máximo combinado de 250. Considerando lo anterior, las empresas que tienen más de 250 empleados en el caso de las industriales y más de 100 empleados en los casos del comercio y de servicio, y los ingresos que obtienen, se deben identificar como grandes empresas.

Para el desarrollo y crecimiento de cualquier empresa, se requiere como ya se mencionó, de una planeación estratégica por lo que se debe identificar cuáles son los objetivos más comunes que persigue cualquier entidad. Así se tiene que el principal objetivo de las empresas industriales, comerciales y de servicio es la obtención de un lucro o rendimiento, para lo cual se constituye con recursos económicos, materiales y humanos. Esta interacción de elementos debidamente organizados debe contribuir al logro de sus objetivos. La administración de las empresas debe considerar lo que se conoce como proceso administrativo, dentro de éste se tiene que debe existir una planeación tanto estratégica como táctica, una organización que permita determinar la forma en que deben conducirse las actividades, una dirección que está representada por la alta gerencia y es quién se responsabiliza de la forma en que se conduce a la organización y los resultados que se obtienen y, por último se tiene la etapa de control que es a través del

cual interactúan todos los elementos y coadyuva en la integración de todas las etapas del proceso administrativo. Al control o control interno, se le asigna la actividad de generar información que sea útil para la toma de decisiones. Uno de los elementos informativos más importantes que permiten la retroalimentación y la toma de decisiones es el constituido por el sistema contable.

El sistema contable, entre otros, establece la clase de información financiera y administrativa que se requiere para una adecuada toma de decisiones dentro de un determinado enfoque o entorno en la que se encuentra la empresa. Corral (2011) realizó durante el periodo de 2005 a 2011, 73 auditorías administrativas a micro y pequeñas empresas, así como 6 a medianas empresas, resaltando la siguiente información: Las micro y pequeñas empresas visitadas no cuentan con:

Una planeación estratégica, que identifique la misión, visión, objetivos y metas., Planeación táctica; se desarrolla de manera empírica y las decisiones se toman conforme van sucediendo los eventos., Un sistema de organización que le permita identificar formalmente sus procedimientos y estructuras. Ninguna de las empresas visitadas, micros y pequeñas, contaba con un documento que permita evidenciar la forma en que están organizadas ni de su filosofía organizacional., Una administración formal que incluya todas sus fases. Son administradas en más del 90 % de los casos por los propios dueños o propietarios, considerando su experiencia en el negocio., Un sistema de control interno o algún procedimiento formal que le permita tener control sobre sus recursos y actividades., Un sistema de información y archivo o mecanismo formal de informes que le permita la retroalimentación de sus actividades. La comunicación se da de manera informal no periódica.

### Control Interno

El Instituto Mexicano de Contadores Públicos (IMCP) (1995) define que “La estructura de control interno de una entidad consiste en las políticas y procedimientos establecidos para proporcionar una seguridad razonable de poder lograr los objetivos específicos de la entidad”. Perdomo (2008) señala como concepto que control interno es el “Plan de organización entre la contabilidad, funciones de empleados y procedimientos coordinador que adopta una empresa pública, privada o mixta, para obtener información confiable, salvaguardar sus bienes, promover la eficiencia de sus operaciones y adhesión a su política administrativa. De acuerdo con Perdomo, los elementos del control interno son siete, a saber:

Organización, Catálogo de cuentas, Sistema de contabilidad, Estados financieros, Presupuestos y pronósticos, Entrenamiento, eficiencia y moralidad del personal y,, Supervisión. Es conveniente también mencionar que Perdomo establece que los objetivos del control interno son Prevenir fraudes, Descubrir robos y malversaciones, Obtener información administrativa, contable y financiera confiable y oportuna, Localizar errores administrativos, contables y financieros, Proteger y salvaguardar los bienes, valores, propiedades y demás activos de la empresa, Promover la eficiencia del personal., y, Detectar desperdicios innecesarios de material y tiempo, entre otros. También, se debe mencionar que para que el sistema de control interno genere la utilidad que de él se espera, deben tomarse en cuánto los siguientes aspectos (IMCP, 2009): Tamaño de la entidad, Características de la actividad económica en la que opera, Organización de la entidad, Naturaleza del sistema de contabilidad y de las técnicas de control establecidas, Problemas específicos del negocio, Requisitos legales aplicable

### Inventarios

De acuerdo con la Real Academia Española, el inventario se define como el registro documental de los bienes y demás cosas pertenecientes a una persona o comunidad, hecho con orden y precisión. En una entidad o empresa, es la relación ordenada de bienes y existencias, a una fecha determinada. Contablemente, es una cuenta de activo circulante que representa el valor de las mercancías existentes en un almacén. En

contabilidad, el inventario es una relación detallada de las existencias materiales comprendidas en el activo, la cual debe mostrar el número de unidades en existencia, la descripción de los artículos, los precios unitarios, el importe de cada renglón, las sumas parciales por grupos y clasificaciones y el total del inventario. (Gaither, 2000)

Perdomo (2008), señala que el control interno de inventarios es el “plan de organización entre el sistema de contabilidad, funciones de empleados y procedimientos coordinados, que tiene por objeto obtener información segura, salvaguardar las mercancía, materia prima, productos en proceso y productos terminados propios, en existencia y de disponibilidad inmediata, que en el curso normal de operaciones están destinados a la venta ya sea en su estado original de compra o después de transformados”.

Los inventarios son importantes en todas las empresas ya sean industriales o de comercio y aún para las de servicio, ya que de ellos y de su adecuado control se espera lograr los objetivos de la empresa que son generar utilidades disminuyendo los costos. En la actualidad existen muchos procedimientos para su control y como consecuencia disminuir su costo de mantenimiento, así se tiene por ejemplo el programa de “justo a tiempo” que tiene por objetivo el elaborar un producto cuando es necesario y en la cantidad demandada por el cliente, conllevando los insumos requeridos para su fabricación (Ramírez, 2005) Resalta la investigación realizada por Bravo (2013) en la que señala en relación con el tema de control interno e inventarios, que “respecto a la forma en que controlan los inventarios las personas que administran a este tipo de (pequeñas y medianas) empresas, se encontró que el 57% efectúa inventarios físicos para su control con diferente periodicidad, siendo mensuales los que se realizan con mayor frecuencia”.

## METODOLOGÍA

Se utilizó en un primer momento el método exploratorio ya que se investigo acerca de los sistemas de control interno sugeridos para las empresas, especialmente en el área de inventarios, y no encontrando información para microempresas debido a que en su generalidad, las investigaciones y libros publicados se refieren a pequeñas, medianas o gran empresa. En un segundo momento, se utilizará el método descriptivo no experimental transversal ya que se pretende identificar a través de la aplicación de cuestionarios a microempresas del sector comercial ubicadas en Mexicali, Baja California, México, la importancia que le dan las empresas de este tipo a este renglón, dado el impacto que tiene en sus finanzas. De esta actividad se pretende ubicar cual sería el mejor procedimiento para el control de los inventarios para microempresas y que éste a su vez, le redunde en un beneficio que le permita lograr sus objetivos. Los pasos que se siguen en esta metodología son los siguientes:

Primero.- Análisis bibliográfico y documental, para referenciar identificar los elementos y características que conforman un sistema de control interno en general y de los inventarios en particular. Se obtuvo información de las siguientes fuentes:

Estructura y disposiciones del gobierno en México referentes a la conformación de las Mipymes y los diversos sistemas de ayuda con los que cuentan, Revisión bibliográfica, sobre el sistema de control interno y de las Mipymes.

Segundo: Diseño, aplicación y captura de los instrumentos que permitan obtener información de los controles establecidos por las microempresas y en particular, los controles que tienen para el renglón de inventarios y los resultados obtenidos.

Tercero: Estudio de las investigaciones realizadas en materia de las Micro, Pequeñas y Medianas empresas en la ciudad de Mexicali, Baja California, México.

Cuarto: Descripción de los resultados obtenidos.

## RESULTADOS

De la revisión documental y bibliográfica sobre el tema de sistemas de control interno y control de los inventarios, se obtuvieron los siguientes resultados:

Primero: Existe una amplia gama de autores que tratan el tema de sistemas de control interno tanto para identificarlos como para establecerlos en las organizaciones, así como la importancia que tiene en materia de auditoría. Sin embargo, para microempresas este tema no es tratado.

Segundo: En materia de acciones que ha realizado los gobierno federal estatal, se ha emitido la Ley para el desarrollo y competitividad de las micro, pequeñas y medianas empresas (Mipymes) y, la Secretaría de Economía a nivel federal, y la Secretaría de Desarrollo Económico del estado de Baja California tienen establecidos mecanismos de ayuda para las Mipymes.

Tercero: De las investigaciones revisadas, se determinó que no existe cultura entre los microempresarios para diseñar un control interno sino que esta actividad se lleva a cabo de manera empírica y de acuerdo con su experiencia. De la aplicación del cuestionario diseñado para identificar los controles de inventarios, que existen en las microempresas, se ha obtenido lo siguiente:

Unico: Se diseñó un cuestionario para identificar los controles establecidos en las microempresas del sector comercio ubicadas en la zona urbana de Mexicali, Baja California, México; estando en su primera fase de aplicación. Los primeros resultados obtenidos, señalan que las microempresas no cuentan con un documento en el que se explique el control que tienen sobre sus inventarios. De la misma de la muestra analizada se concluye que esto sucede debido a que las microempresas son manejadas por los propios dueños y que se basan en su experiencia para administrarla. Queda pendiente la aplicación total del instrumento elaborado y en su caso, completar el trabajo mediante la determinación del impacto financiero que conlleva el no controlar debidamente los inventarios.

## CONCLUSIONES

A pesar de que existe mucha información del control interno y de los inventarios, esta no es aplicable a las microempresas, dada las características particulares de éstas. Los controles, si bien son necesarios, pudieran representar un alto costo para las microempresas y que no están preparadas para solventar. El inventario es el principal activo de las microempresas del sector comercio, dependiendo en gran medida del control adecuado de ellos para estar en condiciones de obtener utilidades.

### RESUMEN

*A partir de los años 80 del siglo pasado hasta la fecha, la innovación ha ocupado los espacios principales en revistas de negocios y académicas. Este interés por la innovación surge en el momento en que el enfoque evolucionista de la firma es tomado como referente principal para explicar el cambio económico y el comportamiento de la empresa. Según esta perspectiva las dinámicas de los sistemas económicos se movilizan por la insistencia permanente de innovaciones en los productos, en los procesos y en las formas de organización. A estas ideas se sumó el concepto de Sistema Nacional de Innovación (Lundvall, 1992), para subrayar la importancia que el entorno tiene en todo este proceso. Las primeras investigaciones sobre innovación se enfocaron en las grandes empresas. Posteriormente, la atención se dirigió a las firmas micro, pequeñas y medianas. Y recientemente, reconociendo la importancia que tienen en la actividad económica de muchos países, algunas investigaciones han intentado conocer las realidades y problemáticas de la innovación en las empresas rurales. Por lo tanto, el objetivo de este trabajo es aplicar un análisis de varianza para determinar la incidencia que el lugar geográfico donde se ubican este sector de empresas, tiene en la frecuencia de su actividad de innovación.*

**PALABRAS CLAVE:** Innovación, Sistema Nacional De Innovación, Empresa Rural

## INNOVATION AND LOCATION

### ABSTRACT

*From the 80s of last century to date, innovation has occupied the main spaces in business and academic journals. This interest arises at the time that the evolutionary approach of the firm is taken as the main reference to explain economic change and the behavior of the company. In this approach the dynamics of economic systems are mobilized by the continued insistence of innovations in products, processes and organizational forms. Subsequently the concept of national innovation system (Lundvall, 1992) underline the importance the environment has on this process. Early research focused on innovation in large firms. Subsequently, attention turned to the micro, small and medium firms. And recently, interest begins to focus on rural businesses, recognizing the importance of these enterprises in economic activity in many countries. Therefore, the aim of this paper is to apply an analysis of variance to determine the impact of geographical location on the frequency of innovation that made rural enterprises.*

**JEL:** O31

**KEYWORDS:** Innovation, National Innovation System, Rural Business

## INTRODUCCIÓN

En las últimas décadas del siglo pasado y en lo que va del siglo XXI, en el escenario económico y empresarial, el enfoque evolutivo ha sido el referente principal para intentar explicar la dinámica del cambio económico y el comportamiento de la firma. Esto condujo a considerar a la innovación como el elemento

esencial de la competitividad empresarial e incluso de la competitividad regional o nacional. Resultado de ello, las investigaciones sobre el tema de la innovación han proliferado, lo mismo se tienen innumerables investigaciones sobre cómo ciertas empresas han desarrollado sus procesos de aprendizaje y capacidades de innovación, que sobre aquellas condiciones del contexto que favorecen u obstaculizan el que las empresas desarrollen las capacidades que les permitan generar una dinámica sostenida de innovaciones. Con estos referentes se propone como objetivo analizar la incidencia que el lugar geográfico donde se ubican las empresas rurales, tiene en la frecuencia de su actividad de innovación. El trabajo está organizado en cuatro partes. En la primera de ellas se discute sobre el concepto de innovación, los tipos de innovación y la importancia del entorno para el desarrollo de la innovación. En la segunda parte se explica la estrategia metodológica y en la tercera parte se analizan y se discuten los resultados del trabajo de campo. Finalizando con algunas conclusiones.

## REVISIÓN LITERARIA

### El Sector Rural

En México, con base en los datos censales y de encuestas sectoriales y nacionales (Particularmente el VII Censo Ejidal 2001 y el IX Censo General de Población y Vivienda 2000 y el XIII Censo de Población y Vivienda 2010, y las Encuestas Nacionales de Ingreso Gasto de los Hogares de 2000 a 2010.) se muestra el profundo estancamiento del sector rural, incluyendo lo agrícola, forestal y ganadero. Las consecuencias de lo anterior se aprecian en términos de la pobreza en donde para el 2010 el 60% de la pobreza extrema se concentra en el sector rural, y en muy amplias desigualdades sociales y regionales. De acuerdo a Gordillo (2011), la sociedad rural se ha transformado profundamente. Se ha envejecido y se ha feminizado como producto sobre todo de la migración. La agricultura ha dejado de ser la fuente de ingresos principal para la mayoría de los hogares rurales. Pero en el campo sigue viviendo más del 20% de la población total. Aun así, la sociedad rural es fundamental para el desarrollo del país por el conjunto de bienes ambientales, culturales y económicos que provee y podría proveer hacia el futuro a la sociedad nacional.

Continuando con Gordillo (Ídem), señala que la sociedad rural es extraordinariamente compleja y diversa. Coexisten diversas lógicas productivas y sociales de las cuales rinden cuentas las diversas tipologías que se han elaborado para los productores agropecuarios. Más que una sociedad predominantemente agrícola se debe reconocer el peso de los recursos naturales entre los cuales los forestales son clave. Se trata de una sociedad rural que, además de diversa, está fuertemente poblada por actividades multifuncionales impulsadas desde las familias y las comunidades. Es una sociedad rural en donde se observan actividades empresariales que buscan entremezclar los saberes agropecuarios con los saberes tecnológicos, con la finalidad de producir bienes y servicios de mayor valor agregado que puedan ser comercializados en mercados mejor remunerados. En un entorno que discurre bajo una lógica distinta a la que la sociedad rural había estado acostumbrada, es como la capacidad de innovación adquiere relevancia. Como lo señala Luhmann (en Ríos y Vera, 2013), las organizaciones – en este caso la empresa rural inmersa en la dinámica del mercado - se encuentra obligadas a innovar, lo que quiere decir a mantener el control sobre las alternativas de cambio (Así, se puede suponer que ante una mayor cantidad de alternativas de cambio que la empresa tiene que enfrentar, se hace necesario incrementar su capacidad de innovación.) sea por medio de la planificación o mediante una capacidad de innovación que se desarrolla a través de decisiones oportunas. Si no hay capacidad de innovar, de reaccionar planificadamente a los cambios internos y externos, la organización perderá las oportunidades que se ofrezcan y se encontrará sometida a un cambio inevitable y sin rumbo conocido.

### La Innovación

Una de las primeras ideas sobre el concepto de innovación fue dada por Schumpeter (1957, citado por Arocena y Sutz, 2003, pp. 20, 21), quien señalaba que debía ser concebida como la introducción de nuevas combinaciones, procedimientos y objetos que podrían ser nuevos o no, pero que al ser utilizados de manera tal en el contexto de referencia, resultan originales. Posteriormente, a principios de los años 80 del siglo pasado, Nelson y Winter (1982), se encargaron de que el concepto de innovación fuera el centro del análisis y la discusión, cuando plantearon las bases de la escuela evolucionista, en un intento sistemático por construir una teoría general del cambio en economía. Su propuesta tenía como elementos esenciales a la innovación, las rutinas y el entorno.

A partir de este momento, la innovación fue el centro de atención en el escenario empresarial. Siguiendo las ideas del enfoque evolucionista, se discutió ampliamente sobre el concepto de innovación, sobre las rutinas y los procesos de aprendizaje capaces de desarrollar las capacidades de innovación y sobre cuales eran aquellos factores del entorno capaces de proveer las mejores condiciones para que las empresas desarrollaran sus capacidades de innovación. En el caso de los procesos de aprendizaje algunos de los autores más importantes fueron Polany (1966), Nonaka (1988), Nonaka y Takeuchi (1995). En lo que respecta al entorno Lundvall (1992) con el concepto de Sistema Nacional de Innovación.

Al aproximarnos a los años 90, empezó a surgir una propuesta amplia sobre el concepto de innovación, pero sin que en ella hubiera aportaciones significativas. Al respecto se tiene el concepto de capacidad de absorción de Cohen y Levinthal (1989, 1990); el concepto de innovación disruptiva de Christensen, C., Bohmer, R. y Kenagy, J., (2000); y más recientemente el concepto de innovación abierta de Chesbrough (2006) y de innovación de base de Smith, Arond, Fressoli, Thomas y Abrol, (2012). Tal vez, lo significativo estuvo en empezar a entender que no solamente lo importante y necesario tenía que ver con las innovaciones tecnológicas y con las innovaciones radicales, sino que eran igual de importantes las innovaciones incrementales, las innovaciones organizacionales y las innovaciones sociales, así como que para que algo fuera catalogado como innovación no necesariamente tenía que finalizar en el mercado. Todo esto fue retomado en la definición sobre innovación que se encuentra en el manual de

Oslo en su edición en español del año 2007. Con estas referencias, en este trabajo se entenderá como innovación una actividad formal o informal, planificada o no planificada, que toda empresa está obligada a realizar si quiere mantener el control sobre las alternativas de cambio, que desarrolla a través de decisiones oportunas y de un razonamiento contrainductivo, que consiste en la introducción de un producto (bien o servicio) o de un proceso, nuevo o significativamente mejorado, o la introducción de un método de comercialización o de organización nuevo aplicado a las prácticas de negocio, a la organización del trabajo o a las relaciones externas. Y donde la base de conocimientos, así como la capacidad para su adquisición y transferencia son un factor que facilita u obstaculiza esta actividad (Ríos y Vera, 2013).

### El Sistema Nacional de Innovación

En lo que concierne a los factores del entorno que facilitan u obstaculizan la capacidad de innovación de las empresas, el concepto de Sistemas Nacionales de Innovación (en adelante SNI) ha sido el referente principal para el análisis. Freeman (1987), Lundvall (1992) y Nelson (1993) fueron los primeros en introducir este enfoque. De manera muy sintetizada, la propuesta del SNI, consiste en señalar que el entorno donde se ubican las empresas juega un papel determinante para el desarrollo de sus capacidades de innovación. Y en ese entorno los agentes más importantes son: organismos e instituciones gubernamentales, centros e institutos públicos de investigación, instituciones de educación superior, empresas, instituciones intermedias e instituciones financieras. Pero lo esencial, es lo que realmente aportan estos agentes y las relaciones de cooperación que pueden establecer entre ellos. Así cabría esperar que las empresas estarán en

mejores condiciones para desarrollar innovaciones de todo tipo, si se localizan en un entorno donde encuentran instituciones de gobierno que coadyuvan en la construcción de infraestructura para el desarrollo de proyectos de largo aliento de ciencia y tecnología, o a través de una política fiscal que las incentive a realizar actividades de innovación; donde cohabitan instituciones de educación superior y centros de investigación vinculadas estrechamente con las empresas de la región, e instituciones financieras que ofertan capital de riesgo o créditos blandos.

Con estas referencias, se puede conjeturar que hay dos factores clave para que las empresas desarrollen sus capacidades innovación. Uno de ellos internamente, ligado a la naturaleza de sus rutinas y procesos de aprendizaje. El otro externamente, relacionado con la naturaleza del SNI dentro del cual se encuentran inmersas. A esto habría que agregar factores como la inclinación a asumir o evitar los riesgos que implica la innovación, que según Vera (2010), va muy de la mano con la cultura organizacional, y por supuesto la fuerza del tejido social o de lo que se ha dado en llamar capital social, que en otras palabras, son los lazos de confianza que es necesario construir en cualquier relación de colaboración.

En el caso de México, Dutrénit, Capdevielle, Corona, Puchet, Santiago, y Vera-Cruz (2010), señalan que algunas de las fallas principales del SNI mexicano son con respecto al mercado la disponibilidad limitada de capital para financiar la innovación y carencia de recursos humanos en ciencia y tecnología. En lo que corresponde al gobierno, distorsiones en la asignación de recursos. En cuanto a fallas sistémicas la insuficiencia de infraestructura. Y en lo que concierne a fallas institucionales, la dispersión de recursos para ciencia y tecnología. Estos mismos autores realizaron un análisis de fortalezas, oportunidades, debilidades y amenazas del SNI mexicano, que se muestra en la tabla 1.

Tabla 1: FODA SNI Mexicano

Fortalezas	Oportunidades	Debilidades	Amenazas
<p>Mercado interno relativamente grande.</p> <p>Clusters regionales y sectoriales competitivos a nivel internacional.</p> <p>Cercanía a EUA y vinculación a los principales mercados.</p> <p>Un conjunto de Instituciones de Educación Superior: públicas y privadas y centros públicos de investigación de alto nivel.</p> <p>Centro de atracción para la inversión extranjera en sectores específicos.</p> <p>Dotación de recursos naturales y ambientales.</p> <p>Diversidad cultural como fuente de creatividad.</p>	<p>Acceso a centros de producción de conocimiento y movilidad de recursos humanos altamente calificados.</p> <p>Biodiversidad como activo potencial.</p> <p>Innovación basada en el conocimiento local.</p> <p>Aumento de la valoración social a la importancia de la innovación.</p> <p>Presencia de subsidiarias y aprendizaje de la fuerza de trabajo que brindan la posibilidad de pasar a atraer centros técnicos.</p> <p>Ingresos adicionales asociados a las remesas y a los precios de las materias primas.</p> <p>Comunidad mexicana en EUA con capacidad económica, empresarial y de lobby</p>	<p>Bajo crecimiento del mercado interno.</p> <p>Fuerza de trabajo poco calificada.</p> <p>Infraestructura insuficiente y presupuesto escaso.</p> <p>Carencia de un Estado de derecho moderno que brinde agentes.</p> <p>Falta de competencia y de un sistema de incentivos que favorezcan emprendimientos basados en innovación.</p> <p>Sistema de innovación incompleto y desarticulado.</p> <p>Falta de una visión de largo plazo sobre el papel de la Ciencia.</p> <p>Debilidades en el diseño, financiamiento y ámbito de la innovación de CTI.</p> <p>Incapacidad de atracción y retención de talentos.</p>	<p>Creciente competencia de economías emergentes.</p> <p>Acelerado ritmo de crecimiento de la frontera científica y tecnológica.</p> <p>Estrategias de países centrales para la atracción de talentos.</p> <p>Alto nivel de dependencia económica y tecnológica de EUA y poca vinculación con los nuevos polos de desarrollo científico, tecnológico y económico.</p>

Dutrénit, et al (2010)

Estas fallas del SNI, así como las fortalezas, oportunidades, debilidades y amenazas identificadas por Dutrénit et al (Ídem), adquieren matices particulares para cada estado de México, acrecentando las fortalezas, oportunidades debilidades y amenazas propias del Sistema de Innovación local o bien haciendo más profundas sus carencias. Para las micro, pequeñas y medianas empresas y específicamente para las que se localizan en el sector rural, estos sistemas de innovación locales adquieren una gran relevancia por los

recursos naturales, culturales y el capital social que presumiblemente están a su alcance, pero también por las limitaciones que pueden existir en lo que respecta con el acceso a financiamientos, a la vinculación con las instituciones de gobierno, las instituciones intermedias y las instituciones de educación superior. Una aproximación a lo que podría ser un suerte de modelo de un sistema de innovación local es propuesto Ryzard (2009), que por cierto él denomina sistema regional – local de innovación. Asumiendo que los sistemas regionales - locales de innovación son los que presumiblemente mayor influencia tienen en la competitividad y en el desarrollo de las capacidades de innovación de las mipymes rurales, a continuación se hará una breve análisis de los sistemas de innovación de los estados de Chihuahua, Coahuila y Sonora (Región Norte); Jalisco, Querétaro, Distrito Federal, Guanajuato, Michoacán y Morelos (Región Centro); Oaxaca, Puebla y Veracruz (región Sur). Por ser en ellos donde se realizó el trabajo de campo. El análisis referido se realizará retomando los datos que aparecen en el documento “Índice de Competitividad Estatal 2012”, elaborado por el Instituto Mexicano para la competitividad (Los indicadores que se utilizaron para realizar este informe no se corresponden exactamente con los indicadores utilizados por la OCDE para el estudio de la innovación en México Sin embargo, como este mismo organismo lo señala, solamente incluyó a aquellos estados que voluntariamente decidieron participar. De manera agregada los indicadores referidos son: insumos financieros y de capital, insumos de capital humano, interacción de los actores clave, productos tangibles, productos tácitos y productos económicos/sociales. En el año 2009, la OCDE realizó un estudio sobre la innovación en México, intitulado: “Estudio de la OCDE de innovación regional 15 estados mexicanos”, el cual como su nombre lo indica no incluyó a todos los estados de la república mexicana. ) Los indicadores utilizados fueron: Sistema de derecho confiable y objetivo, manejo sustentable del medio ambiente, sociedad incluyente preparada y sana, economía y finanzas públicas, sistema político estable y funcional, mercado de factores, sectores precursores de clase mundial, gobierno eficiente y eficaz, vinculación con el mundo, innovación de los sectores económicos. De manera general, tomando en cuenta los indicadores mencionados se construyeron la tabla 2, 3 y 4. En ellas se sintetizan los resultados obtenidos para los estados seleccionados.

Tabla 2: Región Norte Sistemas Regionales – Locales de Innovación

Posición General	32°	28°	26°

*Elaboración propia con datos del índice de competitividad estatal 2012*

Como puede observarse en el cuadro anterior, se puede conjeturar que la región norte representada por el estado de Chihuahua, Coahuila y Sonora, tiene un sistema regional – local de innovación con condiciones más favorables para el desarrollo de las actividades de innovación. Recurriendo a datos específicos sobre estas entidades sobresale su posición en los indicadores: Sociedad incluyente preparada y sana, Mercado de Factores, Gobierno Eficiente y Eficaz e Innovación de los Sectores Económicos. En el caso particular de Chihuahua ocupa el primer lugar en el indicador Vinculación con el mundo que incluye aspectos como relaciones con el exterior, inversión extranjera directa y el comercio internacional. Además de ser el estado con el mayor número de empresas certificadas en ISO 9000 y con el menor porcentaje de personas en el sector informal. En la región centro los estados que la representan muestran un comportamiento notablemente irregular en los indicadores. Sobresaliendo el DF, seguido por Jalisco, Querétaro y Morelos. Destacando la región en los indicadores de Manejo sustentable, Economía y Finanzas Públicas, Vinculación con el Mundo e Innovación en los Sectores Económicos. Lo cual conduce a suponer que existe un Sistema Regional – Local de innovación con condiciones aceptables para el desarrollo de las diferentes actividades de innovación. Datos más específicos muestran que en el indicador Innovación de los Sectores Económicos, que incluye aspectos como grado de innovación y sofisticación de las empresas establecidas, concentración de investigadores, número de patentes solicitadas por habitante y estandarización de los procesos en las empresas con certificaciones internacionales, cuatro de los seis estados de esta zona se ubican dentro de los primeros diez.

En la región Sur, la situación se complica, pues solamente el estado de Veracruz en el indicador Sistema Político Estable y Funcional y el estado de Puebla en el indicador Manejo Sustentable del Medio Ambiente,

se ubican dentro de los primeros diez. Sin embargo, son indicadores que poco aportan a la promoción y fortalecimiento de las actividades de innovación de las empresas. A todo esto se puede decir, que la región sur del país es la que ofrece las condiciones más precarias para el desarrollo de la innovación. Lo cual se reafirma si atendemos al indicador de productos tácitos de la innovación (OCDE, 2009). En este aspecto Chihuahua ocupa el lugar 8º; Michoacán el lugar 22º, Puebla el lugar 13º, mientras que Veracruz ocupa el lugar 27º y Oaxaca el lugar 26º.

## ESTRATEGIA METODOLÓGICA

La investigación se realizó aplicando una estrategia cualitativa y cuantitativa. Respecto al enfoque cualitativo, a través de una investigación documental se analizaron desde la óptica de las sistemas regionales – locales de innovación, las características principales de las regiones en donde se localizan las empresas que formaron parte del análisis de varianza. Por su parte, el enfoque cuantitativo consistió en desarrollar un análisis de varianza con la finalidad de probar las hipótesis nulas siguientes. H1: la intensidad de la innovación que realizan las empresas está determinada por la región donde están localizadas. H2: el tipo de innovación determina la intensidad de la innovación de la empresa. H3: el tipo de innovación está determinada por la zona donde se localizan las empresas. Para llevar a cabo el análisis de varianza se seleccionó una muestra aleatoria de 54 empresas, de una población total de 67. La muestra se definió siguiendo el criterio de Kirk (1995), quien propone para un diseño factorial de dos factores (localización de la empresa y tipo de innovación), con tres y dos niveles respectivamente ( zona norte, zona centro y zona sur; innovación de producto e innovación de procesos) un total de 9 sujetos por celda, es decir  $3 \times 2 \times 9 = 54$  unidades. Este tamaño de muestra, implica el haber considerado un nivel de confianza  $\alpha = 0.05$  y una potencia de  $(1 - \beta) = 0.70$ . Es importante aclarar que el total de 67 empresas corresponde a aquellas de la base de datos de la Red Nacional de Desarrollo Sustentable (en adelante RENDRUS) (Esta red está a cargo de la Secretaría de Agricultura, Ganadería, Desarrollo Rural, Pesca y Alimentación. Tiene como objetivo fortalecer, difundir y consolidar, en las 32 entidades federativas, las capacidades de los productores rurales para generar micro, pequeñas o medianas Agroempresas participantes en la Red Nacional de Desarrollo Rural Sustentable.) que respondieron a un cuestionario que se les hizo llegar vía correo electrónico y con las cuales posteriormente se realizaron entrevistas in situ. De las 32 entidades de la república mexicana donde RENDRUS tiene presencia, se seleccionaron las entidades siguientes: Chihuahua, Coahuila, Sonora, Jalisco, Querétaro, Distrito Federal, Estado de México, Guanajuato, Michoacán, Morelos, Oaxaca, Puebla y Veracruz. Esta selección se realizó tomando en cuenta el área de influencia de los investigadores que trabajaron en un proyecto previo intitulado: “El papel de las redes sociales en el desarrollo de las microempresas rurales en México”. El que varias de las empresas de la base de datos no hayan respondido el cuestionario, se debió a errores en las direcciones electrónicas y a que algunas de ellas ya no existen.

<b>Hipótesis Nulas</b>	<b>Evaluación de las Hipótesis</b>
Efecto principal (factor A): ¿Difieren las regiones en cuanto a sus efectos sobre la intensidad de la innovación?	Se acepta la hipótesis. Por lo tanto las regiones juegan un papel decisivo en la intensidad de la innovación
Efecto principal (factor B): ¿Difieren los tipos de innovación en cuanto a sus efectos sobre la intensidad de la innovación?	Se rechaza la hipótesis. Por lo tanto, el tipo de innovación no influye en la intensidad de la actividad innovativa
Efecto de interacción (factores A y B): ¿Se desempeñan mejor las empresas de cierta región en la realización de determinado tipo de innovación?	Se acepta la hipótesis. Por ello, las regiones sí influyen en el tipo de innovación que realizan las empresas

Relacionando los resultados del análisis de varianza con los resultados de la investigación documental, se tiene en lo que respecta a la primera hipótesis, que señala que las regiones donde se localizan tienen un efecto estadísticamente significativo en la intensidad de la innovación, hay discrepancias con los hallazgos documentales, pues no obstante la clara diferencia en las condiciones del sistema – regional local de innovación en las tres zonas en las que se dividió la república mexicana, encontrándose un entorno más favorable en la región norte, enseguida en la región centro y las condiciones más desfavorables en la región sur; en la región norte es donde menos innovaciones se observan.

Respecto a la segunda hipótesis, la cual fue rechazada, se tiene que el tipo de innovación no tiene una influencia estadísticamente significativa en la actividad de innovación de las empresas. Es decir, la intensidad de la innovación no está determinada por la innovación de producto o por la innovación de proceso. En la tercera y última hipótesis, una vez más, la región marca una diferencia estadísticamente significativa con el tipo de innovación. Cruzando estos resultados con la información documental, se tiene

que no obstante que en la región norte, es donde se puede suponer que existen las mejores condiciones para promover y desarrollar innovaciones de producto y de proceso, no es en ella donde las empresas realizan mayormente esta clase innovaciones. La región centro ocupa el primer lugar en cuanto a número de innovaciones de producto e innovaciones totales. Una explicación posible a este fenómeno pudiera ser las altas calificaciones que presenta el DF en la mayoría de los indicadores, o bien, que algunos de estos indicadores tienen una influencia más directa en lo que a al tipo de innovación se refiere. Como podría ser el caso de la Innovación de los sectores económicos. En este indicador de los seis estados que se incluyeron en la región central, cuatro de ellos están entre los primeros 10 de la república mexicana.

## CONCLUSIONES

De acuerdo al análisis realizado se observa un SNI mexicano en proceso de construcción, con características particulares cuando se le mira desde la perspectiva de los sistemas regionales – locales de innovación. A partir de la división realizada por cuestiones metodológicas, y atendiendo a la información documental, la conclusión sería que se tiene en la zona norte un sistema regional – local de innovación con las mejores condiciones para que las empresas desarrollen actividades de innovación, incluyendo desde luego a las empresas rurales. Destacando aspectos como el de una sociedad incluyente, preparada y sana, el mercado de factores, gobierno eficiente y eficaz e innovación de los sectores económicos. Sin embargo, como ya se discutió, cuando se relacionan estos datos con los resultados del análisis de varianza, se observa un comportamiento de las empresas exactamente contrario a lo esperado, pues son las empresas de la zona norte las que realizan menos innovaciones. Al respecto se pueden dar las siguientes explicaciones. Una de ellas consistiría en señalar que el trabajo de campo se basó en una muestra muy pequeña. Que es necesario tomar una muestra mayor e incluir a empresas rurales de todos y cada uno de los estados de la república mexicana. Y es posible que haya fundamentos de peso en esta posibilidad. Sin embargo, quienes realizamos esta investigación somos partidarios que la discrepancia en los resultados es más una consecuencia de la realidad tan distinta que corresponde a las empresas rurales mexicanas y que los datos sobre el SNI o sobre los índices de competitividad estatal a partir de los cuales se intento caracterizar a los sistemas regionales – locales de innovación no alcanzan a reflejar.

Por lo tanto, es necesario replantear los indicadores de los estudios señalados con datos que permitan caracterizar de manera más atinada la realidad de lo que se podría llamar el sistema nacional rural de innovación. Es importante subrayar, que no obstante que las empresas rurales han estado catalogadas en un segundo plano (al menos en México), son empresas que si realizan innovaciones tanto de producto como de proceso, apoyadas esencialmente en sus rutinas y procesos de aprendizaje, en los saberes que se van heredando de generación en generación. Y posiblemente se trata de innovaciones marginales, pero que para ellas son importantes para mantener un mercado y en algunos casos para incursionar en mercados mejor remunerados. Finalmente, también se encontró, que en general, las empresas rurales no realizan innovaciones organizacionales, lo que se puede presumir tiene un impacto negativo en sus procesos de gestión.

### RESUMEN

*Para la mayoría de las empresas la responsabilidad social puede convertirse en una herramienta para incrementar su productividad y desempeño, para aumentar las inversiones, para posicionar el nombre de la marca, para aumentar la preferencia de compra del consumidor, para campañas de mercadotecnia comercial y de imagen, para asegurar su operación y sustentabilidad a largo plazo, para la administración de la calidad, para mejorar las políticas y relaciones hacia el recurso humano, para reducir los conflictos con los stakeholders y para aminorar las presiones del entorno. En resumen, la Responsabilidad Social Corporativa puede considerarse como un recurso estratégico, pues facilita a la empresa el objetivo de maximizar sus utilidades cumpliendo al mismo tiempo con la responsabilidad inherente hacia su entorno, tanto interno al referirse a sus trabajadores; como externo, con la comunidad en general.*

## MONITORING CORPORATE SOCIAL RESPONSABILITY ON COMPANIES FROM BAJA CALIFORNIA MEXICO.

### ABSTRACT

*For most businesses social responsibility can become a tool to increase productivity and performance, to enhance investments, to position the brand name, enhance the consumer preference, for commercial and image marketing campaigns, to ensure operation and sustainability in the long term, for quality administration, to improve policies and relations towards human resources, to decrease conflicts with the stakeholders and to narrow the pressure of the environment. In brief, corporate social responsibility could be consider as an strategic resource, because it helps the business to achieve the goal to maximize its utilities fulfilling at the same time the responsibility towards its surroundings, both internal concerning the workers, and external concerning the community in general.*

**KEY WORDS:** Social Responsibility, Stakeholders, Corporate Government, Competitiveness

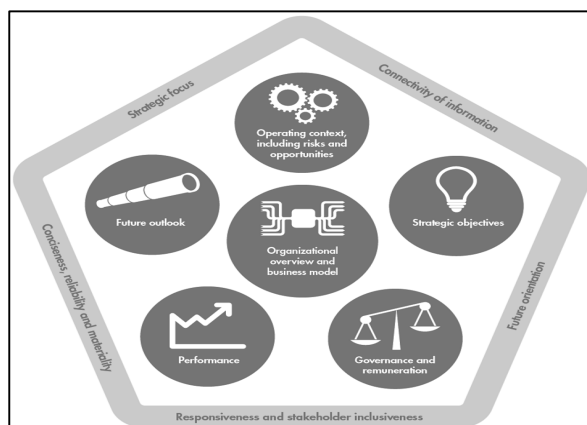

## INTRODUCCIÓN

La respuesta corporativa a las cuestiones sociales y ambientales, mejor conocido como Responsabilidad Social Corporativa (RSC), ha sido estudiada por varios autores que la han visto progresar por las siguientes tres etapas: maximización de utilidades, administración de la confianza y administración de la calidad de vida (Gray, 1977). Se puede identificar cómo las empresas muestran una serie de etapas de transición, en lo que a Responsabilidad Social se refiere; la primera cuando a través de este concepto las empresas denotan una herramienta para mejorar procesos, venderse e incluso posicionarse; la segunda, cuando por medio de ésta intentan alcanzar la confianza de los actores tanto internos, en el caso por ejemplo de los trabajadores, como los externos, en el caso de los proveedores y clientes entre otros; y por último la tercera, a través de la cual buscan lograr la calidad de vida para el contexto en el que interactúan. En adelante, trataremos de identificar las idealidades o ventajas asociadas a estas etapas. Las empresas tienden a mostrar motivaciones diversas para la adopción de una política de Responsabilidad Social Corporativa. Estas motivaciones pueden ir desde el cumplir con los requerimientos legales obligatorios básicos encaminados a controlar prácticas empresariales destructivas, tradicionalmente implementadas por los gobiernos, hasta considerarla como una herramienta para incrementar la productividad y mejorar el desempeño financiero de la empresa (Panwar, Rinne, Hansen y Juslin, 2006).

### Marco Teórico

El Consejo Internacional sobre Reportes Integrados (IIRC) en 2011 reunió a líderes mundiales de las áreas corporativas, de inversión, contaduría, regulación así como académicos, con el propósito de presentar un nuevo enfoque sobre los reportes corporativos que satisfagan las necesidades de las empresas; basándose en los aspectos financieros, administrativos, de gobierno corporativo y sustentabilidad, reflejando su interdependencia. Evolucionando, de esta manera, de reportes corporativos centrados solamente en los reportes financieros de la empresa a "reportes integrados" donde la importancia no necesariamente se enfoca en los resultados financieros de la empresa sino en una serie de aspectos que anteriormente no se tomaban en cuenta pero que también afectan en gran medida su operación y su futuro a corto, mediano y largo plazo. Se presentan cinco "principios rectores" así como seis "elementos de contenido" para la preparación de dichos reportes (figura 1).

Figura 1: Principios y Elementos del Reporte Corporativo

*Fuente: Consejo Internacional sobre Reportes Integrados, 2011.*

Si prestamos atención a lo anterior podemos ver el planteamiento de un "modelo de negocio basado en la sustentabilidad" donde encontramos como común denominador la "responsabilidad" de la empresa ya no

solamente a los altos rendimientos, sino a un compromiso todas las partes interesadas. En relación a lo anterior, se infiere entonces cómo la Responsabilidad Social Corporativa puede considerarse como un elemento clave en el cumplimiento de las obligaciones legales, que van desde lo laboral hasta lo ambiental; al igual que uno de importancia para maximizar utilidades y eficiencia productiva. Varias ramas administrativas han reconocido que la Responsabilidad Social Corporativa es apropiada para sus propósitos, tal es el caso de la administración de calidad, mercadotecnia, comunicaciones, finanzas, recursos humanos, etc. (Marrewijk, 2003). Tal y como lo propone este autor, las empresas optan en considerarla como una herramienta para optimizar el desempeño de sus actividades, logrando con ello incrementar la eficiencia de sus procesos.

En la evolución natural del entorno de negocios, es deseable que las empresas asuman responsabilidades más allá del ámbito económico; por ende, se torna importante responder proactivamente a cuestiones sociales y ambientales para aminorar las presiones sociales, económicas y políticas sobre ellas. (Panwar, Rinne, Hansen y Juslin, 2006). Es significativo enfatizar que las empresas van prestando una importancia incremental a la Responsabilidad Social Corporativa, buscando acatar requerimientos éticos, con lo que se evita impactar negativamente en el nombre de la marca. (Jacobs, 2008). De esta forma, cada vez más empresas coinciden con que la Responsabilidad Social Corporativa se practica primordialmente como una estrategia de posición de negocios (Amos, 2005), por lo que su importancia radica en el impacto sobre la marca de la empresa, su posicionamiento en el mercado y el aumento del valor de sus acciones, así como en la aceptación de ésta por inversionistas potenciales.

En este sentido, podríamos reconocer a las tres etapas, anteriormente mencionadas, como una práctica inclusiva en la Responsabilidad Social Corporativa moderna; donde además de considerar las utilidades, se tomen en cuenta los intereses de todas las partes interesadas o stakeholders. La Responsabilidad Social Corporativa no se concibe solamente como una responsabilidad moral de los administradores de un conglomerado para el bienestar social o un gasto discrecional administrativo que podría obstaculizar la rentabilidad de la empresa, sino como un recurso estratégico que debe reflejarse positivamente en el rendimiento de la empresa. (McWilliams, Siegel y Wright, 2006). Al momento de tomar sus decisiones de inversión, los inversionistas cada vez le dan más importancia a aspectos como el medio ambiente, el impacto social y las prácticas de gobierno corporativo; por ende, las compañías que se preocupen por su reputación, deben reconocer como responde su estructura corporativa a las responsabilidades sociales de la empresa. Esto implica que además de implementar políticas alineadas con los intereses de sus accionistas, se considere un modelo de “Best Practice” que conlleve un sentido social. Aquellas empresas que lo están haciendo han comprobado que al adoptar este tipo de medidas, además de evitar riesgos, aumenta el valor agregado a la marca. (Fombrun, 2006).

Cuando se persiguen inversiones éticas, tanto las personas físicas como morales buscan empresas con una reputación positiva evitando empresas ligadas a prácticas perjudiciales para el medio ambiente, malas prácticas hacia los empleados, regímenes opresivos, etc. El incremento en este tipo de inversiones ha alentado a las empresas a dar mayor atención a la Responsabilidad Social Corporativa (Schepers y Sethi, 2003). Tal como lo comentan Schepers y Sethi (2003) el incremento en este tipo de inversiones ha alentado a las empresas a dar mayor atención a la Responsabilidad Social Corporativa. De esta manera, empresas que se preocupan por el entorno y demuestran prácticas de Responsabilidad Social Corporativa han incrementado la preferencia del consumidor, además de un mayor atractivo de inversión (Gildea, 1994). También se ha sugerido que al adaptar las prácticas y filosofías de los negocios a normas y valores socio-culturales, las empresas pueden facilitar su permanencia.

Como lo comentan Bansal y Roth (2000), esto contribuye a la prosperidad y sobrevivencia de la empresa al reducir conflictos con las partes interesadas o stakeholders y sus costos asociados, al tiempo de asegurar su sustentabilidad a largo plazo. Con esto en consideración y llevando una política corporativa alineada al

cumplimiento efectivo de responsabilidad social, podemos vislumbrar innumerables ventajas para las empresas. Así pues, para la mayoría de las empresas la responsabilidad social puede convertirse en una herramienta para incrementar su productividad y desempeño, para aumentar las inversiones, para posicionar el nombre de la marca, para aumentar la preferencia de compra del consumidor, para campañas de mercadotecnia comercial y de imagen, para asegurar su operación y sustentabilidad a largo plazo, para la administración de la calidad, para mejorar las políticas y relaciones hacia el recurso humano, para reducir los conflictos con los stakeholders y para aminorar las presiones del entorno.

En resumen, la Responsabilidad Social Corporativa puede considerarse como un recurso estratégico, pues facilita a la empresa el objetivo de maximizar sus utilidades cumpliendo al mismo tiempo con la responsabilidad inherente hacia su entorno, tanto interno al referirse a sus trabajadores; como externo, con la comunidad en general. No obstante lo anterior, se cuestiona si este recurso estratégico puede considerarse la panacea que solventará la brecha entre la pobreza y la riqueza, la exclusión social y la degradación ambiental (Marrewijk, 2003).

## METODOLOGÍA

En primera instancia se efectuará un análisis bibliográfico sobre Responsabilidad Social Corporativa, analizando las teorías pertinentes, comparando el grado de compromiso y cumplimiento tanto por las grandes empresas, como por las PYMES. Se conducirá una investigación de campo que permita determinar cómo un pequeño grupo de empresas, dentro de un sector específico pero con características distintas (tamaño, organización, estructura corporativa, etc.), interactúan con las partes interesadas (shareholders-stakeholders). Esta investigación reúne información relevante que permite evaluar la profundidad y diversidad de las actividades de Responsabilidad Social Corporativa, además de examinar cómo empresas con características distintas, aunque dentro de un mismo contexto, utilizan opciones diferentes en relación al manejo o administración de sus relaciones internas, con sus inversionistas y empleados, así como externas, con proveedores-clientes y comunidad en general (Freeman, 1984; Nasi, 1995). Incluimos el concepto de Gobierno Corporativo y la influencia que sobre él genera la Responsabilidad Social. El enfoque de la investigación residió en las relaciones de estas empresas para con sus inversionistas o *shareholders*, empleados y comunidad en general o *stakeholders*. El primer aspecto de la investigación requiere del análisis teórico de la realidad local y de los estudios sobre la temática de estudio, esto se logra mediante las siguientes estrategias:

*Como primera estrategia, se elaboró un marco contextual que describe las empresas en el estado de Baja California, su realidad, entorno, características e importancia.*

*Como segunda estrategia, se desarrolló un marco teórico de los conceptos que componen las variables de estudio de esta investigación, partiendo del análisis de literatura relevante sobre el tema, consultando bibliografía, bases de datos, ponencias, actas, memorias y actas de congresos.*

En esta primera parte se analizaron los aspectos teóricos relativos a la delimitación conceptual, para continuar con aspectos relacionados con la Responsabilidad Social Corporativa.

## RESULTADOS Y CONCLUSIONES

En general se realizó un estudio sobre la importancia de la Responsabilidad Social Corporativa en empresas de Baja California y las razones para tomar esta tendencia como política empresarial. Nuestras conclusiones resultan del estudio realizado y constan de:

*Investigación cualitativa: Esta fase consistió en realizar una entrevista semiestructurada a empresas medianas y grandes en el estado de Baja California, con injerencia en el desarrollo económico de la entidad.*

*Investigación cuantitativa: La siguiente fase consistió en realizar una serie de encuestas a empresas medianas y pequeñas en el estado de Baja California, con injerencia en el desarrollo económico de la entidad.* Se cumplió con los objetivos, tanto generales como específicos, planteados al inicio de este trabajo:

Determinar la diferencia entre las actividades y estrategias de implementación de Responsabilidad Social Corporativa, como parte de las acciones que pueden derivar en el reconocimiento y crecimiento del valor de la marca.

Determinar si existen y cómo se llevan a cabo las actividades y estrategias de gestión de la responsabilidad social corporativa (RSC) en las empresas en Baja California.

Determinar si existen actividades para el cuidado y preservación de los recursos naturales como estrategias Responsabilidad Social Corporativa en las empresas en Baja California.

Determinar si existen actividades para mejorar la calidad de vida en el trabajo como estrategias Responsabilidad Social Corporativa en las empresas en Baja California.

Determinar si existen actividades para mejorar la relación con la comunidad como estrategias Responsabilidad Social Corporativa en las empresas en Baja California.

Determinar si existen actividades para desempeño ético y valores empresariales como estrategias Responsabilidad Social Corporativa en las empresas en Baja California.

Determinar si existen mecanismos para evaluar los costos y beneficios de llevar a cabo estrategias de Responsabilidad Social Corporativa en las empresas en Baja California.

Resulta evidente que la implementación de prácticas encaminadas al seguimiento de una adecuada Responsabilidad Social Corporativa trae consigo, además del cumplimiento cabal de ciertas regulaciones, una serie de bondades hacia la empresa, ya sea grande, mediana o pequeña. Se ha podido señalar, en este sentido, que la Responsabilidad Social Corporativa contribuye a la consolidación de una visión de futuro más consistente y más sensible al largo plazo (Steele y Cleverdon, 2004). A través de la realización de este proyecto se pudo constatar como esas prácticas proveen a la empresa de herramientas que pueden convertirse en ventajas. Entre ellas podemos notar las siguientes:

**Mejor información.** La información es materia prima esencial para la gestión empresarial, un elemento imprescindible para el adecuado posicionamiento ante todos los factores que, en alguna medida, condicionan la actividad de la compañía. Pero en entornos y momentos críticos, esa importancia es aún mayor. Ante la variabilidad e impredecibilidad del entorno, se hace preciso disponer de mayor y mejor información, conceder atención más pormenorizada al mediano y largo plazo considerando el mayor número de variables.

**Mayor conocimiento.** El desarrollo de un sistema integrado de Responsabilidad Social Corporativa posibilita mejoras notables en el nivel de conocimiento de la empresa, en una triple dirección, mejor conocimiento de las características y necesidades de los grupos de interés con los que la empresa se relaciona, de las expectativas y de las demandas que mantienen frente a ella. Propiciando así un mejor

conocimiento de todos los colectivos que inciden en la empresa y en el entorno en que ésta desarrolla su actividad, no sólo más amplio, sino también de mayor horizonte temporal.

Mejor coordinación. Todo lo anterior posibilita evidentes mejoras de coordinación dentro de la empresa. La adecuada centralización y sistematización de ese caudal informativo que afecta a todas las áreas y a todas las actividades supone un movimiento interno y una puesta en común de datos, actuaciones, criterios y estrategias que, si se aprovecha y gestiona eficazmente, puede reforzar sustancialmente los mecanismos de coordinación y reducir sus costos. Mejor evaluación de los riesgos. La perspectiva de la Responsabilidad Social Corporativa incorpora como elemento central la aspiración a una mejor evaluación y gestión de los riesgos que la empresa afronta en sus relaciones con cada uno de sus grupos de interés; muy especialmente de los que inciden en la reputación, así como de los derivados de problemas no directamente imputables a la empresa, pero que pueden afectarla decisivamente: riesgos asociados a la cadena de suministro, a nivel de sector o de país, derivados de planteamientos críticos frente a determinados tipo de empresas. Mayor calidad.

Parece evidente que todos los efectos mencionados apuntan en una misma dirección: la mejora general de la eficiencia y la calidad. En cuanto a lo primero, responde a la propia naturaleza de los sistemas de Responsabilidad Social Corporativa, que tienen su fundamento central en la sostenibilidad y que cuentan entre sus más directas finalidades el impulso de técnicas y procesos más eficientes en términos de utilización de recursos naturales y la reducción general de costes de múltiple origen: regulatorios (sanciones y procesos legales), derivados de una débil integración del personal, de primas de seguros por riesgos, etc. Mayor innovación. La puesta en marcha de un sistema integral y coherente de Responsabilidad Social Corporativa enfrenta dificultades tanto derivadas de resistencias y obstáculos en el propio interior de la empresa, como producidas por los problemas que inevitablemente comportan las políticas de transparencia informativa, de diálogo con todos los sectores afectados y de apertura al escrutinio de la sociedad. Mejor reputación.

Una virtud adicional radica en su contribución específica al fortalecimiento de uno de los más importantes activos intangibles de la empresa: la reputación. Algo que puede verse como una aportación añadida a la calidad de la gestión, entendiendo la reputación como un resultado de la gestión de la marca. La reputación en un rasgo conferido siempre por los demás. Un resultado de la impresión que cualquier persona o entidad produce en su entorno y que en el caso de las empresas obedece a multitud de factores: es el producto neto de la percepción que tienen de la empresa sus grupos de interés y el público en general. Es decir, el grado de confianza que depositan en ella o en otras palabras el valor que les merece su marca.

*Mayor aportación de valor por los stakeholders. Las contribuciones de la Responsabilidad Social Corporativa a la competitividad empresarial son el reflejo de las aportaciones directas de cada grupo de interés a la empresa que impulsan las políticas de Responsabilidad Social Corporativa como contrapartida a la mayor atención que la compañía responsable dispensa a las necesidades y expectativas de cada parte interesada.*

Como resultado de los hallazgos de la parte cualitativa, producto a su vez de los puntos abordados al principio de este trabajo, podemos denotar que cada vez se le da mayor importancia a la Responsabilidad Social tanto por las empresas como por los consumidores, que prefieren los productos y servicios de aquellas que mantienen un compromiso social; por lo que los distintivos y etiquetas que reconocen a las empresas como socialmente responsables se están convirtiendo en un elemento importante de mercadotecnia, que diferencia a las empresas y a sus productos o servicios.

Así pues, la Responsabilidad Social no sólo beneficia a la sociedad, sino a las mismas organizaciones, brindándoles una ventaja competitiva en su sector, tanto a nivel nacional como internacional. De ahí que se preste atención especial a rubros tales como:

Cuidado y Preservación de los Recursos y el Medio Ambiente, Calidad de Vida en el Trabajo. Relación con la Comunidad., Desempeño Ético y Valores. Y que de éstos se disparen una serie de ventajas que pueden potencializar a la empresa dentro de su entorno; pudiéndose traducir, dependiendo de cada uno de los stakeholders, en: Accionistas e inversionistas. Mejores condiciones de acceso a los mercados financieros y menor costo del capital, Atracción de accionistas e inversores de calidad., Atracción de inversión socialmente responsable, Incremento del valor de la acción, Menores posibilidades de conflictos de agencia, Disminución de reclamaciones y demandas legales, Fortalecimiento de la reputación entre inversores., Mayor margen de maniobra en situaciones críticas.

#### Clientes

Atracción de clientes sensibilizados por la Responsabilidad Social Corporativa., Atracción de clientes con necesidades especiales, Mayor fidelidad de la clientela, Aumento de las ventas, Fortalecimiento de la reputación en el mercado, Disminución de reclamaciones y demandas legales.

#### Proveedores

Atracción de proveedores de calidad., Fortalecimiento de la reputación entre proveedores, Mejor selección de proveedores, Mejores condiciones de aprovisionamiento a medio y largo plazo.' Mayor confianza, estabilidad y nivel de cooperación en la relación, Incentivo a inversiones para mejoras en los suministros. Disminución de reclamaciones y demandas legales, Mayor margen de maniobra en situaciones críticas.

#### Empleados

Incremento de la motivación y de la integración, Atracción y retención de talento y de empleados de calidad, Incremento de la productividad, la eficiencia y la calidad, Reducción del absentismo, Mejora del clima laboral y reducción del nivel de conflictividad laboral., Mayor margen de maniobra en situaciones críticas

#### Reguladores

Mayor facilidad en las licencias para operar, Menor probabilidad de sanciones y procedimientos legales. Mejor relación general, Mayor receptividad para la opinión y la influencia, Posibilidad de incentivos. Mejor posicionamiento ante contratos públicos, Mayor margen de maniobra en situaciones críticas.

#### Sociedad

Mejor aceptación social, imagen y reputación, Mayor receptividad para la opinión y la influencia. Mejores relaciones con agentes sociales., Mayor margen de maniobra en situaciones críticas.

Es importante reconocer también que los estándares de Responsabilidad Social creados por y para las grandes empresas no pueden ser transferidos sin adecuaciones a las PYMES y éstas no tienen la capacidad de influir para modificar estándares. Sin embargo, “de facto” las PYMES generalmente tienen una mayor comprensión de la cultura local, están más arraigadas en la comunidad y tienen un mayor compromiso con el lugar en el que operan. Por otra parte, si bien es más sencillo para las grandes empresas obtener ganancias comerciales de las acciones de la aplicación de la Responsabilidad Social, estas prácticas pueden generar ganancias de competitividad para las PYMES también y en muchos casos pueden ser de fácil implementación, siempre y cuando se les sensibilice al tiempo de hacerles ver las bondades y beneficios económicos que les puede traer. De aquí la importancia de analizar la competitividad que llega a generar el

manejo de la Responsabilidad Social en las PYMES. Adicional a lo anterior, la adecuación de políticas empresariales en materia de Responsabilidad Social Corporativa, previstas en la planeación propia de la empresa, incidirían en la productividad de las mismas, lo que puede llevar a generar una mayor riqueza, tanto a la misma empresa y a sus stakeholders.

## RESUMEN

*A partir de los resultados de la aplicación autoadministrada, a tres generaciones de egresados de licenciatura del "Instrumento para conocer la satisfacción de los estudiantes universitarios con su educación", propuesto por Gento y Vivas (2003), se identifican los índices de satisfacción estudiantil con los servicios educativos recibidos durante el proceso de formación, detectando las subdimensiones en donde las cohortes manifiestan mayor insatisfacción, las que representan áreas de oportunidad para mejorar la calidad de los servicios en una Institución de Educación Superior, bajo la premisa de que los niveles de satisfacción estudiantil, constituyen importante referente en la búsqueda de calidad educativa. Al respecto los resultados señalan que aun cuando concurren altos niveles de satisfacción (en promedio 97% de respuestas ubicadas en las opciones de "satisfecho", "bastante satisfecho" o "totalmente satisfecho" en las tres cohortes analizadas), se presentan importantes áreas de oportunidad para instrumentar procesos de mejora en cinco de las diez subdimensiones exploradas; destacando las relacionadas con el cumplimiento a necesidades básicas, servicios de apoyo, seguridad vital y socioeconómica, así como en los sistemas de trabajo.*

**PALABRAS CLAVE:** Evaluación, Calidad Educativa, Satisfacción Estudiantil, Mejora Continua

## CHALLENGES AND OPPORTUNITIES ARISING LEVELS OF SATISFACTION WITH SERVICES RECEIVED IN A UNIVERSITY FROM THE PERCEPTION OF ITS GRADUATES

### ABSTRACT

*From the results of the self-administered application, three generations of undergraduate alumni of the "Tool to determine the satisfaction of college students with their education," proposed by Gento and Vivas (2003), satisfaction rates are identified with the educational services received during the training process, identifying the subdomains where cohorts show greater dissatisfaction, which represent opportunity areas to improve the quality of services in a higher education institution under the premise that student satisfaction levels, constitute an important benchmark in the search for quality education. In this respect the results indicate that while concur high levels of satisfaction (on average 97% of respondents located in the options "satisfied", "fairly satisfied" or "completely satisfied" in the three cohorts analyzed), important opportunity areas presented to implement process improvements in five of the ten sub-dimensions explored; emphasizing compliance related to basic needs, support services, security and socio-economic life and in work systems.*

**JEL:** A22, I21, I23

**KEYWORDS:** Evaluation, Educational Quality, Student Satisfaction, Continuous Improvement

## INTRODUCCIÓN

Cuando se refiere gestión de la calidad, la satisfacción constituye una de las dimensiones que mayor aceptación alcanza (Koontz y Weihrich, 2007; Hayes, 2002; Vavra, 2002), bajo esa consideración este estudio aborda la identificación de niveles de satisfacción de quienes egresan de las licenciaturas en Administración, Contaduría, Gestión Turística y Sistemas Computacionales impartidos en la Facultad de Contaduría y Administración, Campus I (FCA) de la Universidad Autónoma de Chiapas (UNACH) para que a partir de los resultados, puedan establecerse planes de acción orientados a mejorar las áreas de oportunidad detectadas. Para ello, en forma autoadministrada se aplicó a egresados de las últimas tres cohortes (Agosto-Diciembre 2012, Enero-Junio 2013 y Agosto-Diciembre 2013) el “Instrumento para conocer la satisfacción de los estudiantes universitarios con su educación”, (SEUE) propuesto por Gento y Vivas (2003). El interés por realizar este trabajo se inscribe en el marco de proyecto de mayor alcance relacionado con seguimiento de egresados, que incluye el indicador de satisfacción estudiantil como una dimensión que debe valorarse y considerarse, que si bien puede resultar subjetiva (Pérez y Alfaro, 1997), no pierde relevancia, ya que busca identificar la percepción de egresados sobre aspectos relacionados con la institución y los servicios recibidos, (Valenti y Varela, 1998), lo que debe permitir atisbar áreas de oportunidad respecto a la calidad de los servicios ofrecidos.

Esta medición, adquiere significado siempre que a la misma se acompañen acciones necesarias para insertarse en un proceso de mejora continua, de tal forma que si se realiza en forma consistente, permanente y adecuada, (Mejías y Martínez, 2007) fundamentará la toma de decisiones, aprovechando las áreas de oportunidad detectadas. Para socializar de este proyecto, en seguida a esta introducción se presenta la revisión de la literatura en donde se reconoce que aun cuando el término “satisfacción” se acuñó dentro del ámbito de la gestión empresarial; se ha matizado para adaptarse al campo educativo, al tiempo que se destacan algunos resultados generados en proyectos similares; se describe la metodología empleada, enfatizando las características del instrumento utilizado; se detallan los resultados más relevantes y al final se vierten algunas conclusiones, que sugieren las líneas de acción para alcanzar la mejora continua.

## REVISION DE LITERATURA

El concepto relacionado con “satisfacción estudiantil” tiene su origen en el campo de la gestión empresarial, acuñado como “satisfacción del cliente”, frecuentemente utilizado como una meta o indicador de éxito frente a los competidores, (Salinas, Morales y Martínez, 2008) sin embargo, el término se matiza, toda vez que una universidad no puede equipararse a una empresa, tampoco confundir como clientes a los alumnos o suponer producto al proceso educativo, (Vallaes y Carrizo, s/f), pero “si los estudiantes son los destinatarios de la educación, son ellos los que mejor pueden valorarla y, aunque tienen una visión parcial, su opinión proporciona un referente que debe tenerse en cuenta” (Pérez y Alfaro, citados por Gento y Vivas 2003, 17).

Para Wolman (1984), el término satisfacción remite a un estado de placer que se logra cuando una persona alcanza la meta establecida por tendencia motivadora dominante; en este sentido Davis y Newstrom (2001), afirman que la palabra satisfacción involucra un conjunto de sensaciones favorables o desfavorables, que suscita a un individuo la realización de cierta acción o actividad. Por su parte, la Norma ISO 9000; citadas por Gerson (1998), define a la satisfacción del cliente como la percepción que éste tiene sobre el grado en que se le han cumplido sus requisitos, de manera que sus expectativas fueron alcanzadas o sobrepasadas. Tratándose del área educativa, Gento y Vivas (2003) acudiendo a Pérez Juste, afirman que la satisfacción es una dimensión de la calidad que tiene mayor aceptación en los diferentes modelos de evaluación propuestos cuya medición involucra a todos los implicados, desde quienes participan en el diseño,

prestación y mejora del producto, bien o servicio, a quienes son clientes, usuarios o destinatarios, en ese sentido, Elliot y Shin (2002) señalan que una razón adicional que revela la importancia que paulatinamente se ha otorgado a la satisfacción de los alumnos en las evaluaciones de las instituciones educativas, está relacionada con estudios que afirman que la satisfacción estudiantil muestra una correlación positiva con aspectos de motivación, índices de retención y rendimiento académico.

Inhibir la opinión y valoración de los estudiantes, respecto a los servicios recibidos, en el fondo significa ejercer prácticas evaluativas autoritarias o no democráticas, puesto que no se permite la expresión de los actores centrales (Santos, 1996). Cuando no se escuchan y atienden las opiniones de los actores principales del proceso de aprendizaje, de alguna forma resulta paradójica su evaluación, pues de todos los involucrados, procesos y categorías que intervienen en él, es al estudiante la única persona que en forma sistemática y periódica se somete a evaluación (Santos, 1999). Al respecto, la Organización de las Naciones Unidas, para la Educación, la Ciencia y la Cultura (UNESCO, 1998), afirma que los estudiantes y sus necesidades deben ubicarse en el centro de las preocupaciones de quienes toman decisiones, de manera que se constituyan en protagonistas del proceso de renovación de la educación superior, sobre todo en lo relacionado con modelos de enseñanza, formas de evaluación, innovación de métodos pedagógicos, e incluso en la formulación de políticas institucionales.

Aun cuando resultan numerosos los estudios que abordan el objeto de estudio aquí planteado y variadas las formas utilizadas en su medición, los siguientes cuatro, sirven como referentes, a lo que aquí se analiza, pues presentan algunas similitudes, tanto en procedimientos desarrollados como en variables exploradas. El estudio de egresados realizado por la Universidad de Sonora (UNISON, 2008), realizado para todas las licenciaturas ofertadas, que incluye apartado para identificar los niveles de satisfacción global de quienes han concluido estudios en esa institución; encontrando que tratándose de estudiantes de la Licenciatura en Administración, 95% manifiesta niveles de satisfacción, mucha satisfacción o total satisfacción; en la Licenciatura en Contaduría Pública estos mismos niveles alcanzan 98%, mientras que en la Licenciatura en Ciencias de la Computación la satisfacción promedia 88% de los egresados; en global, la valoración promedio del total de egresados satisfechos de todas las licenciaturas ofertadas por esta universidad pública se cuantifica en 98.3%.

La medición sobre satisfacción, realizada por esta institución, está incluida en el modelo de seguimiento de egresados, sin destinar instrumento particular para medir niveles de satisfacción. Por su parte, la Universidad de Baja California Sur (2012) a través de la Dirección de Docencia e Investigación Educativa, realizó encuesta sobre satisfacción estudiantil, orientada a la construcción de indicadores para la toma de decisiones en la mejora y fortalecimiento de servicios, así como para complementar procesos de autoevaluación, diseñando para ello instrumento específico, basado en escala *Likert* con cinco opciones de respuesta que van desde el nivel insatisfactorio hasta muy satisfactorio; considerando tres grandes rubros de servicios (generales, apoyo académico y apoyo integral) desagregados en 12 servicios o programas: que comprenden: cafetería, servicio médico, biblioteca, laboratorios, centro de cómputo, tutorías, psicopedagógico, servicios escolares, servicios estudiantiles, talleres culturales y artístico, deportes e idiomas. Este modelo tiene la particularidad de que no ofrece una valoración global de la calidad de los servicios, sino que presenta promedios de aceptación por servicio; así, los servicios generales y los de apoyo integral alcanzan 79% de satisfacción, mientras que apoyo académico se ubica en 74%; aunque existen programas que alcanzan más del 80% de aceptación como el de bibliotecas, centro de cómputo e idiomas. En este tenor, Romo, Mendoza y Flores (2012), presentan el caso de la Facultad de Filosofía y Letras de la Universidad Autónoma de Chihuahua; quien a través de instrumento autoadministrado exploran mediante 49 reactivos, seis variables relacionadas con profesores, organización académica, organización administrativa, desarrollo cultural y actividades recreativas, plan de estudios y formación recibida; en donde los resultados globales por licenciatura muestran promedios que oscilan entre 67% y 94% de satisfacción, arrojando como áreas críticas de atención las relacionadas con la organización de eventos académicos de

apoyo, becas, servicios de emergencia, fotocopiado, cafetería, teléfono público, costo de la cuota de inscripción y actividades deportivas institucionales.

A su vez, Valenzuela y Requena (2006) presentan estudio sobre índices de satisfacción estudiantil realizado en la Facultad de Ciencias Económico y Administrativas de la Universidad Austral de Chile, que comprendió a estudiantes de las licenciaturas en ingeniería comercial, contador auditor y administrador de empresas turísticas, el cual basado en instrumento construido en escala *Likert* con cinco opciones de respuesta, abarca cinco parámetros: métodos de enseñanza y aprendizaje, evaluaciones, organización de las carreras, equipo docente e infraestructura, los que a su vez se subdividen en 11 subparámetros: clases teóricas, clases prácticas, visitas a terreno y prácticas profesionales, confección de pruebas, retroalimentación, centro de atención de alumnos, dirección de la escuela, decanato de la facultad y malla curricular, cuyos resultados arrojan como promedio global a un 30% de estudiantes satisfechos; 2% se muestra indiferente y 68% se declaran insatisfechos; siendo los parámetros clave relacionados con métodos de enseñanza y aprendizaje, evaluaciones y equipo docente, quienes presentan menores índices de satisfacción, a los que les siguen los de infraestructura y la organización de carreras.

Finalmente, dos consideraciones no deben perderse de vista al realizar este tipo de estudios: la primera tiene que ver con la necesidad de manejar con cautela el concepto de satisfacción estudiantil, puesto que al provenir del mundo empresarial, resulta peligroso extrapolar literalmente el concepto al campo educativo (Flores, 2006), no debiendo equiparar a los alumnos como clientes de la universidad con la misma connotación que se da a los consumidores o proveedores de una entidad mercantil; evitando con ello las controversias y posible perversión de objetivos cuando se trata de organizaciones públicas, no lucrativas (Rey, 1998) y, la necesidad de considerar que la evaluación de la educación universitaria posee múltiples dimensiones, de manera que la satisfacción estudiantil es una de ellas, no la única, puesto que “medir la calidad de un programa o servicio solo por un criterio, empobrece (y en algunos casos distorsiona) los resultados” (Viñas, 2005, 6), a pesar de ello, la información que arroja este indicador, para las organizaciones constituye un insumo al planear las acciones de mejora, es uno de los criterios a considerar.

## METODOLOGÍA

Este estudio transversal, recogió información al finalizar cada uno de los ciclos escolares que integran este reporte, producto de la aplicación autoadministrada del SEUE, utilizando para ello la plataforma electrónica desarrollada en la operación del modelo de seguimiento de egresados establecido en la Facultad, mismo que a través de tablas dinámicas construidas en *Excel* de *microsoft*, genera los concentrados correspondientes.

### Población Objetivo

En este reporte se socializan los resultados obtenidos en la aplicación del instrumento a la totalidad de los egresados de cada una de las cohortes analizadas, de los cuatro programas educativos de licenciatura, cuya cobertura alcanzada se muestra en la Tabla 1, en donde se aprecia que en promedio se logra cobertura cercana a la totalidad de egresados, pues existe la facilidad de que los participantes, cuando son encuestados, aún están incorporados formalmente a la escuela.

Tabla 1: Cobertura Alcanzada en Aplicación del SEUE

Licenciatura:	Cohorte Agosto-Diciembre 2012			Cohorte Enero-Junio 2013			Cohorte Agosto-Diciembre 2013		
	Egresados	Encuestados	%	Egresados	Encuestados	%	Egresados	Encuestados	%
Administración	116	114	98	129	129	100	121	120	99
Contaduría	90	90	100	104	104	100	90	90	100
Gestión Turística	125	124	99	135	132	98	119	119	100
Sistemas Computacionales	67	66	99	85	83	98	53	53	100
Total	398	394	99	453	448	99	383	382	100

*Puede observarse que el porcentaje de cobertura que se alcanza en la aplicación del instrumento, es cercano a la totalidad del número de egresados; en esto contribuye el momento de aplicación, pues al ser autoadministrado al finalizar el ciclo escolar, justo cuando concluyen sus estudios, los participantes están en posibilidades de destinar el tiempo requerido para responder la encuesta, de tal forma que excepcionalmente se dan casos de no respuesta, destacando los egresados de Contaduría que en las tres aplicaciones, participan todos. Fuente: elaboración propia.*

Instrumento aplicado Como se ha expresado, el instrumento utilizado para recopilar la información se denomina SEUE “Instrumento para conocer la satisfacción de los estudiantes universitarios con su educación”; propuesto por Gento y Vivas (2003), originalmente integrado por 93 ítems que comprenden diez subdimensiones. El diseño permite la valoración global del nivel de satisfacción por estudiante, así como la valoración de cada una de las subdimensiones e incluso de cada uno de los reactivos. En su momento fue validado recurriendo al juicio de expertos para garantizar la congruencia del contenido y del constructo; la validez del instrumento se calculó a través del método estadístico de Alfa de Cronbach, obteniéndose un valor relativo de 0.93.

Es de destacar que a efectos de contextualizar al entorno de la Facultad y a las condiciones en que se desarrolla el proceso de formación profesional de los estudiantes, algunos ítems fueron adaptados en su redacción y algunos, por inviables se suprimieron, de tal forma que la versión aplicada explora las diez variables propuestas a través de 88 reactivos, que construido en escala *Likert*, con valoración positiva, basada en cinco posibilidades que comprenden: totalmente insatisfecho (1), poco satisfecho (2), satisfecho (3), bastante satisfecho (4) y totalmente satisfecho (5), los estudiantes expresan los niveles de satisfacción alcanzados en el momento en que ocurre el egreso.

#### Operacionalización de Variables

Diez, son las variables que contempla el instrumento aplicado; a través de las cuales se busca construir los niveles de satisfacción de quienes egresan de la Facultad, con los servicios educativos recibidos; las que se describen en la Tabla 2, en donde además de la definición conceptual, se señalan los indicadores que comprenden cada una de ellas, así como la cantidad de ítems.

Tabla 2: Subdimensiones, Definiciones E Indicadores, Contemplados en el SEUE Para Identificar Niveles de Satisfacción Estudiantil Con Servicios Educativos Recibidos

Subdimensión	Definición	Indicadores	Ítems
I. Satisfacción por el cumplimiento a sus necesidades básicas	Satisfacción de los alumnos por las condiciones de la institución porque ofrecen garantías suficientes para el adecuado desarrollo del proceso de formación profesional	- Habilitación de las instalaciones (ventilación, luz, limpieza) - Suficiencia de los espacios para la enseñanza y el estudio - Suficiencia de espacios para la recreación y el descanso - Adecuación de las instalaciones deportivas y de la cafetería - Adaptación del mobiliario - Adaptación de la cafetería escolar (higiene, suficiencia y variedad de alimentos)	1 al 13
II. Satisfacción con los servicios ofrecidos a los estudiantes	Satisfacción de los alumnos con la manera en que funcionan los servicios estudiantiles	- Adecuación del servicio bibliotecario (instalaciones, atención a usuarios, materiales en existencia) - Apropiaada atención a estudiantes en los procesos de admisión, inscripción, control y registro estudiantil - Adecuado funcionamiento de los servicios del comedor, laboratorios, transporte, médicos	14 al 23
III. Satisfacción por su seguridad vital	Satisfacción de los alumnos por tener la seguridad de que las condiciones de supervivencia básica, dentro del entorno institucional están garantizadas.	- Seguridad del edificio (escaleras, salidas de emergencia, extintores) - Seguridad del mobiliario (sin aristas, materiales rompibles o inflamables) - Seguridad del transporte (seguridad del vehículo y la ruta) - Seguridad de las zonas de esparcimiento - Seguridad del entorno que rodea a la institución	24 al 29
IV. Satisfacción por la seguridad económica	Satisfacción de los alumnos por tener la seguridad que su condición socioeconómica es tomada en consideración y no se constituye en un obstáculo para su proceso de formación	- Igualdad de oportunidades para participar en actividades curriculares y extracurriculares, sin limitaciones por razones socioeconómicas - Igualdad de oportunidades para beneficiarse de todos los servicios de apoyo al estudiante, sin limitaciones por razones socioeconómicas.	30 al 35
V. Satisfacción por la seguridad emocional	Satisfacción por la seguridad de contar con el afecto que requiere un desarrollo equilibrado de la personalidad y el esfuerzo que ha de realizar para lograr su formación	- Trato afectuoso de sus profesores, compañeros, autoridades, administrativos y personal de servicios (biblioteca, cafetería, servicio médico)	36 al 42
VI. Satisfacción por la pertenencia a la institución o al grupo de alumnos	Satisfacción por contar con el reconocimiento debido y la aceptación por el hecho de ser miembros de la institución y del grupo de clase, así como tener las oportunidades de participar en las políticas y proyectos institucionales.	- Aceptación de las autoridades universitarias, profesores, personal no docente, por otros alumnos de la institución y compañeros de clase - Reconocimiento del contexto social por ser miembro de la institución - Sentirse representado ante organismos de cogobierno - Sentir la consideración y aceptación de las contribuciones personales	43 al 52
VII. Satisfacción por el sistema de trabajo	Satisfacción por la manera de organización del trabajo y los recursos que suponen.	- Contenido de los programas y organización del tiempo - Materiales impresos y audiovisuales disponibles en el aula y la institución - Preparación, actualización y condiciones pedagógicas de los profesores. - Incorporación de las nuevas tecnologías a la enseñanza, sistema de evaluación utilizado, acción tutorial u orientadora, metodología de enseñanza, comunicación con los profesores - Acceso a diversas manifestaciones culturales y de recreación - Formación práctica y vinculación con los futuros centros de trabajo	53 al 71
VIII. Satisfacción por el progreso o éxito personal	Satisfacción por los logros obtenidos durante su proceso de formación, relacionados con habilidades, valores y destrezas	- Calificaciones obtenidas - Conocimientos adquiridos, dominio de técnicas de estudio y trabajo intelectual desarrollado - Formación recibida - Habilidades y destrezas adquiridas - Desarrollo integral como persona	72 al 77
IX. Satisfacción por el prestigio o el reconocimiento del éxito personal alcanzado	Satisfacción por el reconocimiento del éxito personal por parte de la institución y sus compañeros	- Reconocimiento de la institución, autoridades, profesores, compañeros de clase, alumnos y el contexto por los logros alcanzados	78 al 82
X. Satisfacción por la autorrealización personal	Satisfacción por la autorrealización personal relacionada con la libertad, la autonomía y desarrollo personal que permite visualizar un futuro promisorio.	- Progreso y desarrollo personal basado en la libertad y autonomía, que permite crecer profesionalmente obteniendo confianza en el futuro profesional	83 al 88

*Podrá notarse que las variables propuestas para la integración del constructo "satisfacción", de alguna forma atiende las ideas de Maslow (1983) partiendo de las necesidades básicas, en seguida las de seguridad, tanto la vital, la económica y la emocional, arribando al final con las de realización y reconocimiento; la medición de estas variables a través del instrumento propuesto, parte de la idea de que la expresión de satisfacción*

es resultante de la combinación de varios factores; en donde se conjuga lo cognitivo y lo afectivo expresado en un proceso valorativo. Fuente: Tomado de Gento y Vivas (2003).

## RESULTADOS

A partir de los resultados obtenidos en las tres cohortes, la Tabla 3, muestra por generación y por programa educativo, los niveles de satisfacción alcanzados, de acuerdo al instrumento aplicado y con base a las categorías de respuesta.

Tabla 3: Niveles de Satisfacción, Por Cohorte y Programa Educativo

Cohorte:	Generación Agosto-Diciembre 2012					Generación Enero-Junio 2013					Generación Agosto-Diciembre 2013				
Niveles/ PE*:	LA	LC	LG T	LSC	T	LA	LC	LG T	LSC	T	LA	LC	LG T	LSC	T
Totalmente Insatisfecho	0	0	0	0	0	0	1	0	0	1	0	0	0	1	1
Poco Satisfecho	1	2	4	2	9	4	4	2	3	13	2	0	5	1	8
Satisfecho	58	49	68	31	206	58	39	54	34	185	48	32	53	32	165
Bastante Satisfecho	51	28	43	29	151	61	46	63	39	209	49	38	50	16	153
Totalmente Satisfecho	4	11	9	4	28	6	14	13	7	40	21	20	11	3	55
Total	114	90	124	66	394	129	104	132	83	448	120	90	119	53	382

\* Abreviaturas: PE = Programa Educativo; LA: Licenciatura en Administración; LC: Licenciatura en Contaduría; LGT: Licenciatura en Gestión Turística; LSC: Licenciatura en Sistemas Computacionales; T: Totales. Esta tabla muestra los niveles de satisfacción alcanzados por programa educativo y por cohorte; puede notarse que si se consideran aceptables los niveles ubicados a partir de "Satisfecho" el grueso de respuestas indica altos niveles de satisfacción (97.3%) y las diferencias entre los niveles de insatisfacción que presenta cada uno de los programas no son significativas; por eso resulta necesario atender estos resultados desde la óptica de las subdimensiones exploradas. Fuente: elaboración propia

Derivado de los resultados globales de satisfacción, a continuación (Tablas 4 a la 7) se presentan los resultados promedio (de las tres cohortes) de los niveles alcanzados en cada programa educativo, considerando las diez subdimensiones exploradas y las categorías de respuesta.

Tabla 4: Niveles de Satisfacción de Egresados de Administración (Promedio de Tres Cohortes)

Satisfacción Por:	1	2	3	4	5
El cumplimiento a sus necesidades básicas	14%	25%	37%	17%	8%
Los servicios ofrecidos a los estudiantes	17%	22%	33%	19%	9%
Por su seguridad vital	14%	21%	40%	18%	8%
Por la seguridad socio-económica	14%	22%	40%	16%	7%
Por la seguridad emocional	5%	15%	41%	27%	12%
Por la pertenencia a la institución o al grupo de alumnos	4%	12%	43%	29%	14%
Por el sistema de trabajo	6%	18%	42%	25%	10%
Por el progreso o éxito personal	1%	8%	31%	40%	20%
Por el prestigio o reconocimiento del éxito personal	3%	11%	43%	31%	12%
Por la autorrealización personal	1%	5%	28%	34%	32%

Esta tabla muestra que los egresados de administración, si bien a nivel global concluyen sus estudios con altos niveles de satisfacción; las subdimensiones relacionadas con: el cumplimiento a necesidades básicas (39%); los servicios ofrecidos a los estudiantes (39%); la seguridad vital (35%); la seguridad socioeconómica (36%) son las que resultan más insatisfechas (categorías poco satisfechas o totalmente insatisfechas) e incluso con un 24% los sistemas de trabajo; en oposición, las relacionadas con el prestigio o éxito personal (91%), el prestigio o reconocimiento del éxito personal (86%) y la autorrealización (94%), son las mejor evaluadas. Fuente: elaboración propia

Tabla 5: Niveles de satisfacción de egresados de Contaduría (Promedio de tres cohortes)

Satisfacción Por:	1	2	3	4	5
El cumplimiento a sus necesidades básicas	10%	24%	37%	20%	10%
Los servicios ofrecidos a los estudiantes	13%	18%	35%	22%	12%
Por su seguridad vital	13%	21%	38%	18%	9%
Por la seguridad socio-económica	13%	21%	40%	17%	8%
Por la seguridad emocional	5%	13%	44%	25%	14%
Por la pertenencia a la institución o al grupo de alumnos	2%	11%	46%	27%	15%
Por el sistema de trabajo	6%	16%	42%	23%	13%
Por el progreso o éxito personal	2%	7%	37%	31%	23%
Por el prestigio o reconocimiento del éxito personal	2%	10%	43%	28%	17%
Por la autorrealización personal	1%	5%	30%	32%	32%

*Aquí se muestran los resultados proporcionados por egresados de Contaduría; que también presentaron altos niveles de satisfacción a nivel global, pero cuando se evalúan las respuestas por subdimensión se encuentran insatisfechas (poco satisfechas o totalmente insatisfechas) las necesidades básicas, de tal forma que: cumplimiento a necesidades básicas (34%); servicios ofrecidos a estudiantes (31%); seguridad vital (34%); seguridad socio-económica (34%); y en menor escala los sistemas de trabajo (22%); en contraparte, las que se vinculan a la autorrealización alcanzan mejores ponderaciones; así el progreso o éxito personal (91%); reconocimiento del éxito personal (88%) y la autorrealización personal (94%) resultan con altos niveles de aceptación. Fuente: elaboración propia*

Tabla 6: Niveles de Satisfacción de Egresados de Gestión Turística (Promedio de Tres Cohortes)

Satisfacción Por:	1	2	3	4	5
El cumplimiento a sus necesidades básicas	14%	27%	37%	15%	6%
Los servicios ofrecidos a los estudiantes	19%	23%	36%	16%	6%
Por su seguridad vital	15%	24%	39%	15%	7%
Por la seguridad socio-económica	15%	22%	40%	17%	6%
Por la seguridad emocional	7%	16%	43%	25%	10%
Por la pertenencia a la institución o al grupo de alumnos	5%	11%	46%	25%	12%
Por el sistema de trabajo	6%	16%	43%	26%	9%
Por el progreso o éxito personal	2%	7%	31%	39%	22%
Por el prestigio o reconocimiento del éxito personal	4%	12%	41%	30%	13%
Por la autorrealización personal	2%	4%	26%	37%	31%

*Tratándose de los egresados de la Licenciatura en Gestión Turística, en esta tabla se aprecia que al igual que las licenciaturas anteriores también se presentan altos niveles de satisfacción a nivel global, pero cuando se evalúan las respuestas por subdimensión se encuentran insatisfechas (poco satisfechas o totalmente insatisfechas) las necesidades básicas, de tal forma que: cumplimiento a necesidades básicas (41%); servicios ofrecidos a estudiantes (42%); seguridad vital (39%); seguridad socio-económica (37%); y en menor escala los sistemas de trabajo (22%); en contraparte, las que se vinculan al progreso personal y la autorrealización alcanzan mejores ponderaciones (satisfecho, bastante satisfecho o totalmente satisfecho); así el progreso o éxito personal (92%); reconocimiento del éxito personal (84%) y la autorrealización personal (94%) resultan con altos niveles de aceptación. Fuente: elaboración propia*

Tabla 7: Niveles de Satisfacción de Egresados de Sistemas Computacionales (Promedio de Tres Cohortes)

Satisfacción Por:	1	2	3	4	5
El cumplimiento a sus necesidades básicas	17%	27%	35%	14%	7%
Los servicios ofrecidos a los estudiantes	27%	25%	30%	12%	6%
Por su seguridad vital	25%	26%	31%	12%	5%
Por la seguridad socio-económica	18%	24%	38%	15%	5%
Por la seguridad emocional	7%	16%	41%	24%	13%
Por la pertenencia a la institución o al grupo de alumnos	4%	12%	45%	28%	11%
Por el sistema de trabajo	7%	18%	42%	24%	8%
Por el progreso o éxito personal	2%	11%	35%	36%	16%
Por el prestigio o reconocimiento del éxito personal	3%	15%	39%	31%	11%
Por la autorrealización personal	2%	8%	32%	36%	21%

*En esta tabla, se muestran los resultados proporcionados por egresados de la licenciatura en Sistemas Computacionales; podrá notarse que presentan similitud respecto a las otras licenciaturas analizadas y de igual forma, aun cuando a nivel global la satisfacción en general es bastante aceptable; las primeras cuatro subdimensiones que explora el instrumento aplicado, son las que generan mayor insatisfacción (poco satisfechas o totalmente insatisfechas); así, el cumplimiento a las necesidades básicas (44%); los servicios ofrecidos a los estudiantes (52%); la seguridad vital (51%); la seguridad socioeconómica (42%) y de alguna medida también los sistemas de trabajo (25%); las mejor evaluadas también son las relacionadas con el progreso o éxito personal (87%); el prestigio o reconocimiento del éxito personal (81%) y la autorrealización personal (89%). Fuente: elaboración propia*

Las tres cohortes analizadas, si bien satisfechas en su gran mayoría; presentan a nivel subdimensión importantes áreas de oportunidad, que a la postre debiera constituir la base para el establecimiento de un programa de mejora continua; asimismo es de considerar que aun cuando los niveles de insatisfacción son similares, existen algunos matices cuando los datos se revisan por programa educativo. Mientras quienes egresan de la licenciatura en Contaduría, presentan niveles de insatisfacción en las primeras cuatro subdimensiones, que no rebasan 34%; quienes estudian Gestión Turística alcanzan en las mismas subdimensiones insatisfacción del 42% en algunos casos; pero son los que estudian Sistemas Computacionales quienes manifiestan insatisfacción en esas subdimensiones, en promedios que rebasan el 50%; de tal forma que si debieran ordenarse cuantitativamente por programa educativo, los niveles de insatisfacción alcanzados serían de mayor a menor: Sistemas Computacionales, Gestión Turística, Administración y Contaduría. A continuación, la Tabla 8, muestra los indicadores relacionados con las subdimensiones que mayores niveles de insatisfacción generan en las tres cohortes analizadas, estos mismos indicadores representan las áreas de oportunidad que habrán de atenderse dentro de los programas de mejora continua que se instrumenten en la Facultad; se incluyen los sistemas de trabajo, aun cuando los niveles de insatisfacción en todas las respuestas proporcionadas por egresados de los cuatro programas educativos, no rebasan el 25%.

Tabla 8: Áreas de Oportunidad Relacionadas Con las Subdimensiones Que Mayor Insatisfacción Generó en las Cohortes Analizadas

Subdimensión	Áreas De Oportunidad
<b>Cumplimiento a necesidades básicas</b>	- Habilitación de instalaciones (ventilación, luz, limpieza) - Suficiencia de espacios para la enseñanza, el estudio, recreación y el descanso - Adecuación de instalaciones deportivas y mobiliario
<b>Servicios ofrecidos a estudiantes</b>	- Adaptación de la cafetería escolar (higiene, suficiencia y variedad de alimentos) - Adecuación del servicio bibliotecario (instalaciones, atención a usuarios, materiales en existencia) - Apropiada atención a estudiantes en los procesos de admisión, inscripción, control y registro estudiantil - Adecuado funcionamiento de los servicios del comedor, laboratorios, transporte, médicos
<b>Seguridad vital</b>	- Seguridad del edificio (escaleras, salidas de emergencia, extintores) - Seguridad del mobiliario (sin aristas, materiales rompibles o inflamables) - Seguridad del transporte (seguridad del vehículo y la ruta) - Seguridad de las zonas de esparcimiento - Seguridad del entorno que rodea a la institución
<b>Seguridad socio-económica</b>	- Igualdad de oportunidades para participar en actividades curriculares y extracurriculares, sin limitaciones por razones socioeconómicas - Igualdad de oportunidades para beneficiarse de todos los servicios de apoyo al estudiante, sin limitaciones por razones socioeconómicas
<b>Sistema de trabajo</b>	- Contenido de los programas y organización del tiempo - Materiales impresos y audiovisuales disponibles en el aula y la institución - Preparación, actualización y condiciones pedagógicas de los profesores. - Incorporación de las nuevas tecnologías a la enseñanza, sistema de evaluación utilizado, acción tutorial u orientadora, metodología de enseñanza, comunicación con los profesores - Acceso a diversas manifestaciones culturales y de recreación - Formación práctica y vinculación con los futuros centros de trabajo

*De esta tabla se desprenden las líneas de acción que pueden instrumentarse en los programas de mejora continua; sin dejar de reconocer que la satisfacción de todas las necesidades siempre encontrará las limitantes presupuestales que caracterizan a las instituciones públicas, sin embargo existen algunas que no necesariamente se atienden solo con dinero; existen necesidades básicas que pueden atenderse; mejorar el servicio ofrecido a los estudiantes resulta una prioridad (subdimensión dos de la tabla); propiciar mejores condiciones de seguridad (subdimensiones 3 y 4) es una obligación institucional y respecto a la mejora en sistemas de trabajo involucra en forma determinante al personal docente. Fuente: elaboración propia, basado en indicadores propuestos por Gento y Vivas (2003).*

## CONCLUSIONES

Las instituciones de educación superior preocupadas por mejorar su desempeño, encuentran en los procesos de gestión de la calidad una eficaz herramienta, que les permite evaluar los servicios que ofrecen; en este

proceso, el nivel de satisfacción que construyen los egresados durante su vida estudiantil universitaria, constituye importante referente en el momento de instrumentar planes de mejora, que debieran transformarse en decisiones de gestión y traducirse en acciones inmediatas. En virtud de que el concepto “satisfacción estudiantil” proviene del mundo empresarial, es necesario manejarlo con prudencia, por el peligro que entraña adoptar en forma literal el concepto de satisfacción del cliente al campo educativo y debe evitarse equiparar a los alumnos como clientes de la universidad con el mismo sentido que se da a los consumidores o proveedores de una entidad mercantil; a pesar de ello, es innegable que la opinión de los estudiantes con los servicios educativos que reciben, que se refleja en los niveles de satisfacción, constituye importante referente cuando se instrumentan modelos de evaluación para las instituciones educativas, máxime cuando estos niveles de satisfacción pudieran estar relacionados con aspectos de motivación, índices de retención y rendimiento estudiantil.

El nivel de satisfacción con los servicios educativos recibidos durante el proceso de formación profesional que muestran los egresados de las tres cohortes estudiadas, presentan elevados porcentajes de aceptación (97.3% en promedio) valor similar a lo encontrado por la Universidad de Sonora y en algunos aspectos con la Universidad de Baja California, sobre todo ésta última en lo que se refiere a la insatisfacción por los servicios ofrecidos; existen diferencias sustanciales con los resultados que muestra la Universidad Austral y algunas coincidencias en la insatisfacción encontrada en la propuesta de la Universidad de Chihuahua. También se coincide con la Universidad de Sonora en lo referente a que es la Licenciatura relacionada con el área de Computación la que presenta menor satisfacción. Sin dejar de reconocer algunas diferencias sobre la cantidad de variables exploradas y con matices sobre la integración del constructo “satisfacción”; se coincide con los estudios realizados por las universidades mencionadas, no solo en los resultados, sino en el tipo de instrumento utilizado y la construcción del mismo.

## RECONOCIMIENTO

Los autores agradecen el apoyo financiero recibido por parte del Programa Integral de Fortalecimiento Institucional (PIFI, versiones 2011 y 2012); que permitió la operación del Sistema Integral del Seguimiento de Egresados en la Facultad de Contaduría y Administración, Campus I de la UNACH; que comprende el indicador de satisfacción estudiantil, cuyos resultados aquí se describen.

Sonia Martha Noreña Montoya, Universidad Autónoma de Baja California

### RESUMEN

*El requerimiento de competitividad que actualmente tienen las empresas debido al cambio social, económico, político y tecnológico presentado a raíz del fenómeno de la globalización, ha elevado los estándares de calidad en el mercado, siendo necesario mantener canales de información con el usuario, para que estas identifiquen sus requerimientos para el diseño de estrategias que satisfagan sus necesidades. En las instituciones de educación superior, se manifiesta el mismo fenómeno, requiriendo identificarse y cuantificarse los -requerimientos del entorno al diseñar los Planes de estudio y procesos educativos. Por ello, se desarrolló una investigación no experimental, transeccional y correlacionar, para identificar el impacto en los resultados de la evaluación externa que se aplica a nivel nacional de los alumnos potenciales a egresar que se encuentran insertados en el mundo laboral.*

**PALABRAS CLAVES:** Programa Educativo, Evaluación Externa

## EXTERNAL EVALUATION AND WORK EXPERIENCE

### ABSTRACT

*The requirement for competitive companies that currently have due to social, economic, political and technological change made following the phenomenon of globalization has raised the standards of quality in the market, being necessary to maintain channels of information to the user, so these identify their requirements for the design of strategies that meet their needs. In institutions of higher education, the same phenomenon occurs; requiring identified and quantified environmental requirements designing Curricula and educational processes. Therefore, a non-experimental, transactional and correlate research was conducted to identify the impact on the results of the external evaluation that is apply nationwide to former students that are inserted into the working world.*

**KEYWORDS:** Education, Job Placement

### INTRODUCCIÓN

La calidad ha constituido el detonante para una diversidad de cambios que han repercutido en el ámbito académico, y que conducen a las instituciones de educación superior (IES) a adoptar objetivos y políticas que impactan en los procesos educativos. En la Universidad Autónoma de Baja California (UABC), la calidad es visible en la construcción del Plan de Desarrollo (PDI) a partir del PDI 2003-2006 enfatiza que “[...]• Brindar una educación de calidad” así como en el PDI 2007-2010 “[...] la responsabilidad de atender una creciente demanda de educación formal y no formal en diversas modalidades; de fortalecer la capacidad de generar, adaptar y aplicar conocimientos útiles; de promover el desarrollo integral del ser

humano mediante la promoción de la cultura y de la actividad física; de fortalecer la colaboración con los diversos sectores sociales; y de hacer todo ello con niveles de calidad y desempeño” y para PDI 2011-2015, en la estrategia: 1.2.1.2. El asegurar la buena calidad de los programas educativos de licenciatura. La Facultad de Contaduría y Administración (FCA), se adhiere a la políticas de calidad, en octubre 2002, recibiendo la acreditación por parte del Consejo de Acreditación de la Enseñanza en Contaduría y Administración (CACECA) como programas de buena calidad de las siguientes licenciaturas: Contaduría, Administración de Empresas e Informática (Campus Tijuana, Mexicali y Ensenada), y Negocios Internacionales (Tijuana) y se re acredita nuevamente en septiembre del 2012. La acreditación es una constancia para la sociedad y del público demandante de los servicios y del cumplimiento de los procesos educativos y gestión que se realicen con calidad, y es al Consejo de Acreditación en la Enseñanza de la Contaduría y la Administración, A.C. (CACECA) afiliado al Consejo para la Acreditación de la Enseñanza Superior (COPAES), quien es responsables de la evaluación de los PE de la FCA. (<http://www.caceca.org.mx/web20/index.php/sample-sites>).

La evaluación por el Consejo de Acreditación CACECA es el compromiso que tiene la FCA en la formación de los estudiantes al realiza en el proceso educativo, lleva a cabo un “juicio de valor que resulta de contrastar el resultado de la medición de una realidad empírica con un parámetro normativo previamente definido” (Martínez, 2012). Considerando que la calidad en los programas de estudio representan la base en que descansa principalmente la formación del profesionista, de ahí su importancia de identificar los requerimientos del entorno, para que estos den respuesta a las necesidades del sector productivo y social y los avances en materia científico-tecnológica que le permitan a los egresados solucionar problemas de forma eficaz y eficiente ante la vida cotidiana de su entorno. (Guía metodológica para la creación y modificación de los programas educativos de la Universidad Autónoma de Baja California, 2010). Es por esta razón que se hace necesarios la identificación y cuantificación de los requerimientos que impactan en el programa educativo de la Licenciatura en Contaduría desde la perspectiva de los estudiantes potenciales a egresar de los periodos 2013-1 de la Facultad de Contaduría y Administración del campus Tijuana correspondiente al plan 2009-2 y su inserción en el mundo el trabajo por lo que la investigación que aquí se describe muestra los requerimientos que deben ser satisfechos y que deben ser incorporados en la currícula en la restructuración del nuevo plan de estudios.

## REVISION DE LITERATURA

Para México la Asociación Nacional de Universidades e Instituciones de Educación Superior (ANUIES), tiene como función el desarrollo de la educación superior en México, y a través de su publicación “La Educación Superior en el Siglo XXI. Líneas Estratégicas de Desarrollo” define la visión del sistema al año 2020 y dice que [...las IES en México integran un vigoroso sistema de educación superior, que forman profesionales e investigadores de alto nivel, genera y aplica conocimientos, extiende y preserva la cultura, tarea que realiza con calidad, pertinencia, equidad y equiparables con los estándares internacionales...] y plantea así mismos los atributos deseables para su operación [...desarrollar sus actividades de docencia, de acuerdo al perfil y la misión de cada una, y utilizar modelos innovadores de aprendizaje y enseñanza que permitan alcanzar altos grados de calidad académica y pertinencia (ANUIES, 2000). Bajo estos estándares la UABC, posee un Modelo Educativo que sustenta la educación a lo largo de la vida, con un enfoque constructivista, humanista, que tiende a la preservación de los valores universales, y valora el esfuerzo, y la búsqueda permanente de la excelencia, la comunicación, la participación responsable, el liderazgo fundado en las competencias académicas y profesionales, una actitud emprendedora, creativa e innovadora, la pluralidad, la libertad y el respeto como espacio entre todos sus miembros, parte de la misión institucional, identificando las funciones de docencia, investigación, vinculación, extensión y gestión institucional. <http://www.uabc.mx/formacionbasica/curricular.htm>.

En los planes y programas de estudio descansa la formación del profesionista, de ahí su importancia del medio en que se dé, debe ser una de sus principales características para que dé respuesta a las necesidades del sector productivo y social, así como a los avances en materia científico-tecnológica que le permitan a los egresados solucionar problemas de forma eficaz y eficiente ante la vida cotidiana de su entorno. (Guía metodológica para la creación y modificación de los programas educativos de la Universidad Autónoma de Baja California.2010). Pero considerando lo que Beyer (2001) menciona que los cambios en lo curricular son asociados a cambios sociales, políticos y económicos, lo que hace que el dinamismo constante del contexto, lo que mantiene en movimiento la restructuración y actualización de los planes de estudios. La UABC establece los lineamientos y políticas institucionales para la restructuración del plan de estudios se delinean en la Guía metodológica para la creación, modificación y actualización de los planes de estudio así mismo también para realizar una modificación del plan de estudios las unidades académicas llevarán a cabo una evaluación diagnóstica interna y externa, que permita conocer las fortalezas, amenazas, debilidades y oportunidades del plan de estudio vigente, así como las necesidades y/o problemáticas que deben ser satisfechas por el programa educativo. (UABC.2010)

Es por ello que a partir del 2013 se inicia una investigación que tiene como objetivo identificar y cuantificar los propósitos del proceso enseñanza aprendizaje del Programa Educativo de la licenciatura de Contaduría desde la perspectiva de los egresados, profesores, estudiantes y empleadores como su inserción en el mundo el trabajo. Teniendo como meta generar información para el tomador de decisiones para desarrollar estrategias que le permitan la formación integral del estudiante de la licenciatura.

## METODOLOGIA

La investigación tiene un diseño transeccional, correlacional y el proceso metodológico se efectúa en cuatro etapas que se describe a continuación en la Tabla 1.

Tabla 1: Proceso Metodológico

Fases	Descripción	Actividades
I	Adquisición de herramientas conceptuales y contextuales	Revisión de la literatura Preparación para la entrada al campo
II	Identificación y focalización del fenómeno de estudio	Construcción del objeto de estudio Definición de los participantes
III	Aplicación del trabajo de campo	Elaboración de la guía de entrevista estructurada Entrevista con los participantes del estudio Registro de los datos
IV	Descripción de resultados	Tratamiento de la información Análisis e interpretación de los datos

*En la Tala se describe el proceso metodológico de la investigación. Fuente: Elaboración Propia.*

Siguiendo el proceso metodológico se realizó un acercamiento a los elementos teóricos, así mismo se procedió se realizaron reuniones y entrevistas con estudiantes potenciales a egresar en los periodos 2013-1 del plan de estudios 2009-2 de la Facultad de Contaduría y Administración del campus Tijuana. Las reuniones y las entrevistas realizadas a los potenciales a egresar han permitido adquirir herramientas contextuales generales. Para el trabajo de campo, se utiliza como técnica de recolección de datos el cuestionario este está estructurado de cuatro apartados: Datos Generales; Experiencia profesional; Examen CENEVAL, que corresponde a la evaluación de un organismo a externo y el Proceso de enseñanza aprendizaje que se describe en la Tabla 2. Por lo que en el trabajo se presenta un avance de la investigación del apartado Examen de CENEVAL donde aplicado a los próximos a egresar del plan 2009-2, en el que se pide que marque si trabaja, y que puesto ocupa para que con los resultados obtenidos de los alumnos que aplicaron el examen de CENEVAL en Mayo del 2013 de la licenciatura en Contaduría de la Facultad

de Contaduría y Administración de la UABC, campus Tijuana, y conocer si hay una influencia con los resultados que se obtuvieron en la evaluación hecha por el organismo externo.

Tabla 2: Encuesta de los Potenciales a Egresar

▪ DATOS GENERALES	a) NOMBRE	Identificación
	b) SEXO	
	c) ESTADO CIVIL	
	d) EDAD	
	e) CORREO ELECTRÓNICO	
▪ EXPERIENCIA PROFESIONAL A LA FECHA	1. ¿Trabaja usted actualmente?	Caracterización laboral
	2. ¿Áreas de la profesión?	
	3. Nombre de la empresa/institución en que trabaja.	
	4. En este trabajo usted es:	
	5. El puesto que ocupa actualmente:	
	6. Antigüedad en el trabajo	
	7. ¿En qué medida coincide su actividad laboral con los estudios de licenciatura?	
	8. El sector económico (rama) de la empresa o institución en que trabaja es:	
▪ EXAMEN CENEVAL	9. LA PRINCIPAL ACTIVIDAD QUE USTED DESEMPEÑA ES	Áreas formativas
	1. De las áreas formativas del Plan de Estudios, señala aquella en la que se te dificultó dar respuesta en el examen CENEVAL.	
	2. Señala las causas del porque se te dificultó el contestar el examen CENEVAL.	
▪ PROCESO DE ENSEÑANZA-APRENDIZAJE	3. ¿QUÉ SIGNIFICA PARA TI EL EXAMEN CENEVAL?	Sugerencias del proceso enseñanza-aprendizaje
	➤ ¿QUÉ SUGERENCIAS HARÍA PARA MEJORAR EL PROCESO DE ENSEÑANZA-APRENDIZAJE?	

La Tabla presenta el contenido de la encuesta que se aplicó a los estudiantes próximos a egresar en los periodos 2013-1 donde se identifican, su caracterización laboral, áreas que conforman el plan de estudios y sugerencias del plan de estudios. Fuente: Elaboración Propia

## RESULTADOS

Como se planteó en la metodología para este trabajo se describen los resultados obtenidos de la encuesta aplicada a los potenciales a egresar correspondiente al apartado II. Examen CENEVAL. El universo de aplicación se describe en la Tabla 3, indicando la población encuestada de los estudiantes potenciales a egresar del plan de estudios 2009-2 de los periodos 2013-1 en la Carrera de Licenciado en Contaduría. La caracterización de los encuestados se muestra en la Tabla 4 y se observa que en el periodo 2013-1 y en la Figura 1 se describen las Áreas que evalúa el CENEVAL así mismo las causas por las que se le dificultó y en la Figura 2, que le significa al estudiante el examen de CENEVAL.

Tabla 3: Universo de Potenciales a Egresar

2013-1	Grupos	Núm. Alum	Turno
1	581	22	Matutino
2	583	27	Vespertino
3	584	24	Vespertino
4	591	18	Matutino
5	592	18	Matutino
6	593	29	Vespertino
7	594	31	Vespertino
		169	

En la Tabla se muestra los grupos que integraron el universo de los sujetos potenciales a egresar encuestados en los periodos 2013-1. Fuente: Elaboración Propia.

Tabla 3: Datos Generales

2013-1			
Sexo	Caracterización		
	Totales	Estado Civil	
Masculino	62	Soltero	132
Femenino	107	Casado	24
		Divorciado	2
		Unión Libre	11

En la Tabla se muestran los Datos Generales que caracterizan a los potenciales a egresar encuestados en el periodo. Fuente: Elaboración Propia.

El potencial a egresar del periodo 2013-1 del plan de Estudio 2009-2 para 156 encuestados le significa un examen diagnóstico. Fuente: Elaboración propia.

## CONCLUSIONES

El modelo curricular basado en competencias profesionales que actualmente priva en la UABC tiene como uno de sus propósitos mantener actualizados y pertinentes los contenidos que permita formar alumnos con un perfil profesional actualizado, capaz, competente con conocimientos en ambientes reales y en beneficio de su comunidad. Al realizar esta investigación apoya a la generación de información lo que permite dar certidumbre a la FCA de los requerimientos desde el punto de vista del usuario, enriqueciendo de manera fehaciente al plan de estudios en su actualización o modificación y al estudiante a alcanzar sus metas educativas.

## **RESUMEN**

*Actualmente los Agronegocios es una rama muy importante de la economía a nivel mundial y el desarrollo de los países subdesarrollados, para las empresas hoy en día es primordial darse a conocer mediante las estrategias plasmadas en los planes de mercadotecnia que les permita marcar las pautas dentro de los mercados que quiere penetrar. Aquí se plasman los objetivos mercadológicos así como las tácticas y estrategias que se pretenden realizar para conseguir estar en la mente de los clientes y consumidores, también se manifiestan las políticas y líneas de actuación para conseguir los objetivos planeados en un tiempo determinado. Por lo antes mencionado se realizó un plan de mercadotecnia para la proyección de sistema de producción Acua-agricola. Dentro de la estructura del proyecto se pueden identificar: los objetivos, justificación, misión, visión y valores, entre otros aspectos de importancia del proyecto, al igual que los diagnósticos internos y externos de la empresa, y algunas estrategias dentro del análisis FODA*  
*Palabras clave:* Plan de mercadotecnia, producción Acua-Agrícola sustentable y Benito Juárez, Sonora México.

## **METHODOLOGY TO IMPLEMENT A MARKETING PLAN IN A SYSTEM OF AN AQUA - SUSTAINABLE AGRICULTURAL PRODUCTION IN SONORA STATE UNIVERSITY UABJ SONORA VILLA JUAREZ**

## **ABSTRACT**

*Summary - Agribusiness is currently a very important branch of the economy worldwide and the development of subdeveloped countries, for companies today is to get noticed by major strategies reflected in marketing plans that will allow them to set the standards in the markets they want to enter. Here the objectives of merchandise as well as the tactics and strategies that are intended to make to get onto the minds of customers and consumers are reflected, also policies and courses of action are manifested for the planned objectives in a given time. As mentioned before a marketing plan was made for the projection system Aqua-farm production. Within the structure of the project can be identified: the objectives, justification, mission, vision and values, among other important aspects of the project, as well as internal and external diagnostics company, and some strategies within the SWOT analysis.*

## INTRODUCCIÓN

Hoy en día se cataloga el Agronegocio como el conjunto de actividades relacionadas con las diferentes áreas del sector primario dentro de un punto de vista económico y empezó a materializarse en la década de 1950. Según Monterroso (2003), los Agronegocios se han convertido en motores de la economía en el siglo XXI, representando un 50% del comercio global, por lo que se considera como un conductor de desarrollo económico, mismos que estimulan a otros giros relacionadas con esta actividad. Según FAO (2013). También puede considerarse como Agronegocios la expansión de los negocios del sector agropecuario y rural y de sus cadenas, a partir de relaciones que involucran estructuras contractuales, alianzas o asociaciones ejecutadas principalmente por el sector privado a partir de los productores del sector agropecuario, sostenibles a largo plazo, que involucran, además de un conjunto asociado de agricultores, a diversos agentes exógenos o de las cadenas agroindustriales y que podrían contar o no, con el apoyo de las políticas públicas. En México actualmente los agronegocios son una gran fuente de generación de recursos económicos y recursos materiales, esto ha impactado positivamente en la economía del país, en Sonora es una de las actividades primordiales que vienen a ser uno de los pilares de la economía del estado, específicamente en el sur del estado, esta actividad es fundamental ya que se cuenta con los sectores productivos más importantes como los porcícolas, avícolas, pecuarios, acuícolas, agrícolas, mineros, etc. Actualmente, en Sonora la acuicultura se ha desarrollado principalmente en el cultivo de camarón, obteniendo una producción cercana a las 50,000 toneladas. (INEGI 2013)

Por lo tanto también el agronegocio ha ido en crecimiento debido a los tratados de comercialización que se han firmado con los diferentes países y al crecimiento de la mercadotecnia, que según Kotler (2006), considerado como el padre de la mercadotecnia moderna, asegura que esta disciplina es un proceso social y administrativo mediante el cual grupos e individuos obtienen lo que necesitan y desean a través de generar, ofrecer e intercambiar productos de valor con sus semejantes y a afirma que en la actualidad se puede hablar de mercadotecnia en donde existen elementos enfocados para que el producto y los valores de éste fortalezcan en todos los niveles, el lazo con los consumidores y también con los inversionistas, empleados, distribuidores, proveedores y todo aquel que forme parte del equipo, pues su finalidad es generar una relación ganar-ganar, sin embargo son pocas las compañías en México que desarrollan marketing porque lo ven como un gasto y en los países de primer mundo lo ven como una inversión. Con estos antecedentes de los Agronegocios, uno de los desafíos más importantes para los sistemas agroalimentarios del mundo y nuestro país, es asegurar el abasto suficiente de alimentos para la población.

Lo anterior se debe a que la demanda de alimentos se intensificara por el crecimiento de la población; la mayor esperanza de vida; los cambios en los patrones de consumo hacia alimentos más saludables, inocuos, de mejor calidad, producidos de forma amigable con el medio ambiente, cuyo origen pueda ser rastreado por cuestiones de salud y que contengan información especializada en su etiquetado; y por la demanda de una población madura creciente y con un ingreso disponible mayor. En contraste, la reacción de la oferta se vislumbra con mayores rigideces, la expansión de la tierra cultivable está prácticamente agotada y se utilizarán mayores volúmenes de productos agrícolas para usos no alimentarios. Tomando en cuenta los datos proporcionados una de las estrategias viables para satisfacer la demanda futura de alimentos de cualquier país, será incrementar la productividad de la producción primaria (SAGARPA, 2010). Por lo mencionado anteriormente, surge la idea de realizar un proyecto de una organización que se dedique a la producción y comercialización de productos orgánicos por medio del método de Acuaponía. Por lo antes mencionado un sistema integrado, es la fusión de la actividad acuícola con la agrícola, mediante la cual se busca desarrollar en cultivo de peces dando la recirculación adecuada del agua para la producción de

productos agrícolas, con ello se puede incrementar las fuentes de empleo e ingresos para la sociedad, con la venta de productos libres de agroquímicos y orgánicos para una mejor calidad de vida.

En consecuencia la Universidad Estatal de Sonora (U.E.S.), Unidad Académica Benito Juárez (U.A.B.J.) a partir del 1° de septiembre de 2012, antes Centro de Estudios Superiores del Estado de Sonora (C.E.S.U.E.S.), desarrolla un proyecto de investigación mediante la implementación y manejo de un Sistema de Producción Acua-Agrícola, el cual es un proyecto productivo que se desarrolla por maestros investigadores de diferentes áreas que consiste en el desarrollo de producción de manera hidropónica, integrando la actividad acuícola con la agrícola el cual tiene cuatro años de investigación, dentro de sus procesos está la operación del sistema está a cargo de la Dirección de unidad como administrador, un Coordinador general que es un docente de la misma universidad y alumnos que practican y desarrollan investigación como encargados de producción y obreros. Este proyecto se basa en desarrollar un cultivo integral en Acuaponía, siendo este el principal objetivo del sistema el compromiso social de promover la implementación de este tipo de sistemas de producción entre los habitantes de la comunidad, y los agricultores de la región para contribuir al autoempleo, la producción y consumo de productos orgánicos de calidad en beneficio de la salud y de la economía familiar, aparte de servir como terapia para los adultos mayores, jubilados o pensionados al momento de hacerse cargo del sistema promoviendo el uso sustentable de los recursos naturales y así garantizar una bienestar en general a la sociedad, a continuación su filosofía empresarial del sistema.

*Misión:* La Misión de (SIPROAA) es integrar el cultivo de manera hidropónica la actividad acuícola y hortícola, empleando un sistema de recirculación de agua, que a su vez optimice los recursos naturales con los que se cuenta, incrementando la productividad y promoviendo la implementación de este tipo de sistema de producción entre los habitantes de la región del Sur del Estado de Sonora.

*Visión:* La Visión del Sistema de Producción Acua-Agrícola, es ser líder en la implementación de los sistemas de cultivo hidropónico, integrando la actividad acuícola y hortícola para la producción y comercialización de productos orgánicos, siendo un agente clave en la transformación de comunidades marginadas contribuyendo al autoempleo y autoconsumo en el Sur del Estado.

#### Valores

**Integridad:** Por la combinación de los sistemas de producción para la obtención de un producto sustentable.

**Calidad:** Se realiza el proceso de cultivo mediante controles de inocuidad para la obtención de productos orgánicos.

**Competitividad:** El cultivo hidropónico de los productos orgánicos de SIPROAA, por su naturaleza lo hacen competitivo con otros productores, debido a sus bajos costos.

**Trabajo en equipo:** La colaboración y la comunicación eficiente de los integrantes del sistema de Producción Acua-Agrícola, hacen que el equipo de trabajo esté integrado para el cumplimiento de la misión, visión y valores.

Como una alternativa para diversificar la actividad acuícola del Estado, el cultivo Acuapónico se presenta como una opción viable de desarrollo en la zona rural, sin embargo dado que en la mayoría de las veces se utiliza agua dulce para su cultivo, es de vital importancia que este se desarrolle de manera intensiva para optimizar el uso del agua, en Sonora como en muchas partes del país y del mundo, el agua dulce se ha convertido en un factor limitante para el desarrollo de esta actividad. Por lo cual en este sistema de producción acua-agricola se pueden cultivar distintos tipos de plantas y hortalizas agrícolas, unas de ellas son: Albaca, sandía, calabaza, chiles, lechuga, flores, tomate, yerbabuena, cebollines, romero, fresas, menta, berenjena, plantas aromáticas, etc. En cuanto a la de producción acuícola se pueden encontrar una variedad de peces, los cuales son adaptados para dicho sistema, entre ellos: Lobina blanca, trucha, bagre, tilapia, mojarra, camarón, etc. Este sistema de producción Acua-agrícola ayuda a la conservación en el medio ambiente por la constante reutilización del agua y la producción de cultivos orgánicos en el mundo, el cultivo en acuaponía aún se encuentra en crecimiento y experimentación, más sin embargo, cada vez son

más los países que se encuentran implementado este tipo de sistema debido a los problemas de escasez y limitación del agua, así como las regulaciones por la disposición de la misma cuando se encuentra cargada de desechos.

Sin embargo es necesario que la acuicultura y agricultura se diversifique ya que la actividad ya empieza a resentir los efectos de presión por condicionantes ambientales, enfermedades, competencia al acceso de recursos financieros y saturación de mercados. Como una alternativa para diversificar la actividad acuícola del Estado, el cultivo de la tilapia se presenta como una opción viable de desarrollo en la zona rural, sin embargo dado que en la mayoría de las veces se utiliza agua dulce para su cultivo, es de vital importancia que este se desarrolle de manera intensiva para optimizar el uso del agua, en Sonora como en muchas partes del país y del mundo el agua dulce se ha convertido en un factor limitante para el desarrollo de esta actividad.

Hoy en día es de gran importancia el contar con una sana alimentación ya que México ocupa uno de los primeros lugares en obesidad a nivel mundial (OMS 2013), por tal motivo se realizó una investigación de mercados con las familias de la comunidad de Benito Juárez en el Sur de Sonora para proporcionar información para la implementación del sistema de producción Acua – Agrícola en el traspaso de sus hogares. En el desarrollo plan de mercadotecnia de utilizaron instrumentos como las entrevistas, cuestionarios, observación directa y la investigación dentro de la organización para recopilar la información requerida para establecer un diagnóstico. Primero se determinan las bases como los antecedentes de la empresa, luego se realizó un análisis de los productos, servicios, clientes, consumidores, mercado objetivo, competencia, distribución y proveedores. Posteriormente se realizó un análisis FODA, en donde se identificó que la carencia principal de la empresa es que no cuenta con un plan de mercadotecnia y surge la necesidad de efectuar una propuesta en el tema para posicionar la empresa en el mercado. Para cada uno de los objetivos de mercadotecnia se determinaron estrategias y tácticas, en donde se detalló cada una de las actividades a realizar como: ¿Qué se hará?, ¿Cuándo se hará?, ¿Quién se encargará de hacerlo? y ¿Cuánto costará? También se establecieron objetivos financieros de la empresa y el impacto de los objetivos mercadológicos. La propuesta mostrara a los clientes potenciales la existencia de la empresa, la marca, sus productos y servicio de asesoría, aparte se estará posicionando la empresa y sus productos en el mercado regional del Valle del Yaqui.

## REVISIÓN DE LITERATURA

Como una manera de atender lo sugerido por FAO, (2010) en cuanto al empleo de tecnologías que usen de forma eficiente los recursos para producir alimentos de manera sustentable en este proyecto se busca realizar un plan de mercadotecnia, para establecer una empresa productora y comercializadora de productos orgánicos, como una medida de contribuir a una mejora alimentación y generando empleos en la región. A nivel mundial existen zonas áridas y semiáridas en donde el agua dulce es un recurso escaso y por lo tanto, su uso eficiente es uno de los desafíos más importantes a los que se tienen que enfrentar, como una alternativa a lo antes mencionado, el sistema de cultivos hidropónicos han sido propuestos como una medida para optimizar el uso de los recursos disponibles: agua, suelo, espacio y capital. En consecuencia el plan de mercadotecnia, según Thompson (2006), es un valioso instrumento que sirve de guía a todas las personas que están vinculadas con las actividades de mercadotecnia de una empresa u organización porque describe aspectos tan importantes como los objetivos de mercadotecnia que se pretenden lograr, el cómo se los van a alcanzar, los recursos que se van a emplear, el cronograma de las actividades de mercadotecnia que se van a implementar y los métodos de control y monitoreo que se van a utilizar para realizar los ajustes que sean necesarios.

El plan de mercadotecnia debe de cumplir con tres propósitos muy importantes: Thompson (2006) Debe ser una guía escrita que señala las estrategias y tácticas de mercadotecnia que deben implementarse para

alcanzar objetivos concretos en periodos de tiempo definidos. Especificar quién es el responsable de qué actividades, cuándo hay que realizarlas y cuánto tiempo y dinero se les puede dedicar. (Stanton, et. Al.2004). Servir como un mecanismo de control. Es decir, establecer los estándares de desempeño contra los cuales se puede evaluar el progreso de cada división o producto. (Guiltinan y Madden, 2001).

De los propósitos anteriores, cabe mencionar que el plan de mercadotecnia debe de ser una guía escrita, donde se despliegan las estrategias, especifiquen los responsables de las actividades a realizar, cuanto y cuando realizarlas, y por último, servir como mecanismo de control. Como se aprecia en la Tabla 1, Cohen (2004), describe en nueve pasos que considera fundamentales para la realización de un buen plan de mercadotecnia los cuales son; resumen ejecutivo, introducción, análisis de la situación, mercado objetivo, problemas y oportunidades, metas y objetivos de la mercadotecnia, estrategias de mercadotecnia, tácticas de la mercadotecnia e implementación y control. Thompson (2006) reflexiona en lo siguiente, resulta muy apropiado el tener una idea clara acerca del contenido básico que debe tener un plan de mercadotecnia, y lo sintetiza en los siguientes pasos; resumen ejecutivo, análisis de la situación de mercadotecnia, análisis FODA (Fortalezas, Oportunidades, Debilidades, Amenazas), objetivos, estrategias de mercadotecnia, tácticas de mercadotecnia, programas financieros, cronogramas, monitoreo y control. La estructura corresponde a la filosofía de Latorre (2007), el cual considera los siguientes diez pasos como importantes para la realización de un plan de mercadotecnia exitoso; la compañía, entorno y mercado, análisis FODA, identificar la necesidad, segmentación, posicionamiento, estrategias, mezcla de mercadotecnia, pronósticos financieros, implementación y control

Tabla 1: Comparativo de propuestas de Planes de Mercadotecnia

Cohen (2004)	Thompson (2006)	Latorre (2007)	Plan propuesto
Resumen ejecutivo	Resumen ejecutivo	La compañía	Resumen ejecutivo
Introducción	Análisis de la situación de la empresa	Entorno y mercado	Antecedentes de la organización
Análisis de la situación	Análisis FODA	Análisis FODA	Análisis de la situación
Mercado Objetivo	Objetivos	Identificar la necesidad	Análisis FODA
Problemas y oportunidades	Estrategias de mercadotecnia	Segmentación	Mercado objetivo
Metas objetivos de la mercadotecnia	Tácticas de mercadotecnia	Posicionamiento	Objetivos mercadológicos
Tácticas de la mercadotecnia	Programas financieros	Estrategias	Estrategias de mercadotecnia y plan de acción
Implementación y control	Cronograma	Mezcla de mercadotecnia	Presupuestos
	Monitoreo y control	Pronósticos financieros	Controles
		Implementación y control	

**Fuente:** Elaboración Propia.

## MÉTODOLOGIA

**Objetivo:** Esta metodología tiene como objetivo elaborar una propuesta de plan de mercadotecnia mediante la realización de un análisis interno y externo en un sistema de producción en un sistema Acua-Agrícola sustentable de productos orgánicos con la finalidad de implementarlo en el Municipio de Benito Juárez, ya sea a gran escala o como un proyecto de desarrollo social en las familias de la comunidad.

**Delimitaciones:** Para este proyecto, se desarrolla un sistema de producción que se busca sea eficiente en el manejo del recurso agua, el desarrollo económico de la comunidad y comercializar productos orgánicos combinando la actividad acuícola con la agrícola para producir como una primera alternativa de manera integral tilapia negra (*Oreochromis niloticus*) con cultivos hidropónicos de tomate bola (*Lycopersicon esculentum*) en un sistema de recirculación de agua dulce, dicho antes el proyecto esta implementado en la localidad de Villa Juárez, Sonora México en la Universidad Estatal de Sonora, y se desarrolla sólo con recursos propios de la institución, apoyos estatales y se están gestionando recursos Federales para su eficiente operación y desarrollo de investigación.

La delimitación del plan de mercadotecnia es que solamente está enfocado sólo a la pertinencia del proyecto en la comunidad, la profundidad del estudio está sujeta a la información disponible de investigaciones previas, encargados del proyecto y sujetos a la que va dirigida el plan de mercadotecnia, por lo tanto la decisión de la implementación del proyecto queda a discreción de los productores y las familias de la comunidad, mismos que serán responsables de administrar el proyecto asegurando producción que puedan servir de indicadores para ver su comportamiento.

*Sujeto:* El presente plan de mercadotecnia se estructuro para la Comunidad de Villa Juárez, donde la Universidad Estatal de Sonora está desarrollando investigación con el Sistema de producción Acua-Agrícola donde se integra la actividad acuícola con la agrícola. Aquí los productores e integrantes de las familias proporcionaron información requerida para realizar el plan de mercadotecnia, dicho proyecto productivo es desarrollado por maestros investigadores de la universidad, esto es por el interés de la institución por buscar nuevas alternativas que incrementen la producción y rentabilidad del campo agrícola, así como coadyuvar con el desarrollo económico de las comunidades rurales para que diversifiquen sus actividades tradicionales de agricultura temporal, y en la búsqueda de promover el autoempleo y la producción de alimentos libres de agroquímicos.

*Materiales:* Para la realización de este plan de mercadotecnia se apoyó en los resultados de una investigación de mercado donde se aplicaron cuestionarios previamente con las familias y productores de la región, también se aplicaron formatos de diagnóstico, entrevistas dirigidas, con los integrantes del proyecto, asesoría de expertos en el área y maestros de la Universidad Estatal de Sonora.

*Procedimiento:* Debido a la incremento del consumo de los productos orgánicos a nivel mundial, surge la necesidad de realizar la una propuesta para un plan de mercadotecnia que ayude a establecer los objetivos y metas que se persigue en la producción y comercialización de los productos orgánicos. Como inicio de la investigación se realizó una plática con el Coordinador general del proyecto para conocer la situación actual del Sistema de Producción Acua-Agrícola, posteriormente se propuso el trabajo a desarrollar, el plan de mercadotecnia que ayude a dar a conocer el proyecto en la región del Valle del Yaqui y Mayo. Para llevar acabo de este proyecto fue necesario realizar una serie de actividades encaminadas a detectar áreas de oportunidad dentro del sistema, y que a continuación se describen:

- A) Primeramente fue necesario solicitar una cita para una entrevista con el líder del proyecto en la Universidad para que nos hable de los antecedentes, constitución y organización del proyecto.
- B) Posteriormente en la universidad se conoció el proceso de producción del sistema y así contar con información de una fuente primaria.
- C) Se aplicaron formatos de diagnóstico, entrevistas, investigaciones de mercados previas e investigaciones de los mismos proyectos, estos instrumentos arrojaron la información necesaria para elaborar un análisis situacional en donde se describen el mercado, el producto, la competencia, distribución, posibles clientes y aspectos internos.
- D) También se desarrolló un análisis externo de las cinco fuerzas competitivas de porter, un análisis de la situación actual de la empresa, un análisis PEST (político, económico, social, tecnológico y ambiental), un análisis interno mediante un diagnóstico de la organización y con esa información se determinó la cadena de valor.
- E) Una vez realizado el análisis de la información recabada se procedió a elaborar el FODA (fortalezas, oportunidades, debilidades y amenazas) para detectar áreas de desarrollo en el sistema.
- F) Seguido se determinó la matriz de estrategias del FODA que ayuden a consolidar la estructura del sistema de producción acua-agrícola.

- G) Por último se desarrolló el plan de mercadotecnia con sus objetivos, estrategias, tácticas que se van a desarrollar para dar a conocer el proyecto.

## RESULTADOS

*Plan de mercadotecnia:* Derivado del análisis que se realizó como se muestra en de la tabla 2 y la figura 6, el plan de mercadotecnia es para su difusión con los productores y las familias de la localidad de Villa Juárez, Sonora, que desean implementar el proyecto de “Sistemas de producción Acua-Agrícola” ya sea a gran escala o en el traspaso de su hogar como una alternativa de desarrollo de autoconsumo o de algún beneficio económico.

Tabla 2: Análisis FODA y elección de la estrategia.

Ambiente externo	<b>OPORTUNIDADES</b> O1- Nuevos Mercados O2- Demanda de producto orgánico O3- Desarrollo de producto con valor agregado O4- Disponibilidad de insumos a bajo costo O5- Crecimiento de la demanda O6- Oportunidad de producir otros productos O7- Implementar nuevas tecnologías O8- Apoyo de programas gubernamentales	<b>AMENAZAS</b> A1- Costo de transporte deficiente A2- Dificultad de acceso al crédito A3- Cambio en el gobierno federal A4- Reformas políticas A5- Altas Tasas De Interés A6- Precios altos de los proveedores A7- Desastre naturales A8- Plagas y enfermedades en los cultivos
<b>Ambiente interno</b> <b>FORTALEZAS</b> F1- Productos con calidad F2- Personal capacitado F3- Diversidad de clientes F4- Bajo costo de producción F5- Conocimiento de consumidores F6- Producto esencial para la economía F7- Buen control sanitario F8- Personal capacitado	<b>ESTRATEGIAS (FO)</b> Detectar el mejor financiamiento con tasa de interés bajo de algún banco. Obtener financiamiento por parte de instituciones gubernamentales.	<b>ESTRATEGIAS (FA)</b> Diseñar e implementar un plan estratégico de la organización. Diseño e implementación de un programa de capacitación para el personal.
<b>DEBILIDADES</b> D1- Poca inversión en el proyecto D2- Dificultad con el producto D3- Poca experiencia en el mercado D4- Falta de confianza del cliente D5- Poco personal y el lento crecimiento D6- Falta de un plan de mercadotecnia D7- Falta de un plan de comercialización	<b>ESTRATEGIAS (DO)</b> Utilizar tecnología que permita eficientar la producción de los productos y mercadeo. Aplicar las tecnologías de información en la organización.	<b>ESTRATEGIAS (DA)</b> Diseñar e implementar un programa de mercadotecnia para encontrar clientes y consumidores potenciales. Lograr la comercialización de los productos para tener participación en el mercado regional.

D8- Falta de un plan  
estratégico

Como dato, la población de la localidad de Villa Juárez, Sonora, México que forma parte del municipio de Benito Juárez, Sonora, donde según el censo de población y vivienda del año 2010 mostrado por INEGI el total de familias habitadas hasta ese año fue de 5, 643 familias y por ello la población objetivo son aquellas productores y familias que cuenten con tiempo libre para implementar y atender el desarrollo del proyecto.

Figura 3: Objetivos Mercadológico 1

<b>Objetivo: 1</b> Ser el líder en venta de alimento orgánico en la región del Valle del Yaqui y Mayo.			
<b>Estrategia:</b> Atraer a nuevos clientes para penetrar en nuevos nichos de mercado. Posicionar la marca y la empresa en los clientes de la región del Valle del Yaqui y Mayo.			
<b>Táctica:</b> Realizar y lanzar un comercial publicitario para televisión y una campaña publicitaria de radio mediante spots donde se anuncie la ubicación de la empresa, los productos que se ofrecen y el servicio de asesoría que se brinda gratuitamente.			
¿Qué se hará?	¿Quién lo va hacer?	¿Cuándo se hará?	¿Cuánto costara?
Publicidad por televisión.	Gerente de la empresa Televisora	En la temporada alta de ventas.	\$15,000
Publicidad por radio.	Gerente de la empresa Radiodifusora	En la temporada alta de ventas.	\$15,000

Figura 4: Objetivos mercadológico 2

<b>Objetivo: 2</b> Incrementar las ventas aproximadamente en un 15% a partir de la aplicación del plan de mercadotecnia para la empresa el periodo de un año.			
<b>Estrategia:</b> Repartición de volantes en puntos estratégicos de la ciudad para atraer clientes.			
<b>Táctica:</b> Publicidad en volantes con promociones de descuentos en sus compras de contado. Descuentos a los clientes con línea de crédito por pronto pago. Abrir líneas de crédito con meses sin intereses en sus pagos.			
¿Qué se hará?	¿Quién lo va hacer?	¿Cuándo se hará?	¿Cuánto costara?
Entrega de volantes con promociones de descuentos.	Gerente de la empresa u agencia de publicidad.	En la temporada baja en ventas.	\$ 1,500

Figura 5: Objetivos mercadológico 3

<b>Objetivo: 3</b> Brindar una mejor atención al cliente con la aplicación de las tecnologías de información.			
<b>Estrategia:</b> Elaboración e implementación de un portal donde se encuentre información de la empresa.			
<b>Táctica:</b> Establecer la realización de una página Web donde se anuncie a la empresa, sus productos, servicio de venta, promociones, asesoramiento, posventa y una liga de sugerencias.			
¿Qué se hará?	¿Quién lo va hacer?	¿Cuándo se hará?	¿Cuánto costara?
Elaboración de una página Web para la empresa.	Gerente de la empresa y empresa encargada de diseñar páginas Webs.	Al inicio de operaciones de la empresa.	\$ 12,000

Figura 6: Objetivos mercadológico 4

<b>Objetivo: 4</b> Crear una imagen de una empresa socialmente responsable y consolidar la presencia de la empresa y sus productos.			
<b>Estrategia:</b> Patrocinios con publicidad y logotipos de la empresa.			

<b>Táctica:</b> Realizar patrocinios de equipos deportivos de escuelas o ligas municipales de los deportes más practicados en la región como lo son el fútbol, básquetbol, voleibol y béisbol.			
<b>¿Qué se hará?</b>	<b>¿Quién lo va hacer?</b>	<b>¿Cuándo se hará?</b>	<b>¿Cuánto costará?</b>
Patrocinio de equipos deportivos.	Gerente de la empresa y representantes de los equipos que porten uniforme con el logotipo de la empresa.	Cuando empiece una liga importante del deporte más popular en la región.	UNIFORMES: Fútbol \$ 5,500 Básquetbol \$ 3,600 Voleibol \$2,000 Béisbol \$ 8,000

Figura 7: Objetivos mercadológico 5

<b>Objetivo: 5</b> Brindar un mejor servicio atención a clientes y con esto tener una ventaja comparativa en cuento a nuestra competencia.			
<b>Estrategia:</b> Implementar un curso de capacitación para empleados y vendedores de atención al cliente.			
<b>Táctica:</b> Contactar a una empresa consultora o universidad que brinde capacitación o cursos de atención a clientes.			
<b>¿Qué se hará?</b>	<b>¿Quién lo va hacer?</b>	<b>¿Cuándo se hará?</b>	<b>¿Cuánto costará?</b>
Implementar un curso de capacitación para empleados (Vendedores) en atención al cliente.	Gerente de la empresa Empresa u organización que realicen la capacitación.	En los meses de temporada baja en ventas.	\$ 3,000

Figura 8: Objetivos mercadológico 6

<b>Objetivo: 6</b> Darse a conocer utilizando las tecnologías de información sin costo aplicables en la red.			
<b>Estrategia:</b> Utilizar las redes sociales y los medios disponibles en internet para la promoción del proyecto.			
<b>Táctica:</b> Abrir un correo electrónico así como un Facebook y un Twitter para la publicidad del sistema y sus productos.			
<b>¿Qué se hará?</b>	<b>¿Quién lo va hacer?</b>	<b>¿Cuándo se hará?</b>	<b>¿Cuánto costará?</b>
Dase a conocer por medio de redes sociales gratuitas.	Gerente de la empresa	Todo el año.	Servicio gratuito.

Costo total anual aproximado del plan de marketing = \$ 66,200. (Moneda mexicana)

## CONCLUSIONES

Los Agronegocios en México constituyen un elemento importante para la operación de empresas que ayudan al desarrollo económico en el sector rural, por consecuencia se destaca que hoy en día es de gran importancia estar preparados para los cambios que se dan en este mundo globalizado, las empresas deben de estar en constante innovación, desarrollo y renovación para afrontar nuevos retos que se le presenten en el entorno económico donde se desarrolla, dentro de la actividad agrícola se contempla el subsector hortícola y orgánico que es actividad donde sus procesos son especializados ya que requieren de conocimientos técnicos, financieros y personal capacitado.

Con el presente proyecto se realizó en la Universidad Estatal de Sonora, se pretende dar a conocer los sistemas de producción Acua-agrícolas mediante un plan de mercadotecnia esto para que sea una excelente opción de desarrollo económico para la región y principalmente por el aprovechamiento del agua, porque como bien se sabe se está desperdiciando y llegara el momento en que se pueda agotar este recurso, otro punto muy importante es que con este método no se utiliza el suelo por lo tanto no se está contaminando con químicos, otro aspecto importante es que hay muchas oportunidades de obtener recursos de financiamiento para poner en marcha este proyecto, por medio de instituciones, y programas de apoyo relacionados con el sector.

Se concluye que es una idea muy viable y una excelente inversión para un proyecto productivo y sustentable, aparte de que se apoyaría a la economía familiar y al desarrollo económico y social de las comunidades rurales, por eso la importancia de darlo a conocer y además de innovador ya que las tendencias por el consumo de productos orgánicos se la mejor alternativa en un futuro.

## RESUMEN

*El sector que representa mayor actividad produciendo bienes y servicios así como un importante generador de empleos en cualquier País es el de las Pequeñas y Medianas Empresas (PYMES), lo que precisa buscar estrategias que favorezcan la continuidad de sus operaciones a lo largo del tiempo. Esta investigación se llevó a cabo con la finalidad de analizar cuáles son las estrategias que han aplicado este tipo de empresas para realizar sus operaciones en el mercado. La investigación realizada fue descriptiva transversal no experimental en la que se utilizó como instrumento de medición la aplicación de cuestionarios a los fundadores y administradores de las pequeñas empresas familiares constituidas por miembros de la comunidad china establecidos en la ciudad de Mexicali, Baja California, México. Una vez que los datos fueron obtenidos, procesados y analizados, se tuvo conocimiento que este tipo de empresas realizan actividades y elaboran estrategias fundadamente en la experiencia, mostrando una marcada resistencia a invertir tiempo y esfuerzo a la realización del diseño de planeación estratégica, sin embargo es fundamental realizar acciones que les ayuden a sacar adelante la operación con el objeto de lograr su permanencia por periodos más amplios, logrando así su prosperidad y consolidación.*

**PALABRAS CLAVE:** Planeación Estratégica, Estrategia, Empresa Familiar, Comunidad China

## ABSTRACT

*The sector represents more activity producing goods and services as well as a major generator of jobs in any country is the Small and Medium Enterprises (SMEs), which requires search strategies that favor the continuity of its operations over time. This research was conducted in order to analyze the strategies that have implemented this type of company for their operations in the market are. The experimental investigation was not descriptive cross in which was used as a measuring instrument the application of questionnaires to the founders and managers of small family companies formed by members of the Chinese community established in the city of Mexicali, Baja California, Mexico . Once the data were collected, processed and analyzed, it was learned that these companies carry out activities and develop strategies rightly on experience, showing a marked reluctance to invest time and effort to the completion of design of strategic planning, but is key actions that will help them move forward with the operation in order to achieve permanence for longer periods, thus achieving prosperity and consolidation.*

## INTRODUCCIÓN

En la actualidad las organizaciones sufren una intensa presión de sus competidores; día a día surgen nuevos productos o servicios capaces de sustituir a los anteriores, por lo que los negocios deben buscar siempre la mejora en la calidad de lo que ofrecen. Para poder sobrevivir y sostenerse, las empresas deben mantener un proceso continuo de alerta, deben estar preparados para adaptarse y adecuarse a las condiciones cambiantes del entorno. El objetivo principal de la planeación estratégica es sentar las bases que permitan la preservación de las organizaciones incluso ante las condiciones cambiantes del contexto de los negocios. En contraste, China es un país con diferentes estructuras sociales, normas culturales y maneras de formar relaciones. Además tiene arraigadas tradiciones y fuertes valores morales nacidos de una larga historia y que continúan a lo largo del tiempo. Ante esta situación, y con la incógnita de conocer como los negocios administrados por miembros de la comunidad china han enfrentado la dinámica en la realidad económica del entorno, se llevó a cabo la presente investigación con el objetivo de analizar las estrategias que han apoyado a la permanencia de dichos negocios e incluso que los han favorecido en su consolidación. Las empresas familiares se convierten en una buena práctica dentro de la sociedad ya que el hecho de construir una empresa a través de un núcleo tan relevante como lo es la familia es un reto que nos es más que otro medio de subsistencia, ya que los propios integrantes deben generar las estrategias necesarias para poder llevar un buen control, gestionar buenas decisiones y sobretodo preservar a la empresa por generaciones (Cisneros, 2007).

### Antecedentes

En la actualidad, Mexicali tiene una población de poco más de 900,000 habitantes, de los cuales alrededor de 40,000 son de origen chino. A finales del siglo XIX se propició una fuerte inmigración de chinos hacia los Estados Unidos de América con el fin de trabajar en la construcción de vías férreas así como en los canales de irrigación. Al concluirse estos trabajos, el país del norte empezó a rechazarlos hasta que, en 1904, se emitió una ley que prohibía su entrada. Esto casi coincidió con el desarrollo agrícola de Mexicali que requería de mano de obra y los mexicanos existentes no eran suficientes en ese tiempo para proporcionarla. Por este motivo, de 1910 a 1920 se facilitó la entrada de asiáticos a trabajar en esta región, los cuales se asentaron predominantemente en lo que tiempo después se conocería como La Chinesca, barrio chino que aún existe en el centro de la ciudad. Con el paso del tiempo, estos inmigrantes que iniciaron como jornaleros, ocuparon espacios como arrendadores de tierras y posteriormente incursionaron al comercio, principalmente restaurantes.

En 1918, un grupo de hombres solteros chinos fundaron la Asociación China con la finalidad de representar a dicha comunidad ante cualquier estancia gubernamental y civil, así como promover su cultura, fortalecer los principios morales y afirmar los lazos de unión familiar. A través de esta asociación se realizaron las primeras acciones de beneficencia pública y se estableció el primer hospital público, financiado con participaciones que los agricultores chinos deducían de sus cosechas de algodón. El control que tenían de la agricultura era por demás sorprendente. Durante las primeras décadas del siglo, algunos chinos rebasaron el nivel de jornaleros agrícolas para convertirse en prósperos empresarios. A mediados del siglo XX, los integrantes de la comunidad china ya establecidos en La Chinesca, fundaron comercios dedicados a la venta de ropa, calzado, mercerías, abarrotes y restaurantes; esto beneficio el desarrollo económico de Mexicali ya que generaron espacios de trabajo y propiciaron prosperidad a la economía local, situación que en hoy en nuestros días sigue presentándose ya que ofrecen 1,200 fuentes de empleo a trabajadores de la ciudad.

## REVISION LITERARIA

Las sociedades evolucionan durante el transcurso de las generaciones; al igual que las especies, las organizaciones, que sobreviven no son las más grandes ni las de mayores recursos, sino aquellas que consiguen adaptarse y adecuarse a las exigencias y desafíos constantes del medio que las rodea. Sobrevivirán aquellas que no solo tengan la capacidad de adaptarse sino que se anticipen y creen condiciones de cambio que repercutan en el ambiente y en las otras organizaciones. En la medida en que consigan anticiparse a esos cambios de manera proactiva, en esa medida será su éxito. Y la planeación estratégica es una herramienta que apoya a la obtención de esos buenos resultados.

Planear consiste en elegir y fijar un objetivo; en elaborar un proyecto y precisar los pasos a seguir para llevarlo a cabo calculando los riesgos que pudieran divisarse; es saber cómo prevenir y evitar la amenazas para minimizarlos; es prepararse de manera continua para la obtención de buenos resultados. Con la planeación debe buscarse asegurar la permanencia de los negocios en razón de que se formalizan planes, programas y procedimientos para que operen de manera congruente frente a las eventualidades que se presentan en el andar cotidiano de las organizaciones. La estrategia es un conjunto de acciones concebidas sistemáticamente en el tiempo, las cuales deben llevarse a cabo para lograr un determinado fin. La estrategia es una elección que involucra a toda la organización y que consiste en seleccionar de entre varias alternativas la que convenga en mayor grado, considerando todos aquellos factores internos y externos que la rodean: y, partiendo de esa elección tomar decisiones buscando siempre una mejor posición futura en relación con la situación actual.

Una buena estrategia debe ser capaz de alcanzar el objetivo deseado; de realizar una buena conexión entre el entorno y los recursos de una organización y competencia; debe ser factible y apropiada; debe ser dinámica, flexible y capaz de adaptarse a las situaciones cambiantes. Una buena estrategia debe ser capaz de proporcionar a la organización una ventaja competitiva. Para Chiavenato (2011), la planeación estratégica es un proceso en la organización que se encarga de trazar las directrices para definir los planes de acción que generaran sus ventajas competitivas y sustentabilidad a lo largo del tiempo. La planeación estratégica es elaborar, desarrollar y poner en marcha los distintos planes por parte de las empresas u organizaciones con la intención de alcanzar los objetivos y metas perseguidos en función de las oportunidades y amenazas que ofrece el entorno.

Es importante señalar que la planeación estratégica no intenta tomar decisiones mirando el futuro, sino respondiendo a determinadas problemáticas del presente; por lo tanto, no se encarga de pronosticar las futuras ventas sino de resolver problemas actuales que pudieran estar relacionados con ellas. Debido a esto es que todas las empresas deben revisar constantemente su planeación estratégica y crear nuevos planes para resolver aquellos conflictos que pudieran afectar el presente. En este sentido, es primordial que todas las personas vinculadas a la gerencia puedan desarrollar sus conocimientos y comprender con exactitud las necesidades de la empresa, para que la planeación estratégica les permita interactuar con un mundo dinámico y en constante evolución.

La administración estratégica comprende cinco etapas: establecimiento de la dirección organizacional, diagnóstico, la formulación de estrategias, su implantación y evaluación de los resultados (Hill y Jones, 2009). Dentro de la dirección organizacional, se enfocan acciones tales como la generación de misión, la declaración de algún estado futuro deseado que no es más que una visión organizacional, de igual manera se convierte en prioritario el establecimiento de objetivos, declaración de los valores, metas y planes de acción. Como segunda fase se debe efectuar los análisis del ambiente tanto externo como interno de la organización, se destaca la elaboración de estrategias y de esta manera tener la posibilidad de generar las ventajas competitivas que le ayudaran a reforzar su actividad. No hay que olvidar el desarrollo de un diagnóstico interno y externo para el desarrollo de objetivos.

## Organización y Familia

Es necesario crearnos un concepto apropiado de lo que encierra el término organización, que nos servirá como antecedente de empresa y poder englobar el término empresa familiar. Kast y Rosenzweig (2004) nos dice que los grupos y las organizaciones constituyen parte importante de nuestra existencia. Generalmente nacemos en el seno de una familia, continuamos nuestro andar en contacto con diversas instituciones. Las organizaciones se diferencian de los grupos informales ya que estos surgen espontáneamente cuando varias personas que tienen intereses comunes concuerden para alcanzar metas comunes. Una organización es un sistema con algún propósito, y en el cual algunas de sus partes, tienen propios propósitos y se diferencia de una empresa porque esta realiza seis tipos de intercambios (Ackoff, 1997):

Intercambio de dinero por trabajo a sus empleados

Intercambio de dinero por bienes y servicios con los consumidores

Intercambio de dinero con los proveedores

Intercambio de bienes y servicios con el gobierno

Intercambio de dinero pagadero posteriormente por dinero recibido por inversionistas y financiadores

Intercambio de dinero pagado ahora por dinero recibido más tarde, con los deudores.

Respecto a la teoría contable, existen postulados que fueron definidos considerando las distintas corrientes teóricas desarrolladas hace varias décadas, así como la práctica de los negocios. Sin embargo, dichos postulados pueden modificarse si cambia el entorno en el que el sistema de información contable opera. Uno de estos postulados es el de “negocio en marcha” que menciona que la entidad económica se presume en existencia permanente, dentro de un horizonte de tiempo ilimitado, en tanto prevalezcan dichas las condiciones favorables para el desarrollo de sus actividades. Alejandro Alcocer define la empresa como “una entidad económica de producción o distribución de bienes o servicios, en la cual se interrelacionan elementos humanos, físicos y técnicos para cumplir con un fin o actividad determinada” (Alcocer, 2009). Por su parte Rodríguez (2006) nos dice que son “unidades básicas de producción, encargadas de realizar las actividades económicas que nos permiten satisfacer las necesidades humanas constituidas por un grupo de personas y una diversidad de recursos (materiales, financieros, técnicos)”.

La pequeña empresa ha proporcionado una de las mejores alternativas para la independencia económica, ya que este tipo de empresas han sido una gran oportunidad mediante la cual los grupos en desventaja económica han podido iniciarse y consolidarse por méritos propios. De igual manera debe anotarse que la pequeña empresa ofrece el campo experimental para generar, con frecuencia, los nuevos productos, ideas, técnicas y formas de hacer las cosas. Si bien es cierto que las pequeñas empresas no logran obtener niveles de operación y venta individuales tan considerables como las empresas grandes o multinacionales, en conjunto si llegan a consumir más que aquellas. La importancia de la pequeña empresa no sólo debe medirse por el número de establecimientos o el capital invertido que existe en ellas, sino que también deben considerarse los empleos y la capacitación que generan y la capacidad de compra que dan a la población trabajadora mediante los sueldos y salarios.

## Empresa Familiar

Toda área de conocimiento debe erigirse sobre una base teórica. En el campo de la administración de empresas, la fuente primordial de material está constituida por la amplia experiencia y la vasta literatura que existe de este tema. Sin embargo, en lo que respecta a la administración de empresas familiares, se carece de una integración teórica y empírica, además de que no se cuenta con una definición unificada. Esta falta de integración teórica propicia que existan muchas definiciones sobre la empresa familiar. En Estados Unidos se reportan más de veinte y en México, los pocos profesionales que se dedican a esta disciplina también manejan definiciones diversas. A pesar de que no hay un consenso sobre la definición

de empresa familiar, la mayoría de los expertos la asocian con el control accionario y la dirección de la organización en manos de los miembros de una familia.

Para Longenecker (1994), una empresa familiar es aquella que cumple con dos requisitos fundamentales: en la parte de propiedad, todas o al menos la parte proporcional que permita mantener el control de la organización deben pertenecer a dos o más miembros de una misma familia; y en segundo lugar, sin restarle importancia alguna, la empresa familiar es aquella en la que al menos dos de los miembros de la familia están involucrados en el funcionamiento de la empresa. Esto quiere decir que no basta con tener el control accionario de la empresa, sino que al menos dos de los miembros de la familia deben estar laborando activamente en la empresa. Aunque no existen datos exactos que proporcionen información precisa de la proporción que guardan las empresas familiares con las que no lo son, debido a que los censos no clasifican a las empresas como familiares y no familiares algunos autores mencionan que a nivel mundial, entre el 80 y 90% de las empresas en el mundo son familiares, generan el 75% del PIB mundial y emplean el 85% de la población trabajadora, razones por las que se les considera un motor económico y social a nivel mundial (Poza, 2005)

Además, Rodríguez Valencia menciona que de más de 2, 000,000 de empresas que operan en México, 98% son controladas por una familia o tienen una fuerte intervención por parte de los miembros de esta. Se puede argumentar que los grandes grupos del país (Alfa, Bimbo, Vitro, etc.), en realidad son grupos familiares. De ahí, la importancia en ocuparse de este tema. Sin embargo, las empresas familiares en México tienen una esperanza de vida de 25 años (Urzúa, 2012). Aunque cada organización tiene sus propios miembros, metas y valores, se ha encontrado que es posible establecer disimilitudes entre las empresas familiares y las que no lo son. Algunas de las características distintivas de las empresas familiares son que, en sus inicios, éstas tienden a contraer pocas o ninguna deuda y suelen estar económicamente subdesarrollados, en el sentido de que no son tan grandes como podrían ser. Otra característica es que, en ocasiones, las empresas familiares normalmente operan sin un sistema burocrático, por lo que las decisiones son tomadas con rapidez y por lo mismo son capaces de ajustarse con prontitud a los cambios de su entorno. Una más, es que dado que en estas empresas, los subsistemas de empresa y familia interactúan, no se suelen tomar decisiones puramente racionales que afecten a la empresa, sino que los intereses de la familia también juegan un papel importante. Por último se menciona que algunos negocios familiares tienden a orientarse hacia las ventas y la producción, dejando áreas como las finanzas y la mercadotecnia en un segundo plano, siendo que estas también son importantes y deben considerarse el momento de la planeación de las actividades de la organización.

### Empresa China

La relación hombre familiar sigue teniendo una fuerte preponderancia del hombre como jefe de familia, las personas mayores son claramente respetadas. Esto genera que dentro de la comunidad China así como de las organizaciones los adultos mantienen una jerarquía importante y reconocida. Como principio general el ciudadano chino es muy emprendedor, con fuerte predisposición a resolver las inquietudes de sus clientes. Es muy activo en la participación dentro de sus organizaciones, se verifica una clara tendencia a superarse permanentemente incorporando capacitación y equipamiento a sus empresas. Sorprende observar el crecimiento permanente de sus compañías.

Por otra parte se trata de personas muy cordiales, amistosas y serviciales. Siempre están tratando de resolver todo tipo de obstáculo; Son muy detallistas y lo manifiestan por medio de gentilezas como los traslados, recepción en la compañía y reservas de todo tipo; hacen que el visitante se encuentre predispuesto para los negocios. “Los chinos no perciben el trabajo como un castigo”, los chinos no tienen la idea religiosa de ‘ganar el pan con el sudor de su frente’, por lo que el trabajo se ve simplemente como una forma de otorgar dignidad a nuestras vidas”. Uno de los aspectos más llamativos de los pequeños comerciantes chinos

establecidos en Mexicali son sus largas jornadas de trabajo, con horarios que se prolongan mucho más de lo habitual. El tipo de negocio también juega un papel importante, ya que los chinos “tienen trabajos de niveles muy básicos, y cuanto más tiempo esté abierto el local, más posibilidades hay de ganar dinero”, “Si un comerciante tiene la tienda abierta no sabe cuántos clientes habrá, pero sí la tiene cerrada no habrá ninguno, seguro”.

## METODOLOGÍA

La presente investigación es de tipo descriptiva porque se mide o recoge información sobre las variables que participan en el problema sujeto a estudio como la administración estratégica y el diseño de estrategias empresariales. El diseño es no experimental transversal ya que se recolectaran datos en un solo momento en su contexto natural, mediante entrevistas a los fundadores y administradores; teniendo como propósito el describir variables y analizar su incidencia. El método utilizado para la recolección de información cualitativa y cuantitativa es a través de la aplicación de la entrevista (Hernández, Fernández y Baptista, 2006).

### Planteamiento del Problema

No existe un modelo que integre las capacidades internas y los recursos de las empresas familiares que las ayuden a ser más profesionales, entendiéndose por profesionalización la capacidad interna con que una Empresa Familiar estructura, gestiona y gobierna los recursos y capacidades que le son propios de tal forma de conseguir los resultados deseados para el logro de sus objetivos. (Basco, 2006). Se debe contemplar que no existe una teoría que se ajuste a las necesidades de las empresas familiares, ya que la mayoría de los trabajos en el ámbito de la empresa familiar se relacionan principalmente con investigaciones que se enfocan en reconocer y apreciar las características de éstas, sin embargo las necesidades que presentan la mayoría de las empresas familiares acerca de su funcionamiento y supervivencia representan un reto para emprender dicha investigación. Se tiene que gran parte de ellas fracasan debido a su mala administración, dentro de la cual se encuentra la planeación estratégica. Por ello es importante que quien tiene un negocio cuenta, desde un principio, con las herramientas básicas para encauzarlo adecuadamente. Además debe estar preparado para que, cuando crezca, lo haga sanamente. Tener una idea de la empresa a futuro permitirá, desde sus inicios, una adecuada toma de decisiones (Molina, 2006).

### Objetivo

El objetivo de esta investigación es determinar si entre los factores de permanencia de las pequeñas empresas familiares de origen Chino en Mexicali, Baja California se encuentra la adecuada implementación de la planeación estratégica.

### Objetivos Específicos

Identificar a las empresas familiares establecidas en Mexicali de origen Chino.  
Conocer si las Empresas Familiares identifican los elementos que la distinguen de sus competidores.  
Identificar las estrategias de las Empresas Familiares que son implementadas como parte de su planeación estratégica

### Procedimiento Para la Recolección y Análisis de los Datos

La primera fase de la investigación se procedió a caracterizar a las empresas familiares, para conocer la capacidad interna que tienen de estructurar, gestionar y gobernar sus recursos y capacidades con el objetivo de mejorar su competitividad y afianzar su permanencia. Se determinó la utilización de este tipo de

cuestionario por ser éste un instrumento de apoyo que permitió recolectar gran cantidad de información que resultó sumamente útil para el planteamiento del problema de estudio.

El instrumento de medición diseñado para esta investigación fue un cuestionario con preguntas abiertas, a manera de entrevista. Este instrumento se aplicó para conocer información respecto a quien o quienes son las personas que fundaron la empresa y si todavía se encontraban laborando en ella; quien tomaba las principales decisiones del negocio; si dentro sus prácticas administrativas desarrollaban manuales de organización, implementación de políticas y estrategias; y, si consideran relevante el conocer a la competencia directa.

## RESULTADOS

Tabla 1: ¿Llevaban a Cabo Planeación en la Empresa?

*Elaboración propia*

Se puede observar que el 55% de los propietarios lleva a cabo un proceso de planeación para su empresa, sin embargo un alto porcentaje deja de lado esa actividad lo que trae como consecuencia una administración sin herramientas que sirvan de apoyo para la continuidad del negocio, siendo un 45% esta proporción.

Tabla 2: ¿Posee Manuales de Organización?

*Elaboración Propia*

Solo el 40% de las empresas poseen manuales de organización por lo cual el 60% restante puede que no conozca con certeza sus responsabilidades y actividades que debe desarrollar situación alarmante para la operación de la empresa, por lo cual la gerencia debe establecer normas y controles administrativos, los cuales deberán quedar por escrito y es precisamente a través de los manuales de organización que se pueden establecer dichas normas y políticas.

Tabla 3. ¿Se Implementan Políticas y Estrategias en la Empresa?

*Elaboración propia*

Un 42% de las empresas carecen de la actividad de elaboración de políticas y estrategias por lo que esa es una de las causas de que no se cuenten con líneas de acción dentro de las empresas para su correcta implementación, siendo solo el 58% las empresas las que tienen un enfoque en el proceso de elaboración de políticas y estrategias.

Tabla 4: ¿Considera Relevante Implementar Una Planeación Estratégica Para Evitar el Cierre del Negocio?

*Elaboración propia*

Se tiene plenamente identificado con un 36% que la falta del manejo de la planeación estratégica, es la causa del cierre de las empresa, lamentablemente se tiene el precedente de la repercusión que trae consigo el no implementarlo, pero tampoco se ve un interés por efectuar el proceso y revertir la situación a la que se pudiera enfrentar.

Tabla 5: ¿la Empresa Cuenta con una Estrategia Para Competir?

*Elaboración propia*

La figura muestra que del total de empresas familiares, el 45% si cuenta con una estrategia para competir como práctica común, el 29% no cuenta con una estrategia, y un 5% de ellos no sabe sobre la necesidad de estas.

## CONCLUSIONES

Hoy en día la organización debe reforzar sus actividades con el afán de lograr su subsistencia, y más aún si se trata de una organización de carácter familiar, quien se enfrentan a un sin número de dificultades para permanecer en el mercado de manera competitiva y rentable, por lo que tienen la necesidad de emprender estrategias innovadoras que les ayuden a enfrentar y superar los retos a los que se verán expuestos en su contexto actual. Dentro de los factores que inciden en la permanencia de las pequeñas empresas familiares de origen Chino en Mexicali Baja California, la empresa familiar en muchas ocasiones resulta difícil de analizar desde un punto de vista organizacional, ya que los conceptos de confianza y comunicación entre los miembros de una familia pueden afectar subjetivamente la relación, se encontró la falta de planes de acción enfocados a su organización. Otro de los factores detectados, en orden de importancia, son los problemas derivados a la falta de la elaboración de manuales organizacionales, lo que genera que haya un desorden en las actividades que se realizan en las empresas, lo cual también se aprecia dada la falta de experiencia en el negocio.

Así mismo, uno de los aspectos trascendentales para la falta de competitividad es que la mayoría de las organizaciones son de carácter familiar y surgieron con la finalidad de satisfacer necesidades básicas de la familia y no con una visión de desarrollo y competitividad; Por ende estas empresas carecen de planes de crecimiento a mediano y largo plazo, por lo que se puede confirmar que no basan su administración diaria en los procesos de planeación estratégica, lo que no les permite tener diferentes cursos de acción con los cuales puedan definir sus estrategias para hacer frente a la competencia a la que se enfrentan día con día.

Es importante que las empresas realicen un análisis más detallado de sí mismas y de sus competidores, para establecer una estrategia, ya es importante que cuenten con estrategias que les ayuden a ser más competitivas en su entorno. Por tema cultural siguen confiando la administración de su organización a los fundadores quienes se merecen el respeto y admiración dado por su género y edad, es decir la experiencia es la que se sigue imponiendo sobre la planeación estratégica, de esta manera han llevado a cabo la labor de gestión administrativa.

## **RESUMEN**

*Toda universidad cumple su misión social al penetrar en la cultura en que está inmersa, mediante el avance constante del saber en los temas de mayor relevancia y necesidad para cada país. En el marco social del rol formativo de las universidades, la UES ha desarrollado distintas estrategias para atender y fomentar habilidades, hábitos y conductas saludables entre sus estudiantes; Una universidad promotora de la salud es aquella que incorpora el fomento de la salud a su proyecto, con el fin de propiciar el desarrollo humano y mejorar la calidad de vida de quienes allí estudian o trabajan, influyendo así en entornos laborales y sociales. Por lo tanto se realizó un estudio reflexivo en cuanto a los alcances del Programa de Salud Universitaria (PSU) con respecto a los resultados emitidos por el Examen Médico Automatizado (EMA) en los ciclos 2011-2, 2012-2 y 2013-2, determinando que no se cuenta con un seguimiento del estudiante al egresar de la Universidad, de tal manera que se propone realizar una segunda aplicación del EMA o se diseñe un instrumento que mida el grado de impacto de las actividades desarrolladas por el PSU entre los estudiantes próximos a egresar y así contar con datos específicos sobre el resultado de la promoción a la salud que la UES implementa.*

# **STUDIO REFLECTIVE ENVIRONMENT TO THE EXISTING PARTNERSHIP BETWEEN THE UNIVERSITY AND THE HEALTH PROMOTION STATE UNIVERSITY OF SONORA UNIT ACADEMIC BENITO JUAREZ**

## **ABSTRACT**

*All University fulfills its social mission to penetrate the culture in which it is immersed, through continued progress of knowledge in the subjects of greater importance and necessity for each country. Within the social framework of the formative role of the universities, the UES has developed different strategies to meet and foster skills, habits and healthy behaviors among students; A health promoter University is one that incorporates the health promotion project, in order to facilitate the development human and improve the quality of life of those who there studying or working, thus influencing labour and social environments. So it was a reflective study in terms of the scope of the program of Health University (PSU) regarding the results issued by the examination doctor automated (EMA) in 2011-2, 2012-2, 2013-2 cycles, determining that you there is with the student track to graduating from College, in such a way that intends to make a*

*second application of the EMA or be designed an instrument that measures the degree of impact of activities by the PSU coming students to graduation and thus have specific data on the outcome of the health promotion that UES implements.*

## INTRODUCCION

Las instituciones de educación superior hoy en día desarrollan un papel protagónico en la sociedad, las universidades son escenario de formación técnica y profesional de los miembros de la comunidad y a través de la educación, la investigación y la difusión del saber, orientan y apoyan los cambios en diversos espacios nacionales e internacionales. Toda universidad cumple su misión social al penetrar en la cultura en que está inmersa, mediante el avance constante del saber en los temas de mayor relevancia y necesidad para cada país. De esta forma, las instituciones de educación superior buscan comprender los fenómenos y aportar soluciones que enriquezcan y orienten el futuro nacional, regional y mundial. En otras palabras, la existencia misma de una universidad implica su participación en la cultura y en los procesos relevantes de la nación a la que pertenece. (Muñoz, 2008) Las universidades deben aspirar al protagonismo en el cambio cultural mediante la educación de personas más cultas, abiertas, emprendedoras e íntegras, comprometidas con el desarrollo progresivo de la sociedad. Sin embargo, este cambio cultural exige desafíos enormes para las universidades, pues no sólo demanda una formación de excelencia en cada disciplina, sino que requiere el fortalecimiento de conductas y actitudes transversales que adoptará cada egresado convertido en profesional, quien construirá y tomará decisiones al interior de la sociedad. Surge aquí objetivo transversal para la existencia de una universidad, y que se refiere al desarrollo permanente de las capacidades, habilidades y hábitos de sus miembros.

## REVISION DE LITERATURA

La Universidad Estatal de Sonora UES, es una Institución creada en 1983 y desde su fundación ha tenido como objetivo formar recursos humanos profesionales y científicos con una gran visión global con capacidad para incidir en el desarrollo local, nacional e internacional, por medio de sus funciones de docencia, investigación, extensión del conocimiento y difusión de la cultura, por medio de capacitación de excelencia. A la fecha, cuenta con cinco unidades académicas ubicadas en San Luis Rio Colorado, Hermosillo, Navojua, Magdalena Y Benito Juárez; Su misión es contribuir al progreso social del país, atendiendo las prioridades del desarrollo integral del estado de Sonora por medio de sus funciones de docencia, investigación, extensión del conocimiento y difusión de la cultura. Formar a los alumnos con programas dirigidos a lograr un sólido conocimiento disciplinario y práctico de la profesión, así como al fomento de actitudes que fortalezcan la conciencia de nacionalidad, el pensamiento solidario con el bien social y una visión creativa e innovadora.

En el marco social del rol formativo de las universidades, la UES ha desarrollado distintas estrategias para atender y fomentar habilidades, hábitos y conductas saludables entre sus estudiantes; Una universidad promotora de la salud es aquella que incorpora el fomento de la salud a su proyecto, con el fin de propiciar el desarrollo humano y mejorar la calidad de vida de quienes allí estudian o trabajan, influyendo así en entornos laborales y sociales. De esta manera promueve conocimientos, habilidades y destrezas para el propio cuidado y para la implantación de estilos de vida saludables en la comunidad universitaria. (Shepherd, 2002) La promoción de salud en el ámbito escolar constituye un valor agregado al de por sí ya extraordinario valor que tiene la escuela.

La complejidad de un mundo en integración y que enfrenta el nuevo desafío de la era de la información, sumada a la necesidad de complementar a la educación con la enseñanza de habilidades para la vida, lo anterior ha generado un amplio consenso entre los especialistas, los maestros, la familia y la comunidad entorno a la urgencia para fortalecer y transformar la universidad; en este sentido la promoción de la salud juega un papel primordial ya que es un escenario privilegiado para fomentar cambios de estilos de vida en pro de la salud, logrando un conjunto de conductas que refuercen el potencial de salud de cada individuo y de la comunidad escolar en su conjunto, educando en valores y actitudes que propicien mejores respuestas de los sujetos a su ambiente social, cultural y económico, además se hace necesario y esencial proporcionar los medios para que, a lo largo de su vida, la población se prepare para las diferentes etapas de las mismas y afronte las enfermedades y lesiones crónicas y que esto se ha de hacer posible a través de las escuelas, los hogares, los lugares de trabajo y el ámbito comunitario, en el sentido de que exista una participación activa por parte de las comunidades en la consecución de la salud individual y colectiva.

(Meda, 2012) Estos argumentos sustentan la propuesta de la UES en implementar programas de prevención y promoción de la salud universitaria, el principal interés es brindar atención integral que permita disminuir los índices de reprobación y deserción escolar durante su estancia en la institución, con el propósito de contribuir al desarrollo de su vida profesional; uno de las estrategias que la UES ha implementado para atender estos indicadores ha sido El Programa de Salud Universitaria (PSU), el cual brinda servicio médico y psicológico a los estudiantes para atender cualquier problema físico o emocional y contribuir al desarrollo personal y académico a través de una atención integral y de calidad. El PSU tiene como objetivo promover el autocuidado de la salud individual y grupal de los alumnos a través de estrategias y acciones orientadas al desarrollo de competencias sociales, estilos de vida y entornos saludables; se desarrollan diversas actividades para el cuidado y promoción de la salud.

Dentro de las actividades que el PSU realiza dentro de la Universidad se encuentra la promoción y difusión de la salud a través talleres y conferencias, talleres para padres, distribución de trípticos y carteles, consultas de atención médica y psicológica, así como la aplicación del Examen Médico Automatizado (EMA) el cual se realiza con los estudiantes de nuevo ingreso en el transcurso de su primer semestre en la UES. El EMA es un instrumento de valoración integral de la salud que permite identificar enfermedades existentes y de herencia familiar, además de explorar los factores de riesgo y protección que más influyen en la salud integral de los jóvenes estudiantes, proporciona información valiosa de la salud física y mental de los estudiantes universitarios de primer ingreso. Se compone de cuatro cédulas de auto respuesta que integran 105 preguntas que identifican enfermedades existentes y de herencia familiar, también explora los factores de riesgo y de protección que más influyen en la salud. Es una importante herramienta que se utiliza para la apertura del expediente clínico de cada alumno. El análisis e interpretación de los resultados obtenidos del EMA, ayudan a crear distintas estrategias para contribuir en la formación de estudiantes con mayor cultura por el autocuidado de la salud, entre ellas podemos encontrar las siguientes:

*Permite conocer y prevenir posibles padecimientos en los alumnos Identifica y compara el estado de vulnerabilidad de la comunidad estudiantil Permite contar con parámetros de evaluación para la implementación y mejora de programas en materia de atención, promoción, educación y prevención de la salud Proporciona información general sobre el nivel escolar y genero de los alumnos.*

## METODOLOGÍA

### Objetivo

En este trabajo se busca dar a conocer un estudio reflexivo en torno a la necesaria asociación que debe existir entre el ámbito universitario y la promoción de la salud, con el fin de dar seguimiento a las acciones

implementadas por la UES a través del Programa de Salud Universitaria (PSU) con la aplicación del Examen Médico Automatizado (EMA) y contar con líneas de acción que logren medir el impacto de las actividades de promoción a la salud en cada estudiante perteneciente a la Universidad.

*Delimitaciones:* Esta investigación ha tomado como referencia los datos emitidos por el EMA únicamente de una de las cinco unidades académicas de la UES, es decir, la información presentada corresponde a los estudiantes de la unidad académica Benito Juárez y algunas de las limitaciones presentadas son:

La unidad académica Benito Juárez, es la de menor matrícula en la Universidad. La profundidad del estudio está sujeta a la información disponible a partir del año 2011, en el que se realizó la última modificación al EMA, resultando tal como lo utilizamos a la fecha. Del cúmulo de información emitida por el EMA, solo se puede utilizar aquella en la que los resultados puedan tratarse de manera general, respetando el derecho de privacidad que poseen cada estudiante-paciente; es por ello que los datos específicos por estudiante no serán considerados para este proyecto, solo aquellos en los que se describan niveles de vulnerabilidad en términos generales.

*Sujeto:* La presente investigación se realizó con los estudiantes de nuevo ingreso de los ciclos escolares 2011-2, 2012-2 y 2013-2 correspondiente a los Programas Educativos de Lic. Sistemas Computacionales Administrativos, Lic. Entrenamiento Deportivo, Lic. Agronegocios y únicamente en el ciclo 2013-2 se ha incluido la Lic. En Administración de empresas. La edad de los estudiantes oscila entre los 17 y 19 años en promedio.

*Materiales:* Para la realización de este proyecto se ha utilizado el Examen Médico Automatizado, elaborado por la Universidad Autónoma de México UNAM, la UES ha establecido un convenio de colaboración de manera que contrata los servicios de la UNAM para proporcionar las cédulas del examen y su evaluación y procesamiento de los datos. Contiene 105 preguntas concernientes a seis áreas de vulnerabilidad:

Trastornos de la nutrición  
Enfermedades crónicas  
Sustancias adictivas  
Sexualidad y reproducción  
Violencia  
Salud mental

Los resultados que estas áreas de medición arrojan sobre los estudiantes consta de tres aspectos, los cuales son: Marcadores de alta vulnerabilidad, prevalencia de factores de riesgo y prevalencia de factores protectores; para efectos de la presente investigación solo se tomaron en cuenta los marcadores de alta vulnerabilidad, ya que se considera necesario realizar un seguimiento a los estudiantes que se identifiquen dentro de esta categoría siendo considerados como un grupo de alto riesgo.

*Procedimiento:* En cada ciclo escolar, 11-2, 12-2 y 13-2 se realizó una planificación de grupos por Programas educativos, en cada sesión se disponía de dos horas para llenar las cédulas del EMA y a la vez se llevó a cabo revisión visual, odontológica y mediciones antropométricas de cada estudiantes, datos que son indispensables para el llenado completo de las cédulas. El tiempo promedio de aplicación por cada ciclo escolar fue de una semana, incluyendo segundas aplicaciones por grupo para mayor cobertura de estudiantes y revisión de cada cédula corroborando su correcto llenado. Este proceso de aplicación se realiza en el mes de Septiembre y se envían a la Ciudad de México a la UNAM para su procesamiento, en el mes de noviembre, la UNAM entrega a la UES los resultados obtenidos referentes a los niveles de vulnerabilidad y así implementar acciones preventivas y correctivas de promoción a la salud dentro del PSU. Estas

actividades se programan en función de los resultados obtenidos, de tal manera que el Plan General de Actividades del PSU contempla las siguientes actividades.

Tabla 1: Plan General de Actividades del Programa de Salud Universitaria

Metas	Acciones
Desarrollar programas de prevención e intervención en el control de la salud <b>FÍSICA</b> , para beneficio de la comunidad universitaria	Llevar a cabo consultas médicas a los estudiantes que lo requieran durante el semestre. Implementar un programa de promoción del programa de Salud Universitaria entre los estudiantes, a través de visitas a las aulas. Elaboración del periódico mural brindando a los estudiantes información referente en áreas de vulnerabilidad juvenil. Aplicación de la campaña del botiquín escolar entre los estudiantes de la unidad. Realizar mínimo una conferencia al mes sobre las distintas áreas de vulnerabilidad juvenil a fin de orientar a los estudiantes. Elaboración y distribución de trípticos y dípticos en las distintas áreas de vulnerabilidad juvenil. Organizar y llevar a cabo la feria de la salud universitaria Análisis de los resultados del Examen Médico Automatizado (EMA) Aplicación del Examen Médico Automatizado (EMA) a los alumnos de nuevo ingreso
Desarrollar programas de prevención e intervención en el control de la salud <b>EMOCIONAL</b> , para beneficio de la comunidad universitaria	Aplicación de asesorías psicológicas y terapias psicológicas a los alumnos que lo requieran durante el semestre. Implementar un programa de promoción permanente del programa de Salud Universitaria entre los estudiantes, a través de visitas a las aulas. Elaboración del periódico mural brindando a los estudiantes información referente en áreas de vulnerabilidad juvenil. Análisis de los resultados del Examen Médico Automatizado (EMA). Aplicación del Examen Médico Automatizado (EMA) a los alumnos de nuevo ingreso Realizar mínimo una conferencia al mes sobre las distintas áreas de vulnerabilidad juvenil a fin de orientar a los estudiantes. Colaboración en la organización y aplicación de la feria de la salud universitaria

## RESULTADOS

A continuación se muestran en representaciones graficas los resultados obtenidos en la aplicación del Examen Médico Automatizado (EMA) en los ciclos escolares 11-2, 12-2 y 13-2; los cuales muestran los porcentajes de presencia en los marcadores denominados altavulnerabilidad.

Figura 1: Cantidad de Estudiantes Analizados Por Ciclo Escolar

Por cada ciclo escolar la cantidad de estudiantes fue variable debido a la matrícula inscrita en el periodo, cabe mencionar que los datos mostrados no corresponde al dato total de estudiantes que respondieron el EMA, sino a la cantidad de estudiantes analizados, considerando un margen que varía del 5 al 10 % por ciclo escolar.

Figura 2: Prevalencia del Primer Marcador de Alta Vulnerabilidad

*El primer marcador llamado Trastorno de la nutrición se incluyen la Obesidad y la Desnutrición grave; De un total de 138 estudiantes en el ciclo 2011-2, el 10.9 % resultó con obesidad y el 0.7 con desnutrición grave; en el ciclo 2012-2 el 7.8 % con obesidad y el indicador de desnutrición resultó en 0%, así mismo en el ciclo 2013-2 donde el único indicador de este marcador fue de obesidad con un 11.0%.*

Figura 3: Prevalencia del Segundo Marcador de Alta Vulnerabilidad

*En este segundo marcador de enfermedades crónicas, muestra resultados de Hipertensión y Diabetes, los cuales han mostrado en los tres ciclos analizados, una alta vulnerabilidad, arrojando respectivamente en el ciclo 11-2 un 5.1% y 3.6%; en el 12-2, 4.3% y 8.7% y en el ciclo 13-2, un 6.3% y 4.7%*

Figura 4: Prevalencia del Tercer Marcador de Alta Vulnerabilidad

El tercer marcador de alta vulnerabilidad corresponde al uso de sustancias adictivas, en las cuales se incluye Consumo alto de Alcohol, Consumo alto de tabaco, consumo alto de marihuana y consumo de otras drogas ilícitas mayormente usadas por los estudiantes; La grafica muestra cada ciclo escolar en la sustancia indicada; la de mayor indice es el alcohol presentando en el 11-2 un 33.9%; en el periodo 12-2 un 6.4% y en el ciclo 13-2 0.8%.

Figura 5: Prevalencia del Cuarto Marcador del Alta Vulnerabilidad

El marcador de Sexualidad y Reproducción incluye Infecciones de transmisión sexual y embarazos no planeados. De 138 estudiantes en el ciclo 11-2 el 9.4% ha experimentado embarazo no planeado, mientras que en el 12-2 el 11.3% y en el 13-2 el 11.8% se experimentó un aumento en el índice medido del mismo aspecto.

Figura 6: Prevalencia del Quinto Marcador de Alta Vulnerabilidad

*El marcador de violencia se ha dividido en dos aspectos, el índole sexual muestra en el 11-2 un porcentaje de 1.4% de estudiantes que han padecido, sin embargo en el 13-2 son un 3.9% quienes se han visto involucrados en situaciones de este tipo, el aspecto familiar no tuvo registro excepto en el ciclo 13-2 donde un 1.6% ha sufrido violencia familiar.*

Figura 7: Prevalencia del Sexto Marcador de Alta Vulnerabilidad

*En relación al marcador salud mental, trata Bulimia Y anorexia, así como ideación suicida, en los cuales se encontró que en el ciclo 2013-2 es donde más se han presentado casos relacionados a la anorexia y bulimia así como a ideación e intento suicida, 1.6% y 2.4% respectivamente en comparación con los ciclos anteriores donde el porcentaje no llegaba al 1%.*

## CONCLUSIONES

Al haber analizado la información correspondiente a los resultados del EMA y en comparación con las actividades desarrolladas por el PSU en los que se incluyen estrategias orientadas a prevenir y/o corregir

los distintos niveles de alta vulnerabilidad entre los estudiantes, se detectó que no existe un sistema de seguimiento dentro de la UES en el que se pueda determinar el grado de impacto del Programa de Salud Universitaria sobre la conducta y hábitos de los estudiantes. Es decir, se determina el nivel de vulnerabilidad con el que llegan de preparatoria a la Universidad, mas no se conoce si esos niveles han sido modificados después de la intervención del PSU; según la bibliografía revisada, es altamente conveniente que la Universidad establezca medidas y estrategias para medir el impacto directo de estas acciones. De manera que la información obtenida en la presente investigación sirve de antecedente para futuras investigaciones a nivel Estatal (en las cinco Unidades Académicas de la UES) ya que los resultados presentados de alta vulnerabilidad solo corresponden a la Unidad Académica Benito Juárez, sin embargo, es el mismo procedimiento de operación en todas los campus de la Universidad.

Si bien, la UES ha realizado distintas actividades alternas al PSU que han coadyuvado al fortalecimiento de la promoción de la salud, tal ha sido el caso de la obtención de la Certificación como Escuela Segura y Saludable, con la cual se identifica a esta Universidad como una de las Instituciones que más interés han tenido en cuanto a que sus estudiantes y la comunidad universitaria en general posea un nivel óptimo de salud; por lo tanto, se recomienda aplicar en el octavo semestre de cada programa educativo el Examen Médico Automatizado o se construya un nuevo instrumento que reúna las propiedades de validez y confiabilidad que proporcionen datos sobre los cambios que el estudiante ha experimentado en su salud física y/o emocional a través de las acciones desarrolladas por la UES mediante el Programa de Salud Universitaria.

# **POLÍTICAS PÚBLICAS E INCUBADORAS DE EMPRESAS EN MÉXICO: ESTUDIO LONGITUDINAL 1994-2013**

Norma Leticia Vizcarra Vizcarra, Universidad Tecnológica de Tijuana  
Virginia Guadalupe López Torres, Universidad Autónoma de Baja California  
Imelda Yáñez Ruiz, Universidad Tecnológica de Tijuana

## **RESUMEN**

*El presente trabajo muestra el desarrollo de las políticas públicas federales sobre las incubadoras de empresas en México durante el periodo 1994-2013, en particular los apoyos que se les ha dado bajo el esquema administrativo y políticas públicas establecidas por sexenio presidencial. Estudio que se realizó mediante una investigación cualitativa y análisis documental de tipo longitudinal que abarca tres periodos presidenciales concluidos y uno iniciado en diciembre del 2012. El resultado de esta investigación muestra diferentes políticas públicas implementadas por sexenio, determinando el tipo de soporte y lineamientos que regularon su manejo. Se encontró un avance progresivo en el apoyo a proyectos emprendedores, en los que se utiliza a las incubadoras de empresas como estrategia para impulsar el desarrollo de empresas competitivas que generen empleos.*

**PALABRAS CLAVE:** Políticas Públicas, Incubadoras De Empresas, Estudio Longitudinal

## **PUBLIC POLICIES AND BUSINESS INCUBATORS IN MEXICO: LONGITUDINAL STUDY 1994-2013**

## **ABSTRACT**

*This paper presents the development of federal public policy on business incubators in Mexico during the period 1994-2013, in particular the support that has been given under the public administration and political scheme established by every presidential term. This study was conducted by qualitative research and analysis of longitudinal documents covering three concluded presidential administrations and the most recent one starting in December 2012. The result of this research shows different public policies implemented by administration, determining the type of support and guidance that regulated its management. Progressive advancement in supporting entrepreneurial projects, in which the incubators used as a strategy to promote the development of competitive enterprises that generate jobs found.*

**JEL:** 012, 021, M11, M13

**KEYWORDS:** Public Policy, Business Incubators, Longitudinal Study

## **INTRODUCCIÓN**

El presente trabajo forma parte de una tesis doctoral y tiene como finalidad el dar a conocer el papel de las políticas públicas en el desarrollo del sistema de incubación empresarial en México. La tesis lleva por nombre: Modelo de Transferencia Tecnológica y de Conocimiento para Impulsar la Productividad de las Incubadoras de las Universidades Tecnológicas de México, 2011-2012. Hablar de la situación económica de un país conlleva a identificar diferentes factores que afectan su desarrollo y crecimiento. Un eslabón determinante en el progreso son las Micro, Pequeñas y medianas empresas (MIPYME) que de acuerdo a

INEGI (2011) forman más del 90% de las unidades económicas a nivel internacional y en América Latina de un 95 a 99%. Mientras que en México, de acuerdo a obra citada, aproximadamente 98% de empresas conformadas por los sectores de manufactura, comercio y servicios (que son el 98.4% del total de unidades económicas) genera más del 74% de empleos. De acuerdo a lo anterior, la Comisión Europea (2006), destaca como principal segmento a las microempresas, con una representatividad del 99% de todas las unidades económicas dentro de la Unión Europea (UE).

Mientras que en México, durante los últimos años, se habla de más de 200,000 empresas que inician operaciones anualmente en el ámbito productivo, teniendo como referencia un universo de 4.1 millones de empresas de las cuales: 95.6% se clasifican como microempresas, 3.4% son pequeñas, 0.8% medianas y únicamente el 0.2% grandes. Sin embargo, se presenta como un dato con mayor relevancia a la apertura de estas, la falta de permanencia en el mercado. Lo anterior, debido a que el 65% de las PYME desaparece antes de dos años, un 50% cierra en el primero, 30% en el segundo y solo el 10% subsiste al decimo año (Nájar, 2011). Con base a los puntos tratados, se argumenta el diseño y seguimiento de estrategias que permitan impulsar y fortalecer los emprendimientos. Siendo el propósito de este trabajo, el análisis de las políticas públicas relacionadas con la incubación de empresas, como una alternativa para prever el cierre de MIPYMES y solventar algunas de las deficiencias antes señaladas. Basando esto en que las incubadoras de empresas se forman con la finalidad de orientar y dar acompañamiento a emprendedores en la realización de su plan de negocios y proceso de creación de su empresa, mediante consultoría en las diversas áreas necesarias para incursionar en el ámbito productivo, contribuyendo a su permanencia y competitividad en el mercado (SNIE, 2011).

Para realizar el presente estudio, se dividió en siete apartados, a saber: Resumen, Introducción, Método, Desarrollo, Resultados, Conclusiones y Referencias. La parte de Desarrollo fue estructurada en seis secciones. En la primera se incluyeron generalidades que facilitarían la comprensión del tema a tratar. De la segunda a la quinta se identifican las normas y políticas implementadas para impulsar, apoyar y regular la incubación de empresas en México durante los cuatro periodos presidenciales comprendidos entre 1994 y 2013. La sexta, muestra un comparativo de los cuatro sexenios analizados, incluyendo algunos elementos políticos que diferencian un proceso del otro. Para finalizar se emiten conclusiones.

## REVISIÓN LITERARIA

Con el fin de normar criterios sobre uno de los términos más importantes dentro de este trabajo, se consideró pertinente conocer los razonamientos utilizados respecto a la denominación de la Pequeña y Mediana Empresa (PYME) y MYPIME. Al respecto INEGI (2011) menciona que, la Unión Europea (UE) y la Organización para la Cooperación y Desarrollo Económico (OCDE) reconocen dos criterios para clasificar a las empresas, dentro de algunas de estas categorías: para fines administrativos o legales, clasificándolas de acuerdo al personal ocupado, ventas y balance anual y para fines estadísticos únicamente se considera el número de empleados. En cuanto a las siglas utilizadas para referirse, a este sector de empresas, se observaron diversas investigaciones de tipo internacional, como análisis de la OCDE en el que se refieren a las PYMES incluyendo a las Microempresas dentro de este término (Palomo, 2005). La participación de la PYME a nivel mundial, según CEPAL (2010), ocupa un lugar prioritario en el progreso nacional, debido a la representatividad que tienen en cuanto a unidades económicas de cada país y generación de empleos. Se observan resultados de investigaciones a nivel internacional en las que se percibe que en Estados Unidos (EE.UU) y en la UE el 95% de empresas son PYME y generan el 75% de empleos. Mientras que en América Latina este sector empresarial tiene una participación entre un 60 y 90% según INEGI (2011) y contribuyen con un 35 a 40% en la generación de empleo de acuerdo al Sistema Económico Latinoamericano y del Caribe, SELA (2009 en CEPAL, 2010). Se puede apreciar también que en el 2008 el 98% de unidades económicas son MIPYME estrato a quienes corresponde el 75.1% del personal ocupado y solo el 24.9% a las grandes empresas (INEGI, 2011).

En base a los puntos anteriores, el apoyo a las PYME, debería ser una de las prioridades a considerar en toda administración pública dentro de sus planes, políticas y programas para impulsar el desarrollo económico. A la vez, las incubadoras de empresas son una estrategia de soporte y fortalecimiento para los proyectos emprendedores, orientados en el caso de México, a crear empresas que generen empleos, más que al apoyo de emprendimientos de mediana y alta tecnología (OCDE, 2012).

Los elementos que de acuerdo a CEPAL (2010, p.19-24) han caracterizado diferentes etapas en las políticas públicas de América Latina son: a) acciones aisladas no definidas en un marco estratégico durante los 70's y parte de los 90's, excepto en Chile. b) diseño de políticas de apoyo a las PYME como estrategia para generar empleos, desarrollar empresas y crear firmas a mediados de los 90' así como, c) inclusión de planes estratégicos de apoyo, vinculación y operatividad a partir del 2000. Aunque se describe una gran dependencia de la política macroeconómica antes de los 90's, en décadas posteriores se dio más importancia al fomento empresarial y políticas de competitividad en relación a las PYME. De acuerdo con Morales, (1998) en el caso de México, se desaprovecharon grandes oportunidades debido a la falta de planes y políticas acordes a las necesidades prioritarias de los diferentes sectores. Enfatizando este autor, sobre la importancia que tiene el invertir en tecnología que favorezca el desarrollo productivo nacional y fortalezca las relaciones comerciales internacionales.

## MÉTODO

El presente estudio se desarrolló en base a una investigación cualitativa y análisis documental de tipo longitudinal que abarcó tres sexenios presidenciales concluidos y uno iniciado en diciembre del 2012. Con el propósito de identificar el proceso político que ha dado soporte a las incubadoras de empresas, se analizaron los Planes Nacionales de Desarrollo (PND). A la vez se dio seguimiento a la ejecución de los apartados que incluían: políticas de apoyo a las incubadoras de empresas, factores de impulso a la transferencia de conocimiento y tecnología, iniciativas de promoción a proyectos emprendedores y estrategias para el desarrollo y consolidación de las PYME. Esto, mediante alineación del PND con informes presidenciales y de la Secretaria de Economía (SE), así como información publicada por el Instituto Nacional de Estadística y Geografía (INEGI). Bajo el mismo contexto, se revisaron artículos relacionados con políticas públicas de México y de otros países.

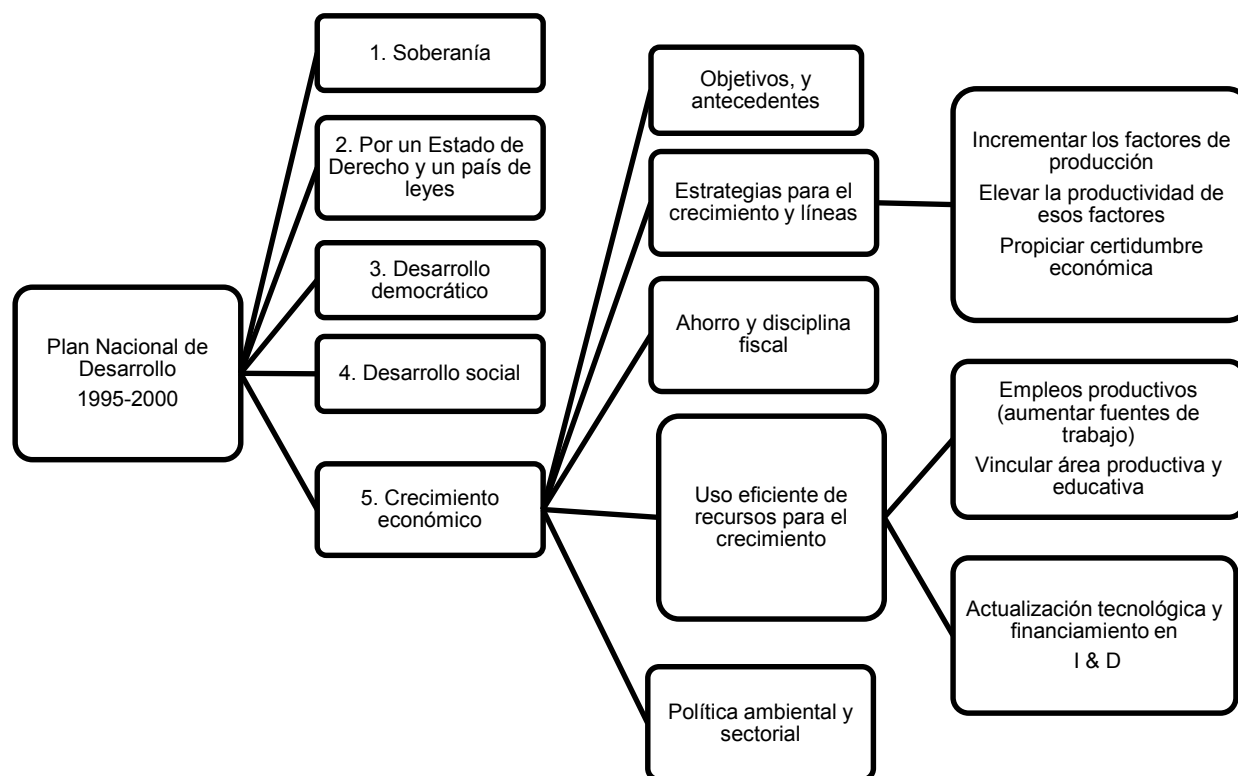

## DESARROLLO

Al considerar lo anterior y con el propósito de conocer el apoyo que han tenido las incubadoras en México, fue necesario dar seguimiento a la estructura política que dio origen a un sistema regulatorio de promoción e impulso para este sector. La presente sección, se ha estructurado en cuatro sexenios gubernamentales, mediante un estudio longitudinal que abarca el periodo 1994-2013. Dentro de este lapso de tiempo, se identificaron desde normas y políticas regulatorias implementadas para impulsar la tecnología e investigación, hasta estructuras organizacionales que adaptan el sistema de incubación a las necesidades primordiales de las regiones. De esta forma, se delimitan las líneas de apoyo en base a rubros e indicadores de productividad y eficiencia determinados en los cuatro periodos analizados.

### Periodo Gubernamental 1994-2000 (Ernesto Zedillo Ponce de León)

Para iniciar el estudio de las políticas implementadas durante este periodo gubernamental, se llevó a cabo el análisis del PND 1995-2000, realizado por el Ejecutivo Federal, en el que proponían cinco objetivos fundamentales, de los cuales se desprendían los planes estratégicos, tácticos y operativos. En el objetivo cinco, denominado Crecimiento Económico, se determinan metas relacionadas con la atención de necesidades que son solventadas por las incubadoras de empresas, ver figura 1.

Figura 1: Plan Nacional de Desarrollo (PND) 1995-2000

La figura ilustra el marco conceptual de los puntos que el plan de desarrollo del sexenio 1995-2000 cubrió respecto a las incubadoras de empresas. Fuente: Elaboración propia con base en el PND 1995-2000, (Pder Ejecutivo Federal, 1995)

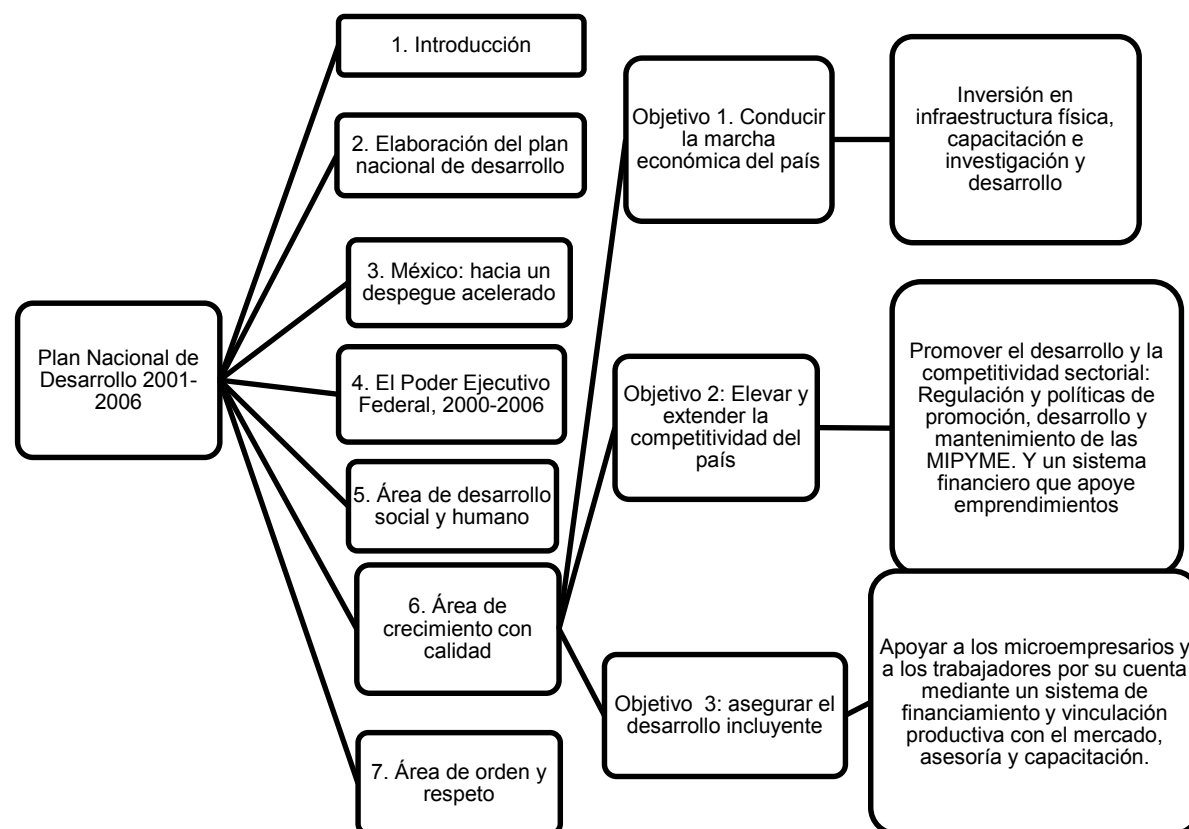

Al analizar las políticas públicas de este periodo, es un tema obligado la crisis económica ocurrida entre 1994 y 1995. Esta condición, según Avalos y Hernández (2006), provocó un endeudamiento significativo a corto plazo, lo que originó la definición de estrategias encaminadas a resolver esta situación. Las consecuencias de esta situación, determinó las prioridades desviando la atención que requería el sector de las PYME y el apoyo a la creación de incubadoras de empresas, como estrategia de impulso para este sector. El PND, elaborado por esta administración, presenta como estrategias dentro del objetivo de crecimiento económico: propiciar el incremento de factores productivos buscando el aprovechamiento de los recursos y creando un ambiente de certidumbre. Aun así, están enfocados a cubrir necesidades que se relacionan con el desarrollo empresarial. El objetivo descrito, lleva un apartado que proponía aumentar la eficiencia de los recursos que apoyen el desarrollo. En esta parte, se describe la intención de aumentar las fuentes de trabajo y vincular el área productiva y educativa con el fin de generar profesionistas pertinentes al campo laboral. Se contemplaba también el destinar fondos para investigación y desarrollo (I&D) y actualización tecnológica. No se identificaban aún programas ni políticas de regulación o apoyo para las incubadoras de empresas, aunque se reconocía la importancia de vincular la educación con el sector productivo.

#### Periodo Gubernamental 2000-2006 (Vicente Fox Quezada)

Con el fin de conocer las iniciativas desarrolladas en este sexenio, se analizó el PND 2001-2006 identificándose objetivos y programas encaminados a promover y apoyar la incubación de empresas en México. El presente plan está fundamentado en cuatro procesos de transición: demográfica, social,

económica y política. Identificando antecedentes y factores que involucran la situación actual de los cuales se desprende la detección de oportunidades, objetivos y estrategias (ver figura 2).

Figura 2: Plan Nacional de Desarrollo 2001-2006

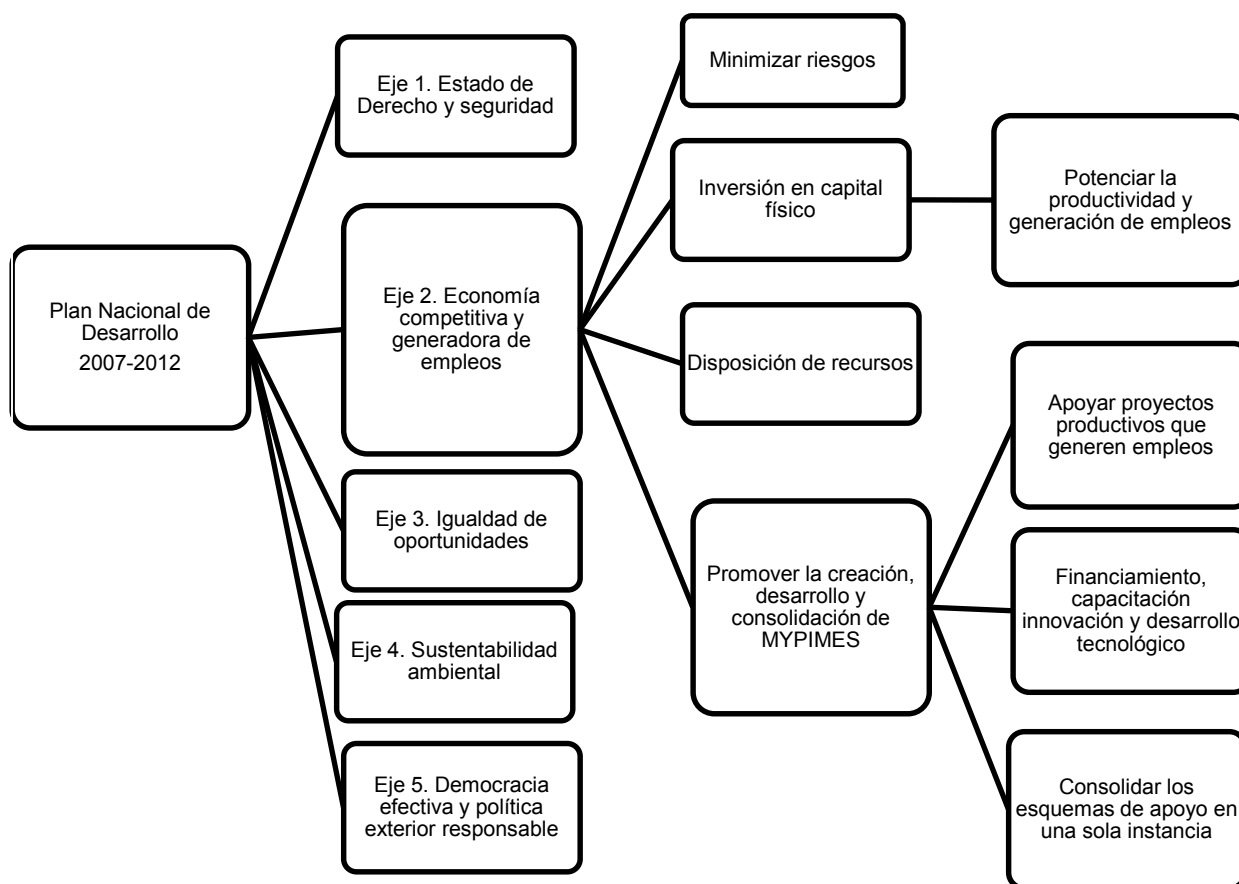

Fuente: Elaboración propia, con base en el PND (Poder Ejecutivo Federal, 2001). La figura muestra el marco conceptual de los puntos que el plan de desarrollo del sexenio 2001-2006 cubrió respecto al tema de las incubadoras de empresas.

El documento en cuestión, es presentado mediante una estructura que consta de siete apartados, siendo estos: 1. Introducción, 2. Elaboración del plan nacional de desarrollo, 3. México: hacia un despegue acelerado, 4. El Poder Ejecutivo Federal, 2000-2006, 5. Área de desarrollo social y humano, 6. Área de crecimiento con calidad y 7. Área de orden y respeto. Se identifica un apartado que involucra dos incisos relacionados con la incubación de empresas y aunque no se menciona como tal, se describen los elementos que la conforman. Siendo estos: el tres en su sección: Transición económica y el seis dentro de sus objetivos rectores: 1. Conducir responsablemente la marcha económica del país 2. Elevar y extender la competitividad del país y 3. Asegurar el desarrollo incluyente. El PND 2001-2006 denota una marcada tendencia al involucramiento del estado en el proceso de desarrollo y permanencia de empresas, mencionando en dos de los objetivos rectores presentados dentro del apartado seis (objetivos dos y tres) diversas estrategias para proteger y apoyar emprendimientos y MIPYMES.

### Periodo Gubernamental 2006-2012 (Felipe Calderón Hinojosa)

Durante este sexenio se identificaron programas, políticas gubernamentales y acciones de promoción para el proceso de incubación de empresas, así como el seguimiento a programas y mecanismo de financiamiento creados para impulsar la tecnología. Tal es el caso de la primera Ley de Ciencia y Tecnología desarrollada con el fin de regular los apoyos del Gobierno Federal para impulsar la investigación científica y tecnológica. Lo trascendental fue convertir esta iniciativa en una política que vinculara las actividades de investigación con la resolución de problemas nacionales que impacten la competitividad. Estos lineamientos fueron reformados en el PND 2008-2012 incorporando a la innovación como eje rector, mediante un marco jurídico que proteja la propiedad intelectual del investigador (COCITBC, 2011). Se promovió el desarrollo de incubadoras de empresas con el fin de impulsar la economía nacional, ya que el crecimiento del país había sido insuficiente en los últimos años para combatir el rezago financiero y el impacto social que esto implica, situación que el Poder Ejecutivo Federal (2007) contempla en el PND 2007-2012, el cual incluye en el Eje 2. “Economía competitiva y generadora de empleos”, acciones para mejorar la calidad de vida de los mexicanos mediante el crecimiento sostenido y generación de empleos formales. Para dicho fin se determinó la inversión en capital físico que ayude a minimizar riesgos en nuevos proyectos y facilite los recursos para su realización (ver figura 3).

Figura 3: Plan Nacional de Desarrollo 2007-2012

Fuente: Elaboración propia, con base en el PND (Poder Ejecutivo Federal, 2006). La figura ilustra el marco conceptual de los puntos que el plan de desarrollo del sexenio 2007-2012 cubrió respecto a las incubadoras de empresas.

Con base en lo anterior, el Poder Ejecutivo Federal (2007) describe como estrategia para potenciar la productividad y competitividad el impulsar procesos de investigación científica e innovación tecnológica, enfocado esto a la promoción de proyectos productivos de emprendedores y MIPYMES en crecimiento, consolidando así los esquemas de apoyo en una sola instancia quien se encarga de distribuir y controlar los recursos en programas como el de incubadoras de empresas.

Con base en lo mencionado, en México se creó un Sistema Nacional de Incubadoras de Empresa (SNIE) dependiente de la Secretaría de Economía (SE), la cual regula y controla el apoyo y buen funcionamiento de las incubadoras. Para integrarse a dicho sistema se requiere contar con un modelo de incubación reconocido, en la actualidad se tienen cinco modelos de incubación tradicional, seis de tecnología intermedia y tres de alta tecnología.

El sector conformado por las Incubadoras de Empresas, de acuerdo al SNIE (2011) atiende a todos los emprendedores que estén interesados en llevar a cabo una idea de negocio, apoyando a las micro y pequeñas empresas en la definición y formalización de su modelo de negocio. Se considera como función principal ayudar a preparar un plan de negocio y dar acompañamiento en el proceso de creación de la nueva empresa mediante consultoría en mercadotecnia, contabilidad, diseño industrial, entre otros, ofreciendo en algunos casos espacios físicos para facilitar el emprendimiento. Con base en lo expuesto y retomando los puntos del Plan de Desarrollo y programas de apoyo creados, se visualiza un enfoque de protección a emprendimientos de pequeñas y medianas empresas que tiene la finalidad de generar nuevas fuentes de trabajo e incentivar la economía. Cabe mencionar la trascendental función del fondo PYME y su programa de apoyo para incubadoras de empresas, mediante el cual se otorga diferentes tipos de asesoría y servicios integrales para que inicien su negocio, También el Capital Semilla es un programa del Fondo PYME que ofrece apoyo financiero a proyectos para la formación e impulso de nuevos negocios graduados de incubadoras registradas en el SNIE (Fondo PYME, 2012).

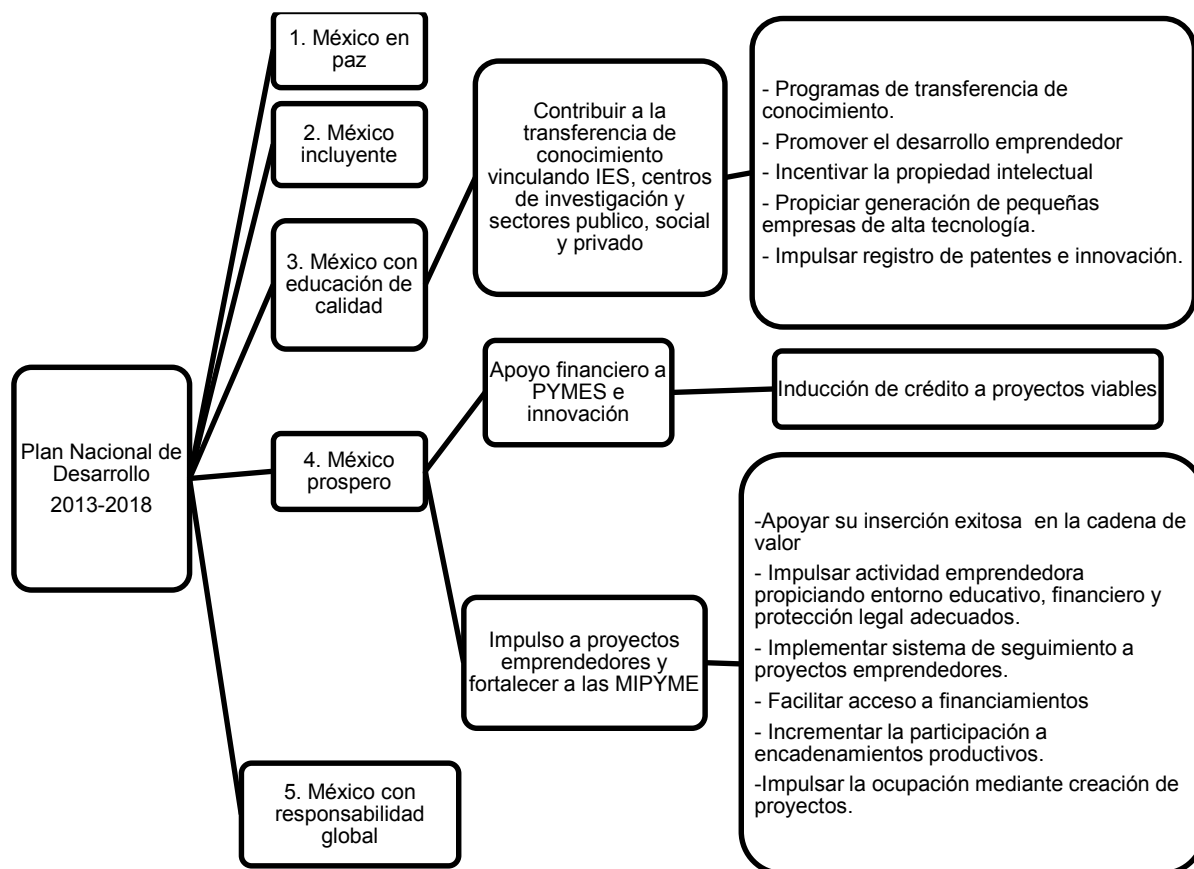

Posteriormente durante marzo de 2011, dio inicio el Programa de Financiamiento a Emprendedores, el cual ha incentivado el otorgamiento de créditos por parte de la banca comercial respaldados con garantías del Fideicomiso México Emprende. Este programa se ha caracterizado por ofrecer un producto de crédito homogéneo en condiciones muy competitivas para el emprendedor. Otro programa de gran ayuda para las PYME que funcionó durante el periodo de julio de 2009 a mayo de 2012, fue el Programa de Compras del Gobierno (Secretaría de Economía, 2012).

#### Periodo Gubernamental 2012-2018 (Enrique Peña Nieto)

El estudio correspondiente a este periodo gubernamental se inicia mediante el análisis del PND elaborado por la administración del gobierno federal 2012-2018; representando el primer documento de trabajo que rige la programación y presupuesto de la Administración Pública Federal. La estructura de este plan se conforma de ocho capítulos. De acuerdo con los objetivos y estrategias incluidos dentro del PND 2013-2018 (ver figura 5) se aprecian dos apartados en los que se contempla dar seguimiento e impulsar el trabajo realizado por las incubadoras de empresas. Siendo uno de ellos el objetivo de “México con educación de calidad”, en donde se propone el impulso a la transferencia de conocimiento mediante la vinculación de las Instituciones de Educación Superior (IES). En dicho objetivo, los cinco primeros capítulos corresponden a las metas nacionales (uno por cada meta). Describen los retos por sector y propone un plan de acción de acuerdo a cada objetivo. El capítulo sexto presenta las estrategias a desarrollar de acuerdo con las metas. El séptimo describe los indicadores que valoran su cumplimiento; y el octavo otorga instrucciones sobre el seguimiento de los diferentes programas con centros de investigación y los sectores: público, social y privado. Esto se pretende realizar en base a programas de transferencia y fomento a la cultura emprendedora así como el impulso a la propiedad intelectual, patentes e innovación. Promoviendo a la vez la creación de nuevas empresas de alta tecnología.

El segundo objetivo relacionado con el proceso de incubación de empresas es el de “México Prospero” incluye el apoyo financiero a PYMES mediante la inducción de crédito y el impulso de iniciativas emprendedoras que generen empleos. Facilitando la incursión de estas a encadenamientos productivos, financiamientos accesibles y políticas que propicien y respalden su desarrollo y fortalecimiento. Con el fin de cumplir con los objetivos trazados en el desarrollo de este plan, el 14 de enero del 2013, se crea el Instituto Nacional del Emprendedor (INADEM). El 28 de febrero se publican las reglas de operación del Fondo PYME y del 14 al 20 de marzo se realizan los talleres informativos a cargo del INADEM. Siendo este, un órgano administrativo desconcentrado de la Secretaría de Economía (SE), que tiene como objetivo instrumentar, ejecutar y coordinar la política nacional de apoyo incluyente a emprendedores y a las micro, pequeñas y medianas empresas, impulsando su innovación, competitividad y proyección en los mercados nacional e internacional para aumentar su contribución al desarrollo económico y bienestar social, así como coadyuvar al desarrollo de políticas que fomenten la cultura y productividad empresarial (INADEM, 2013).

Figura 5, Plan Nacional de Desarrollo 2013-2018

Fuente: Elaboración propia, en base al PND (Ejecutivo Federal, 2013). La figura ilustra el marco conceptual de los puntos que el plan de desarrollo del sexenio 2007-2012 cubrió respecto a las incubadoras de empresas.

Esto modifica la forma de clasificar a las incubadoras y el proceso de apoyo, anteriormente eran: tradicionales, de tecnología intermedia y de Alta tecnología. Hoy se clasifican como: básicas y de alto impacto, dando la categoría de incubadora en transición cuando aun no se reúnen los requisitos impuestos

por el INADEM. Los programas de apoyo actuales que están relacionados con la incubación de empresas son: Instituto Nacional de Emprendedor, Fondo PYME, y Programa Nacional de Financiamiento al Microempresario (PRONAFIM).

## CONCLUSIÓN

Con base a lo descrito, se puede señalar la presencia de un proceso ascendente de concientización en el diseño de políticas públicas que apoyen el fortalecimiento de las MIPYME y den impulso a los proyectos emprendedores canalizados a través de incubadoras de empresas. El desarrollo de programas identificados en dicho sentido, consideran la incubación como una estrategia encaminada a ofrecer soporte que permita la permanencia y competitividad de empresas generadoras de empleos. La forma en que se regula y apoya el desarrollo empresarial, así como las tácticas que respaldan estrategias para fomentar y fortalecer proyectos emprendedores que reactiven la economía del país, lleva a vincular los diferentes entes que fortalecen este proceso. Las IES y centros de investigación son organismos que ofrecen áreas propicias para la creación de conocimiento y procesos tecnológicos, por lo que, en el siguiente inciso se trata el tema de la transferencia de conocimiento y sus antecedentes.

# RELACIÓN ENTRE EL AUGE DE LOS MICROCRÉDITOS FINANCIEROS Y EL ALIVIO DE LA POBREZA EN EL ESCENARIO LATINOAMERICANO

Mario Luis Perossa, Universidad Maimónides  
Alejandra Elena Marinaro, Universidad Maimónides

## RESUMEN

*El propósito de este trabajo es analizar la relación existente entre el crecimiento de los microcréditos para la producción como herramienta de inclusión social de sectores desprotegidos y la relación existente con la disminución de los índices de indigencia y pobreza de los países latinoamericanos para el período 2008-2011. La hipótesis de trabajo a contrastar es que el aumento de los microcréditos redundará en mejoras tangibles para la sociedad a través del correcto apalancamiento de los pequeños trabajadores, cuyos ingresos son destinados casi por completo al consumo y la inversión, por lo cual el multiplicador de esta pequeña economía es muy importante.*

**PALABRAS CLAVE:** Microfinanzas, Inclusión, Microcréditos, Indigencia, Pobreza

## RELATIONSHIP BETWEEN THE RISE OF MICRO CREDIT AND FINANCIAL RELIEF OF POVERTY IN LATIN AMERICA

## ABSTRACT

*The purpose of this paper is to analyze the relationship between the growth of microcredit as a tool for the production of social inclusion of vulnerable sectors and the relationship with decreased rates of homelessness and poverty in Latin American countries for the period 2008 - 2011. The working hypothesis to be tested is that the rise of microcredit results in tangible improvements to society through the proper leverage of young workers, whose incomes are destined almost entirely for consumption and investment, so the multiplier in small economy is very important.*

**J.E.L:** D13, G21, G23, O17

**KEY WORDS:** Microfinance, Inclusion, Microcredit, Poverty

## INTRODUCCIÓN

En todos los países y sociedades de cualquier época, han existido prestamistas que se han encargado de prestar a aquellos sectores de la población que no tienen acceso al crédito comercial, abusando de la necesidad del prójimo y haciendo uso de su situación dominante ante la necesidad del prestatario, aún habida cuenta que este sector cuenta con los índices más elevados de devolución de préstamos. Siguiendo a Littlefield y Rosenberg (2004, p. 38) el microfinanciamiento ha sido más estable que la banca comercial. La crisis de 1997, por ejemplo, golpeó las carteras de los bancos comerciales indonesios, pero el reembolso de los préstamos de los 26 millones de microcréditos del *Bank Rakyat Indonesia* apenas se redujo. Durante el período 1976/2006, el *Grameen Bank* concedió 5.400 millones de dólares en micropréstamos con una tasa de devolución del 98,3%, compuesto por 5,89 millones de prestatarios de los cuales el 96% han sido mujeres (Cajamar, s/d, p. 7). En Sudamérica, en la última década ha aumentado la cantidad de Instituciones Micro Financieras (IMF) lo que originó un aumento en el volumen de negocios global con incrementos en la cantidad de préstamos otorgados y un incremento en el promedio del monto de los préstamos. Así mismo,

es observable una disminución de los niveles de pobreza en los países que utilizan mas intensamente este tipo de modalidad de microcrédito. El objetivo del presente trabajo es observar si existe una correlación positiva entre el aumento del microcrédito y el mejoramiento de los indicadores de pobreza, por lo tanto la hipótesis es que cuando aumentan los servicios microfinancieros, los sectores más desprotegidos pueden apalancarse y de esta manera reducir la pobreza. Los principales motivos de la exclusión financiera de este grupo de personas, son:

Los pobres no tienen patrimonio.

Los pobres no cuentan con quien avale sus préstamos.

Los pobres no planifican.

Los préstamos de pequeño monto no resultan rentables a los bancos comerciales.

La creencia que los pobres no devuelven los préstamos.

Los pobres no tienen capacidad de ahorro.

Gutierrez Nieto (2000) opina que los objetivos más importantes del microcrédito es la lucha contra la pobreza. Según Karim y Osada (1998), citado por Gutiérrez Nieto (2000) las políticas de desarrollo de arriba-abajo tienen pocas posibilidades de llegar al estrato más pobre de la sociedad, al menos en el corto plazo, y resulta más efectivo el enfoque de abajo-arriba, apoyando directamente a los excluidos a través del microcrédito. No se debe definir como microfinanzas a cualquier prestación de servicios financieros cuyo foco sea la población de bajos ingresos, ya que la definición de microfinanzas para este trabajo queda reservada a aquella prestación de servicios microfinancieros que se apoyan en el uso de tecnologías innovadoras, haciendo posible la expansión de estos servicios en circunstancias donde, sin la innovación, no hubiera sido posible ofrecerlos de una manera rentable y sostenible.

En términos generales, se interpreta como microfinanzas la oferta de una o más prestación de toda una gama de servicios financieros proporcionados mediante la aplicación de tecnologías innovadoras de crédito y de prestación de otros servicios, en circunstancias en las que, con las tecnologías bancarias tradicionales, esta prestación no se podría hacer rentable o sosteniblemente; por lo tanto, las microfinanzas se definen como la prestación de servicios financieros a clientes de bajos ingresos incluyendo a los autoempleados. Son mecanismos innovadores de crédito y facilidades de ahorro destinados a aquella porción de la población excluida del sector financiero formal. Entonces es posible pensar el microcrédito como un instrumento -no el único- de lucha contra la pobreza, susceptible de ser utilizado desde distintas perspectivas que conducirán, lógicamente, a distintos resultados según sea la perspectiva que elijamos (Padilla y Ulloa, 2008).

En opinión de Lacalle, existen cinco grupos de microcréditos que abarcan todos los ámbitos de actuación en los que los microcréditos se han desarrollado con mejor o peor fortuna, donde cada uno de ellos implica una metodología particular. Esto es, una estrategia operativa y de gestión propia para cada grupo. Esta clasificación permite además, que cada actor microfinanciero pueda operar de acuerdo a sus intereses, ya sean económicos o vocacionales, sin generar más confusión (Lacalle et al, 2010). Los cinco grupos son:

Microcréditos contra la pobreza extrema (personas que viven con menos de un dólar al día).

Microcréditos para el desarrollo (personas pobres pero con sus necesidades básicas cubiertas).

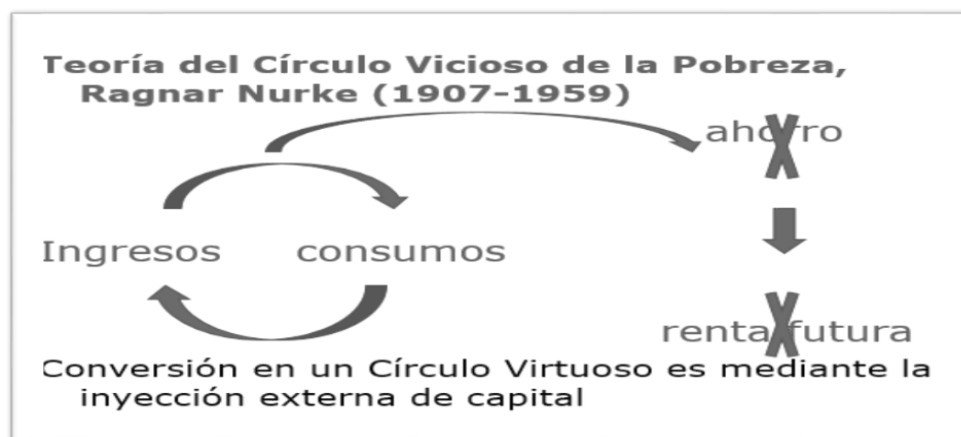

Microcréditos para la inclusión (personas excluidas y marginadas; no necesariamente pobres).

Microcréditos para emprender (personas con una idea de microactividad económica y que actualmente ya están recibiendo ingresos; o por trabajo o por subsidio. Normalmente actividad económica secundaria e informal).

Microcréditos para el empleo (personas muy emprendedoras que quieren poner en marcha un negocio formal con aspiración de crecer y generar empleo).

Los microcréditos surgen para sacar del círculo vicioso de la pobreza a millones de personas muy pobres. La Teoría del Círculo Vicioso de la Pobreza, enunciada por el economista Ragnar Nurke (1907-1959), viene a afirmar que las personas más pobres están sumidas en un camino sin salida –en un círculo vicioso–. En el gráfico N° 1 es posible observar la teoría del círculo vicioso. Según Nurke, los pobres destinan sus pequeños ingresos enteramente al consumo, por lo que no tienen ninguna capacidad de ahorro ni de inversión, lo que a su vez limita las posibilidades de incrementar su renta futura. La única forma de romper este esquema de pobreza y convertirlo en un Círculo Virtuoso es mediante la inyección externa de capital (Lacalle et al, 2010).

Figura N° 1: el Círculo Vicioso de la Pobreza

*Fuente: elaboración de los autores. El economista Ragnar Nurke enunció en su teoría sobre el círculo vicioso de la pobreza, que ésta no puede erradicarse sin inyección de fondos adicionales, ya que los pobres no tienen capacidad de ahorro y por lo tanto no pueden incrementar su renta futura, ya que todos los ingresos deben volcarlos al consumo para manutención. La transformación del círculo vicioso en un círculo virtuoso, según Nurke, es a través de la inyección externa de capital, que posibilitaría el apalancamiento del ahorro por préstamos externos reembolsables.*

Muchas regiones del planeta aún continúan en la trampa del círculo vicioso de la pobreza y el subdesarrollo: las condiciones sociales, económicas y políticas impiden su expansión cultural y económica. De esta manera, pensando el problema de la exclusión desde una perspectiva distinta a la que se reduce a la pérdida de ingresos, es posible enriquecer el análisis del problema y, por consiguiente, las acciones necesarias para enfrentarlo. Así, se puede observar como los efectos de la exclusión -originada en los problemas en el mercado de trabajo- pueden llevar a un proceso de desafiliación en tanto ruptura de vínculos relacionales. O, en un sentido aún más amplio, se puede entender la exclusión como una desigualdad en muchas dimensiones (aunque la exclusión del mercado de trabajo suele tener un efecto múltiple sobre las otras esferas): económica, social, política y cultural, entre otras. De este modo, una óptima utilización de los microcréditos será aquella que permita enfrentar la exclusión sin reducirla en su complejidad (Arnaiz, 2010). Debido a que las microfinanzas se orientan a los sectores de menores ingresos de la población –los más pobres de los pobres–, los autores interpretan que debe existir una correlación positiva entre el aumento de los microcréditos y la mejora en la calidad de vida (disminución de la pobreza). En consecuencia, un aumento de la cantidad de IMF, el crecimiento del número de préstamos y el mayor monto promedio por crédito otorgado, debe contribuir a la mejora de la calidad de vida de los prestatarios y su aumento en los ingresos. Siguiendo la teoría desarrollada por Nurke, de la disminución de la pobreza debido a la inyección externa de capital.

La idea que subyace es que el mayor apalancamiento conseguido por los préstamos otorgados para pequeñas producciones y servicios permite aumentar la corriente de beneficios, logrando de esta manera un mayor consumo en bienes y servicios que les permita –en un tiempo razonable– salir de su situación de pobreza.

Debe tenerse presente que el análisis no contempla las acciones desarrolladas por los estados para combatir la pobreza extrema, a través de planes de emergencia y subsidios, los cuales habitualmente se direccionan en el consumo para la satisfacción de necesidades mínimas – subsidios ó créditos de subsistencia-, que no logran crear un crecimiento sostenible de los ingresos, perpetuando las condiciones socioeconómicas de marginalidad de estos sectores. El análisis de correlación realizado muestra la disminución de la pobreza para el grupo de los países analizados corregido por la incidencia de cada país de acuerdo a la cartera de créditos concedidos, por un lado, y el mismo índice corregido por el volumen total de préstamos concedidos. De esta forma también es posible observar si el mayor beneficio se obtiene vía aumento de los montos otorgado y por el incremento de la cantidad de préstamos.

El resultado positivo de la correlación entre las variables aumento nivel de vida (disminución de la pobreza) y profundización de las microfinanzas, en cualquiera de las dos dimensiones tratadas, indican el carácter beneficioso para las clases humildes el uso intenso y correcto de esta herramienta, el análisis no solo permite corroborar la hipótesis planteada originalmente sino también confirmar la teoría enunciada por Ragnar Nurkse, quien explica que el círculo vicioso de la pobreza es posible transformarlo en un círculo virtuoso mediante la inyección de capital externo. Una mayor correlación entre el índice de la pobreza y la cantidad de créditos otorgados, explica que es mas beneficioso llegar a mas personas que aumentar significativamente el monto unitario de los préstamos.

La primera conclusión a la que arriban los autores se relaciona con la consistencia de la teoría de Nurkse, quien afirmaba que es necesario el auxilio externo para poder franquear situaciones de pobreza, lo cual pudo confirmarse mediante el análisis de los datos brindados por el BM y Microfinanzas 100. Otro resultado hallado fue que es mas importante la cantidad de préstamos que el monto entregado, aunque este trabajo no se orientó hacia el monto de los préstamos, pero esta es una conclusión consistente con los resultados encontrados. Por otra parte, los autores opinan que los microcréditos en particular y las microfinanzas en general son la herramienta adecuada para brindar a los sectores marginados de la sociedad la posibilidad real de aumentar sus ingresos, lo cual asociado a una mejor nutrición, una mayor educación y experiencia y la posibilidad de realización, crean las condiciones necesarias para lograr la movilidad social y la plena integración de sus integrantes a la sociedad.

## **RESUMEN**

*De acuerdo a la política pública establecida en el Plan Nacional de Desarrollo (PND), el Plan Estatal de Desarrollo (PED) y los Planes Municipales de Desarrollo (PMD) o llamado Bando Municipal (BM), donde se busca mejorar el bienestar rural y reducir los índices de pobreza, tanto a nivel Nacional, Estatal y Municipal. Es por ello, que surge la necesidad de impulsar el mercadeo de los productos lácteos que se producen en la Zona Oriente del Estado de México, específicamente en el Municipio de Ayapango y las delegaciones que lo integran. El Marketing Rural (MR) representa una opción para el Desarrollo Rural (DR), y específicamente para las Unidades de Producción de Lácteos (UPL) del Municipio de Ayapango Estado de México, para que puedan mercadear los productos que producen y que son el sustento económico de sus familias. Por lo que al formular estrategias de comercialización, le permitan obtener un precio justo y logren posicionarlos en los mercados aledaños, con el propósito de que puedan lograr el retorno de su inversión y sea su actividad primaria, para lograr un ingreso digno para el apoyo de su familia.*

**PALABRAS CLAVES:** Marketing Rural, Desarrollo Rural, Unidades de Producción de Lácteos

## **ALTERNATIVE RURAL MARKETING FOR RURAL DEVELOPMENT CASE OF DAIRY PRODUCTION UNITS IN THE EAST AREA OF MEXICO STATE**

### **ABSTRACT**

*According to the public policy established in the National Development Plan (PND), the National Development Plan (PDE) and the Municipal Development Plan (PDM) or called Bando Municipal (BM), which seeks to improve rural welfare and reduce poverty, both at National, State and Municipal levels. Therefore, it arises the need to promote the marketing of dairy products produced in the East Zone of the State of Mexico, specifically in the Municipality of Ayapango and delegations in it. The Rural Marketing (MR) is an option for Rural Development (RD), and specifically for the Dairy Production Units (UPL) Ayapango Township State of Mexico, so they can market the products they produce and that sustain economic development of their families. So when formulating marketing strategies, allowing it to obtain a fair price and achieve position them in nearby market, in order that they can achieve return on investment and is their primary activity, to achieve a decent income to support his family.*

**KEYWORDS:** Rural Marketing, Rural Development, Dairy Production Units

## INTRODUCCIÓN

De acuerdo a la política pública establecida en el Plan Nacional de Desarrollo (PND), el Plan Estatal de Desarrollo (PED) y los Planes Municipales de Desarrollo (PMD) o llamado Bando Municipal (BM), donde se busca mejorar el bienestar rural y reducir los índices de pobreza, tanto a nivel Nacional, Estatal, Regional y Municipal, surge la necesidad de impulsar el mercadeo de los productos lácteos que se producen en la Zona Oriente del Estado de México, específicamente en el Municipio de Ayapango, donde existen una gran variedad de empresas conocidas como Unidades de Producción de Lácteos (UPL) que están identificadas en el sector primario como productores y recolectores de materia prima para la fabricación de productos lácteos, las cuales se dedican a la producción y comercialización ellas mismas, así mismo realizan múltiples actividades en la zona rural buscando su desarrollo. Estas organizaciones llevan a cabo de manera integral la venta de manera directa y en otros casos por medio de intermediarios de sus productos, debido a que son las que pueden detonar al territorio, a través de la realización de todo el ciclo productivo, que va desde la materia prima, pasando por el proceso de transformación y llegando al consumidor de manera directa.

Es por ello, que surge la necesidad de generar un proceso de mercadeo, que se identifica como Marketing Rural, que de acuerdo a (Ravindranath & Naranyansa, 2004), se “involucran los procesos de desarrollo, fijación de precio, promoción y distribución de productos rurales específicos y servicios, que lideren el intercambio entre mercados rurales y urbanos, y que satisfagan la demanda del consumidor permitiendo alcanzar los objetivos organizacionales”. Es por ello que, el Marketing Rural (MR) representa una opción para el Desarrollo Rural (DR), y específicamente para las UPL del Municipio de Ayapango Estado de México, para que puedan mercadear los productos que producen y que son el sustento económico de sus familias. Por lo que al formular estrategias de comercialización, le permitan obtener un precio justo y logren posicionarlos en los mercados aledaños, con el propósito de que puedan lograr el retorno de su inversión y sea su actividad primaria, para lograr un ingreso digno para el apoyo de su familia. El MR como propuesta para el desarrollo y la lucha contra la pobreza. Por lo que Kashyap (2011), propone un modelo de MR denominado 3M, que es una herramienta de intervención para iniciar y potencializar a las UPL basada en tres puntos fundamentales: Micro financiamiento (Microfinance), con visión y acompañamiento empresarial; Micro mercado (Micromarket), a nivel local y regional; y Micro planeación (Microplanning), que involucra elementos como el territorio, los recursos y el saber-hacer. Dentro del modelo se plantean una serie de pasos que incluyen: a) el estudio de la economía local, b) identificar actividades económicas con potencial, c) preparar un plan de negocios, d) identificar mercados, y e) desarrollar habilidades y capacidades empresariales, donde se mezcla lo rural-rural, lo rural-urbano y lo urbano-urbano. De acuerdo a lo anterior, la problemática de comercialización que presentan las UPL, es que existen deficiencias en las formas de como comercializan sus productos y les genera problemas de mercadeo, para la obtención de un precio justo a la hora de su venta.

Uno de los elementos claves que hay que tomar en consideración en este proceso de mercadeo que es la distribución de los mismos en el proceso de venta está dado aproximadamente en que un poco más del 50% de lo que producen es vendida a intermediarios a precios muy bajos, que en muchas ocasiones no recuperan la inversión realizada; otra situación se da debido a que un poco más del 30%, la venden de manera directa en los alrededores de la zona, y sus clientes son la población vecina y en algunos mercados del lugar, y también los castigan en los precios, porque no es valorado el esfuerzo que se realiza durante todo el proceso de producción, y el resto lo utilizan para el autoconsumo y cubrir sus necesidades alimentarias. Es por ello la importancia de poder implementar el MR como alternativa para el DR, que permitan por un lado apoyar a los responsables de las UPL, a continuar con su actividad y no se dediquen a otra, que de acuerdo a su lógica campesina buscan otras alternativas de sustento, y se alejan de las actividades primarias. Por lo tanto, se hace necesario agregarle una cadena de valor que le permita implementar estrategias de mercadeo basada en el MR para su DR.

Por lo que el objetivo de la investigación que está en proceso terminal y, que es resultado de un proyecto de investigación es el de evaluar a los actores y los factores comerciales de las UPL, para determinar el impacto del MR, como un nuevo paradigma para el DR, con el propósito de posicionar sus productos en los diferentes mercados locales, estatales y hasta nacionales. Así mismo, analizar como el MR apoya al DR de las UPL de la zona suroriente del estado de México, y cómo impacta en la disminución de la pobreza. También se busca determinar la dinámica del mercadeo de las UPL, estableciendo indicadores técnicos, productivos y de calidad basados en el modelo de 3M del MR, para los productos ofertados, que son determinantes en el modelo planteado, y establecer cuáles son los factores que favorecen o afectan la competitividad del mercado.

## REVISIÓN LITERARIA

La población rural de México ha venido disminuyendo en las últimas décadas, conforme a la definición del INEGI (una población se considera rural cuando tiene menos de 2,500 habitantes, mientras que la urbana es aquella donde viven más de 2,500 personas). La dispersión de la población en el país durante 1910, se reflejaba predominante rural: más del 70% de la población habitaba en zonas rurales y menos de la tercera parte se ubicaba en zonas urbanas. En los años 30's, la población rural comenzó a perder terreno lentamente frente a la urbana, que representaba ya 33.5% de la población. Sin embargo, a partir de la década de los 40's, el país experimentó una intensa fase de industrialización (fundamentalmente en torno al petróleo y la manufactura) que detonó el crecimiento económico y estimuló la generación y desarrollo de centros urbanos. Veinte años después, en 1950, el incremento de población que tanto se buscó a principios del siglo XX, comenzaba a materializarse de la mano de un intenso proceso de urbanización; para entonces, 57.4% de la población era rural y 42.6% urbana.

En el periodo de 1950 a 2005, la población rural bajó su participación de poco más del 57% a un 23.5%; mientras que el número de habitantes se redujo de 24.8 millones a 24.3 en el lapso del año 2000 al 2005. Todo ello en un contexto de mayor dispersión poblacional y menores tasas de mortalidad que magnifican el efecto de la emigración del campo a las ciudades y el extranjero. En la actualidad, la distribución de la población por tamaño de localidad observada a principios del siglo XX se revirtió totalmente, en vista de que 8 de cada diez habitantes del país reside en una localidad urbana. De acuerdo al INEGI la población rural en 2010 es de 25,179,916 habitantes, poco más del 22%. La relación entre la población rural con los mercados y la modernización social han transformado al México rural, con cambios importantes en los patrones de consumo, formas de vida, y en las características de la fuerza laboral y en las fuentes de ingreso y de empleo. Sin embargo, estos cambios no han sido acompañados por un proceso de desarrollo económico capaz de reducir la pobreza y la desigualdad rural; a pesar de los cuantiosos recursos públicos destinados ex profeso, y de las transferencias privadas expresadas en remesas, y en la dinámica de los mercados.

Es por ello que, el marketing es considerado como una disciplina cuyo origen corresponde a un proceso de evolución dado dentro del desarrollo económico de la humanidad. (Hoyos, 2008). Al respecto, Esteban, *et al.* (2008), menciona que surge de manera natural en el momento en que se formaliza la actividad comercial. Aunque el término fue acuñado en 1910, su contenido y ámbito de aplicación han sufrido cambios constantes a lo largo de las últimas décadas. Se consideran como elementos centrales el análisis del ambiente del marketing, dividido en micro y macro ambiente que suele ser determinado por un análisis FODA (Fortalezas, Oportunidades, Debilidades y Amenazas); y la mezcla de marketing ó 4 P's: Producto, Precio, Plaza y Promoción. Dentro del ambiente de marketing se analizan las diversas interrelaciones existentes entre la competencia y los consumidores. El micro ambiente incluye a los intermediarios, los competidores, el tipo de mercado y el segmento meta, y por el otro lado, el macro ambiente establecidas por las cuestiones políticas, culturales, económicas, demográficas y tecnológicas. De acuerdo a Kotler, *et al.* (2003), el marketing es "la función de negocios que identifica las necesidades y deseos de los clientes; determina los mercados meta que mejor pueden servir a la organización y diseña los productos, servicios y

programas apropiados para servir a esos mercados”; es decir, la meta del marketing es crear de forma rentable una satisfacción en los clientes al forjar con ellos relaciones cargadas de valor. Por lo tanto, es importante saber cómo definir y segmentar un mercado y cómo lograr una posición sólida en él al desarrollar productos y servicios que satisfagan las necesidades de los segmentos meta elegidos. Se debe saber cómo poner precio a su oferta y hacerla atractiva y costeable, y cómo escoger y administrar intermediarios para hacer que los clientes tengan acceso a sus productos; saber cómo anunciar y promover los productos que tienen en existencia para que los clientes los conozcan y los deseen. Es evidente que quienes comercializan algo necesitan una amplia gama de habilidades para detectar, atender y satisfacer las necesidades de sus consumidores.

Partiendo de lo anterior y como consecuencia del potencial económico percibido en el sector rural y dado que los productores de lácteos rurales no son ajenos a los procesos de comercialización, surge la noción de MR que, de acuerdo a (Ravindranath & Naranyansa, 2004), mencionan que “el involucrar a los procesos de desarrollo, fijación de precio, promoción y distribución de productos rurales específicos y servicios, que lideren el intercambio entre mercados rurales y urbanos, y que satisfagan la demanda del consumidor permitiendo alcanzar objetivos organizacionales”. Así mismo Ravindranath & Naranyansa (2004) & Kashyap, P. (2011), identifican tres tipos de relaciones de marketing rural: Urbano – Rural, donde ciertos productos se producen en la ciudad con la finalidad de comercializarse en las zonas rurales, estos pueden ayudar a los habitantes de las comunidades a mejorar su calidad vida e incluso el nivel de los bienes producidos (por ejemplo, pesticidas); Rural – Urbano, se da cuando una comunidad rural comercializa sus productos a las ciudades y centros urbanos, principalmente se trata de productos de agricultura y bienes alimentarios; y Rural – Rural, sucede entre comunidades rurales que aprovechan la proximidad geográfica para comercializar productos entre sí, se destaca la existencia de “especialidades productivas” en algunos pueblos.

Existen diferencias entre el consumidor urbano y el consumidor rural, al respecto, Krishnamacharyulu (2011) explica las más importantes: La forma de comprar (El mercado rural está caracterizado por ser disperso y fragmentado. Las ocupaciones laborales están muy orientadas a las temporadas, generalmente de cosecha, por lo que el poder adquisitivo no es constante); Decisiones sobre el precio (Los consumidores rurales generalmente se guían por un precio más bajo sin descuidar la calidad, pues hacerlo pondría en riesgo su economía limitada); Decisiones de promoción (Debido al bajo nivel de alfabetización que se presenta en las comunidades rurales, la mayor parte de la promoción de un producto debe basarse en los principios de sencillez y visibilidad); Desarrollo de habilidades (Las personas de las comunidades rurales no confían en personas externas a la misma, por lo que es necesario desarrollar ciertas habilidades para enfrentar este problema, como lo son: la generación de confianza a través de la demostración de genuino interés en la problemática rural, respeto, tolerancia y humildad). Por lo que Gupta (2011), sugiere una adaptación de la mezcla de marketing ó 4 P's para solventar los problemas presentes en el mercado rural (bajo ingreso per cápita, consumo estacional ligado a festividades religiosas y ocasiones especiales, caminos en malas condiciones, problemas de empoderamiento, entre otros), y propone en su lugar utilizar las 4 A's: *Product* (Producto) vs *Acceptability*: Productos diseñados para el sector rural; *Price* (Precio) vs *Affordability*: Precio razonable, no caro, ajustado al ingreso; *Placement* (Plaza) vs *Availability*:

Entendida como disponibilidad del producto; y *Promotion* (Promoción) vs *Awareness*: Reconocimiento de la marca/producto. Como propuesta para el desarrollo y la lucha contra la pobreza, Kashyap (2011), propone un modelo de MR denominado 3M, que es una herramienta de intervención para iniciar y potencializar microempresas rurales basado en tres puntos fundamentales: Micro financiamiento (*Microfinance*), con visión y acompañamiento empresarial; Micro mercado (*Micromarket*), a nivel local y regional; y Micro planeación (*Microplanning*), que involucra elementos como el territorio, recursos y saber – hacer. Dentro del modelo se plantean una serie de pasos que incluyen: a) el estudio de la economía local, b) identificar actividades económicas con potencial, c) preparar un plan de negocios, d) identificar

mercados, y e) desarrollar habilidades y capacidades empresariales. Por lo que, se considera que el MR resulta ser una herramienta que permite vincular de manera exitosa a los productos rurales con el mercado. Se encuentra presente en los intercambios comerciales y relaciones Rural – Urbano y Rural – Rural, donde existe la presencia de las UPL con el territorio. Éste último es activado a través de la valoración de sus recursos, genéricos y específicos, productos, saber–hacer y redes de actores, por lo tanto puede constituirse como una ventaja competitiva. Modi (2009) ,menciona en su análisis que el significado y la definición del MR no son tan claros como aquellos del marketing comercial, y que tal condición limita la posibilidad de considerarse como un tópico de investigación toda vez que no cuenta con un dominio ni perspectiva propios que le permitan desarrollar bases teóricas y generar conocimiento especializado.

Al respecto, se argumenta que dicha confusión teórica parte desde el propio término “rural”, ya que, de acuerdo a Solsona (2006), existe una gran dificultad para definirlo y es entendido de forma muy diferente en los distintos países. Suárez & Tobasura (2008) mencionan que a lo largo del tiempo, diferentes autores han enfatizado uno u otro aspecto, o incluido en su definición varios de ellos. Dentro de las concepciones planteadas de lo rural se destacan: a) lo rural en términos de la dicotomía rural - urbano; b) su conceptualización en términos de variables demográficas como la densidad de población; c) de acuerdo al uso particular de la tierra y las relaciones sociales en torno a la producción agrícola; d) lo rural como una construcción social configurada a partir de las nuevas actividades dadas en el espacio rural y su relación con lo urbano. Entonces, se puede decir que el MR, se ubica dentro de un contexto rural, que conceptualmente es un campo inacabado, y que involucra intercambios comerciales entre mercados rurales y urbanos; donde la dinámica de las relaciones urbano - rural, rural - urbano, y rural - rural, otorgan un sentido ambiguo a su campo de acción.

De manera más concreta, se ha identificado que existen intercambios comerciales entre compañías multinacionales (ubicadas o no en zonas rurales) y consumidores rurales, bajo un esquema de marketing completamente comercial; y también existen micro emprendimientos rurales cuyos mercados se encuentran en zonas urbanas, y que operan de la misma manera. Bajo esa perspectiva, se enfatiza que la propuesta del MR no puede limitarse sólo al contexto y la participación de actores rurales y sus intercambios, sino que debe diferenciarse por una visión única que le permita desarrollar su propia base teórica, conceptos, vocabulario y herramientas; en ese sentido, Modi (2009) sugiere que la perspectiva del MR debe ser la del desarrollo, es decir, que busque responder cómo el marketing puede ser usado para incrementar el desarrollo de una zona rural y sus habitantes.

El MR desde la perspectiva de desarrollo, tiene el potencial de mejorar los niveles de vida en las áreas rurales a través de estrategias que permitan su inserción en los mercados y la generación de ingresos. En ese sentido, su enfoque se refiere a todas aquellas actividades de marketing cuyo impacto en la población rural sea positivo. A diferencia de aquellas organizaciones comerciales que emplean el marketing para venderles a los sectores rurales de bajos ingresos, el marketing rural busca generar los mayores beneficios para los habitantes de las zonas rurales. Al respecto, se destaca la existencia de algunas instituciones como organizaciones no gubernamentales, organizaciones internacionales de cooperación, agencias de gobierno, cooperativas y micro emprendimientos que han utilizado el marketing desde la perspectiva de desarrollo con la finalidad de alcanzar sus metas organizacionales e impactar positivamente en los sectores rurales. Sin duda, el papel que juegan dichas organizaciones en los procesos de desarrollo territorial y de formación de capacidades y habilidades en los pequeños productores es fundamental, tan es así que durante la presente investigación se han identificado diversas estrategias de marketing rural entre las que se destaca la aplicación del Modelo 3M (Kashyap, 2009) diseñado con la finalidad de procurar una guía capaz de asistir a dichas organizaciones en su propósito de lograr el desarrollo territorial y la mejora sostenible en las condiciones de vida de los propios productores bajo el contexto rural de cualquier país.

## METODOLOGÍA

La metodología que se está utilizando en la investigación es la de Investigación Acción, la cual permite dar propuestas de solución a problemas sociales, y en este caso en particular para apoyar la investigación y que permita formular estrategias de mercadeo de productos lácteos que se procesan por las UPL en el Municipio de Ayapango, y al combinarla con el enfoque de MR, que utiliza el modelo propuesto por Kashyap (2011) denominado 3M, que es un modelo innovador de intervención para iniciar y potencializar microempresas rurales basado en tres puntos fundamentales: Micro financiamiento (*Microfinance*), con visión y acompañamiento empresarial; Micro mercado (*Micromarket*), a nivel local y regional; y Micro planeación (*Microplanning*), que involucra elementos como el territorio, recursos y saber – hacer, permitan detonar al territorio y lograr con esto su desarrollo rural.

## RESULTADOS

Los resultados preliminares encontrados hasta este momento reflejan que existen aproximadamente 233 UPL, que tienen ganado lechero, de los cuales 19 aproximadamente son productores de queso en el Municipio de Ayapango, que se encuentra en la Zona Oriente del Estado de México, las cuales se dedican al sector de los lácteos, que el 40% aproximadamente cumple con la función de producción y comercialización de sus productos, que el resto solo se dedican a la transformación y venta de los mismos. Que el 75% aproximadamente vende sus productos tanto al mayoreo a intermediarios o para grandes organizaciones tales como restaurantes y distribuidores de la zona, como al menudeo, el resto sus ventas las realizan de venta al público, que en todos los casos carecen de un visión de mercadeo rural, y que se guían por su lógica campesina, que al que pregunte y compra se lo venden.

## CONCLUSIONES

Se puede establecer una conclusión preliminar debido a que la investigación sigue en desarrollo, y es que surge la necesidad de fomentar entre los responsables de las UPL, la importancia de aplicar al MR como alternativa de desarrollo rural y los beneficios que traería al municipio, que a su vez está catalogado como Pueblo de Encanto, y busca su acreditación como Pueblo Mágico. También de mejorar las niveles de vida de las familias que la integran. Por último, que el desarrollo rural del municipio en parte depende de lo que produce, y que el implantar esta herramienta les daría una nueva perspectiva de mercado y crecimiento.

# LA LIBERTAD ONTOLÓGICA EN EL PROCESO DE LA COMUNICACIÓN

José Ismael Cepeda Cepeda, UACH

Jesús Carlos Martínez Ruiz, UACH

Víctor Hugo Medrano Nevarez, UACH

Rubén Borunda Escobedo, UACH

## RESUMEN

*En el mundo contemporáneo, se considera un hecho que la libertad de expresión y comunicación, conlleva el respaldo de las naciones democráticas. Los países altamente desarrollados presumen de la libertad que existe en sus culturas para expresar, sin temor a censura, las opiniones generadas a través de diferentes medios de comunicación masiva existentes. La comunicación es un término que en general viene del latín communicatio communicationis, que significa participación y se hace explícito en el verbo communicare; “hacer participe a otro de lo que uno tiene”. Sin embargo, obliga una reflexión y genera una interiorización a lo más profundo del ser humano para conocer una realidad estrechamente relacionada con su responsabilidad social en el proceso comunicativo y trascendente hacia su propuesta ética como persona. Entendamos pues, que el proceso de comunicación personal que deriva en la expresión de su pensamiento, deberá estar libre de ataduras y prejuicios que limiten su visión de la realidad, dejándose llevar contrariamente, por las apariencias que recoge del mundo exterior. Por consiguiente, implica un análisis concienzudo del problema de la Libertad en el individuo.*

**PALABRAS CLAVE:** Libertad de Expresión, Comunicación, Ética

## THE ONTOLOGICAL FREEDOM IN THE PROCESS OF COMMUNICATION

### ABSTRACT

*In the contemporary world, it is considered a fact than freedom of speech and communication, bear the support of the democratic nations. Countries unrolled highly boast of the freedom that exists in their cultures to express, without fear to censure, the opinions generated through different existing mass media. Communication is a term that in general is in Latin communicatio communicationis, that it means participation and communicare is made explicit in the verb; “Making another one participant of what one has”. However, a reflection obliges and generates an internalization to the innermost thing of the human being to know a reality once narrowly its social responsibility in the telling and transcendent process toward its ethical proposal like person was related to. Let's understand then, than the process of personal communication that he derives in the expression of your thought, that will have to be free of fetters and prejudices that limit your vision of reality, getting carried away contrarily, by appearances that picks up of the world outside. Therefore, it implies a conscientious analysis of the problem of the Freedom in the individual.*

## INTRODUCCIÓN

Dentro de las facultades intelectivas del hombre, se ubica la voluntad, misma que a través de nuestra inteligencia, dilucidamos las ideas que despiertan nuestro deseo hacia el bien reconocido, induciéndonos a quererlo, a desearlo. *“Así, al manifestarse esa tendencia, después de la aprehensión de un bien, con la inteligencia, descubrimos la presencia de un apetito del mismo orden espiritual que se actualiza. El hombre, la sustancia, su sujeto de inhesión, donde se hace notar la facultad apetitiva espiritual, cada vez que este quiere”* (García Alonso, 1986) Pero, ¿qué es lo que hace la voluntad que nos permite reconocer su presencia? Para algunos pensadores como Baruch Spinoza que niega la voluntad y manifiesta que en el espíritu solo existe el entendimiento o como Etienne Bonnot de Condillac, que reduce la voluntad al ámbito de lo sensible manifestando que la voluntad *“es un deseo sensible predominante”*.

Entendamos que el acto se especifica por su objeto y las facultades por los actos. Consecuentemente, la voluntad realiza actos que, por provenir de ella, se llaman voluntarios y estos actos voluntarios son **actos** que se realizan con conocimiento del fin. Quiero comunicar “algo” en orden directo al fin propuesto; que se conozca mi expresión verbal o escrita. En el orden de escala de valores de los animales y las plantas, el fin es natural, corresponde a su naturaleza el desarrollo de sus actos, no así en el hombre en donde se dan los llamados fines medios. Si bien el hombre intelectual visualiza un tipo de bien en función del fin último, corresponde a la voluntad, al querer conforme a la libertad de poder escoger ese fin. En la comunicación, se puede conocer la verdad en el reconocimiento de los hechos y se puede tener la voluntad de darlos a conocer, pero se puede incumplir en el fin comunicativo cuando se limita la libertad de decirlo, o peor aún, disimular o encubrir la realidad.

El hombre determinara la elección del fin en base a una clasificación del acto voluntario que se da de acuerdo al tipo de conocimiento. *Actos voluntarios necesarios*. Actos donde el bien aprehendido es el Bien Absoluto, el fin último. *Actos voluntarios libres*. Actos donde el bien aprendido es relativo o particular que es un fin medio. Esta primera clasificación ubica a la libertad como una modalidad de la voluntad (Ochoa Antondo, 2006). De acuerdo al análisis filosófico del acto voluntario, se muestran doce fases; cuatro corresponden al fin, cuatro más a la elección de los medios y por ultimo cuatro relacionados a la ejecución del acto. Es en la segunda etapa donde se manifiesta la libertad y se concreta en la ejecución del acto libre como parte de la tercera fase. Dentro del proceso de la comunicación humana, entenderemos que existe una característica fundamental, **es reflexiva**, es decir que el hombre puede comunicarse y puede ser consciente de sus comunicación que además tiene una intencionalidad (Ortega Ibarra, 1992) Esa intencionalidad, producto de la voluntad, solo será aplicable cuando el acto comunicativo sea libre. Las Etapas del Acto Humano (García Alonso, 1986)

Orden	Potencia	Denominación Técnica	Traducción Popular
Intención del fin	Entendimiento	Simple aprehensión	Se me ocurre decir tal cosa.
Intención del fin	Voluntad	Simple Volición	Me gustaría decirlo
Intención del fin	Entendimiento	Juicio de posibilidad y conveniencia	Puedo decirlo y es conveniente
Intención del fin	Voluntad	Intención Eficaz	Quiero decirlo

Elección de los Medios	Entendimiento	Deliberación O Consejo	Tengo Tales Medios Para Ello
Elección de los medios	Voluntad	Consentimiento	Me parecen todos buenos
Elección de los medios	Entendimiento	Ultimo juicio práctico	Este es el mejor
Elección de los medios	Voluntad	Elección libre	Pues elijo éste

Ejecución del Acto	Entendimiento	Imperio de la Razón Practica	¡Hazlo, Dilo!
Ejecución del acto	Voluntad	Uso activo	Allá voy
Ejecución del acto	Potencias ejecutivas	Uso pasivo	Lo digo
Ejecución del acto	Voluntad	Fruición	Me gozo en la acción

Contrariamente a la propuesta cartesiana que asocia la libertad con la indiferencia, en el acto humano, es en la deliberación donde se comparan los motivos. Pico della Mirandola (D.Barbedette,1976), filósofo renacentista, hace una especie de manifiesto de la indeterminación del hombre. Si cabe la indeterminación de la voluntad por los bienes particulares, es por eso que se crea una tensión en el acto deliberativo que es coartado en el momento de la decisión por una autodeterminación de la voluntad que pone lo que le falta a los bienes particulares que no son su objeto.

## PRUEBAS DE LA LIBERTAD

Reconocido es a través de un gran número de filósofos y pensadores, que el objeto de la voluntad es el Bien Común (*bonum in communi*) o el Bien Absoluto. Se dice que este bien se identifica con la felicidad en abstracto y por consiguiente, pensar en él, no nos mueve más que como un bien particular al igual que otros. Cuando el entendimiento de bien o de apetibilidad encarna en un bien concreto, tenemos lo que se llama el término de la voluntad que permite el descanso en esa tendencia. Es en esta etapa de la elección de los medios donde la inteligencia le da a conocer a la voluntad, las imperfecciones de los medios que hacen que se autodetermine, marcando el juicio práctico, al cortar el juicio deliberativo.

*Se podrá entender consecuentemente la definición de libertad como:* modalidad de la voluntad por la cual ésta se determina a sí misma a elegir un bien particular o dejar de hacerlo, en otras palabras a comunicar un hecho o pensamiento o evitarlo. *La inteligencia o la razón le presenta a la voluntad, los bienes particulares a través de la reflexión y los compara con el Bien Absoluto haciendo posible la Libertad.* Dicha facultad es la raíz y esencia de la Libertad. Comunicar deberá ser, en consecuencia, un proceso en el que existe un conocimiento previo que se quiere comunicar y que bajo la reflexión se desahoga en una propuesta voluntaria y libre por un medio a un emisor que a su vez buscara encontrar sentido a lo comunicado.

*“El comunicador será capaz de aportar algo al juzgar de aquello que conoce, si es verdadero, falso, bueno, malo, etc. y de razonar, es decir, discurrir inductivamente o deductivamente uniendo y separando juicios”* (Ocampo, 2005).

Aquí es muy importante razonar que en comunicación masiva, el comunicador, en un acto de plena libertad, no deja de estar sujeto a la responsabilidad de acercarse, lo más próximo posible, a la verdad o realidad existente como fundamento de su propuesta ética y de su credibilidad como emisor. Se establece que la prueba metafísica de la libertad tienen un mayor grado de certeza que las otras pruebas, que son: la prueba moral, la prueba de consentimiento universal y la prueba psicológica. *La prueba moral* es aquella postulada por Emmanuel Kant al sostenerla como postulado de la moral. Kant rechaza la propuesta metafísica porque no considera posible la metafísica como ciencia y porque además piensa en una libertad absoluta que resulta contradictoria desde el punto de vista de la razón pura. Para Kant, la esencia de las cosas es un postulado de la razón práctica, es decir, una suposición sin fundamento racional que le resultaba conveniente para fundamentar su filosofía moral. Un postulado de esta clase no es en el fondo más que una opción arbitraria, tan justificada como la opción contraria. En el pleno uso de la libertad comunicativa, el hombre se siente obligado de una manera absoluta a hacer el bien y evitar el mal y por consecuencia a comunicar lo verdadero y evitar la mentira o las verdades a medias. Una obligación absoluta implica la tendencia de la voluntad a un bien absoluto. Esta tendencia no proviene de la libre elección del hombre sino de una necesidad natural.

*El consentimiento universal* en el sostenimiento de la libertad, no es prueba suficiente, ya que, podría darse el caso de alguien que sostuviera lo contrario y estar en la verdad, tomando en cuenta que la verdad no es

motivo de consenso, sino de adecuación de la mente con la realidad. Se puede plantear de la siguiente manera. El punto de partida de la prueba es el hecho de que la gran mayoría de la humanidad a lo largo de la historia y a lo ancho del mundo, ha practicado o practica alguna religión. Según el principio de finalidad, todo agente obra en vista de un fin. De aquí que se puede deducir que un deseo natural de un ser racional no puede ser vano. Aplicando este principio, resulta que la religión natural no puede ser vana. De aquí que se concluya en la existencia de la divinidad.

*El hecho psicológico*, del cual la mayoría tenemos conciencia clara, puede ser contrario para alguien que no tenga tal experiencia o por alguien que diga que se trata de una ilusión. Además de que no se trata solo de constatar la libertad, sino explicarla, cosa que se hace con la prueba metafísica. En la *libertad de actuar* los actos que no están determinados por una fuerza exterior también reciben el nombre de libertad de coacción. Aquí encontraríamos en el actuar humano, la libertad civil, la libertad política, la libertad física y la libertad moral, en cierto modo. Este tipo de libertad se refiere a los actos humanos donde entran en juego otras facultades que son imperadas por la voluntad. “Aun cuando se trate de libertades exteriores, tienen sus implicaciones interiores por lo cual no debemos esperar que alguien nos vele el entendimiento, manipulándonos, o, incluso, coaccionándonos para realizar actos que deben ser imperados por la voluntad” (Ochoa Antondo, 2006). *La libertad de querer* corresponde a los actos voluntarios en sí mismos o actos elícitos que son interiores y que ya quedaron ubicados en la fase esencial del acto voluntario donde se eligen los medios a través de la decisión. Una vez analizados los contenidos del conocimiento adquirido y considerando la veracidad de la información, el comunicador determina en plena libertad, su deseo de comunicar su propuesta. *La libertad de elección* o también denominada libre arbitrio, puede tomar dos formas:

Libertad de ejercicio. En esta se elige entre actuar o no hacerlo, por lo cual no depende de un hecho externo, denotando con ello una interioridad profunda. Esta libertad corresponde a los actos auténticamente libres.

Libertad de especificación. Se refiere a la especie de bienes que son objeto de elección.

Se determina que dentro de éstos dos formas de libertad están implícitos los límites de la misma. La libertad de ejercicio solo se da con los bienes particulares. Citando al Dr. Agustín Basave Fernández del Valle (1996), además de la libertad de ejercicio y de especificación, hace un especial énfasis en la libertad existencial de elegirnos y dice: “*Por la libertad tenemos acceso a la verdad. Con ella nacemos a la vida consciente y con ella nos salvamos del fracaso, porque es libertad de salvación*”. Por ello mi libertad es indelegable. Por su parte Fulton J. Sheen (1956), establece que en consecuencia de *la libertad de*, existe *la libertad para*, implicando finalidad. Es decir, todo comunicador en su derecho libre de comunicar habrá de determinar cuál será la finalidad de los comunicado y éste comunicado habrá de buscar un bien colectivo que provoque un impacto en la conciencia de los receptores. Consciente debe estar el comunicador que el mundo contemporáneo, impregnado de liberalismo, permisivismo, hedonismo y consumista, aísla la libertad de elección de perfección, olvidándose de la finalidad hacia el bien común, llevando a la sociedad a un ambiente difuso y superficial que lleva al hombre al hastío y al vacío existencial bajo el influjo del llamado “progreso”.

Dentro del análisis metafísico, el proceso comunicativo deberá llevar consigo la búsqueda previa y exhausta de la verdad en todas sus propuestas, para conciliar la realidad con la razón y determinar, una vez encontrada la verdad objetiva de los hechos, lo que conviene decir y comunicar y liberar al ser de su ignorancia casual o voluntaria (“La verdad os hará libres”). A este respecto, Manuel Ocampo (2005) establece: “*La comunicación está abierta al ser y a la trascendencia y su fin es el conocimiento, posesión y realización de la verdad en todos y cada uno de los hombres que es el bien común. La causa final de la comunicación no puedes ser otra que la propia perfección, la verdad y el bien inmanente o terreno, y trascendente, el bien*

*común. La comunicación no es un fin en sí misma sino que constituye un medio para alcanzar la propia perfección del hombre y de todos los hombres en la sociedad, que es el bien común”.*

Un comunicador que no esté impregnado en un sentido realista, con una propuesta ética y una base filosófica moral, contribuirá en consecuencia a una desorientación y al caos social, atentando contra la objetividad comunicativa. En parte, el comunicador es un moralizador de la sociedad, debiendo, con el medio disponible de comunicación masiva, mantener las pautas que edifiquen el comportamiento del hombre conforme a la naturaleza humana y a su perfección. El acto de comunicar en el comunicador, deberá estar libre de ataduras y prejuicios que las líneas editoriales impongan, cediendo en su lugar, al libre proceso de comunicar lo debido, lo verídico y lo formativo.

Hay que evitar la manipulación comunicativa que conlleva a satisfacer las necesidades económicas de los más poderosos en detrimento de la sociedad actual, de por sí desposeída de cultura e irreflexiva y envuelta en el más peligroso relativismo. El uso irracional en la educación de los hijos a través de medios visuales de comunicación masiva como la televisión y el internet, en sustitución de los propios padres y de la escuela, están provocando tendencias de comportamiento que alejan al sujeto en formación de una educación en valores, terminando por ir en contra de su propia naturaleza humana.

*“En la actividad periodística comunicativa, la prudencia emerge como virtud fundamental, ya que sintetiza, ordena y dirige las acciones directivas, gnosológicas, artísticas y las aptitudes y actitudes que la fundamentan, tendientes a la comunicación adecuada del saber sobre las realidades actuales que al público le es necesario o útil conocer para su actuación libre en sociedad”* (Galdon, 2001).

Urge en las escuelas de formación superior en las que se preparan los futuros comunicadores, la necesidad de retomar la filosofía como parte de las currículas académicas, para que se instruya a los alumnos en aspectos éticos, poéticos, ontológicos, gnosológicos y antropológicos que les permita discernir la propuesta comunicativa, hacia el bien común y en ejercicio libre, justo y pleno .

# FUENTES Y MECANISMOS DE FINANCIACION EN LAS PYMES DE VILLAVICENCIO (COLOMBIA)

María del Carmen Ruiz Sánchez, Universidad de los Llanos

## RESUMEN

*En atención al nivel de participación de las pequeñas y medianas empresas en el tejido empresarial de la ciudad de Villavicencio, y las repercusiones de la financiación en el comportamiento de cualquier organización empresarial, en el presente proyecto se realiza una caracterización de la estructura financiera de dichas empresas en una muestra de 81 empresas de este tipo, extractadas de los sectores industrial, comercial, de servicios y turismo, la cual es contrastada con el análisis de la estructura financiera presentada en los estados financieros con el fin de establecer como han incidido las fuentes de financiación sobre la rentabilidad.*

**PALABRAS CLAVE:** Fuente de Financiación, Estructura Financiera, Margen, Rentabilidad,

## FINANCING SOURCES AND MECHANISMS IN SMES VILLAVICENCIO

### ABSTRACT

*In attention at the participation level the small and medium companies in the managerial fabric of the city of Villavicencio, and the repercussions of the financing in the behavior of any managerial organization, project is carried out a characterization of the financial structure of this companies presently in a sample of 81 summarized in this kind of companies of the industrial, commercial, of services and tourism sectors,, which is contrasted with the analysis of the financial structure presented in the financial states with the purpose of settling down like they have impacted the financing sources about the profitability.*

**JEL:** M21, M41, G12, G21, G32.

**KEYWORDS:** Financing Sources, Financial Structure, Margin, Profitability

## INTRODUCCIÓN

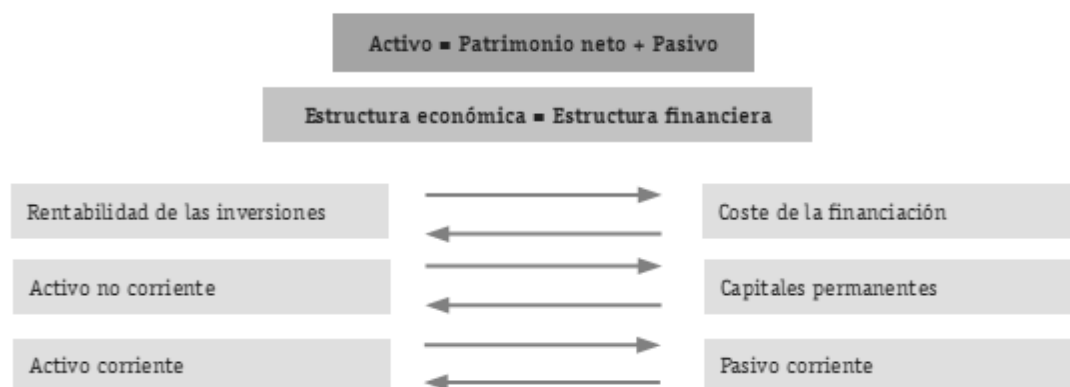

La presente investigación revisa las fuentes y mecanismos de financiación en las pymes de Villavicencio, teniendo como definición de Pymes lo establecido en la Ley 590 de 2000, para el fomento de la micro, pequeña y mediana empresa, posteriormente modificada por la ley 905 de 2004, como “toda unidad de explotación económica por persona natural o jurídica en actividades empresariales, agropecuarias, industriales comerciales o de servicio, rural o urbano” y que para Colombia se clasifican de acuerdo al número de empleados y al valor de los activos, en términos del salario mínimo mensual legal vigente. El desarrollo de la investigación se realiza en dos grandes partes: la primera consiste en una caracterización de la estructura financiera, a partir de una muestra de 81 pequeñas y medianas empresas con domicilio en Villavicencio, que busca conocer, directamente de los pequeños y medianos empresarios, las fuentes de financiación utilizadas, los criterios que utilizan las pymes de Villavicencio para obtener financiación, en que es utilizada dicha financiación; y los beneficios que esperan obtener con el uso de la deuda. La segunda parte de la investigación consiste en el análisis de la estructura financiera de las pymes seleccionadas, a partir de la información presentada en los estados financieros, con el objeto de contrastar esta información con la obtenida en la fase anterior, para lo cual se realizó un análisis de indicadores financieros de liquidez,

endeudamiento, apalancamiento y rentabilidad, con los cuales se trata de establecer como ha incidido la financiación en la rentabilidad de las pymes.

## REVISIÓN LITERARIA

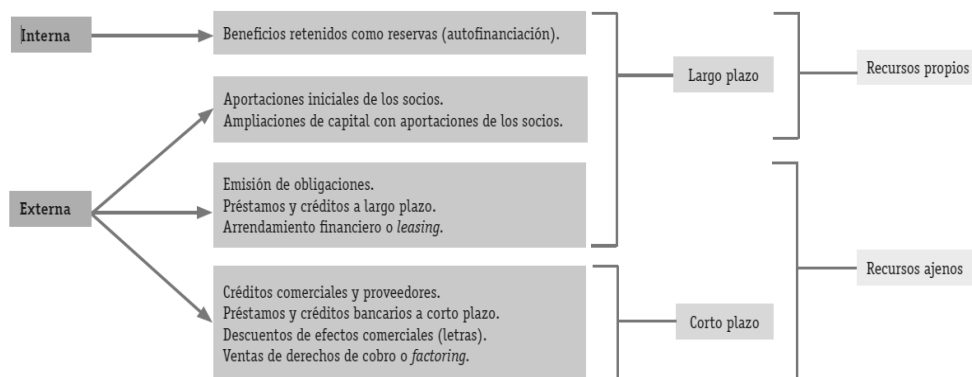

Partiendo de la importancia de las pymes, la cual radica en su alto grado de participación en el tejido empresarial de cualquier país, resultando de vital importancia para su economía, y teniendo en cuenta que existen algunas pautas generalmente aceptadas para la financiación empresarial, entre las cuales merecen citarse: Que la rentabilidad de las inversiones debe ser mayor al costo de financiación del capital y dado que existe una gran correlación entre la estructura económica y la estructura financiera. el activo no corriente debe ser financiado con capitales de largo plazo (pasivo no corriente o fondos propios) y el activo corriente con pasivo corriente o de corto plazo; correlación representada, en el documento las fuentes de financiación elaborado por la Universidad de América, mediante la figura 1:

Figura 1: Correlación Estructura Económica Vs Estructura Financiera

Fuente: Fuentes de financiación. Universidad de América UNIVERSIDAD DE AMERICA. Fuentes de financiación de la empresa [en línea]. <[http://www.uam.es/personal\\_pdi/economicas/fphernan/PaperFI.pdf](http://www.uam.es/personal_pdi/economicas/fphernan/PaperFI.pdf)> [citado en 4 de diciembre de 2012]. p. 292

Igualmente, en el citado documento se describen las fuentes de financiación en tres categorías: según sea el plazo: en corto o largo; dependiendo del origen o procedencia de los recursos: en interna si provienen del desarrollo operacional de la empresa o externa si son aportados por terceros; y según la exigibilidad de los mismos: en propios o no reembolsables y ajenos o reembolsables, como se aprecia en el siguiente esquema:

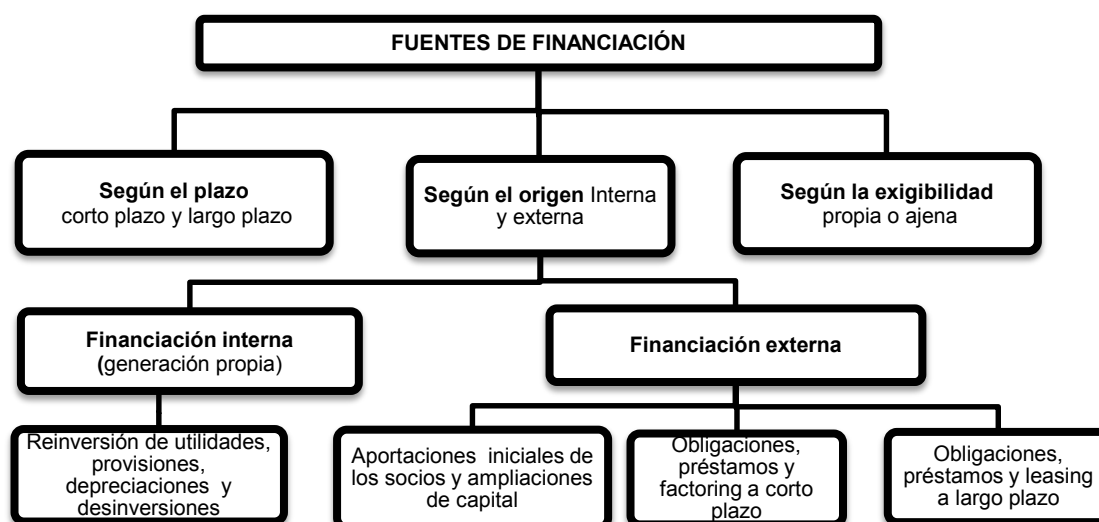

Fuente: Fuentes de financiación. Universidad de América. UNIVERSIDAD DE AMERICA. Fuentes de financiación de la empresa [en línea]. <[http://www.uam.es/personal\\_pdi/economicas/fphernan/PaperFI.pdf](http://www.uam.es/personal_pdi/economicas/fphernan/PaperFI.pdf)> [citado en 4 de diciembre de 2012]. p. 292

*Fuentes de financiación en Colombia:* A partir de la definición dada por el SENA en su estudio Financiamiento para PYMES, realizado en el año 2009, en el cual define Fuentes de financiación como: “los mecanismos que bajo diferentes condiciones, principalmente de tasas y tiempo de amortización, son facilitados por las entidades del sector financiero para irrigar recursos económicos que permiten a personas jurídicas o naturales, disponer de la liquidez requerida para la implementación fundamentalmente de proyectos propios de su actividad económica, con el propósito de realizar inversiones en creación empresarial, fortalecimiento, crecimiento y sostenibilidad de sus operaciones en el corto, mediano y largo plazo, que además les permita alcanzar una rentabilidad con la que se facilite el pago de sus compromisos financieros”; estas se pueden clasificar en tres (3) grandes categorías, dependiendo del plazo, el origen y la exigibilidad. El plazo hace alusión al lapso de tiempo para el cual se consiguen y deben cancelarse los recursos, dividiéndose en corto plazo, cuando su redención es menor a un año y largo plazo, si ésta es superior al año.

*El origen:* Depende de la procedencia de la financiación, que puede ser interna o de autofinanciación, si provienen de la operación misma de la empresa, como son la depreciación, las provisiones, venta de activos o reinversión de utilidades y externa, si su consecución implica asumir endeudamiento nuevo con los socios o con terceros.

*La exigibilidad:* Se clasifica en propia, si no es exigible su devolución por terceras personas, y en ajena, si la empresa debe retornar los recursos en un tiempo determinado.

Figura 2: Fuentes de Financiación

Fuente: Fuentes de financiación. Universidad de América, Fuente: Adaptación del autor con base en el diagrama presentado en el documento “Fuentes de financiación. Universidad de América”.

En el desarrollo del proyecto es importante revisar las fuentes de financiamiento existentes para las pymes en Colombia hasta el primer semestre del año 2012, con el fin de establecer si las pymes de la ciudad de Villavicencio han accedido a este tipo de fuentes, en qué condiciones y cuál ha sido el costo; bajo la óptica de autores como Galindo (2005), que han encontrado la relación existente entre los diferentes tipos de empresas vigentes en Colombia y sus posibles alternativas de proveer los recursos requeridos por los

emprendedores y empresarios para la implementación de sus proyectos, tanto en la creación, como en el fortalecimiento empresarial, en cuanto a recursos propios, proveedores, capital semilla – cofinanciación, donaciones y crédito. De otra parte revisadas las fuentes de financiación disponibles en Colombia, se encontró que estas dependen en gran parte de las diferentes entidades que ofrecen servicios financieros en el país, las cuales para mayor facilidad se han dividido en tres (3) grupos:

Entidades Vigiladas por la Superintendencia Financiera, Entidades no vigiladas por la Superintendencia Financiera y Entidades Sin Ánimo de Lucro con servicios financieros, entre las que se destacan las Fundaciones, las Corporaciones y Otras ONGs, Programas de asistencia financiera del gobierno.

## METODOLOGÍA

El proyecto buscar obtener información directamente en las fuentes primarias con el fin de establecer los criterios que utilizan las pymes de Villavicencio para obtener financiación y a que se destina dicha financiación; aclarando que no se pretende explicar relaciones de causalidad ni de correlación, únicamente pretende describir el tipo de entidades con las cuales se financian las pymes, y en que utilizan los recursos obtenidos y confrontar dicha información con los estados financieros; estableciéndose una muestra representativa de dicha población, en la cual se aplicó una encuesta dirigida a los propietarios y/o contadores de las empresas.

Dado que al inicio del desarrollo del proyecto no se dispone de un marco muestral completo y actualizado para la investigación, que permita la definición exacta del tamaño de la población, se recurre a la fórmula de muestreo para población desconocida para establecer el tamaño de la muestra:

$$N = \frac{Z^2 pq}{i^2}$$

donde:

Z: corresponde a un nivel de confianza esperado del 95% lo que en la curva de distribución normal equivale a  $\pm 1,96$

p: Prevalencia esperada del parámetro a evaluar, para el caso se tomará un  $p = 0,5$

q: corresponde a la diferencia entre el 100% de la población y el nivel de prevalencia esperada, por tanto será  $1-p$

I: Corresponde al nivel de error que se prevé como susceptible de cometer, para el presente proyecto se considera tolerable hasta un 15% En atención a los datos anteriormente expuestos la fórmula para determinar el tamaño de la muestra será:

$$\frac{n = \frac{1,96^2 * 0,5 * 0,95}{0,15^2}}{= 81}$$

El resultado indica que se requiere un grupo de ochenta y un (81) pymes para aplicación de los instrumentos respectivos, por lo cual se recurrió al aplicativo SIREM, para la definición de una muestra aleatoria y al azar, que se conformó de acuerdo a la información presentada en la tabla 1:

Tabla 1: Conformación de la Muestra

Sector	Nº Empresas	Participación	Muestra
Comercio	65	69%	56
Industria	15	16%	13
Turismo	6	6, %	5
Servicios	8	9%	7
<b>Total</b>	<b>94</b>	<b>100,%</b>	<b>81</b>
Tamaño de la muestra			<b>81</b>

La tabla indica que la muestra se conformó teniendo en cuenta el nivel de participación de cada sector frente a un total de 94 pymes, reflejando que el sector comercio tiene la mayor participación, con un 56%, el segundo lugar le corresponde al sector industrial con una participación de 16%, el tercer lugar lo ocupa el sector servicios con el 9% y por último está el sector turismo con el 6%.

## RESULTADOS

La información obtenida mediante permite establecer que el 50% de las Pymes posee activos en el rango de \$2.000 MM y \$5.000 MM, y el otro 50% es inferior a dicho rango. Estas operan con una estructura financiera conformada en mayor grado por aportes de sus propietarios, al evidenciarse que sus pasivos representan en promedio el 43% y el patrimonio un 57% y que la utilización de las líneas de crédito dirigidas al fomento de las pymes es mínima. El análisis revela como principal fuente de financiación de las pymes de Villavicencio a la banca comercial y al préstamo con la banca comercial como mecanismo de financiación principal, seguido del sobregiro bancario; destacándose que el costo del endeudamiento es relativamente alto, especialmente para los sectores comercio y servicios, lo que implica que este absorbe una buena parte del margen operacional de las empresas, debiendo aclararse que esta situación es influenciada por las pymes dedicadas a los servicios en las cuales dicho costo absorbe la totalidad de la utilidad operacional y el margen neto que se muestra es originado por otros ingresos o no operacionales, aspectos que se resumen en la tabla 2:

Tabla 2: Participación del Costo de la Deuda en la Rentabilidad de las Pymes

Empresa	Promedio Margen Operacional	Promedio Costo de Endeudamiento	Participación Promedio Costo de Endeudamiento en Margen Operacional
Industria	10%	6%	64%
Comercio	6%	23%	35%
Servicios	6%	30%	213%
Turismo	15%	5%	33%
<b>PROMEDIO TOTAL</b>	<b>9%</b>	<b>16%</b>	<b>86%</b>

La tabla compara los promedios de margen operacional con el costo del endeudamiento, reflejando que el margen operacional de las pymes de Villavicencio, en los sectores analizados oscila en un rango del 9 al 15%, representando en promedio el 9%, los costos de endeudamiento oscilan entre el 5 y el 30%, por lo cual la financiación representa en promedio el 86 % del margen operacional, y que el margen neto promedio, que constituye los excedentes de las empresas, se mantiene en un rango del 2 al 5%, como puede apreciarse en la tabla siguiente:

Tabla 3: Margen de Rentabilidad Por Sector

Margen/Sector	Industrial	Comercio	Servicios	Turismo	Promedio Sector
M. Bruto	25%	26%	52%	90%	48%
M. Operacional	10%	6%	6%	15%	9%
M. Neto	4%	3%	4%	5%	4%

La tabla muestra los márgenes de rentabilidad bruto operacional y neto de cada sector, en el cual vale la pena resaltar que los sectores industrial y comercial tienen comportamientos relativamente similares en su rentabilidad operacional que oscilan entre el 25 y 26%, con diferencias que solo corresponden al 1%, los sectores servicios y turismo, reflejan un margen bruto muy superior, lo que se explica porque este tipo de empresas no presentan costo del servicio en sus estados de Resultados, sin embargo, y el margen neto, que corresponde a la utilidad generada en cada ejercicio oscilando entre el 3 y el 5 %, conservando un nivel promedio del 4%.

Para mejor comprensión los resultados del proyecto se presentan en torno a cada uno de los objetivos del mismo, así: Caracterización de las pymes De acuerdo a los resultados obtenidos se concluye que la estructura financiera de las pequeñas y medianas empresas – pymes de los sectores comercio, servicios y turismo, se caracteriza por:

El 58% de las pymes operan con activos inferiores a dos mil millones y el 42% restante sobrepasa este nivel, en tanto que su nivel de pasivos patrimonio presenta una relación del 20% de pasivos y 80% de patrimonio, lo cual indica que la financiación está soportada principalmente por aportes de sus propietarios y la financiación externa es realmente escasa.

Respecto a la financiación con recursos externos, las pymes encuestadas en Villavicencio, prefieren en un 70%, financiarse con las instituciones financieras de la banca comercial, en la siguiente forma: préstamos y sobregiros bancarios representan el 47% y 24% respectivamente, seguido del leasing con un 14%, en tanto que los demás tipos de financiación son relativamente poco utilizados en un nivel inferior al 15%.

Vale la pena resaltar que en Villavicencio, las líneas de crédito dedicadas al fomento de las pymes presentan muy bajo nivel de utilización, ya que de las empresas encuestadas solo el sector turismo manifestó que del total de su financiación, el 8% correspondió a créditos con BANCOLDEX; por su parte las empresas del sector industrial y comercial indicaron haber utilizado créditos de la línea FINAGRO en el 16% y 3% respectivamente. Como dato especial, se resalta que el único sector que acepta haber utilizado préstamos de usura es el sector comercial, aunque solo sea por parte del 1% de las empresas.

Aspectos que inciden en la obtención de recursos de deuda Se concluye que los aspectos que inciden en las decisiones de financiación de las pymes de los sectores industria, comercio, servicios y turismo de Villavicencio son: La tabla 4 refleja que las pymes de Villavicencio, eligen una fuente de financiación con base en ocho aspectos que consideran claves: Garantía exigida, plazo, tipo de financiación, periodo de pago, frecuencia con que se financian, costo, destino de la financiación y que efectúan una comparación entre el costo de la deuda y la rentabilidad de la inversión a la que es destinada dicha financiación.

Tabla 4: Aspectos Que Inciden la Elección de una Fuente de Financiación en las Pymes de Villavicencio

Aspecto	Características
Garantía exigida	El pagaré representa un 66%, seguido de la hipoteca con un 16%, la Carta de Crédito con un 9%, y en menor grado la pignoración de vehículos y títulos con un 5% y el codeudor o deudor solidario con 4 %.
Plazo de financiación	El mediano plazo es utilizado en un 50%, seguido del corto plazo con una participación del 28% y el largo plazo es el término menos utilizado representado solo el 22%.
Tipo de financiación utilizada	El préstamo bancario con la banca comercial es el instrumento más utilizado, seguido del sobregiro bancario, la aceptación bancaria y la carta de crédito.
Periodo de pago	La mayoría de pymes afirman realizar en primer grado pago mensual, seguido del pago trimestral y en menor grado un pago semestral.
Frecuencia de la financiación.	En promedio adquieren en un año; un crédito de corto plazo, un crédito de mediano plazo y en mínima proporción un crédito de largo plazo.
Costo de financiación.	El 65% de las empresas encuestadas manifiestan que el costo de la financiación es DTF +1 a 5 puntos y el 35 % restante afirma que es el DTF + 5 a 10 puntos.
Destino financiación.	El 63% lo utiliza para compra de activo fijo, el 37, % lo destina para capital de trabajo.
Comparación costo deuda versus rentabilidad de la inversión	El 81% realiza comparación del costo de la deuda y la rentabilidad de la inversión realizada, el restante 19% afirma no realizar esa comparación. De las que afirmaron comparar; el 78% manifiesta que el rendimiento de la inversión fue superior al costo de la financiación, mientras el 22% manifiesta una inversión inferior al costo del endeudamiento.

Incidencia de los tipos de financiación en la rentabilidad obtenida en las pymes de los sectores analizados En forma global se evidencia que el costo de la deuda absorbe una gran parte del margen operacional de las empresas, 86% en promedio, que ningún sector alcanza a cumplir las expectativas de los socios en cuanto a la rentabilidad esperada de su inversión, por lo cual a continuación se relacionan la rentabilidad esperada con la rentabilidad obtenida:

Tabla 5: Relación Rentabilidad Esperada y Rentabilidad Obtenida Por las Pymes de Villavicencio

Sector	Rentabilidad Esperada	Rentabilidad Neta Obtenida
Industrial	Mínimo el 5%	Promedio del 4.3%.
Comercio	Mínimo el 5%	Promedio del 2,7%
Servicios	Entre el 5% y el 10%	Promedio del 4.4%
Turismo	Mínimo del 10%	Promedio del 5,3%

La tabla refleja que los propietarios de las pymes de Villavicencio esperan obtener utilidades entre el 5 y el 10 %, sin embargo, sus estados de resultados solo presentan utilidades en un rango del 3 al 5%, de los cuales las pymes del sector comercio se presentan en el menor rango con 2,7%, el sector comercial e industrial, que presentan niveles bastante similares alrededor del 4,3% y el sector turismo presenta el mayor nivel de rentabilidad con un 5,3%.

## CONCLUSIONES

El estudio permite concluir que las pymes de Villavicencio son financiadas en mayor grado por los aportes de sus propietarios, al evidenciarse que sus pasivos representan en promedio el 43% y el patrimonio un 57%. La financiación externa en este tipo de empresas procede primordialmente de la banca comercial, utilizando como principal mecanismo de financiación el préstamo soportado mediante pagaré, seguido del sobregiro bancario, resaltándose además, que el uso de las líneas de crédito dirigidas al fomento de las pymes es mínima y que el costo de la financiación les absorbe en promedio el 86% de la utilidad operacional, con lo cual se concluye que el costo de endeudamiento de las pymes es excesivamente alto para la rentabilidad con la cual están funcionando, lo que conlleva a correr riesgos excesivos si no tienen ingresos diferentes de su operación.

En cuanto a la rentabilidad, se observó que ningún sector ha logrado los niveles de rentabilidad esperada, por cuanto los propietarios de las pymes esperan que la rentabilidad final esté en un rango promedio del 5 al 10% y los estados financieros demuestran que ésta oscila entre el 2,7% y el 5,3%.

# INDUSTRIAS GENERADORAS DEL DESARROLLO ECONÓMICO FRONTERIZO EN MÉXICO: CARACTERIZACIÓN DE LA INDUSTRIA ELECTRÓNICA EN CIUDAD JUÁREZ

Emmanuel García Uribe, Universidad Autónoma de Ciudad Juárez.

Alma Gabriela Griego Villalobos, Universidad Autónoma de Ciudad Juárez.

## RESUMEN

*Históricamente el desarrollo industrial ha sido uno de los detonantes económicos en las regiones fronterizas del norte de México. Una de las industrias que ha tenido mayor crecimiento en esta región es la industria electrónica. Ciudad Juárez concentra un importante número de empresas manufactureras de calidad mundial dedicadas a este sector que demanda importantes inversiones tecnológicas y promete crecimientos constantes. Este trabajo realiza una caracterización de la industria electrónica instalada en Ciudad Juárez donde se analiza su historia, capacidades y escalonamiento tecnológico, así como los factores que permitieron su desarrollo.*

**PALABRAS CLAVE:** Industria Electrónica, Exportaciones Mexicanas, Cd. Juárez

## GENERATING ECONOMIC INDUSTRIES OF THE DEVELOPMENT OF THE BORDER IN MEXICO: CHARACTERIZING THE ELECTRONICS INDUSTRY IN CIUDAD JUAREZ

## ABSTRACT

*Historically, industrial development has been one of the economic detonators in the border regions of northern Mexico. One industry that has had the greatest growth in this region is the electronics industry. Ciudad Juarez concentrates a large number of world class manufacturing companies engaged in this sector that demands major technological investments and promises steady growth. This work makes a characterization of the electronics industry installed in Ciudad Juarez where its history, capabilities and technology scaling is analyzed, and the factors that led to its development.*

**JEL:** M00

**KEYWORDS:** Electronic Industry, Mexican Exportations, Cd. Juárez

## INTRODUCCIÓN

La industria electrónica ha tomado un papel muy importante a nivel mundial, sus sectores con nuevas tecnologías en la información y comunicación, han dado forma a una nueva organización social y productiva. En 1999 Dabat y Toledo, visualizaban un nuevo ciclo industrial con grandes consecuencias para la configuración espacial de la economía mundial, a favor de Estados Unidos por su liderazgo tecnológico y empresarial en el sector electrónico informático, en contra de Japón, por su posición relativamente débil en los nuevos sectores de punta. Favorable para Asia Oriental, con un posicionamiento como una de las principales potencias exportadoras, seguida bastante detrás por países como México. Lo

que se reflejó en corto tiempo en la industria electrónica. Sin embargo, el sector electrónico permite llevar a México a un nuevo panorama que le permite ser un país competente y capaz de participar entre los países líderes en la industria electrónica.

Es importante remarcar la diferencia entre la industria electrónica y la industria eléctrica, si la principal función del aparato o componente es transformar la energía eléctrica a otra forma de energía, se considera eléctrico. En cambio si la función del aparato o componente es procesar algún tipo de información entonces se considera electrónico (ProMéxico).

## REVISIÓN LITERARIA

La especialización en industria electrónica de ciertos países posibilitó una integración rápida y avanzada al mercado mundial, a los Estados Unidos. Países con mercados internos pequeños, elevaron de manera vertiginosa sus importaciones y exportaciones, generándoles un alto grado de vulnerabilidad, ante industria electrónica mundial, y ante los cambios de la política comercial de Estados Unidos (Dabat, Rivera y Toledo, 2001). El Sistema de Clasificación Industrial de América del Norte 2007 (SCIAN), divide la industria electrónica en cinco grandes subsectores: Computación y oficina, semiconductores, comunicaciones, audio y video, equipo médico e instrumentos de precisión, medición, control y óptico.

En México la industria electrónica es una de las más dinámicas, su crecimiento se refleja en el ámbito de los servicios, las grandes empresas son de capital extranjero y algunas nacionales con tecnología que proviene del exterior del país. Según Ordoñez (2002), en México, está constituida por dos segmentos muy diferentes: el de sustitución de importaciones o industria reconvertida, y el de maquila. En los años sesenta y setenta México se convirtió en el décimo primer exportador mundial de productos electrónicos, centrándose en la industria por sustitución de importaciones y la primera generación de la industria de maquila de la frontera norte. En 1994 se firma el Tratado de Libre Comercio de América del Norte (TLCAN) se implantan en el país las principales empresas transnacionales de la electrónica y la informática mundial, para aprovechar los beneficios del TLCAN (Dussel, 1998; Ordóñez, 2002).

En esta etapa del TLCAN, Estados Unidos y Canadá visualizaron a México como parte de su espacio económico, con menores costos de producción, permitiéndoles mejorar su competitividad en el mercado mundial. A la empresa asiática y europea les era posible producir a bajo costo en México y exportar sin aranceles a Estados Unidos. A los grandes exportadores electrónicos de Asia Oriental hacia Estados Unidos, el TLCAN los hizo menos competentes internacionalmente ya que tendía a sacarlos del mercado estadounidense, y favorecía la entrada de sus principales empresas en México (Dabat, 2004). México aparte de su colindancia con Estados Unidos era atractivo en la industria electrónica por sus bajas remuneraciones del trabajo y no tan bajos niveles de calificación laboral y productividad del trabajo, esta última en pleno ascenso. Ante esto, ha surgido el interés por el estudio de los sistemas de innovación porque se consideran motores del desarrollo económico del país (Freeman, 1995; Lundvall, 1992). Algunas de las principales empresas de la industria electrónica a nivel mundial tienen operaciones en México, 9 de las 10 principales empresas transnacionales de servicios de manufactura están ubicadas en el país, los estados con una alta producción en la industria son: Baja California, Chihuahua, Jalisco, Nuevo León y Tamaulipas. Entre 1991 y 2000, la industria electrónica se convierte en el principal exportador de manufactura en México (Instituto Nacional de Estadísticas y Geografía, INEGI, 2009).

En la desaceleración del crecimiento de Estados Unidos en el año 2001, afectó de forma importante la Industria maquiladora electrónica del país, particularmente a Chihuahua, reduciéndose la producción y el empleo. La electrónica de consumo decayó muy poco, por la fortaleza del sector de televisores que no dejó de crecer durante la crisis conservando en todo momento su primer lugar mundial. (COMTRADE 2004 y US Census Bureau 2004). Después de la crisis económica, dado que México cuenta con ventajas

competitivas (su dinámica demográfica, su ubicación geográfica y sus tratados comerciales), en 2012, tuvo una importante participación en las exportaciones a nivel mundial. Obtuvo el primer lugar mundial como exportador de pantallas planas, posicionándose sobre países altamente competitivos. Obtuvo el quinto lugar en las exportaciones de computadoras a nivel mundial, cuarto lugar en micrófonos, audífonos y altavoces y el décimo lugar en teléfonos celulares (ProMéxico, 2013).

En su origen, la industria electrónica apoyó el desarrollo industrial de la zona fronteriza Norte de México. En México, Chihuahua y Nuevo León tiene una intensa actividad industrial y capacidad de innovación. La industria electrónica en el estado de Chihuahua, consta exclusivamente de maquiladoras de exportación, influyente sector en la actividad económica, el 58% de las exportaciones de Chihuahua corresponden a la industria electrónica. Se identifican en el Estado importantes corporativos mundiales, pero se observa carencia de proveedores (Fabricantes bajo contrato) CM's y (Proveedores especializados) SS's, la implantación de éstos y de empresas (Fabricantes de equipo original) OEM's de primer nivel, serían incentivos para los proveedores locales.

En 2011, ocho empresas con planta de manufactura en Chihuahua se encuentran entre las 25 empresas electrónicas más exportadoras de México: PCE Technology de Juárez, ECMMS, de México, Jabil Circuit de Chihuahua, Scientific Atlanta de México, Tatung de México, Foxconn México Precisión Industry y IEC Technologies. El monto de exportaciones de estas empresas ascendió 16,882.3 millones de dólares, representando 23.7% de las exportaciones totales de la industria electrónica en dicho año. La inversión extranjera directa (IED) por el sector electrónico en Chihuahua en el período 2007– 2011 fue de 999.4 millones de dólares, que representa el 21% del total de inversión generada por dicho sector en el mismo período. Ciudad Juárez es un influyente sector en la actividad económica del estado, importante generador de empleos y de divisas. En los noventa se asentaron plantas japonesas de la rama electrónica, en este mercado con bajos costos de producción y alta calidad, a esto se añadió la entrada en vigor del TLCAN que inhibe la importación de maquinaria, componentes e insumos procedentes de regiones externas al bloque comercial norteamericano (Contreras, O. y Carrillo, J., 2001).

En el estado se ha desarrollado un importante agrupamiento industrial, entre las principales empresas OEMs se encuentran Lexmark, Scientific Atlanta de México, Thomson y Toshiba que operan bajo el régimen de maquila. Asimismo, en esta región se localizan importantes empresas CEMs: ECMMS, Flextronics, Foxconn, Jabil, Plexus, SMTC, Tatung y Wistrón. (Economía, Monografía: Industria Electrónica en México. , 2012). Manuel Ochoa Ochoa, vicepresidente de Borderplex Alliance, afirma que Juárez es un lugar viable para hacer productos de exportación a Estados Unidos, la calidad de su mano de obra y el costo, son mejores que los de China. Se mantiene como la ciudad con más empleo en manufactura de exportación, a pesar de la crisis económica y de violencia que vivió. En la actualidad hay más posibilidades de inversión, la dinámica, el ambiente, entre otros proyectos, vienen a ofrecer la posibilidad de una dinámica distinta para la ciudad, que definitivamente les conviene a los corporativos. Juárez exportó 45 mil millones de dólares en 2012, (El Diario.mx, 2013) lo que significa casi el 20 por ciento de las ventas no petroleras del país al extranjero.

Según René Mendoza Acosta, director regional de la Cámara Nacional de la Industria Electrónica de Telecomunicaciones y Tecnologías de la Información (Canieti) en conjunto con la Secretaría de Economía, se trabaja en el desarrollo de una propuesta que permita aumentar la proveeduría en la industria maquiladora. De las fortalezas más significativas de Cd. Juárez además de su ubicación geográfica frente al mercado de Estados Unidos, es el asentamiento de plantas de corporativos mundiales que han destinado recursos a centros de desarrollo de investigación, además posee una industria diversificada en componentes electrónicos y telecomunicaciones. Los acuerdos comerciales favorecen el sector, el Tratado de Libre Comercio México Unión Europea TLCUE que en 1997 se firma el Acuerdo Global, y el Tratado de Libre

Comercio de América del Norte TLCAN firmado en Noviembre de 1993, la industria electrónica es un sector estratégico en la región (Industrial, 2002).

## CONCLUSIONES

Por lo anterior, la industria electrónica ha sido parte importante en el despegue de la economía del país, y sobre todo la franja fronteriza Norte ha contribuido considerablemente por medio del sector maquilador, la principal ventaja es la colindancia con Estados Unidos, además su mano de obra calificada a mejor costo han mantenido a ciudad Juárez en la mira de otros países dispuestos a invertir en ella. México se ha enfocado en tener personal con mayor conocimiento y preparación profesional lo que permite ser más competitivos ante otros países, atrayendo inversiones directas extranjeras motivadas por un mejor servicio. Los tratados como el Tratado de Libre Comercio contribuyeron a que otros países decidieran producir en el país, pues uno de los beneficios de dicho acuerdo es evitar la barrera arancelaria, lo que hace posible importar equipo y exportar productos a Estados Unidos y Canadá.

Un área de oportunidad es la implantación de empresas proveedoras de partes o componentes Proveedores Especializados SS's, lo que disminuiría las importaciones, principalmente en la frontera donde existen concentraciones de empresas fabricantes que requieren de partes para sus productos terminados. La electrónica es una industria que ha permitido a Cd. Juárez incrementar aceleradamente su participación en la economía global, representa nuevas oportunidades para el desarrollo regional y nacional, apoyándose en el incremento de las capacidades locales y locales y adoptando nuevas tecnologías.

# SISTEMA AGROFORESTAL LA SOSTENIBILIDAD DEL MEDIO AMBIENTE

Jafet Samir González Gómez, Francisco de Paula Santander  
Jhon Antuny Pabón León, Universidad Francisco de Paula Santander

## RESUMEN

*La relación intrínseca de la humanidad y los recursos renovables han dejado una herencia de intervenciones en los ecosistemas, que sumado al actual modelo extractivista neoliberal que privilegia principalmente a los exclusivos sectores económicos, ha consentido la tala indiscriminada de bosques sin realizar actividades forestales que propendan por la conservación de los recursos boscosos y la regulación del ciclo hidrico, además de afectar directamente los ingresos económicos de la comunidad campesina del área rural del Municipio de Bochalema del Departamento de Norte de Santander. El desarrollo de la investigación Programa Piloto de Implementación de Sistema Agroforestal como Motor de Desarrollo Sostenible ha generado alianzas públicos-privadas que impactaron positivamente a las comunidades beneficiarias del proyecto, logrando a través de estrategias participativas comunitarias la identificación de las causas del fenómeno de la deforestación en el municipio, entre las que se destacan la extensión de la frontera agrícola y pecuaria, y, las inadecuadas prácticas en los procesos extractivos mineros que se llevan a cabo en la jurisdicciones municipales; de igual manera, la comunidad reconoció que el menoscabo de los valores tradicionales, la apatía y la omisión de denuncia de los ecocidios han aunado en la problemática ambiental.*

**PALABRAS CLAVE:** Desarrollo Sostenible, Participación Ciudadana, Agroforestería

## AGROFORESTRY ENVIRONMENTAL SUSTAINABILITY

### ABSTRACT

*The intrinsic relation between the humanity and the renewable resources has left a heritage of interventions in the ecosystems, in addition to the current neoliberal extractive model which mainly favors the exclusive economic sectors, has contributed to the indiscriminate felling of the forests without starting forestry activities that tends to the conservation of the forest resources and the regulation of the hydric cycle, besides affecting directly the incomes of the farming community of the rural area of Bochalema a North Santander Department town. The development of the pilot program of implementation of the agroforestry system as the engine of sustainable develop has generated public – privates alliances that have positively impacted the beneficiary communities of the project, achieving throughout community- participative strategies the identification of the causes of the deforestation phenomenon in the town. Among them is standing the agricultural and livestock frontier and, the inappropriate practices in the extractives mining processes that are taken in the area at the same time the community has recognized the detriment of traditional values, apathy and failure to report the ecocide that has joined to the environmental issues.*

**KEYWORDS:** Sustainable Development, Citizen Participation, Agroforestry

## INTRODUCCIÓN

La presente investigación es un avance del proyecto denominado Programa Piloto de Implementación de Sistema Agroforestal como Motor de Desarrollo Sostenible; es una estrategia que entrelaza las sinergias de la Academia, las Instituciones Gubernamentales y la Comunidad Rural del Municipio de Bochalema para contrarrestar las presiones socioeconómicas en el ambiente. Según los expertos en la última década a nivel mundial han desaparecido 130 millones de hectáreas de bosques y se calcula que tal pérdida le cuesta a la economía mundial entre 2 y 4.5 billones de dólares al año (FAO, 2011). Colombia un país considerado Hot Spot por presentar tasas de deforestación de 120 mil hectáreas anuales que en el periodo de 1961 al 2005 se ha perdido casi 5,3 millones de hectáreas, lo cual significa una deforestación media anual de 120 mil hectáreas de bosques (Peña, Rojas y Pérez, 2010). El municipio de Bochalema ubicado en el departamento de Norte de Santander, el cual, ostenta gran oferta de tierras con vocación forestal y de vocación minera, cuya actividad, amenaza la superficie de la cobertura boscosa debido a que su práctica se ha caracterizado por alto grado de informalidad e ilegalidad que inciden en la destrucción y fragmentación de áreas boscosas transformando la estructura de los ecosistemas estratégicos de la región (PDDFNdS, 2011), además, de la pérdida cobertura boscosa generalizada en el Departamento, la contaminación hídrica por aguas residuales y de residuos sólidos repercuten en la escasez del preciado líquido en el municipio de Bochalema (E.O.T., 2003)

La preocupación de la problemática ambiental permitió la realización del primer “Foro Bosques para el Futuro” en el Municipio de Bochalema del Norte de Santander como una estrategia participativa para diagnosticar la utilización de los bosques de la región, el objetivo del foro-taller fue la de diagnosticar el manejo y aprovechamiento de los bosques para construir en comunidad propuestas que viabilicen el desarrollo forestal sostenible en el municipio de Bochalema. Los resultados pudieron evidenciar que el fenómeno de la deforestación es causado por los sistemas productivos tradicionales como la ganadería, la agricultura y la minería; la extensión de la frontera de dichas actividades han incidido en la pérdida de la cobertura boscosa del Municipio y en la escasez del preciado líquido. A través de la metodología Acción Participativa -IAP- se logró que asistieran de manera masiva y democratizadora plantear las posibles alternativas de solución a las evidentes problemáticas que rodean al recurso bosque. Asimismo, la participación ciudadana es pilar fundamental para entrelazar los entes gubernamentales, la academia y la comunidad del municipio de Bochalema para reformular sistemas sustentables de producción, como lo es la agroforestería un medio de producción para el pequeño y mediano campesino.

## REVISIÓN DE LA LITERATURA

El desarrollo sostenible entendido como el equilibrio entre la colonización y la preservación de los recursos naturales, ha debatido dos tesis principales, la primera la sostenibilidad antropocéntrica o débil, fundamentada en principios neoliberales y extractivistas, ha visionado la utilización de los recursos naturales para satisfacer las necesidades de la humanidad, desconociendo la conexión de las esferas económicas, sociales y ambientales que convergen con la humanidad (Figura 1), dicho en otras palabras, la sostenibilidad para el hombre, por el hombre y hacia el hombre, en su aspiración de sobrevivir (García, 2003). La segunda tesis es, la sostenibilidad fuerte o ecológica, basadas en la cosmovisión del sistema o teoría general de sistemas (Vega, 2005), donde afirma la interdependencia e interconexión de los subsistemas económicos, sociales y generales en el tiempo (Figura 2). La precaución del uso racional de los recursos renovables, ya que, son considerados esenciales para el sostenimiento de la vida en el globo, los cuales, el uso desmedido podría ocasionar eventos catastróficos sin la posibilidad de la sustitución de mucho de aquellos recursos (Gómez, 2005; Arias, 2006).

Las teorías del desarrollo sugieren una participación de la comunidad para generar la integración colectiva y orientar la ejecución de políticas y programas para el crecimiento económico, la reducción de la pobreza,

el bienestar social, y la adecuada prestación de los servicios públicos. Sugiere las sinergias de los respectivos sectores para intervenir, mantener, reformar o transformar los sistemas de organización (Velásquez y González, 2003). La participación comunitaria tiene un ámbito democrático, político y social dependiendo del contexto en que se desenvuelva (Pérez, 2004); desde el punto de vista democrático y político, se han garantizado los mecanismos para la ecuanimidad gubernamental en los diferentes sectores sociales, principalmente para proteger el orden burocrático de la democracia, pero más allá del clientelismo y de los vaivenes proselitistas, además del discurso teórico de la polis y la demos que infiere el término de “participación ciudadana”, es menester señalar, la carga axiológica de la planeación participativa para la adopción de decisiones justas y correctas (Salazar, 2004), ha significado en la historia una solidaridad entre hermanos de una misma estirpe o un mismo territorio para el cumplimiento de objetivos comunes (Pérez, 2004).

Las prácticas de producción orientadas a interactuar los procesos de usos de tierras con el fortalecimiento de prácticas de producción ancestrales, se llama agroforestería, en palabras de Ospina (2006) “la agroforestería es una interdisciplinar, también una tradición e innovación productiva y de conservación de la naturaleza, desarrollada, donde existen formas de manejo y aprovechamiento de sistemas agroforestales en fincas y territorios comunitarios para obtener una producción biodiversa, libre de agroquímicos y duradera con predominio y desarrollo de saberes tradicionales y novedosos, fortalecimiento de la identidad cultural, interacciones ecológicas totales de complementariedad del sistema, diversificación del paisajes, aprovechamiento adecuado de recursos naturales, privilegio del trabajo humano, uso de tecnologías de bajo impacto ambiental y relaciones sociales y económicas de bienestar, equidad y justicia”, ó como lo aseveran Farrell y Altieri (1999) “la agroforestería representa un concepto de uso integrado de la tierra que se adapta particularmente a las zonas marginales y a los sistemas de bajos insumos”

## METODOLOGÍA

El enfoque Investigación Acción Participativa (IAP) es una metodología que estudia la realidad buscando el desarrollo de dos tipos de conocimiento, el teórico y el práctico en el contexto de determinado (municipio de Bochalema). Expone Ander-Egg (2003) la IAP es poner la investigación en un plano único, poner las ideas en acción. La finalidad principal de los métodos de intervención social como lo es la IAP; es la participación activa de la comunidad para proponer soluciones de los problemas locales identificados. Este modelo sistemático y flexible posibilita a la “lógica de la realización” (Ander-Egg, 2003) para liberar el potencial de la comunidad. Las técnicas para la elaboración del diagnóstico participativo fue la realización del evento Primer Foro: Bosques para el Futuro, con el objetivo de diagnosticar el manejo y aprovechamiento de los bosques para construir en comunidad propuestas que viabilicen el desarrollo forestal sostenible en el municipio de Bochalema. A través de la co-ejecución de la Universidad Libre Seccional Cúcuta y la Alcaldía Municipal de Bochalema, se invitó como honorables talleristas a la Secretaria de Desarrollo Económico de Norte de Santander, La Corporación Autónoma Regional de la Frontera Nororiental -CORPONOR- y el Servicio Nacional de Aprendizaje -SENA- para que conformaran la mesa técnica del Foro instalada en la Casa de la Cultura José Rozo Contreras en el municipio de Bochalema, departamento de Norte de Santander.

Se utilizó la metodología Campesino a Campesino -CaC- por buscar la participación de la comunidad rural para la sistematización de conocimientos sobre aspectos agrícolas, sociales y económicos (Cóndor, 2010). La metodología empleada en el foro-taller “Bosques para el Futuro”, logró la masiva participación de los líderes rurales de las veredas del Municipio de Bochalema convergiendo en el mismo espacio con la academia y los entes gubernamentales; a través de actividades lúdicas pedagógicas de participación, se cuestionó a los asistentes sobre el uso de los bosques y las propuestas o soluciones que permitirían el desarrollo forestal sostenible en el municipio de Bochalema.

## RESULTADOS

Es importante enunciar la renovación de los lazos académicos de las Universidades del departamento de Norte de Santander, este entrelazamiento de la Universidad Francisco de Paula Santander y la Universidad Libre seccional Cúcuta en procura del cuidado de los recursos renovables del Departamento y en especial en el municipio de Bochalema, permitió la planeación, direccionamiento, control y ejecución exitosa de las actividades lúdico pedagógicas del foro “Bosques para el Futuro”. Aproximadamente un promedio del 4.7% de los asistentes afirmaron que el foro taller respondió a las actuales problemáticas ambientales del Municipio, y con el mismo promedio los asistentes aceptaron que el foro fue vinculante con los temas expuesto por los talleristas y los organizadores. Otro tanto, con el 4.4% respondieron que las actividades desarrolladas en el foro permitieron avanzar hacia la solución de dichos problemas. Las actividades participativas permiten el fortalecimiento de la cultura ambiental, por ello la metodología es esencial para que las comunidades rurales se involucren en los procesos de desarrollo socioeconómico en las regiones, por lo tanto, el 4.6% de los asistentes afirmaron que la metodología consintió la participación y reflexión individual y grupal, por lo que, el 4.5% dijo que fue variada y no generó cansancio, de igual forma, que los espacios permitidos por la Alcaldía Municipal generó interacción de los participantes entre sí.

Los participantes identificaron que el principal problema ambiental del municipio de Bochalema es el fenómeno de la deforestación, debido a que no existe conciencia ecológica, haciendo necesario la sensibilización de la comunidad en temas ambientales, aunque la comunidad es consciente que la alcaldía municipal de Bochalema, CORPONOR y el SENA han aunado esfuerzos para proteger el recurso boscoso e hídricos a través de proyectos de encerramiento de áreas naturales estratégicas dentro de las jurisdicciones municipales. Por otro lado, la comunidad también afirma que no se han hecho los esfuerzos necesarios para prevenir y mitigar los efectos negativos de la deforestación y el cambio climático, debido a que no se realizan planes de manejo y aprovechamiento de los bosques.

## CONCLUSIONES

Los ejecutores y participantes del foro taller evidenciaron la preocupante situación del área boscosa del municipio de Bochalema y recomendaron estrategias para la conservación del medio ambiente, las cuales permitirán acceder a proyectos participativos sustentables de convocatorias nacionales e internacionales. Las principales dificultades de la planificación y la organización comunitaria para preservación del medio ambiente se deben a las falencias culturales encontradas en la comunidad bochalemense, la falta de compromiso comunitario para modernizar los procesos productivos y la apatía en la participación de proyectos locales sostenibles. Con apoyo del Comité de Evaluación Ambiental del Municipio de Bochalema -CEAM- se direccionaron las estrategias necesarias para la asociatividad de la comunidad alrededor de la protección y conservación del medio ambiente, así mismo, establecer el cronograma de capacitaciones y establecer las acciones necesarias para contrarrestar las causas del fenómeno de la deforestación en el municipio de Bochalema.

# TRANSMISIÓN DE CONOCIMIENTOS EN LA INDUSTRIA DE LA ESFERA NAVIDEÑA DE CHIGNAHUAPAN PUEBLA MÉXICO

María Antonieta Monserrat Vera Muñoz, Benemérita Universidad Autónoma de Puebla

Rafaela Martínez Méndez, Benemérita Universidad Autónoma de Puebla

Gerardo Serafin Vera Muñoz, Benemérita Universidad Autónoma de Puebla

## RESUMEN

*El presente trabajo desarrolla un análisis de las diferencias y particularidades existentes en la transferencia de conocimientos en la práctica de un trabajo artesanal por las personas que prestan sus servicios en la industria de la esfera navideña en las MIPYME localizadas en Chignahuapan Puebla, México y las redes de conocimiento interorganizacionales-sectoriales como facilitadoras de la referida transmisión; entre las personas que realizan actividades de globo, metalizado, decorado y empacado. Los resultados muestran cómo se da la transferencia de conocimientos y que esta transferencia nace propiamente con el trabajo a domicilio en el que se involucra a la familia, quienes aprenden desde la construcción de herramientas de trabajo como pinceles elaborados con pelo de gato, perro, conejo o pelo de cola de ardilla, hasta las actividades antes descritas; esto se presenta debido a que el trabajo en la industria de la esfera es de temporada y las personas en su mayoría tienen un empleo fijo y su trabajo en los más de 400 talleres localizados en la zona opera bajo la modalidad de trabajo a domicilio. Señalando también la presencia de transferencia de conocimientos en los mismos talleres con capacitación de los integrantes de los mismos con mayor experiencia.*

**PALABRAS CLAVE:** Transferencia de Conocimiento, Redes de Conocimiento

## TRANSFER OF KNOWLEDGE IN THE INDUSTRY OF THE SPHERE CHRISTMAS CHIGNAHUAPAN PUEBLA MEXICO

### ABSTRACT

*This paper analyzes differences in the transfer of knowledge by craftspersons who provide services in the industry of the Christmas sphere in SMEs located in Chignahuapan, Puebla, Mexico and interorganizacionales-sectoriales knowledge networks as facilitators of the aforementioned transmission; among those who carry out activities of globo, metallic, decorated and packaged. The results show how knowledge transfers and is properly born with homework which involves the family, who learn from the construction of work tools such as brushes made with hair cat, dog, rabbit or tail hair of squirrel, to the activities described above. This arises because they work in a seasonal industry and people mostly have a steady jobs. Work in more than 400 workshops located in the zone operates in the form of homework.*

**JEL:** M00

**KEY WORDS:** Transfer of Knowledge, Knowledge Networks

### INTRODUCCIÓN

El capital humano es el recurso más importante en una organización y crece en la medida en que desarrolla y mejora sus conocimientos, competencias y habilidades. Dado que el tiempo es una condición necesaria

para que esto ocurra, a menudo en las organizaciones hay personas con mucha trayectoria y con un alto desarrollo de capacidades y de altísimo impacto en los resultados. La transferencia de conocimientos se hace más dinámica y factible con las redes sociales interorganizacionales-sectoriales, factor indispensable de la actividad empresarial, y que es a través de éstas como se puede tener acceso a diferentes recursos, entre otros a diferentes conocimientos. Considerando la transmisión del conocimiento desde dos escenarios: el primero de ellos en el trabajo a domicilio y el segundo el trabajo desarrollado en el taller.

*La investigación se estructura de la siguiente forma:* Revisión de la literatura, donde se integra el punto de vista de respecto a las redes de conocimiento en materia de transmisión de conocimientos, así como información de la elaboración de esfera navideña. Posteriormente se presenta la metodología utilizada, los resultados y conclusiones.

## REVISIÓN DE LA LITERATURA

### Transmisión de Conocimientos

El conocimiento no es algo fácil de definir, diversos autores lo describen bajo el concepto de *know how* (saber hacer), que implica un conjunto de técnicas y conocimiento que están incluidos en la naturaleza humana y que por lo tanto están dispersos y divididos (Nelson, 2000). Otros autores coinciden en que el *know how* reside en redes o regiones y localidades. En los años cincuenta Polanyi (1958; citado por Nelson, 2000) sostenía que una parte del conocimiento humano era articulado, es decir que podía ser descrito y comunicado en forma de lenguaje, mientras que otros aspectos de este conocimiento son tácitos, no fácilmente explicables en palabras o en símbolos. El conocimiento implica intercambio o flujos de información (Macdonald, 1992; Imai, 1991). En la transmisión y utilización de conocimientos se distinguen dos tipos: el codificado o formal y el tácito. El codificado no necesita ser exclusivamente teórico, pero requiere ser suficientemente sistemático para ser escrito o guardado (Gibbons *et al*, 1994).

Se expresa en publicaciones, patentes y artefactos, se puede decir que es el resultado del conocimiento tácito que se codifica en esas formas. El conocimiento es transmitido a través de redes de comunicación (Quandt, 2000). El conocimiento tácito no está disponible en forma de texto se observa se alberga en las cabezas de quienes trabajan en procesos particulares de transformación o el que está incluido o personificado en un contexto organizativo particular (Gibbons *et al*, 1994; citado por Casas, 2003); está contenido en habilidades y que por tanto puede ser copiado, está contenido en las personas y es difícil de ser transferido. Implica un proceso de aprendizaje continuo por los individuos (Quandt, 2000). Senker y Faulkner (1996) señalan que el conocimiento tácito se expresa en el conocimiento personal que ha sido adquirido a través de su educación formal o de la experiencia. Por sus características el conocimiento tácito no puede expresarse en forma impresa y se adquiere por la experiencia siendo incorporado en las personas. Los canales de transmisión del conocimiento, señalados por Lundvall (2000:127) se presentan en Tabla 1.

Tabla 1: Canales de Transmisión de Conocimiento

Tipos de Conocimiento	Canales de Transmisión
Codificado: el know-what el know-why	Libros , conferencias y mediante al acceso a bases de datos
Tácito: el know-how el know-who,	Experiencias, práctica, movilidad y la interacción social.

*El conocimiento Tácito, se transmite por medio de experiencias y practicase de las personas y es el que se encuentra en el trabajo artesanal. Del canal de transmisión de las interacciones personales se genera en la vinculación con las redes de conocimiento.*

Senker y Faulkner (1996) plantean, que el conocimiento tácito es transferido mediante las redes personales.

## Redes de Conocimiento

Las redes de conocimiento son expresiones de la interacción humana en un contexto social propio e íntimamente ligado al desarrollo de las civilizaciones. Las redes se encuentran en un ámbito histórico, espacial y territorial determinado, han existido desde la creación del hombre y funcionan en contextos locales, regionales, nacionales e internacionales muy concretos. Las redes sociales se insertan en la concepción de la teoría de la acción colectiva que "delimita que el capital social formados por redes de reciprocidad, cooperación voluntaria y compromiso" son parte de la propia dinámica del sistema social. (Vargas, 2003:7). Según Casas (2003) estas redes: "...implican tanto la formación de redes profesionales y de entrenamiento como de redes de difusión y transmisión de conocimientos o de innovaciones, que estarían dando lugar a la formación de espacios regionales de conocimiento".

Existen autores como Podolny y Page (1998), quienes señalan que una red social se puede considerar como un conjunto de actores que establecen relaciones de intercambio durables y repetidas, y que carecen de una autoridad organizacional legítima para arbitrar y resolver disputas durante el intercambio. Al auspicio de lo anterior es que se contempla la transmisión de conocimientos en el trabajo a domicilio. Otros autores como Coleman (1988), Granovetter (1985) y Lin (2001) entre otros, argumentan que una red contiene puntos de unión, que proveen acceso tanto a las personas que pueden por ellas mismas proveer soporte, como a aquéllas que se pueden transitar a través de sus propias redes de contactos (Espinoza, 2011p. 236). Coleman (1998), señala que la clausura de la estructura de la red (extensión a través de la cual los contactos se conectan entre sí), facilita la emergencia de normas efectivas y mantiene la confianza, con lo que se fortalece el capital social. Bajo este segundo argumento se visualiza la transmisión de conocimientos del personal que presta sus servicios en los talleres de esfera.

Los dos modelos anteriores coinciden en la formación de una estructura relacional en las redes para desarrollar y transmitir conocimientos. Tanto individuales como colectivos. Las redes de conocimiento se caracterizan por: a). Las redes de conocimiento son expresiones de la interacción humana en un contexto social propio e íntimamente ligado al desarrollo de las civilizaciones, b). El propósito de tales redes, es producir, almacenar, difundir y transferir conocimiento científico y tecnológico por medio de cualquier método pertinente, c). El objetivo de dicha transmisión no es sólo el hecho de informar y difundir, sino de transformar el entorno en la búsqueda constante del enriquecimiento intelectual del ser humano en su quehacer creativo e innovador a través del estudio sistemático que ofrece la investigación científica pluridisciplinaria, d). Las redes se encuentran en un ámbito histórico, espacial y territorial determinado, y funcionan en contextos locales, regionales, nacionales e internacionales muy concretos, e. El avance de las redes ha estado a la par del saber producido e íntimamente relacionado con la ciencia en el contexto económico social de la sociedad, (Espinoza, 2011).

Las redes registran también el carácter individualista creador del hombre en lo que se conoce como "ciencia popular" o conocimiento no científico, igualmente importante en el flujo de información en dicha red. Siguiendo con Espinoza (2011) menciona que existen varias dimensiones de redes unas orientadas a lo intraorganizacional y otras a lo interorganizacional- sectorial. La fortaleza de las redes de investigación es su contribución a la acción descentralizada basada en alguna informal división de tareas.

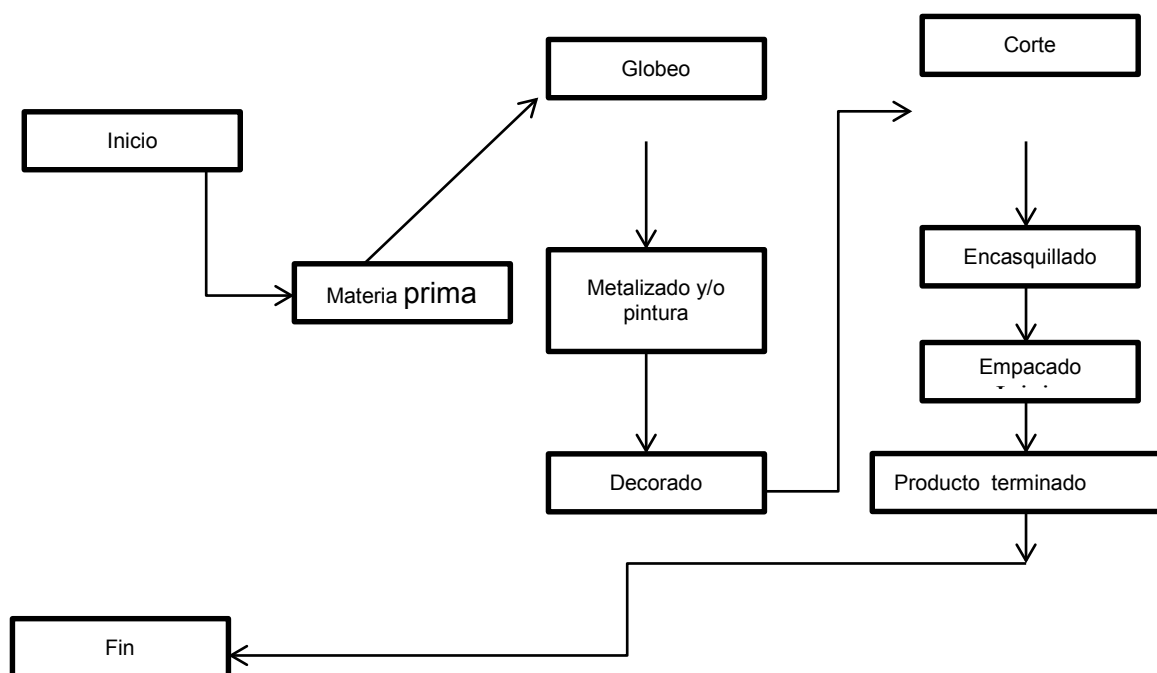

De acuerdo con Plucknett, Smith, y Ozgediz (1990) existen varias clasificaciones de redes. Adicionalmente mencionamos la existencia de tres tipos de redes desde el enfoque de i+d+i: la primera enfocada hacia la compartición de conocimiento, la segunda conlleva la coordinación de prioridades de investigación y proyectos en campos específicos de ciencia y tecnología y la tercera se concentra en la coordinación de políticas de investigación y en la colocación de recursos para propósitos de dimensión internacional (Espinoza, 2011p. 240). Esos tres tipos de redes de investigación participan con puntos comunes. Primero: todas promueven el intercambio de información y conocimiento entre sus miembros. Segundo: dependen

de un focus compartido de intereses comunes, temas, objetivos o resultados. Tercero: los éxitos de las redes están en gran medida determinados por la habilidad de sus miembros tanto para contribuir con información como para beneficiarse de la información que es generada y configurada (ensamblada). Las redes tienden a evolucionar a través del tiempo, de la función básica de intercambio de información y conocimiento, a incluir coordinación, localización e intercambio de recursos. La transferencia de conocimiento tiende a constituir una fortaleza local. Finalmente el conocimiento que se transmite lo apoyamos en lo señalado por Ryle (2005): ‘Aprendemos a hacer mediante la práctica, ayudados por la crítica y el ejemplo, aunque a menudo sin recibir lección alguna sobre la teoría’ (p. 55).

### Industria de la Esfera Navideña en Chignahuapan, Puebla

**Chignahuapan** es municipio poblano ubicado en la Sierra Norte, en la parte noroeste del estado, **su nombre en náhuatl significa “donde abunda el agua”**, a una distancia aproximada de 109 kilómetros de la ciudad de Puebla. La importancia de esta ciudad radica principalmente en la **fabricación de esferas de vidrio soplado decoradas a mano**, logrando la calidad requerida para su exportación a Estados Unidos, Centroamérica y Sudamérica. Familias enteras se han especializado en las diferentes etapas de la fabricación de las esferas. Unos se dedican a inflar el vidrio caliente, otros decoran, ponen diamantina, encasquillan y pintan. Las casas se adecuan para el trabajo. Los niños son los que se dedican más al empaque, aunque no desconocen las etapas del proceso, también existe el trabajo en los talleres de esfera. El proceso de producción Figura 1.

Figura 1: Flujo del Proceso de Producción Esfera Navideña

Fuente: Elaboración propia.

### Descripción de Actividades del Proceso

**Globo:** Varilla de Vidrio neutro que con ayuda de un soplete (vidrio soplado), girando la varilla alrededor del fuego manipulada por las manos del artesano hasta lograr separar un trozo de vidrio llamado bulbo; calentado nuevamente al fuego para después ser soplado con la boca del artesano y dar forma de esferas redondas o de figuras. Con ayuda de un alambre se controla el tamaño del producto.

*Metalizado:* Se sumergen las esferas y figuras en un líquido que las metaliza para después pintarlas y secarlas en cajas muchos artesanos se ayudan para mantener las esferas de pie con desperdicio de madera llamado aserrín.

*Decorado:* En este paso, aflora la creatividad del artesano al plasmar diferentes diseños en las esferas.

*Corte:* Con ayuda de un esmeril se corta el excedente de la esfera.

*Encasquillado:* se inserta en la esfera un casquillo con un alambre oblicuo que sirve para que la esfera se cuelgue.

*Empaque:* Es la parte final del proceso se coloca en las cajas una protección plástica y se van colocando las esferas, verificando también que el producto cumpla con la calidad requerida.

Las esferas son de diferentes tamaños que van desde las más pequeñas del tamaño 0 hasta las grandes del No. 12. Resumiendo: El trabajo se realiza de manera manual empleando sólo tecnología muy rudimentaria, se trabajaba en pequeños talleres y en la casa del artesano, el artesano emplea un elevado número de horas para fabricar cada uno de los productos de principio a fin y cada producto es individual, original y diferente del anteriormente fabricado.

## METODOLOGÍA

El estudio se enfoca a identificar las diferencias y particularidades existentes en la transferencia de conocimientos en la práctica de un trabajo artesanal por las personas que prestan sus servicios en la industria de la esfera navideña en las MIPYME o en sus domicilios, localizados en Chignahuapan Puebla, México. Considerando como variable de investigación: la transmisión de conocimiento tácito en el trabajo a domicilio y el trabajo en los talleres de esfera. El marco muestral se construyó con las unidades y marcos siguientes ver Tabla 2:

Tabla 2: Determinación de la Muestra

Unidad de Análisis	Trabajadores en la Industria de la Esfera en Chignahuapan Puebla, México
Tamaño del universo	15000
Tamaño de la muestra	375
Instrumento	Cuestionario
Periodo de aplicación	Marzo 2013
Cuestionarios aplicados	375
Cuestionarios respondidos	375

*Esta tabla muestra la población estudiada y el tamaño de la muestra, los trabajadores a quienes se les aplicó el cuestionario fueron contactados por personas conocidas por los investigadores y que son miembros de la comunidad, debido a que en los meses de enero febrero y marzo las fábricas y talleres de esfera no tienen actividad, permanecen cerrados iniciando su operación normal en abril.*

## Operacionalización de Variables

La Operacionalización de variables se realiza en la Tabla 3

Tabla 3: Operacionalización de Variables

Variable	Subvariable	Indicadores	Parámetros	Instrumento
Transferencia de conocimientos (Tácticos)	Tipo de conocimiento	Globo Metalizado Decorado Empacado	Se adquirió No se adquirió	Cuestionario (Pregunta 10)
	Forma en que se adquirió el conocimiento	Capacitación en casa Capacitación en el taller Iniciativa personal	Se adquirió No se adquirió	Cuestionario (Pregunta 6,8 y 12)
	Tiempo en que se adquirió el conocimiento	Tiempo	Menos de 1 mes 1-2 meses 2-5 meses 6-12 meses Más de 1 año	Cuestionario (Pregunta 9)
	Personas que apoyaron para adquirir conocimientos	Familiares Amigos Compañeros de trabajo Instructor	Si apoyaron No apoyaron	Cuestionario (Pregunta 6,8 y 11)
	Facilidad y agilidad en el conocimiento adquirido	Relación con el facilitador del conocimiento	Si facilitó y agilizó No facilitó y agilizó	Cuestionario (Pregunta 13)

*Esta tabla muestra la población estudiada y el tamaño de la muestra del objeto de estudio*

La aplicación de los cuestionarios es el instrumento utilizado para la obtención de información la recolección de datos fue por cuota; asignándole a cada encuestador que aplicará un determinado número de cuestionarios. Así como la observación in situ y entrevistas espontáneas a 25 trabajadores. Para determinar el tamaño de la muestra se utilizó la siguiente fórmula:

$$n = \frac{Z^2 p q N}{N e^2 + Z^2 p q} \quad (1)$$

Donde:

n=?

e= 5%

N = la población = 15000 trabajadores

Z = nivel de confianza 95%=1.96

p = 0.50

q = 1-.50

(2)

Sustituyendo los valores en la fórmula tenemos:

$$n = \frac{(1.96)^2(0.50)(1-0.50)(15000)}{(15000)(0.05)^2 + 1.96^2(0.50)(1-0.50)} = 375 \quad (3)$$

La aplicación de cuestionarios fue en una sola etapa en el mes de marzo 2014, con duración de dos semanas.

## RESULTADOS

Previo a la aplicación del cuestionario se utilizó una pregunta filtro para tener la certeza de que la persona trabaje en la producción de esfera navideña. De la aplicación del cuestionario, se obtuvieron los resultados que a continuación se presentan:

### Perfil del Trabajador

El perfil del trabajador de los talleres de esfera navideña se puede definir con base en los resultados que muestra la Tabla 4 como: sexo, edad, escolaridad y tamaño de familia, relacionados con las preguntas 1, 2,3 y 4.

Tabla 4: Perfil del Trabajador

Concepto	Indicador	(%)	Total
Sexo (1)	Femenino	62	100%
	Masculino	38	
Edad (2)	Menos de 18	8	100%
	18-29	34	
	30-35	30	
	36-40	15	
	Más de 40	13	
Escolaridad (3)	Primaria	52	100%
	Secundaria	11	
	Técnico	15	
	Otros	6	
	No estudio	16	
Tamaño de familia (4)	1 a 2	16	100%
	3 a 4	46	
	5 a 6	19	
	7 a 8	19	

*Esta tabla muestra el perfil del trabajador de los talleres de esfera navideña identificando que hay mayor presencia de mujeres, la edad predominante es de 18 a 29 años con estudios de primaria y de tres a cuatro integrantes de la familia.*

Respecto al perfil del trabajador, con base en los resultados presentados en la tabla 4 la mano de obra femenina es la que tiene mayor número de fuentes de empleo ocupadas. También se observa, la mínima presencia de trabajo de menores de edad (menos de 18 años), existe un sesgo en trabajadores adultos jóvenes que se encuentran en los rangos de más de 18 a 29 y de 30 a 35 años. Notamos además que los trabajadores tienen el grado mínimo de estudios de nivel primaria, pero también un buen porcentaje no estudio. Finalmente es importante el resultado de número de integrantes de la familia que predomina entre 3 a 4 personas, considerando a la madre y al padre de familia, se tienen únicamente 2 hijos. La Tabla 5 muestra los resultados de la pregunta 5.

Tabla 5: Antigüedad de los Trabajadores de los Talleres de Esfera Navideña

	Menos de 1 año	1-2 años	2-5 años	6 a 10 años	Más de 10 años	Total
Antigüedad en el oficio (5)	11%	18%	35%	23%	13%	100%

*La Tabla refleja respecto a la pregunta 5 los más altos porcentajes en el rango de 2 a 5 años; seguido de 6 a 10 años por lo que se aprecia que los trabajadores conservan su empleo.*

Los resultados que se aprecian en la tabla 5 exhiben seguridad en el trabajo al mostrar una antigüedad que denota madurez, en los rangos de 2 a 5 y de 6 a 10 años. Los resultados de las preguntas 6, 7, 8, 9, 12, 13 y 14 se presentan en la Tabla 6. En la Tabla 6 se muestran los resultados de las preguntas 6, 7, 8, 9, 12, 13 y 14 continuando para efectos del análisis. Se aprecia la presencia de la transmisión de conocimientos al inicio (pregunta 6), en primer lugar entre los familiares y en segundo lugar con los compañeros de trabajo, resultado que se confirma con los resultados que se muestran correspondientes a las preguntas 8 y 12, Incremento de la Transmisión del conocimiento y diversidad de conocimientos Transmitidos, respectivamente. Respecto al tiempo de aprendizaje, podemos comentar que es en tiempo mínimo que va de menos de un mes hasta 12 meses de forma muy equilibrada y según la actividad dentro de la producción de esfera en la que se va a desempeñar el trabajador.

Tabla 6: Resultados de la Transmisión de Conocimientos

Concepto	Parametro	%	Total
Inicio del Aprendizaje del oficio (6)	Familiar en casa	57	100%
	En el trabajo	34	
	Algun amigo	8	
	Otro	1	
Lugar de trabajo (7)	Taller	76	100%
	Domicilio	24	
Incremento de la Transmisión del conocimiento (8)	Familiar en casa	58	100%
	En el trabajo	34	
	Algun amigo	8	
	Otro	0	
Tiempo de aprendizaje (9)	Menos de 1 mes	24	100%
	1 a 2 meses	21	
	2 a 5 meses	29	
	6 a 12 meses	21	
	Mas de 1 año	5	
Diversidad de conocimientos Transmitidos (12)	Familiar	61	100%
	Compañeros de trabajo	35	
	Forma distinta a las anteriores	4	
Relación previa con la persona que le transmitió el conocimiento (13)	Si	69	100%
	No	31	
Trabajo unicamente en el domicilio (14)	Si	9	100%
	No	81	

La Tabla presenta resultados que ratifican de quieren se reciben los conocimientos como se señala en las preguntas 6,8 y 12, puntualizado que es de familiares.

El lugar de trabajo es primordialmente en los talleres, sin embargo no se descarta el trabajo a domicilio. Notamos también la existencia de una relación ya establecida con la persona que trasmite los conocimientos. Tabla 7: Concentrado de respuestas a las preguntas 10 y 11, que se refieren a datos de actividades realizadas como parte el oficio en los talleres de esferas navideñas y la dificultad de aprendizaje de cada una de ellas.

Tabla 7: Actividades Realizadas en los Talleres de Esfera Navideña

Actividad	Variedad de Actividades Realizadas (10)	Dificultad de Aprendizaje de las Actividades (11)
Globo	128	131
Metalizado	94	53
Decorado	143	83
Empacado	30	4
Encasquillado	4	4

En la Tabla se observa que de 375 personas 143 actividades de globo y 128 de decorado, constituyendo estas dos las mas demandadas en los talleres y domicilios. Tambien se observa que la actividad mas dificil de aprender y dominar es el globo.

Los resultados que se resumen en la Tabla 7, muestran que los trabajadores a los que se les aplicó el cuestionario han prestados sus servicios realizando más de una actividad y que las actividades que se practican frecuentemente que son más requeridas es la de decorador y de globo. También observamos que la actividad que presenta mayor dificultad de aprendizaje es el globo seguida de la actividad de decorado. Relacionando los resultados con las variables encontramos lo que se presenta en la Tabla 8.

Tabla 8: Relación de Resultados con las Variables de Investigación

Variable	Subvariable	Indicadores	Parámetros	Resultado
Transferencia de conocimientos en el Trabajo a Domicilio y en los talleres donde se elabora esfera navideña	Tipo de conocimiento	Globo Metalizado Decorado Empacado	Se adquirió No se adquirió	Decorado es el conocimiento más adquirido seguido del globo.
	Forma en que se adquirió el conocimiento (Quien lo transfirió)	Capacitación en casa Capacitación en el taller Iniciativa personal	Se adquirió No se adquirió	La forma en que se inicia con la transmisión del conocimiento en la elaboración de esfera en el domicilio con los familiares.
	Tiempo en que se adquirió el conocimiento	Tiempo	Menos de 1 mes 1-2 meses 2-5 meses 6-12 meses Más de 1 año	Concluimos con base en las respuestas que el tiempo de aprendizaje va desde 1 mes hasta 1 año
	Personas que apoyaron para adquirir conocimientos	Familiares Amigos Compañeros de trabajo Instructor	Si apoyaron No apoyaron	Las personas que participan de forma intensa en la transmisión de conocimientos son los familiares y en segundo lugar los compañeros de trabajo.
	Facilidad y agilidad en el conocimiento adquirido	Relación con el facilitador del conocimiento	Si facilitó y agilizó No facilitó y agilizó	La actividad en a que se tiene mayor dificultad de aprendizaje es el globo, seguida del decorado.
	Facilidad y agilidad en el conocimiento adquirido	Relación con el facilitador del conocimiento	Si facilitó y agilizó No facilitó y agilizó	Las respuestas indican la existencia de una relación previa con la persona que transmitió el conocimiento

*Esta tabla muestran los resultados obtenidos en la aplicación de los cuestionarios, relacionado con las variables y podemos mencionar que es notable la transmisión de conocimientos tácitos respecto a las diferentes actividades involucradas en el proceso de elaboración de esfera navideña, entre familiares y compañeros de trabajo.*

Con base en los resultados presentados identificamos que el conocimiento que se transmite es el conocimiento tácito, que la transmisión se apoya en las redes de conocimiento familiares y retomando los conceptos presentados en la revisión de la literatura, podemos determinar que existen redes de conocimiento al localizarse un grupo de individuos con intereses comunes y que se transmiten sus conocimientos y experiencias con base en la confianza y la reciprocidad. La red que se identifica es interorganizacional-sectorial, y los actores que intervienen en ella son primordialmente familiares y compañeros de trabajo. Finalmente incorporamos los resultados obtenidos en la Tabla 9, para confirmar la existencia de las redes, considerando las dimensiones para el análisis de las redes de conocimiento señalado en estudios realizados por Casas (2003).

Tabla 9: Existencia de las Redes de Conocimiento en la Transmisión de Conocimientos

Concepto	Si Aplica Familiares	Si Aplica Compañeros de Trabajo
Existencia de la Red de Conocimientos.	Si	Si
Elementos de la Red de Conocimientos. (elemento humano, así como por factores tecnológicos y sociales)	Si	Si
Formación de la Red de Conocimientos. (Relación del empresario con clientes y Proveedores)	Si	Si
Dimensiones de la Red de Conocimiento. Análisis :		
1) El contexto institucional de la colaboración entre los sectores público y privado;	Si	Si
2) La estructura o morfología de las redes;( los nodos representan a los actores y las áreas que conectan los nodos representan las relaciones, es decir los integrantes)	Si	Si
3) La génesis, desarrollo y dinámica de las redes (Dinámica: direccionalidad, duración, frecuencia comunicación)	Si	Si
4) El contenido y/o los insumos que se intercambian ( Sobre la idea de conocimiento: tácito y codificado; intercambio de conocimiento, Flujos e insumos de conocimiento: endógeno y exógeno, Tipos de conocimiento: científico, tecnológico, empresarial, Fuentes: acceso a fuerza de trabajo altamente capacitada, universidades locales e internacionales, competidores, alianzas, incentivos gubernamentales, prensa y artículos sobre comercio, eventos locales e internacionales, Canales para cruzar fronteras: contratación de nuevo personal, publicaciones, reuniones, modos informales de comunicación, movilidad de personas entre organizaciones Extensión de fronteras: relaciones personales informales.	Si	Si
5) Los resultados de las redes y del intercambio de conocimientos. (Innovaciones radicales o incrementales, Generación de capacidades en las empresas, Generación de conocimiento, resultados sociales, económicos y/o políticos y Creación de redes de conocimiento).	Si	Si

*Esta tabla muestra la existencia de las redes de conocimiento que apoyan la transmisión de conocimientos entre trabajadores de esfera navideña, compañeros de trabajo y familiares.*

Tabla 10: Dinámica de las Redes de Conocimiento en las MIPYME Poblanas

Estructura de Las Redes (Integrantes)	Dinámica: Direccionalidad, Duración, Frecuencia Comunicación y Alcance	Contenido: Formas de Intercambio E Insumos Que Circulan	Resultados de las Redes Y Del Intercambio de Conocimiento
<b>Trabajador</b>	Contactos personales del trabajador. Se observa una direccionalidad de ambas partes, una durabilidad que tiene su origen al inicio de la vida laboral. Construcción de la relación por interés de ambas partes. El inicio de la relación coincide con el inicio de las actividades laborales.	<b>Información</b> con respecto a las actividades que integran el proceso de elaboración de esfera navideña. <b>Acceso a recursos</b> , en este caso sobre herramientas necesarias que faciliten las actividades.	Generación de conocimiento tácito sobre las actividades que integran el proceso de elaboración de esfera navideña
<b>Familiares</b>	Contacto personal del trabajador. Construcción de la relación por interés de ambas partes. Se observa un intercambio frecuente de información y conocimientos sobre las actividades que integran el proceso de elaboración de esfera navideña. Y al igual que la relación anterior, el inicio de la relación coincide con el inicio de las actividades laborales del trabajador.	<b>Conocimientos</b> , específicamente respecto a las actividades que integran el proceso de elaboración de esfera navideña a la tecnología e insumos. <b>Acceso a recursos</b> , en este caso a materias primas y herramientas.	Herramientas acorde a las necesidades y exigencias de las actividades que integran el proceso de elaboración de esfera navideña.
<b>Compañeros de trabajo</b>	Contactos personales. Por interés de ambas partes hay un intercambio cotidiano de información y conocimientos tácitos y este vínculo ha existido desde que inició la actividad laboral del trabajador en el taller.	Información sobre las actividades que integran el proceso de elaboración de esfera navideña	Conocimientos tácitos de las actividades que integran el proceso de elaboración de esfera navideña.
<b>Empresa (taller)</b>	Contactos personales. Por interés de ambas partes hay un intercambio cotidiano de información y conocimientos tácitos y este vínculo ha existido desde que inició la actividad laboral del trabajador en el taller.	Asignación de un compañero que guíe en el desempeño de actividades que integran el proceso de elaboración de esfera navideña	Conocimientos tácitos de las actividades que integran el proceso de elaboración de esfera navideña.

*Esta tabla muestra la existencia de las redes de conocimiento entre el trabajador y los diferentes actores que integran la red de conocimientos.*

Con la Tabla 10 presentamos por medio de la dinámica de las redes la transmisión de conocimientos de conocimiento, apoyándonos en a propuesta de Casas, (2003). En la tabla 10 es notoria la participación de actores diferentes a los referidos en otros estudios, realizados y se presentan únicamente de forma muy sintética a los que participan en la red.

## CONCLUSIONES

En la realización de actividades manuales, dentro de la diversidad de conocimientos, el conocimiento que se transmite es el conocimiento tácito. En la transmisión del referido conocimiento se tiene como apoya la participación de las redes de conocimiento o redes sociales, que si bien hay diversidad de ellas existen en específico un tipo de redes que se caracterizan por facilitar la transmisión del conocimiento tácito. El resultado del trabajo, en primer lugar nos permitió confirma la transmisión de conocimientos tácitos mediante la existencia de las redes sociales establecidas por el trabajador con sus familiares y compañeros de los talleres de esfera navideña. Así como identificar a los actores que integran la red formada por el trabajador con base en los estudios realizados por diferentes autores. Y que el trabajo d elaboración de esfera navideña se aprende en el seno familiar, y se perfecciona en la misma familia y en los talleres, lo que permite externar la notaria xistencia del trabajo en talleres y en los domicilios.

Apoyando lo anterior con una propuesta de dimensiones de la red, en la que intervienen actores que no se han manejado de forma frecuente, en estudios de redes. Comentamos también que el perfil del trabajador concuerda con la población que predomina en las pequeñas provincias de los distintos estados de México. Para cerrar las conclusiones señalamos que se deduce de nuestros resultados que las redes de conocimiento facilitan el intercambio y la transmisión de conocimientos tácitos, no codificados por medio de experiencias y guía en el desarrollo de actividades, atendiendo a la confianza entre los actores que intervienen y considerando como punto central de inicio en la referida transmisión a la familia.

# CONTRIBUCIÓN AL GASTO PÚBLICO

Alicia Sánchez de la Cruz, Universidad Autónoma del Carmen  
Hugo García Álvarez, Universidad Autónoma del Carmen  
Nancy Veronica Sánchez Sulú, Universidad Autónoma del Carmen

## RESUMEN

*En el presente trabajo se realiza un análisis de la obligación que tienen los ciudadanos mexicanos a la contribución del gasto público en especial los habitantes del Municipio del Carmen, y del derecho que tiene el estado al cobro y este a su vez de proporcionar servicio de recolección de basura. La economía de un Estado depende de los ingresos que obtenga, pero es necesario conocer la incidencia de los impuestos, tales como los derechos en el gasto público y su impacto en la economía de las familias, de la importancia de contar con un Plan de Desarrollo para tener bien establecido sus finanzas públicas.*

**PALABRAS CLAVE:** Gasto Público, Finanzas Públicas, Estado, Plan De Desarrollo

## THE CONTRIBUTION THAT PUBLIC EXPENDITURE

### ABSTRACT

*In the present work there is realized an analysis of the obligation that the Mexican citizens have to the contribution of the public expenditure especially the inhabitants of the Municipality of Carmen, and of the right that has the condition to the collection and this one in turn of providing service of compilation of garbage. The economy of a State depends on the income that it obtains, but it is necessary to know the incident of the taxes, such as the rights in the public expenditure and his impact in the economy of the families, of the importance of possessing a Plan of Development to have his public finance established well.*

**JEL:** M00

**KEYWORDS:** Public Expenditure, Public Finance, State, Plan Of Development

## INTRODUCCIÓN

El gobierno municipal es la célula fundamental dentro de la estructura de gobierno de nuestro país. En los últimos años se ha desarrollado un proceso que busca su fortalecimiento, realizando las obligaciones y facultades plasmadas en la Constitución Política de los Estados Unidos Mexicanos (CPEUM), en las Constituciones Políticas de cada uno de los Estados, en las Leyes Orgánicas Municipales y otras normas jurídicas que complementan el marco legal donde se sustentan las funciones municipales, ampliando su participación en la vida social, política y económica del país (INEGI, 2011). La función principal del gobierno municipal, según lo establece el artículo 115 CPEUM, es la prestación de servicios públicos, orientados a satisfacer las demandas de la comunidad, como son: agua potable, alcantarillado, drenaje, alumbrado público, rastros, panteones, calles, parques, jardines, limpieza, recolección y traslado de residuos, seguridad pública, tránsito y los que se establezcan en las legislaturas locales.

Para materializar esta función, el gobierno municipal requiere de recursos económicos que le permitan atender las necesidades en forma oportuna y en beneficio de su población. Para solventarlas, recibe recursos de la Federación a través del estado, resultado de los Convenios de Coordinación Fiscal y Colaboración Administrativa. Asimismo, cuenta con ingresos propios que complementan sus recursos. Cabe señalar que

jurídicamente el municipio carece de facultades legislativas, de ahí que sean los Congresos Locales los encargados de establecer las contribuciones que los habitantes deberán cubrir a la hacienda municipal. En el ámbito fiscal, los preceptos normativos que regulan la situación jurídica de los individuos como causantes son la Ley de Ingresos y el Código Fiscal, emitidos por la Legislatura Local y decretados por el Ejecutivo Estatal. En este análisis se presenta la situación del cobro por concepto de recolección de basura que entro en vigor a partir del primero de enero del 2014 y que ha causado molestia en la población Carmelita, debido a que se observa un gran descontento masivo, dicha aprobación se realizó en diciembre del 2013. Tal y como lo señala la Constitución Política de los Estados Unidos Mexicanos (CPEUM, 2014) en su artículo 31 fracción cuarta, es la obligación de los mexicanos contribuir para los gastos públicos, así de la Federación, como del Distrito Federal o del Estado y Municipio en que residan, de la manera proporcional y equitativa que dispongan las leyes. En la primera parte se analizará el Plan Municipal de Desarrollo y las Finanzas Públicas del municipio del Carmen en relación con la Ley Hacendaria de los Municipios del estado de Campeche, que dieron inicio en el 2014 del cobro de los servicios de recolección de basura. La segunda parte estudiará la problemática que enfrenta el municipio con la deuda pública.

## REVISIÓN LITERARIA

A principios del 2014 se aplico el cobro en lo establecido en la sección tercera “Servicios de aseo y limpia por recolección de basura” establecida en la Ley Hacendaria de los Municipios del Estado de Campeche en donde indica la obligación al pago del derecho antes mencionado, haciéndose efectiva a partir del primero de enero provocando indignación entre los habitantes de Ciudad del Carmen, calificando en redes sociales, medios informativos como un pago arbitrario y lacerante para la economía familiar, cabe señalar que dentro del portal del H. Ayuntamiento del Municipio del Carmen no se presenta algún boletín o boletines que informe de la obligación generando incertidumbre ya que desde el momento que acudía el ciudadano a realizar el pago del impuesto predial, se les informaba de la aplicación en lo establecido en Ley para hacer efectivo el cobro del servicio de recolección de basura no mensual como lo marca la Ley citada, el pago a realizar se tenía que realizar anual.

Para conocer un poco más de las funciones que tiene el Estado es importante definirlo y tal como lo señala Ramírez (2000), el Estado desde el punto de vista jurídico, es como una persona jurídica formada por una comunidad política, asentada en un territorio determinado y organizada soberanamente en un gobierno propio con decisión y acción. Se dice también que el Estado, fue construido para atender fines sociales, de todos los miembros de una sociedad. Ahora bien para poder cubrir el gasto publico necesita obtener recursos económicos; los cuales proviene de los ingresos tributarios tales como los establece el artículo 2 del Código Fiscal de la Federación ( CFF) como; los impuestos, aportaciones de seguridad social, contribuciones de mejoras y derechos. Y como el pago del Servicio es identificado como un Derecho que tiene el Estado el Código Fiscal de la Federación lo define como son las contribuciones establecidas en Ley por el uso o aprovechamiento de los bienes del dominio público de la Nación, así como por recibir servicios que presta el Estado en sus funciones de derecho público, excepto cuando se presten por organismos descentralizados u órganos desconcentrados cuando en este último caso, se trate de contraprestaciones que no se encuentren previstas en la Ley Federal de Derechos. También son derechos aquellas contribuciones a cargo de los organismos públicos descentralizados por prestar servicios exclusivos del Estado (CFF, 2013).

Dichas contribuciones no son otra cosa que los ingresos públicos derivados que percibe el Estado, reconocidas en ley, mediante aportaciones pecunarias que en forma obligatoria que son exigidas a los particulares y que servirán para satisfacer las necesidades colectivas. Cabe señalar que dentro del Plan Municipal de Desarrollo 2013-2015 del Municipio del Carmen no especifica el inicio o necesidad de empezar a realizar la contribución al cobro del servicio de recolección de basura, y como lo señala en sus dos vertientes estratégicas al 2015.

Servicios públicos de calidad  
Programa municipal de agua potable  
Servicios públicos de calidad

Proveer servicios públicos con estándares de clase mundial de manera tal que se contribuya positiva y eficientemente en la competitividad urbana; impactando favorablemente la calidad de vida de los carmelitas. Línea estratégica: limpia y recolección de basura.

### Estrategias

*Formulación y aprobación del Programa de Limpieza, Recolección, Manejo, Tratamiento y Disposición Final de los Desechos Sólidos Urbanos del Municipio de Carmen.*

*Gestionar la conversión del relleno sanitario de Ciudad del Carmen en Centro de Proceso, Transformación y Aprovechamiento de Residuos Sólidos Urbanos.*

*Dotación de centros de acopio y disposición de residuos sólidos urbanos en las regiones de Isla Aguada, Sabancuy, Mamantel y Península de Atasta.*

*Gestión con la federación para coadyuvar en el manejo de los residuos peligrosos.*

*Diseñar programas de rutas estratégicas para la recolección de basura.*

*Capacitar al personal de aseo urbano para desempeñar sus labores.*

*Erradicar los establecimientos irregulares de basura. Servicios Públicos de Calidad Plan Municipal de Desarrollo 2012 - 2015*

*Promover una ciudadanía concientizada de su participación en el aseo urbano. Mantener un programa de atención oportuna a requerimientos especiales. Es importante mencionar que las principales fuentes de recursos de los municipios, según el Artículo 115 de la Constitución Política de los Estados Unidos Mexicanos, son las siguientes:*

1. La explotación de sus bienes patrimoniales.
2. Las contribuciones que señalen las Legislaturas Locales.
3. Los derechos derivados de la prestación de servicios públicos.
4. Los recursos federales: participaciones y aportaciones.

Dichos recursos los obtiene el Estado por medio del gasto público para así poder cumplir con las necesidades, siendo este el conjunto de erogaciones que realiza en el ejercicio de sus funciones. Es importante mencionar que las finanzas publicas otorgan sustento a las funciones del estado a fin de cumplir con los postulados del desarrollo social (soto, 2007). Osornio (1992) menciona que la actividad financiera del Estado es definida como la actividad que desarrolla el Estado con el objeto de procurarse los medios necesarios para los gastos publicos destinados a la satisfacción de las necesidades públicas y en general a la realización de sus propios fines. Desde esta visión la actividad financiera del Estado conoce tres momentos fundamentales: Primero el de la obtención de ingresos, los cuales pueden llegar al Estado tanto por instituciones de derecho privado tales como la explotación de su propio patrimonio (empresas, renta de inmuebles, venta de bienes), como por medio de instituciones de derecho público, como los diversos tipos de tributos, o bien por instituciones mixtas como la contratación de empréstitos o la emisión de bonos; Segundo el de gestión o manejo de los recursos obtenidos, así como la administración y explotación de sus bienes patrimoniales con carácter permanente; Tercero el de la realización de erogaciones para sostener las funciones públicas, la prestación de servicios públicos

La aplicación del cobro se encuentre en la sección tercera, por servicios de aseo y limpieza por recolección de basura, Capítulo Primero, por servicios publicos, del título tercero, De los derechos, donde obligan al pago del derecho de servicios de aseo y limpieza por recolección de basura quienes resulten beneficiados,

en el 2013 era el artículo 76 de la Ley Hacendaria de los Municipios del Estado de Campeche, reformándose al artículo 81 (2014) ver tabla 1.

Tabla 1: Análisis de la Ley Hacendaria de los Municipios del Estado de Campeche 2013-2014

Sección Tercera, Por Servicios de Aseo y Limpieza Por Recolección de Basura, Capítulo Primero, Por Servicios Públicos, del Título Tercero, de los Derechos	Sección Tercera, Por Servicios de Aseo y Limpieza Por Recolección de Basura, Capítulo Primero, Por Servicios Públicos, del Título Tercero, de los Derechos	Comentarios No Hubo Cambio Alguno
<p>Ley 2013</p> <p>ARTÍCULO 76.- Están obligados al pago de este derecho quienes resulten beneficiados con este servicio.</p> <p>ARTÍCULO 77.- Este servicio público estará atendido por el Municipio, mediante el transporte de toda clase de basura y desperdicio en vehículos de su propiedad.</p> <p>ARTÍCULO 78.- Los propietarios, poseedores o inquilinos de los predios urbanos con frente a la vía pública deberán mantener y conservar debidamente aseadas y limpias sus banquetas y la parte proporcional de la calle, cooperando en esta forma con el Municipio en la limpieza y aseo de la ciudad. <u>Todo aquel propietario, poseedor o inquilino que no cumpla con la anterior disposición incurre en una multa por la cantidad de un día de salario mínimo vigente de la zona económica correspondiente, la cual impondrá el titular del departamento, en caso de que exista o en su defecto, la Tesorería Municipal.</u></p> <p>ARTÍCULO 79.- Los propietarios o arrendatarios de predios donde estén establecidos comercios o industrias podrán celebrar convenios con el Municipio para que el departamento designado al respecto efectúe servicios particulares de recolección de desechos sólidos, generados en los citados establecimientos.</p> <p>ARTÍCULO 80.- Los servicios de aseo y limpieza por recolección de basura, deberán pagarse cada mes en la Tesorería Municipal correspondiente, de acuerdo al número de veces el salario mínimo general diario vigente en el Estado</p>	<p>Ley 2014 actualizado al 26/12/13</p> <p>Artículo 81. Están obligados al pago de este derecho quienes resulten beneficiados con este servicio.</p> <p>Artículo 82. Este servicio público estará atendido por el Municipio, mediante el transporte de toda clase de basura y desperdicio en vehículos de su propiedad. <u>El Municipio podrá celebrar convenios-concesión, para atención de este servicio público.</u></p> <p><b>ARTÍCULO 83.-</b> Los propietarios, poseedores o inquilinos de los predios urbanos con frente a la vía pública deberán mantener y conservar debidamente aseadas y limpias sus banquetas y la parte proporcional de la calle, cooperando en esta forma con el Municipio en la limpieza y aseo de la ciudad. <b>Nota:</b> Artículo reformado por Decreto No. 108 de la LXI Legislatura, P.O. No. 5394 de fecha 26/12/2013.</p> <p><b>ARTÍCULO 84.-</b> Los propietarios o arrendatarios de predios donde estén establecidos comercios o industrias podrán celebrar convenios con el Municipio para que el departamento designado al respecto efectúe servicios particulares de recolección de desechos sólidos, generados en los citados establecimientos.</p> <p><b>ARTÍCULO 85.-</b> Los servicios de aseo y limpieza por recolección de basura, deberán pagarse cada mes en la Tesorería Municipal correspondiente, de acuerdo al número de veces el salario mínimo general diario vigente en el Estado</p>	<p>Se reformo la numeración del artículo</p> <p>Se adiciono convenio-concesión, señalando que el municipio no proporcionaba el servicio con vehículos de su propiedad antes del 01 de enero del 2014 ya que la recolección de basura era concesionada, de acuerdo al informe del cuarto trimestre 2005 de su página web de la empresa Promotora Ambiental, S.A. de C.V. (PASA, 2005), el 15 de noviembre comenzó a operar la concesión municipal en Ciudad del Carmen, de recolección doméstica y barrido manual y mecánico, asimismo la operación del relleno sanitario. En este artículo reformado se elimina la multa de un salario mínimo.</p> <p>Solo se reforma la numeración</p> <p>Aquí no se cumple con el pago mensual ya que el cobro se realiza en el 2014 un cobro anual.</p>

*Elaboración propia basada en la Ley Hacendaria de los Municipios del Estado de Campeche (2013, 2014).*

Dicho servicio aún en el 2013 como menciona la Ley estará atendido por el Municipio, mediante el transporte de toda clase de basura y desperdicio en vehículos de su propiedad, pero desde el 2005 era proporcionado por la empresa PASA (Promotora Ambiental, S.A. de C.V.), debido a la deuda contraída por la empresa que recolecta la basura el gobierno municipal se ve impedido liquidamente poder cubrir su obligación lo que deriva el uso de este derecho para poder obtener recursos necesarios para liquidar el adeudo que según diarios locales asciende a 16 millones de pesos, también se conoce en el primer informe

de gobierno municipal del H. Ayuntamiento del Carmen (2013) que la deuda pública al 31 de julio del 2013 asciende a un monto de 622 millones 545 mil 124 pesos. Generando a la empresa PASA riesgos de inversión por la problemática en el pago, y ante tal situación la empresa disminuyó su operación en el municipio de Ciudad del Carmen, y debido a ello la población no ha recibido un servicio completo de calidad. La Ley Hacendaria de los Municipios del Estado de Campeche se actualizó el 26 de diciembre del 2013 de los cuales se muestra en la siguiente tabla los cambios y comentarios sobresalientes de dicha reforma.

Tabla 2: Análisis Comparativo de la Tarifa de Cobro en VSM (Veces Salarios Mínimos)

Recolecta Basura	Tarifa					
	GRUPO 1 2013	GRUPO 1 2014	GRUPO 2 2013	GRUPO 2 2014	GRUPO 3 2013	GRUPO 3 2014
I.-Domicilio por mes:						
A. Residencial	1.16 a 1.45	2.00 a 3.00	1.16 a 1.45	1.21 a 1.51	0.58 a 0.72	2.00 a 3.00
B. Media	0.87 a 1.08	1.50 a 2.00	0.87 a 1.08	0.90 a 1.12	0.43 a 0.54	1.50 a 2.00
C. Popular e interés social	0.43 a 0.58	1.00 a 1.50	0.43 a 0.58	0.44 a 0.60	0.21 a 1.29	1.00 a 1.50
D. Precaria	0.21 a 0.36	0.50 a 1.00	0.21 a 0.36	0.21 a 0.37	0.10 a 0.18	0.50 a 1.00

*Elaboración propia basada en la Ley Hacendaria de los Municipios del Estado de Campeche (2013, 2014). Nota: Artículo reformado por Decreto No. 108 de la LXI Legislatura, P.O. No. 5394 de fecha 26/12/2013. Nota: Párrafo último adicionado por Decreto No. 108 de la LXI Legislatura, P.O. No. 5394 de fecha 26/12/2013.*

De acuerdo a lo establecido en su artículo 17 de la Ley Hacendaria de los Municipios del Estado de Campeche (2014), la clasificación en grupos de los Municipios serán los siguientes: Campeche; Carmen; y Calakmul, Calkiní, Candelaria, Champotón, Escárcega, Hecelchakán, Hopelchén, Palizada y Tenabo. El Municipio del Carmen se localiza al suroeste del Estado de Campeche, limitando, al noreste, con el Municipio de Champotón y el Golfo de México; al sur, con el Municipio de Palizada y el Estado de Tabasco; y al este, con los Municipios de Escárcega y Candelaria. La extensión territorial del Municipio es de 12,748 Km<sup>2</sup>, equivalente al 22.4% de la superficie del Estado, que es de 56,858.84 km<sup>2</sup>; es el segundo Municipio del Estado en extensión territorial.

El clima es cálido-húmedo y la temperatura varía de 25° a 33°C, su actividad económica se basa principalmente en la actividad petrolera. Teniendo claro su ubicación Significa que Ciudad del Carmen se encuentra en el Grupo dos, de acuerdo a la tabla 2, el cobro debe ser mensual como lo señala la Ley Hacendaria de los Municipios del Estado de Campeche, pero el cobro se realiza anual, por ejemplo un domicilio catalogado como popular se pago por servicio de recolección de basura la cantidad de \$382.62 que representa al mes un promedio de 31.88 cobrando el 0.50 de salario mínimo del 2014 de la zona que representa el \$63.77, por lo que el pago estuvo dentro del rango del 0.44 a 0.60, como lo muestra la tabla 2.

## DEUDA PÚBLICA

De acuerdo a Chávez (2003), las finanzas públicas están compuestas por el gasto público, los ingresos y el endeudamiento. Si el buen manejo de las finanzas públicas es el responsable, el patrimonio y entiéndase este último como parte de la constitución más sus activos y pasivos, dicho patrimonio no decrecerá, incluso se incrementará con el tiempo para permitir hacer frente a nuevas demandas sociales y aumentar el bienestar de la población a través de la provisión de bienes y servicios públicos que contribuyan a un aumento potencial productivo. A lo antes señalada en el Municipio de Ciudad del Carmen a raíz de la deuda generada en el trienio municipal 2009-2012 se siguió presentando no solo la falta de aportación al gasto público a través del pago de derecho del servicio de recolección de la basura, también la falta de pago al servicio del mismo a la empresa PASA, incrementando la deuda pública y minimizando aún más el ingreso del municipio. En México de acuerdo a datos del universal (2013) la deuda de los municipios del país sumó 44 mil 378 millones de pesos durante el primer trimestre de 2013; de los cuales, la mitad está concentrada en 25 ayuntamientos de los 2 mil 440 que hay en el país, revelan datos de Hacienda. De acuerdo con el reporte

de Obligaciones Financieras de Municipios, el territorio con el monto más elevado de pasivos fue Guadalajara, Jalisco, con 2 mil 633 millones de pesos, los cuales tiene totalmente comprometidos con la banca comercial. Por sí solo, los adeudos del municipio de Guadalajara son superiores a los pasivos de entidades federativas como Yucatán (2 mil 412 millones de pesos), Baja California Sur (2 mil 345 millones), Colima (2 mil 131 millones), Querétaro (mil 777 millones), Campeche (mil 056 millones) y Tlaxcala (38 millones). El segundo municipio más endeudado es Tijuana, Baja California, que registró pasivos por 2 mil 524 millones de pesos en el primer trimestre (mil 618 pesos por habitante). Monterrey, Nuevo León se ubicó en la tercera posición al contabilizar obligaciones por 2 mil 090 millones de pesos en el periodo correspondiente, mientras que Zapopan, Jalisco, reportó mil 429 millones. La calificadora Standard & Poor's ajustó a la baja su indicador del Marco Institucional en el que operan los gobiernos municipales en México, a una clasificación 5 desde 4, debido a la mayor incertidumbre en este nivel de gobierno, en comparación con las administraciones estatales. La escala del Marco Institucional va de 1 a 6, donde 1 se refiere a predecible, mientras que 6 es volátil y con recursos insuficientes. El indicador 5 refleja un Marco Institucional en desarrollo y desbalanceado, esto significa que el ajuste impacta sobre las calificaciones en escala nacional de cuatro municipios: Nuevo Laredo, Tamaulipas; Gómez Palacio, Durango; Cajeme, Sonora, y Solidaridad, Quintana Roo.

Mucho se ha escuchado de las deudas de los Municipios, cabe señalar que Campeche, junto con Michoacán y Nayarit han registrado los mayores incrementos en sus niveles de endeudamiento durante el primer trimestre al aumentar 33.55, 32.89 y 31.07% sus compromisos financieros, respectivamente de acuerdo a la información del economista (2011). Según el último reporte de la Secretaría de Hacienda, Campeche adeudaba 328 millones de pesos y al cierre del 2010, mientras que en los tres primeros meses del año solicitó créditos para ubicar su deuda en 438 millones a los 622 millones declarados en el primer informe de gobierno 2012-2015 solo en el municipio del Carmen datos que no coinciden.

Según Fitch Ratings en su comunicado del día 26 de agosto del 2013 ratificó la calificación de “BBB-(mex)” a la calidad crediticia del Municipio del Carmen, Campeche; la perspectiva crediticia se modifica a ‘negativa’. Asimismo, ratificó la calificación de ‘A(mex)vra’ de un crédito bancario otorgado por Banco Interacciones al Municipio en 2012, con un saldo de \$188.9 millones de pesos (mdp) al 30 de junio de 2013. Esta modificación se debe a la perspectiva crediticia obedece a los limitados niveles de ahorro interno (flujo disponible para servir deuda y/o realizar inversión), en virtud del importante crecimiento del gasto operacional (GO, gasto corriente y transferencias no etiquetadas) observado en los últimos ejercicios, asimismo, refleja el elevado y creciente nivel de endeudamiento bancario y no bancario. Aunque el Municipio presente un dinamismo económico impulsado principalmente por la actividad petrolera en la región, sus ingresos dependen de manera importante de recursos estatales y federales, así como la aportación provenientes de PEMEX (Petróleos Mexicanos) y que esta calificación se debe también a que al cierre del 2012 los egresos presento una elevada estructura al gasto operacional con una tasa mediana anual de crecimiento (tmac) en los últimos cinco ejercicios de 12.4%, con ingresos fiscales ordinarios (IFOs) de un 5% en los últimos tres años. Los ingresos ordinarios según Cuevas (2012), son aquellos recaudados por el Estado en forma regular tales como los impuestos, los derechos o los ingresos por la venta de bienes y servicios que ofrecen los organismos y empresas paraestatales como Petróleos Mexicanos (PEMEX) o el Instituto Mexicano del Seguro Social (IMSS).

## CONCLUSIÓN

El problema generado por la deuda pública es muy importante ser abordado no solo por las finanzas públicas y por su aplicación legal, sino más por las causales que provoca una mala administración. Por otra parte la población aunque este obligada a la contribución para el gasto público muchas veces la falta de aplicación de la Ley hace que se sientan afectados en su economía familiar por el cobro de servicios que por años no fueron efectuados y las costumbres se vuelven leyes. El Estado necesita actualizar su Plan de Desarrollo

acorde a las necesidades actuales, mantener informada a la población y no esperar que los medios masivos cumplan con su obligación, para lograr así que la población comprenda la importancia de su aportación, sino también se solidarice con el Municipio y así lograr una mejor solidez en las finanzas públicas, y que los ingresos generados por derecho, cobrado a los habitantes del Municipio del Carmen atiendan las necesidades del gasto público, la cual según vendrá a minimizar la deuda contraída en el trienio anterior para que el Estado pueda cubrir las necesidades de servicio de recolección de basura que tanto afecta a la población. Para ello, será necesario que la administración Municipal actual asuma compromisos de transparencia, eficiencia y de rendición de cuentas en relación a sus finanzas públicas. Por otro lado a pesar de que se extrae las tres cuartas partes del petróleo en el país, esto no garantiza que existan buenas finanzas públicas o excelentes ingresos y para evitar que la deuda pública se convierta en un problema insostenible, es importante esperar los resultados no solo del cobro de recolección sino también, las reformas fiscales del 2014, que ayudarán a mantener las finanzas públicas solvente y sostenible en el mediano y largo plazo.

## MICROEMPRESAS Y HERRAMIENTAS DE MERCADOTECNIA

Hugo García Álvarez, Universidad Autónoma del Carmen  
Alicia Sánchez de la Cruz, Universidad Autónoma del Carmen  
Martha Córdova Zacarías, Universidad Autónoma del Carmen

### RESUMEN

*En este trabajo se propuso evaluar el uso de las herramientas de mercadotecnia, en especial el constructo conocido como “las 4 P” en microempresas de servicios de Ciudad del Carmen. Las entrevistas realizadas sugieren que hay una aplicación empírica de las herramientas pero las acciones no se articulan como lo sugiere la teoría. Es posible que el uso limitado de las herramientas esté relacionado con que una vez satisfechas las necesidades económicas familiares, no se espera invertir más en las tiendas, porque no se conceptualizan a sí mismas como empresas. Una vez superada esta limitación será factible establecer estrategias que les permitan mejorar su desempeño con la implementación de nuevas herramientas de mercadotecnia y la articulación eficiente de las que ya usan.*

**PALABRAS CLAVE:** Mercadotecnia, Microempresas, Ciudad del Carmen

## MARKETING MIX IN SMALL BUSINESS

### ABSTRACT

*This paper evaluate how small businesses in Ciudad del Carmen, Campeche, use marketing tools, such as the one known as “4 Ps” or marketing mix. Interviews conducted among small business owners of small retail stores or “tienditas de la esquina” suggest that there is an empirical understanding of individual items of that mix, but they are not used as articulated as required by theory. Limited use of the marketing mix may be related to the original economic motive why such a business was built. Once such a need is solved all entrepreneurship is lost, because they do not see themselves as something more than a source of income for family immediate needs.*

**KEYWORDS:** Marketing Tools, Smallbusiness, Ciudad del Carmen

### INTRODUCCIÓN

La innegable importancia de las micros y pequeñas empresas en México y en Latinoamérica obliga a conceptualizar de manera precisa cuáles serían las mejores estrategias para que éstas funcionen mejor en mercados emergentes pero plenamente integrados al sistema mundial de comercio. Las Mipymes si bien en sentido estricto son instancias de generación de recursos económicos Juegan un importante papel de carácter social, tanto por su papel como creadoras de empleo y amortiguadoras del problema del desempleo [...] como por ser un instrumento de cohesión y estabilidad social al brindar oportunidades de empleo a colectivos semi o escasamente cualificados. (Saavedra y Hernández, 2008, pp. 132-3). Para este trabajo se analizaron además de las 4 P (Producto, precio, plaza y promoción) factores de conocimiento del mercado para tratar de determinar las fuentes de información y las consideraciones que entran en juego al momento de tomar decisiones estratégicas en algunas microempresas de Ciudad del Carmen, Campeche.

## REVISIÓN DE LA LITRATURA.

Cuando se habla de las 4 P, según los autores clásicos (Kotler, McCarthy), se hace referencia a la relación precisa entre los elementos que debía considerar una empresa a la hora de lanzar un nuevo producto, “la creación, desarrollo, distribución y venta de un producto”, es decir los elementos para, entre otras cosas, decidir cómo fijar un precio y definir los canales de distribución. En su presentación de qué es la mercadotecnia Stanton, Etzel y Walker (1999) sugieren que el proceso para llevar a cabo un plan de mercadeo estratégico consta de cinco pasos: un análisis de la situación, definir los objetivos del mercadeo, identificar el posicionamiento propio y la ventaja diferencial, seleccionar los mercados meta y medir la demanda del mercado y, finalmente, diseñar la mezcla estratégica, la combinación de las 4 P. Los primeros dos pasos del proceso se refieren a las razones que llevan a los empresarios a establecer un determinado negocio, contestar a las pregunta qué hacen y por qué lo hacen. Los pasos tres y cuatro corresponden con las diferenciaciones necesarias para distinguirse de la competencia y las correspondientes al análisis de los espacios donde se va a interactuar con la competencia.

A propósito de la definición de competidores como un elemento básico para la fijación de precios y las estrategias promoción basadas en la distinción de similares, es muy útil considerar la división en dos ramas propuestas por Vera y Díaz (2012), quienes a raíz de una revisión de definiciones llegan a la conclusión de que los competidores se pueden conceptualizar en términos de a) la oferta, si las características de las empresa son similares en tecnología, estrategias, productos y servicios y ofrecen sus productos a los mismos clientes; o b) la competencia se puede conceptualizar en términos de los clientes o la demanda si “se cimienta en las características de los compradores, deduciendo que las empresas que atienden a clientes percibidos como similares son percibidos como competidores” (p. 158). En esta misma investigación los autores agregan un tercer factor para que una empresa considere a otra como competidora y es el que ellos llaman Capacidades estratégicas (competitivas) similares, e incluyen en este factor similitudes en una serie de componentes de la dinámica interna de la empresa como son el mismo tiempo de respuesta, uso de canales de distribución similares, capacidad instalada similar, proximidad de mercados entre otros (p. 160)

Stanton et. al. (1999) dicen que el mercado está compuesto por personas y organizaciones que tengan necesidades que satisfacer, dinero que gastar y la oportunidad para gastarlo, éste es el espacio en que el negocio define a su mercado objetivo, o mercado meta: las empresas seleccionan un grupo al cual dirigir sus esfuerzos de mercadeo de acuerdo con las oportunidades que identifiquen y su habilidad para pronosticar la demanda. La utilidad de esta definición operativa de mercado meta u objetivo queda demostrada porque ha sido adaptada sin grandes modificaciones para su uso en actividades de mercadeo sin afán de lucro (cfr. Pérez, 2004). La empresa, sin importar el tamaño, al constituirse como negocio inicia un proceso social de mercadeo ya sea que ofrezca un producto o un servicio y por lo tanto, se vuelve necesario para ello conocer y analizar las herramientas que les permitan completar el proceso de intercambio de productos con base en lo que necesitan y desean (cfr. Kotler y Armstrong, 2003); pero las decisiones de inversión deben hacerse con un conocimiento preciso de los objetivos y los recursos disponibles para lograrlos y para tal efecto existen herramientas simples que ayudan a elegir qué métodos utilizar dependiendo de los intereses.

México es el único mercado de América Latina en el que la distinción de las empresas en Micro, Pequeñas, Medianas o Grandes está definida por el número de empleados; otros países incorporan en sus definiciones su participación en el mercado, el capital con que cuentan o el giro (Saavedra y Hernández, 2008). En México, si una empresa tiene menos de 10 empleados es una microempresa sin importar el giro ni ninguna otra característica. Según un trabajo de Huang y Brown (1999) el problema más importante de las empresas pequeñas se encuentra en el área de Mercadotecnia, en total representa un 42 por ciento de los problemas detectados: Especialmente promoción, investigación de mercados y capacitación son los problemas

encontrados con mayor frecuencia, y todos están relacionados con el conocimiento o las capacidades, lo que refleja una carencia general de *expertise* en el sector de los negocios pequeños (pág. 77). Esta falta de atención a los elementos de mercadotecnia puede deberse a que las micro y pequeñas empresas atienden problemas inmediatos y no tienen ni los recursos económicos ni de personal para atender los elementos generales de una adecuada planeación administrativa, por no decir que de mercadotecnia. En el fondo la pregunta de investigación de este proyecto es si los postulados de la mercadotecnia tal como los aprendemos en la escuela funcionan en el mundo de las microempresas mexicanas. Para poder adaptar los conocimientos necesitamos primero conocer el fenómeno y verificar cómo se cumplen en situaciones concretas para poder ofrecer herramientas útiles.

Para lograr esto se propuso responder las preguntas ¿Qué elementos de las 4 P de la mercadotecnia emplean las Microempresas de Ciudad del Carmen? ¿Qué elementos son necesarios, cuáles no son necesarios de acuerdo con las prácticas de las propias microempresas? ¿Cómo adaptar estas 4 P a contextos particulares para generar propuesta de mercadotecnia efectivas para las Microempresas? Jorge Vera (2003, p. 47-8) considera que la orientación al consumidor que ahora dirige los esfuerzos de las empresas supondrán en el futuro un cambio de este modelo, en lugar de producto se hablará del consumidor, en lugar del precio se tratará de la relación costo-calidad, en lugar de plaza tomará mayor importancia la conveniencia y en lugar de promoción se hablará de “comunicación con el cliente”. Estas adecuaciones y evolución del modelo sugieren que necesitamos tener una idea más clara del modo en que estos elementos son empleados en situaciones concretas, por lo que nos propusimos identificar el modo en que algunas microempresas de Ciudad del Carmen emplean la herramienta conceptual conocida como 4 P.

## METODOLOGÍA

Se seleccionó una técnica de recolección de información cualitativa porque éstas permiten penetrar en los significados y configuraciones mentales de los individuos involucrados en los procesos que estamos analizando; además dadas las condiciones del caso, una serie de entrevistas cumplirían el papel de primer paso en la investigación al explorar de manera exhaustiva (Malhotra, 2004, p. 150) la mezcla de la mercadotecnia que emplean actualmente algunas microempresas en Ciudad del Carmen. Como procedimiento específico de recolección se emplearon una serie de entrevistas focalizadas en las cuales se empleó la técnica de ejemplificación de conducta porque a través de ella se alienta “al entrevistado a hablar de sus experiencias concretas, a describir paso a paso el camino que lo llevó a la decisión... (y) podemos revivir en forma real o creativa la situación” (Benassini, 2009, p. 70). Se trató reconstruir los elementos del modelo de las 4 P que los microempresarios han utilizado ya sea de manera sistemática e informada o empírica. La selección de este procedimiento requiere capacitar al personal que realizará las entrevistas, lo cual se realizó de manera grupal en 3 sesiones durante el mes de abril de 2012.

Los temas que se exploraron en las entrevistas fueron: 1.-Producto: 1.1 variedad, 1.2 calidad, 1.3 características, 1.4 empaque, 1.5 servicio, 1.6 comportamiento. 2.- Precio: 2.1 precio de lista, 2.2 descuentos, 2.3 facilidad de pago, 2.4 alza de precios. 3.- Plaza: 3.1 surtido, 3.2 proveedores, 3.3 ubicación, 3.4 distribución de los productos, 3.5 control de las ventas. 4.- Promoción: 4.1 medios de comunicación, 4.2 tipos de publicidad, 4.3 publicidad de boca en boca, 4.4 promociones especiales.

Los negocios fueron seleccionados por conveniencia y proximidad al grupo de investigadores, siempre y cuando cumplieran los requisitos de ser una microempresa, es decir que tuviera menos de 10 empleados, pero más de 2 y que se encontrara dentro del ramo de servicios con atención directa de clientes. Se entrevistó a dos tipos de personajes, dueños y empleados que fungían como encargados generales.

Para lograr una saturación de información se recurrirá al procedimiento conocido como bola de nieve para contactar nuevos negocios a partir de los establecimientos entrevistados en esta primera etapa. En un siguiente encuentro analizaremos los resultados completos de este primer acercamiento al problema. Se

aplicaron 8 entrevistas que se llevaron a cabo en pequeños comercios de abarrotes, “tienditas de la esquina”, en el entendido de que este grupo es relativamente homogéneo por lo que presentarían problemáticas similares y soluciones similares a los conflictos que se les han presentado.

## RESULTADOS

El objetivo de este trabajo es verificar si el empleo de estrategias de recolección de información cualitativas permite evaluar el empleo de la herramienta conceptual conocida como 4 P de mercadotecnia para la toma de decisiones en las Microempresas de Ciudad del Carmen. De la aplicación de las entrevistas uno de los hallazgos más destacados es la aparente falta de espacio para tomar decisiones de parte de las microempresas involucradas en el estudio. Todas reportaron en principio haberse establecido en el lugar donde se encuentra porque ese era el domicilio familiar. En la entrevista E3, comentaron “ahora sí que no lo decidí, si no que ya pues ésta es una casa solamente la parte de adelante”. Salvo uno de los casos, todas las tiendas están situadas en la misma casa donde vive la familia. El único caso diferente es el de la E1 que reportó haber puesto la tienda en una casa de su propiedad que estaba en renta, pero que se estaba deteriorando mucho por lo que decidió mejor poner una tienda. Este proceso de conversión de domicilio en tiendas deja de lado la posibilidad de haber decidido con información de mercado la ubicación de la Plaza donde se establecería el negocio. Sólo uno de los casos reportó un inicio como venta no registrada de refrescos, y su posterior formalización una vez que se logró presencia en la colonia.

Sí, al principio como le comentaba empezamos con una tienda clandestina donde se vendía refresco y ya después pues se obtuvo un puesto así, de esos pequeños de cristal, y ya últimamente pues se mandó a remodelar poniéndole un techo, paredes más amplias para que se distribuyeran los productos y el cliente viera la variedad de producto.(E2)

Este pudiera ser en todo caso el proceso de crecimiento del negocio, que sin embargo se detiene una vez que se alcanza cierto tamaño, porque en las condiciones en que se trabaja la utilidad es suficiente para que el negocio siga funcionando pero no la suficiente para crecer más allá de remodelaciones y ajustes:

No se ha hecho remodelación, simplemente se techó, se le puso techo a la parte de adelante para que la gente no se moje cuando haya lluvia o para que no le dé el sol, los niños pueden jugar en ese espacio, pero la remodelación interna no se ha hecho y ya tenemos 10 años [...] Pues yo quisiera que el negocio tuviera un lugar céntrico para elevar mis ventas, pero, pues no deja tanta utilidad el negocio como para la buscar un local más céntrico, más... donde haya más fluidez de tráfico, más peatones, más gente andando por ese lugar. Ahorita nos conformamos con ese lugar, porque las utilidades son buenas y estamos solos en la colonia y eso nos permite controlar a esa población que compra nuestros productos. (E1)

Las utilidades que obtienen las microempresas de su operación, en el caso que nos ocupa, se puede reducir a dos aspectos con poco margen de maniobra: el margen de ganancia con que cuentan las “tienditas” es limitado y carecen de la habilidad o capacitación para administrar esos escasos recursos de que disponen. En el primer aspecto la información proporcionada por los entrevistados es poco alentadora:

Pues como somos pequeños comerciantes no llevamos ningún control de ventas porque... no sé cómo decirle. No es mucho lo que se vende en todo el día, como hay muchas tiendas a los costados, alrededor pues no es mucho lo que tenemos. El control nada más porque es que cada dos meses pago los impuestos, pero... [¿No lleva alguna libreta?]

No nada, ¿por qué? (E4)

Este es sólo un caso, el resto lleva su control de ventas de manera elemental, “se apuntan en una libreta lo que se ha vendido y se lleva una relación” (E6). Sólo dos de los casos reportaron buscar activamente proveedores para los productos que vende en su tienda, usualmente tiendas más grandes o distribuidoras mayoristas, el resto identifica como sus proveedores a aquellos que le llevan el producto hasta su tienda, lo que los vuelve una parte muy importante de su negocio.

Sí, Coca-cola, Sabritas, Bimbo, Barcel, Marinela, Júmex. [Usted ¿Va algún Súper o tienda a proveerse de sus productos?] No, porque te vuelvo a repetir, ya los traen, ahora sí los mismos proveedores traen todos los productos. Mucha importancia [tienen los proveedores], pues porque sin ellos gastaría en ir a comprar las cosas. (E3)

Lo que también coloca a las tiendas en una posición limitada a la hora de establecer sus precios, en el caso de una de las “tienditas” mejor organizadas, su dueño comentó:

Los proveedores siempre nos dan unos precios y nosotros le tenemos que sacar la ganancia generalmente en las tienditas como tenemos pocos producto, nosotros le ganamos el 20% al producto, le sacamos el 20% y sobre eso nos vamos, pero tratamos de buscar a los proveedores que nos den mucho más baratos los productos para sacarle mayor ganancia, claro que generalmente siempre acudimos, casi siempre o generalmente a un proveedor que es el que nos dota del producto con rapidez y siempre lo tiene, pero hay ocasiones que podemos buscar las ofertas para que tengamos un mayor margen de utilidad de ganancia. (E1)

Ese 20 por ciento de ganancia es la mayor reportada, la menor fue de la E4, quien dijo aumentar un 10 por ciento sobre el precio de lista: “Pues yo como propietaria de la tiendita le pongo los precios que debe de tener de ser sugerido le digo aumentándole un 10% a cada producto”. Tampoco parece haber un sistema detrás de la decisión del sobreprecio. Este limitado control de los precios no les permite establecer promociones ni descuentos, ni ofrecer descuentos o facilidades de pago o crédito. Algunas tiendas reportaron algún tipo de trato preferencial a clientes de mucho tiempo pero otros dijeron que si bien habían intentado dar crédito, no les funcionó y tuvieron que dejar de hacerlo.

No, no vendemos a crédito, no, no damos crédito porque hemos tenido problemas, antes sí lo hacíamos pero hay problemas, perdemos clientela porque el cliente que te debe no te va a comprar porque te debe, evita, busca otro lugar para surtirte y por eso mismo el crédito se acabó en este negocio. Aquí todo es a contado, nosotros compramos a contado y vendemos a contado; aunque a veces los niños les falta 50 centavos les falta un peso y pues se los damos así y hay clientes que son de confianza que sí le damos el producto de esa manera y sabemos que sí van a regresar a pagar. (E1)

Varias tiendas hablaron de esta confianza y la construcción de una clientela con base en el buen servicio, “sí, claro que sí [es importante la atención], así el cliente se lleva una buena impresión de la tienda y también del producto” (E2), “porque el cliente lo que busca es amabilidad” (E3). Sin embargo, la noción de atención se reduce a una cuestión utilitaria,

Sí es importante la atención, el cliente debe tener siempre la razón, hay clientes que te exigen las cosas, se expresan mal, gritan ¡Quiero esto! Pero siempre hay que tratar al cliente con amabilidad no gritarle tampoco, no contestarle como él te pide las cosas, sino que hay que irle buscando para que esté contento el cliente, porque si lo tratas mal se te va a ir y ya no te va a comprar. (E1)

Habría aquí espacio para elaborar con mayor amplitud el concepto de atención al cliente y como eso se debe convertir en un factor de contratación de personal, pero sólo una de las microempresas hizo explícita esta conexión. En general la capacitación del personal no fue abordada.

En relación con la publicidad las personas entrevistadas la reconocieron como una herramienta para aumentar sus ventas, “la publicidad a veces sí sería necesario, pero la verdad es muy caro” (E6); pero con mucha claridad identificaron que en su limitado mercado, es necesario que se planteen estrategias de alcance también limitado a su área de influencia geográfica, como el caso de E1, quienes comentaron que

Íbamos a pintar una pared para poder promocionarnos, pero eso quedo sólo en planes no se ha hecho, los precios ya subieron, los productos ya subieron su precio y nosotros vendemos casi siempre lo mismo, ósea que nuestras ventas no han mejorado, sino que subieron los precios y vendemos lo mismo (E1). O como en el caso de E3

Pues quizá sí [sería necesario algún tipo de promoción], de manera pienso que con un sonido o algo así, sólo para los vecinos, pues porque tampoco va a venir gente de otras colonias exactamente para comprar aquí (E3).

Aunque la opinión que parece representar el consenso entre los entrevistados es que su escaso uso de la publicidad se debe a que “pues no es grande la tiendita, es una tiendita chica y entonces pues la única promoción es la que ponen los mismos proveedores que viene a surtir” (E4). La publicidad de estas microempresas es en realidad publicidad de las grandes trasnacionales que les proveen de sus productos. Es importante destacar que a los entrevistados se les cuestionó por el uso de publicidad de boca a boca, ante la cual vincularon este fenómeno con los chismes y dijeron que puede tener una vertiente tanto positiva como negativa; aunque ninguno dijo emplear esta estrategia de publicidad de manera habitual, reconocieron de manera explícita su relación con la atención que reciben los clientes.

## CONCLUSIÓN

Partiendo de la premisa de que esta es una primera aproximación al problema, concluimos que sí pudimos identificar diferentes elementos de la llamada mezcla de la mercadotecnia usados por las microempresas entrevistadas, aunque éstos obedecen a la experiencia de los dueños, no necesariamente a la lectura de libros o manuales de administración y se requerirá profundizar más en estos vínculos entre lo que dice la teoría y lo que sucede en las calles. Lo que no fue tan claro es cómo relacionan estos conceptos de manera articulada para tomar decisiones. En algunos casos se vincula la promoción de la tienda con un buen servicio, o las ganancias con la mejora de la infraestructura del local, pero no se detectó una articulación de los cuatro conceptos para tomar decisiones.

Es posible que esto se deba al escaso margen de maniobra que las “tienditas” se asignan a sí mismas en las diferentes variables de la mercadotecnia, o a algo más profundo en su papel como fuente de ingresos para la familia, se invierte pocos recursos materiales, pero también poco tiempo, y poco capital intelectual: “De repente por medio de la familia, se decidió poner el negocio y poco a poco comenzó a marchar [...] es una colonia muy habitada y no existe competencia junto a nosotros” (E6). Probablemente más de uno haya reflexionado sobre su empresa y se haya hecho las preguntas de E1 y haya llegado a las mismas conclusiones:

Pues no sé, tendría que pensar si quiero mejorar mis ventas, en realidad somos conformistas no hemos tratado de subir nuestras ventas, también hemos perdido clientes, pensamos que como mantenemos la cantidad de venta de dinero nos conformamos con eso. (E1)

Un diagnóstico como el presentado hasta aquí nos permite identificar de dónde partimos, cuál es la situación en que nacen las microempresas y qué objetivos se plantean sus dueños, y sólo en función de estos dos elementos es que será posible establecer estrategias que les permitan mejorar su desempeño con la implementación de nuevas herramientas y la articulación eficiente de las que ya usan. Los hallazgos reportados sugieren que es necesario seguir explorando cómo usan las herramientas de la mercadotecnia las microempresas de Ciudad del Carmen para poder sugerirles como mejorar este uso.

## RESUMEN

*En este trabajo se realiza una aproximación del precio de la opción sobre el tipo de cambio peso mexicano/dólar estadounidense, a través del modelo de Heston (1993), partiendo de la estimación de los parámetros que intervienen en los procesos de difusión dicho modelo, los cuales son determinantes para calcular el precio de la opción sobre divisa. El alcance de este trabajo es doble: el primero es, estimar los parámetros a través del algoritmo híbrido Nelder-Mead simplex (1965) programado en Matlab y el segundo, calcular el precio de la opción call europea sobre tipo de cambio mexicano. Los resultados muestran que el modelo resulta ser adecuado para describir la serie de rendimientos de los precios de dicha divisa. Este hecho se ve reflejado en un 95% de las simulaciones logradas, las cuales replican una distribución empírica con las propiedades de ser leptocúrtica, asimétrica y de colas anchas, generada por un sistema bivariado de difusión, mostrando una misma distribución continua según la prueba de bondad de Kolmogorov-Smirnov. Puede afirmarse que el modelo de Heston constituye una buena alternativa para obtener los precios de la divisa peso mexicano/dólar estadounidense, ya que se muestra que son muy próximos los precios del mercado.*

## PRICE OPTION EXCHANGE ON MEXICAN PESO / U.S. DOLLAR UNDER STOCHASTIC VOLATILITY

### ABSTRACT

*In this work an approximation of the option price on the exchange rate Mexican peso versus U.S. dollar weight is carried through the Heston model (1993), based on the estimation of the parameters involved in the diffusion processes that model which are determining the price of the option on currency. The scope of this paper is twofold: first, to estimate the parameters through the Nelder-Mead hybrid algorithm simplex (1965) programmed in Matlab and the second, the price of a European call option on the Mexican exchange rate. The results show that the model appears to be adequate to describe the series of returns of prices of that currency. This fact is reflected by 95 % of those achieved simulations, which replicated an empirical distribution with the properties of being leptokurtic, skewed and fat tails, generated by a bivariate distribution, showing the same continuous distribution as system testing Kolmogorov-Smirnov goodness. Arguably the Heston model is a good alternative for pricing Mexican peso versus the U.S. dollar weight because it shows that they are very close to market prices.*

## INTRODUCCIÓN

La desregulación financiera de los últimos años ha venido imponiendo nuevas condiciones a la competencia entre los propios intermediarios financieros bancarios y no bancarios, lo que dio pie a una sucesión de burbujas financieras especulativas de dimensiones sorprendentes y de manera irracional (Schiller, 2003; Stiglitz, 2002). Por lo tanto, la medida preventiva más importante para enfrentar una crisis imprevisible, de la que ningún país está exento, es la administración de riesgos oportuna a través de productos derivados y de manera específica por medio de opciones sobre tipo de cambio.

El trabajo se organiza de la siguiente manera. En la sección dos, se presenta los estudios de modelos de precios de las opciones con volatilidad constante y estocástica, así como, la argumentación que sustenta que el modelo de Heston proporciona precios teóricos muy cercanos a los precios del mercado por considerar la volatilidad estocástica. A continuación, se presenta la metodología que describe el procedimiento para estimar los parámetros que involucra el modelo de Heston y calcular los precios teóricos: se establece el algoritmo de Nelder-Mead para estimación de los parámetros, los cuales se utilizarán posteriormente para calcular los precios teóricos de los Call y Put para opciones sobre tipo de cambio, programados en MatLab. En la sección cuatro, se presentan resultados de la investigación. Finalmente se discuten las conclusiones, limitaciones y futuras líneas de investigación posibles para mejorar los precios teóricos.

## REVISIÓN DE LITERATURA

Existen estudios que han demostrado que el modelo de valoración de opciones de Black y Scholes está sujeto a sesgos sistemáticos, originados por la violación del supuesto de normalidad en los rendimientos del activo subyacente (Melino y Turnbull, 1991; Day y Lewis, 1992; Bakshi et al., 1997; Nandi, 1998; Bates, 1996, 2000, 2003; y Lin et al., 2001). Para mejorar la precisión de los precios, los modelos de valoración de opciones con volatilidad estocástica, tales como Hull y White (1987), Scott (1987), Wiggins (1987), Melino y Turnbull (1990), y Heston (1993), incorporan la leptocurtosis o exceso de curtosis de los rendimientos del activo subyacente; también sustentan que la fijación de dichos precios se deriva de los procesos de difusión del precio y de la volatilidad, además de considerar una correlación nula entre el rendimiento del precio del activo subyacente y su volatilidad.

Guo (1998) empíricamente estudió los parámetros en el proceso de variación neutral al riesgo y el precio de riesgo de mercado de variación implícita en las opciones sobre divisas en PHLX basado en el modelo de Heston (1993), de igual manera, Lin, et al. (2001) estudiaron de manera empírica cómo el modelo de Heston (1993) reduce los errores en los precios de las opciones del índice FTSE 100. Bakshi et al. (1997) han evaluado empíricamente el precio de la opción sobre divisa bajo modelos de volatilidad constante y con volatilidad estocástica, en la Bolsa de Filadelfia (PHLX), incluidas las opciones de la libra esterlina, marcos alemanes, el yen japonés y el franco suizo, durante el periodo de 1994 a 2001. También extraen los parámetros implícitos en el modelo de Heston (1993), al permitir una correlación cero entre la volatilidad y el rendimiento del activo subyacente, y los precios teóricos se aproximan a los de mercado. Dado lo anterior, la hipótesis a probar en este trabajo, es: la estimación de los parámetros implícitos del modelo de Heston (1993) con datos del mercado por el método numérico de Nelder-Mead, otorgan un precio más próximo al del mercado.

## METODOLOGÍA

Los datos para este análisis fueron obtenidos de Thomson DataStream, considerando la serie de tipo de cambio peso mexicano respecto al dólar estadounidense diaria, entre el 14 de abril de 2003 a 31 de

diciembre de 2012, totalizando 2322 observaciones diarias de cada serie financiera. Con el fin de realizar una mejor valuación de los precios y comparar los modelos de Heston y Black-Scholes con los precios del mercado, se realiza la estimación de los parámetros de los modelos de forma individual, considerando un vector semilla  $x_0 = (\mu_0, \theta_0, \sigma_0, \kappa_0, \rho_0) \in \mathbb{R}^5$  y que oriente el algoritmo híbrido de Nelder-Mead hacia la búsqueda de un mínimo local, el cual parte de las estadísticas descriptivas. Para calcular los precios teóricos, partiendo del modelo de Black y Scholes (1973) que suponen que la volatilidad de los rendimientos es constante y utilizan el concepto de cobertura a través de un portafolio libre de riesgo, siendo así, un modelo de equilibrio. Ante este panorama, surgen varios modelos de volatilidad estocástica de valoración de opciones, tales como Hull y White (1987), Scott (1987), Wiggins (1987), Melino y Turnbull (1991), Heston (1993) y Bates (1996), que han surgido para resolver el supuesto irrealista: la volatilidad de rendimiento constante.

En esta investigación, se adopta el modelo de volatilidad estocástica de Heston (1993) para investigar el desempeño de los precios en relación con el modelo de Black y Scholes (1973). Heston (1993) obtuvo una solución de forma cerrada para la opción europea sobre un activo, incluyendo acciones, divisas y bonos, con una reversión a la media de la raíz cuadrada de volatilidad estocástica; afirmó que la correlación entre los rendimientos de los activos subyacentes y su volatilidad afectó a la asimetría y leptocurtosis de la distribución de los rendimientos del activo subyacente. En dicho modelo, el proceso de difusión para el precio del activo subyacente es análogo al proceso del modelo de Black y Scholes (1973), salvo en el hecho de que la volatilidad también sigue un proceso estocástico. En concreto, Heston (1993) postuló un proceso de Ornstein-Uhlenbeck para la volatilidad instantánea del activo subyacente  $\sqrt{\sigma_t}$ :

$$dS_t = \mu S_t dt + \sqrt{\sigma_t} S_t dW_{S_t} \quad (1)$$

$$d\sigma_t = \kappa(\theta - \sigma_t)dt + \sigma \sqrt{\sigma_t} dW_{\sigma_t} \quad (2)$$

donde  $dW_{S_t}$  y  $dW_{\sigma_t}$  son procesos de Wiener bajo la medida de probabilidad real  $P$  y donde  $\mu$  representa la tasa de crecimiento para el proceso correspondiente al precio del activo subyacente. Ambos procesos están correlacionados, de tal manera que  $dW_{S_t} dW_{\sigma_t} = \rho dt$ . El parámetro  $\theta$  representa el nivel medio de la varianza de largo plazo, mientras que  $\kappa > 0$  recoge la velocidad de reversión a la media. Así como,  $\sigma_t$  representa la volatilidad de la varianza  $\sqrt{\sigma_t}$ , la presencia de este parámetro, hace que el modelo se adecúe a la valoración de productos derivados sensibles a la volatilidad de la volatilidad, y cuando  $\sigma_t = 0$  la volatilidad es una función determinista del tiempo. En general, si la función de densidad de probabilidad neutral al riesgo del precio es  $f(S_T)$ , el precio de ejercicio  $K$ , el momento de la madurez es  $\tau = T - t$ , e invirtiendo la transformada de Fourier en la función de densidad lognormal de  $S_T$ , condicionada a la variación media y a la densidad de la varianza media, entonces el precio de una opción call europea sobre tipo de cambio está dado por la expresión:

$$C = S_t e^{-r\tau} P_1 - K e^{-r\tau} P_2 \quad (3)$$

Nótese que la expresión (3), es análoga a la fórmula de Black-Scholes. Heston (1993) demostró que las funciones  $P_j$  para  $j=1,2$ , pueden obtenerse a partir de la transformada inversa de Fourier y deriva la función de densidad  $P_j$ :

$$P_j = \frac{1}{2} + \frac{1}{\pi} \int_0^\pi \operatorname{Re} \left[ \frac{e^{-iz \ln(K) f_j}}{iz} \right] dz \quad (4)$$

donde  $i = \sqrt{-1}$  y  $f_j$  para  $j=1,2$ , son las funciones características correspondientes a  $P_j$  y toman la siguiente forma:

$$f_j = e^{C_j + D_j \sigma + iz \ln(S_0)} \quad (5)$$

$$C_j = rizT + \frac{\kappa\theta}{\sigma^2} \left[ (b_j - \rho\sigma iz + d_j)T - 2 \ln \left( \frac{1 - g_j e^{T d_j}}{1 - g_j} \right) \right] \quad (6)$$

$$g_j = \frac{b_j - \rho\sigma iz + d_j}{b_j - \rho\sigma iz - d_j} \quad (7)$$

$$d_j = \left[ (\rho\sigma iz - b_j)^2 - \sigma^2 (2u_j iz - z^2) \right]^{\frac{1}{2}} \quad (8)$$

siendo  $u_1 = \frac{1}{2}$ ,  $u_2 = -\frac{1}{2}$ ,  $b_1 = \kappa + \lambda - \rho\sigma$  y  $b_2 = \kappa + \lambda$ . Por tanto, para calcular el precio de una opción call europea utilizando la fórmula de la Ec. (3) es necesario evaluar las dos integrales en la parte real de números complejos de la Ec. (4).

Teniendo en cuenta la condición de no arbitraje y el precio de una opción call (3), además usando la paridad put-call para obtener el precio de opción put europea, se tiene:

$$P = C - S_t e^{-r_f t} + K e^{-r_d t} \quad (9)$$

## RESULTADOS

Aplicando la metodología descrita, en primer lugar se obtienen los estadísticos descriptivos (Tabla 1) para obtener el vector semilla y alimentar el algoritmo de Nelder-Mead, que proporciona los parámetros en donde existe un mínimo local (Tabla 2); también se realizaron las pruebas de heteroscedasticidad para comprobar que las series de tiempo presentan volatilidad (Hiesh, 1989; Domínguez, 1993; Diebold y Nerville, 1989), así como, comprobar que la serie es estacionaria, para tener precios más precisos.

En la segunda fase, se estiman los parámetros del modelo de Heston (1993) a través del algoritmo de Nelder-Mead programando en Matlab, para posteriormente proceder a calcular los precios de la opción call sobre tipo de cambio y obtener el error, respecto a los precios de mercado.

En una tercera fase, se calculan los precios teóricos de las opciones sobre tipo de cambio peso mexicano/dólar estadounidense (Figura 1), en la que se valida la estimación de los parámetros y donde los precios teóricos otorgan un error insignificante para la toma de decisiones de los inversionistas y agentes económicos.

Tabla1: Estadísticos Descriptivos y Pruebas de Heteroscedasticidad y de Raíces Unitarias

Variables	MX/USD	Rendimientos MXUSD	Variables	MX/USD	Rendimientos MXUSD	Variables	MX/USD	Rendimientos MXUSD

Valor de p	0.00000	0.0000000				<b>PP</b>		
			<b>Prueba de raíces unitarias</b>			t-estadístico	-2.707054	-46.84019
						MacKinnon	0.233700	0.000000
						Valor de p	0	

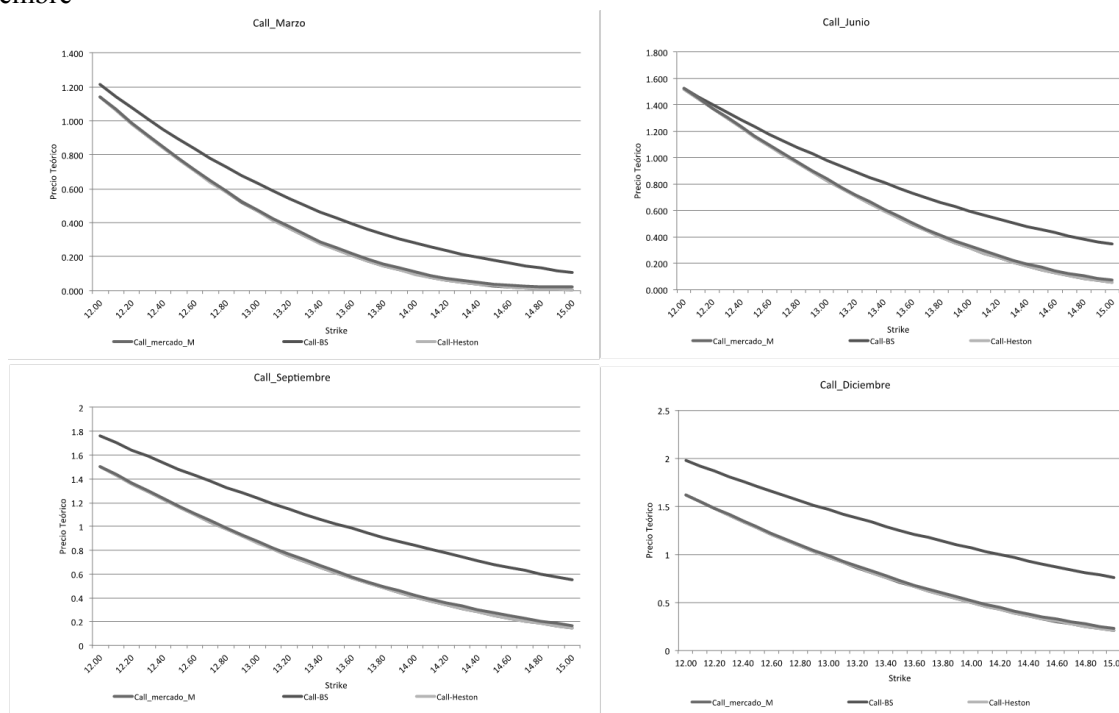

Se comprueba la hipótesis de el tipo de cambio presenta volatilidad cambiante en el tiempo es evidente en la Figura 1, y se comprueba con el valor-p que corresponde a la prueba White (Tabla 1) siendo menor a 0.05 y con un estadístico de prueba (38.13883 y 139.6199) ambos mayores al crítico (3.84), respectivamente; por lo tanto se rechaza la hipótesis nula de homoscedasticidad, entonces, la evidencia está claramente a favor de que la volatilidad de las series en estudio cambia en el tiempo. Tal como se puede apreciar en la Tabla 1, las fluctuaciones del tipo de cambio exhibe leptocurtosis, lo que significa que la probabilidad de fluctuaciones extremas de esta variable es mayor que lo que se observaría si estas innovaciones estuvieran distribuidas normalmente; la explicación a este fenómeno es la existencia de una aglomeración temporal de la varianza de las fluctuaciones cambiarias. También se observa que la asimetría para los rendimientos del tipo de cambio es positiva, lo cual indica que los datos están por encima del valor de la media. Finalmente con el estadístico Jarque-Bera y con el valor-p, correspondiente a la prueba de hipótesis  $H_0$ : los rendimientos tienen distribución normal versus  $H_1$ : los rendimientos no tienen distribución normal, se rechaza la hipótesis  $H_0$  con un 95 por ciento de confianza, lo cual indica que las series no tienen una distribución normal. También se realizaron las pruebas de raíces unitarias: la Aumentada de Dickey-Fuller (ADF), la de Dickey-Fuller-Elliott-Lothman-Stock (DF-GLS), la prueba de Phillips-Perron (PP) y la de Kwiatkowski-Phillips-Schmidt-Shin (KPSS), con lo cual se comprobó que la serie de tipo de cambio es estacionaria, por lo cual se procede a estimar los parámetros de lo modelo de Heston y así obtener precios más precisos. Fuente: Elaboración propia.

Tabla 2: Estimación de Parámetros del Modelo de Heston

Vector X	Diario	Semanal	Quincenal	Mensual
$\mu$	0.027108	0.0271082	0.0271082	0.0271082
$\theta$	0.018528	0.0185277	0.0185277	0.0185277
$\sigma$	0.286069	0.2860691	0.2860691	0.2860691
$\kappa$	4.524628	4.5250697	4.5246278	4.5246278
$\rho$	0.208646	0.2086459	0.2086459	0.2086459
$\psi(x)$	1.000	1.000	1.000	1.000
$[s1, p1, h1]$	[0.00569, 0.862, 0]	[0.0055, 0.857, 0]	[0.0054, 0.861, 0]	[0.0053, 0.859, 0]
Iteraciones	13	13	13	13

Se verifica que las estimaciones de los parámetros son consistentes, ya que se prueban para datos diarios, semanal, quincenal y mensual. Tal como lo muestra la Tabla 2. El algoritmo de Nelder-Mead muestra que es eficiente la estimación de los parámetros de un sistema de ecuaciones diferenciales parciales estocásticas (modelo de Heston (1993)) en Matlab, dando valores aproximadamente iguales en las pruebas (semanal, quincenal y mensual) con un mismo número de iteraciones. También refleja que el 95% de las simulaciones replican una distribución leptocúrtica, asimétrica y de colas anchas, generada en un sistema bivariado de difusión, mostrando una distribución continua según la prueba de bondad de ajuste de Kolmogorov-Smirnov  $[s1, p1, h1]$ . Fuente: Elaboración propia.

Figura 1: Precios de Opciones Call Sobre Tipo de Cambio con Vencimientos: Marzo, Junio, Septiembre y Diciembre

Se muestra que el modelo de Black-Scholes sobrevalora los precios de la opción hasta con un error promedio del 0.15%, 0.20%, 0.38% y 0.51% para vencimientos en marzo, junio, septiembre y diciembre, respectivamente. En cambio, el modelo de Heston subvalora ligeramente los precios teóricos respecto a los del mercado, presentando un error de 0.00008%, 0.00019%, 0.00007% y 0.0023% para los mismos vencimientos, respectivamente. Cabe mencionar, que el modelo de Heston (1993) proporciona precios cercanos a los del mercado, lo cual se argumenta también a la estimación de los parámetros de dicho modelo. Fuente: Elaboración propia.

## CONCLUSIONES

La estimación de los parámetros del modelo de Heston (1993) por medio del algoritmo de Nelder-Mead en Matlab, proporcionan precios teóricos semejantes a los del mercado, se afirma que dicho modelo, constituye una buena alternativa para obtener los precios de la opción sobre el tipo de cambio peso mexicano/dólar estadounidense, con el cual, al considerar la volatilidad estocástica del activo subyacente otorga un modelo más eficiente, para la toma de decisiones de los agentes económicos y la sociedad en su conjunto.

Dentro de las limitaciones hay que resaltar, el no haber considerado las tasas de interés estocásticas, por lo cual, se establece como futura investigación, un modelo de tres factores, en donde se consideren la volatilidad y tasas de interés, ambas estocásticas, asimismo, la estimación de dicho modelo, lo cual implica, tres ecuaciones diferenciales parciales estocásticas con siete parámetros a estimar, así como, establecer el algoritmo para la estimación de los parámetros.

# RESPONSABILIDAD SOCIAL EMPRESARIAL EN LAS PEQUEÑAS EMPRESAS CONSTRUCTORAS DE PUEBLA, MEXICO

Rafaela Martínez Méndez, Benemérita Universidad Autónoma de Puebla.  
María Antonieta Monserrat Vera Muñoz, Benemérita Universidad Autónoma de Puebla  
José Gerardo Serafin Vera Muñoz, Benemérita Universidad Autónoma de Puebla

## RESUMEN

*La presente investigación tiene como objetivo conocer de qué manera es llevada a cabo la Responsabilidad Social Empresarial en las pequeñas empresas constructoras ubicadas en Puebla México. Para lo cual se aplicó la investigación documental para sustentar el marco teórico y la investigación empírica. La muestra estuvo integrada por 53 pequeñas empresas constructoras, para realizar la investigación empírica se aplicó un cuestionario. Como resultado de la investigación se encontró la práctica de acciones comunes de Responsabilidad Social Empresarial; el tener y actuar con un código de ética empresarial; así como considerar importante la medición del consumo de agua y energía*

**PALABRAS CLAVE:** Responsabilidad Social Empresarial, Dimensiones de la RSE, Sector de la Construcción

## CORPORATE SOCIAL RESPONSIBILITY IN SMALL BUILDING COMPANIES, PUEBLA, MEXICO

### ABSTRACT

*This research aims to determine how it is carried out corporate social responsibility in small construction companies located in Puebla Mexico. For documentary research which was applied to support the theoretical framework and empirical investigation. The sample consisted of 53 small construction companies, for empirical research a questionnaire was applied. And act like having a code of business ethics, and as a result of research practice common shares of CSR was found and considered important to measure the consumption of water and energy*

**JEL:** M00

**KEYWORDS:** Corporate Social Responsibility, CSR Dimensions, Construction Sector

### INTRODUCCION

Durante los últimos años, uno de los temas que ha cobrado mayor relevancia en el ámbito de la administración es la Responsabilidad Social Empresarial (RSE), por el debate que ha generado sobre sus alcances e implicaciones y sobre todo por la dificultad para establecer su práctica; este enfoque sobre la forma como se deben administrar las empresas, ha ayudado a replantear los esquemas tradicionales de gestión empresarial, propiciando un gran cambio en la forma de hacer negocios, en función de estos planteamientos, de tal forma que se fundamenta la necesidad de las empresas como motores de desarrollo económico, al tiempo que actúan de manera ética y socialmente responsables, sin que los beneficios o utilidades económicas se antepongan sobre los aspectos sociales. Entre las investigaciones sobre Responsabilidad Social Empresarial se encuentran los siguientes; Barroso (2008), estudió cuarenta

empresas de Mérida, Yucatán, México. Su objetivo fue verificar qué entienden por RSE sus directivos, si creen que es necesaria para el éxito de sus empresas y si éstas son socialmente responsables. Calderón, Álvarez, y Naranjo (2011) en su investigación encontraron la relación teórica entre la responsabilidad social empresarial (RSE) y la gestión humana, y a partir de ella hallar evidencias en empresas colombianas del papel de esta área en el cumplimiento de la responsabilidad social. La investigación base del trabajo utilizó técnicas cuantitativas complementadas con entrevistas expertos y grupos foco. Moreno y Grateroll (2011) realizaron una investigación sobre las prácticas de Responsabilidad Social Empresarial (RSE) que lleva a cabo la pequeña y mediana empresa (Pyme) del sector metalmecánico en la Zona Industrial II de Barquisimeto, Estado Lara, Venezuela, en el se determinó la existencia de capacidades y recursos en la Pyme sin que éstos sean usados estratégicamente para fortalecer sus ventajas competitivas; también se evidenció la práctica de acciones comunes de (RSE), toda vez que se considera importante la protección del ambiente, la reducción de energía, manejo de desechos, aguas residuales. López (2013) estudio la RSE de 272 Mipymes de la ciudad de Celaya-Guanajuato-México. Los resultados muestran que poco menos de la mitad de las empresas implementa actividades de RSE enfocándose principalmente a acciones relacionadas a fomentar la calidad laboral, al ámbito medioambiental y a la mercadotecnia social.

En este contexto el objetivo de la presente investigación es conocer de qué manera es llevada a cabo la Responsabilidad Social Empresarial en las pequeñas empresas constructoras ubicadas en Puebla México. Por lo tanto la pregunta central de la misma es ¿Qué prácticas de Responsabilidad Social Empresarial se realizan en las pequeñas empresas constructoras de Puebla, México? Esta investigación está estructurada en tres grandes apartados: en el primero, trata sobre el Marco Teórico de la Responsabilidad Social Empresarial, las dimensiones de la RSE y el sector de la construcción; en el segundo apartado trata de la metodología que se aplicó en esta investigación y por último las conclusiones.

## REVISION LITERARIA

### Conceptualización de la Responsabilidad Social Empresarial

Las diversas definiciones de RSE formuladas por diferentes organismos e instituciones y desde diversos ámbitos –académico, gubernamental, empresarial– destacan la consideración de la Responsabilidad Social Empresarial como una estrategia voluntaria, la incorporación de preocupaciones sociales y ambientales a la gestión empresarial y su relación con la ética. Desde los años noventa, la responsabilidad social se integra en el discurso sobre la ética de la empresa, y surge el concepto de “empresa ciudadana” o “empresa socialmente responsable”, que destaca la responsabilidad de la empresa hacia el medio ambiente y la colaboración con la comunidad

El *Business for Social Responsibility*: (BSR) (2000) citado por López y Contreras (2010: 420) sostiene que la responsabilidad social empresarial es la administración de un negocio de tal forma que excede las expectativas éticas, legales, comerciales y públicas que tiene la sociedad hacia una empresa. De acuerdo a Taquia (2006), el Banco Interamericano de Desarrollo define la RSE como las prácticas empresariales que constituyen parte de la estrategia corporativa pero son complementarias al negocio, las cuales evitan efectos negativos o generan beneficios para los grupos participantes como los clientes, empleados, accionistas, comunidad y entorno. Dichas prácticas son de carácter voluntario y no impuesto por leyes o regulaciones. En este sentido para Chiavenatto (2007: 527) la Responsabilidad Social es el grado de obligación que una organización asume por medio de acciones, que proyectan y mejoren el bienestar de la sociedad a medida en que buscan alcanzar sus propios intereses.

El Centro Mexicano para la Filantropía (CEMEFI), organismo fundado en 1988 y de carácter privado, indica que una empresa socialmente responsable es aquella que tiene un compromiso consciente y congruente de cumplir íntegramente con su finalidad tanto en lo interno como en lo externo, considerando

las expectativas de todos sus participantes en lo económico, social o humano y ambiental, demostrando el respeto por los valores éticos, la gente, las comunidades, el medio ambiente y para la construcción del bien común (Porto y Castromán, 2006) citado por Barroso (2008: 77). Los autores consideran que la responsabilidad social son las acciones que una empresa emprende para mejorar el bienestar de sus integrantes y su entorno. Las definiciones coinciden en que la Responsabilidad Social Empresarial es la integración voluntaria por parte de las empresas de las preocupaciones sociales y medioambientales en su quehacer cotidiano.

### Dimensiones de la Responsabilidad Social Empresarial

A los involucrados en los procesos de la empresa se les llama *stakeholders*, quienes son las personas o grupos que tienen propiedad, derechos o intereses en una empresa y en sus actividades, pasadas, presentes o futuras, las cuales pueden ser legales o morales, individuales o colectivas (Rojas, M'Zail, Torcotte y Kooli, 2006) citado por Barroso (2007:67). La RSE implica de modo implícito una extensión de la teoría de la agencia hacia otras partes interesadas (*stakeholders*) a parte de los accionistas Piñeiro y Romero (2011; 9). La empresa debe tomar en consideración los intereses de los mismos, actualmente se entiende que los grandes grupos de interés son los clientes, empleados, proveedores, propietarios o accionistas, etc. De acuerdo al Libro Verde (Comisión Europea, 2001) las áreas de contenido de la RSE, se divide en dos bloques o dimensiones una interna a la empresa y otra externa. Dentro de la empresa, las prácticas socialmente responsables afectan fundamentalmente a los empleados y al medio ambiente en lo que respecta a cuestiones como la gestión de los recursos humanos, la salud y seguridad en el trabajo, la gestión del cambio y la gestión de los recursos naturales empleados en la producción. La dimensión externa recoge las relaciones de la empresa con las comunidades, los socios comerciales, las Organizaciones No Gubernamentales, los proveedores, los clientes y los inversores, así como la consideración del respeto por los derechos humanos y por las preocupaciones medioambientales globales.

### La Responsabilidad Social Empresarial en México

En la última década se ha producido un incremento de la conciencia por parte de las empresas de su entorno. El distintivo ESR acredita a las empresas que han asumido voluntaria y públicamente el compromiso de una gestión socialmente responsable como parte de su cultura y estrategia de negocio. La obtención del este distintivo es la consecuencia de la implantación de una gestión socialmente responsable en cuatro ámbitos de la responsabilidad social empresarial, (RSE) que son: a) calidad de vida en la empresa, b) ética empresarial, c) vinculación de la empresa con la comunidad y, d) cuidado y preservación del medio ambiente (CEMEFI, 2012). La validez de este distintivo es de un año pero puede ser renovado. Uno de los principales avances en el tema es haber logrado el consenso de los principales organismos empresariales y de responsabilidad social sobre un concepto y un marco ideológico común, lo que, sin duda, facilita su difusión y comprensión. Es así como todos los organismos de AliaRSE4 entienden a la RSE como: el compromiso consciente y congruente de cumplir integralmente con la finalidad de la empresa, tanto en lo interno como en lo externo, considerando las expectativas económicas, sociales y ambientales<sup>6</sup> de todos sus participantes, demostrando respeto por la gente, los valores éticos, la comunidad y el medio ambiente, contribuyendo así a la construcción del bien común

La Cámara Mexicana de la Industria de la Construcción (CMIC) crea en 2010, el Comité Nacional de Responsabilidad Social. Desde entonces, el Comité se encarga de diseñar la normatividad de Responsabilidad Social Empresarial (RSE) aplicable a las más de 10,000 empresas afiliadas a está y a sus programas de implementación, así como de la difusión de un código de ética, evaluando los avances de los comités delegacionales de responsabilidad social con los que cuenta la CMIC.

## El Sector de la Construcción

El sector de la construcción en México generó en el año 2012 5.6 millones de puestos de trabajo y 2.8 puestos de trabajo indirectos según cifras de la Cámara Mexicana de la industria de la construcción. Fue la tercera actividad económica con mayor capacidad de generación de empleo ya que emplea a personas con alta especialidad y a las menos especializadas, por cada 10 puestos de trabajo directos, se generan 5 Indirectos en ramas económicas relacionadas. Está relacionada con 63 de las 79 ramas productivas y por cada peso que se invierte en la industria de la construcción, 43 centavos se derraman en las ramas integradas a la cadena productiva. El sector de la construcción es uno de los sectores más importantes para México en la generación del valor agregado, representando en el período 2006-2011 entre 6.8% y 6.5% del Producto Interno Bruto PIB total según el sistema de Cuentas Nacionales de México esta participación no ha variado significativamente en los últimos años. Dentro del sector de la construcción el subsector de edificación es el que tiene mayor importancia; en el 2010 su participación en el PIB total fue de 3.69%, mientras que la construcción de obra pesada representó el 2.44% y los trabajos especializados de construcción tuvieron una participación del 0.50% respecto a la actividad total de la economía.

## **METODOLOGÍA**

La presente investigación es de tipo descriptivo con enfoque cuantitativo. El diseño es no experimental, el investigador no tiene injerencia en la generación de los resultados, sino que sólo los registra. Es también transversal debido a que la información se obtuvo en un solo período de tiempo (Hernández, Fernández y Baptista, 2003), siendo el método el estudio de campo y la técnica utilizada la encuesta estructurada. Las variables de Responsabilidad Social Empresarial que fueron analizadas son: Código de ética, prácticas laborales Medio ambiente y vinculación con los grupos de interés. La población objeto de estudio fue de 118 pequeñas empresas de la construcción en el Estado de Puebla según el Instituto Nacional de Estadística Geografía e Informática (INEGI), la fórmula utilizada para determinar el tamaño de la muestra fue:

$$n = \frac{k^2 pqN}{e^2(N-1) + K^2 pq} \quad 1$$

Donde:

N= es el tamaño de la población o universo 118 pequeñas empresas.

k = es el nivel de confianza que se asignó es de 95% = 1.96

e = el error muestral asignado de 5%

p = probabilidad de ocurrencia del evento 50%

q = probabilidad de no ocurrencia del evento 50%

n= tamaño de la muestra

$$n = \frac{1.96^2(0.50)(0.50)118}{0.10^2(118-1) + 1.96^2(0.50)(0.50)} = 53 \text{ Número de empresas encuestadas}$$

## Perfil de la Muestra

De las 53 pequeñas empresas encuestadas la mayoría (63.8%) de más de 10 años de antigüedad, con media de 12.2 años y desviación estándar de 1.8 años; giro principal es la edificación de vivienda unifamiliar 42%, mantenimiento e instalación 27% y obra pública 15%. El 64% los gerentes de la empresa son dueños de la misma, el 36 % es ajeno a la misma. Así como el 42% de los gerentes encuestados estudiaron la Licenciatura en Ingeniería Civil, el 12% estudio la Licenciatura en Arquitectura, el 16% estudió una Licenciatura económico administrativa, 32% carrera trunca.

## RESULTADOS

De la muestra estudiada de las 53 pequeñas empresas del sector de la construcción ubicadas en el Estado de Puebla México encuestada, los resultados que se obtuvieron se presentan a continuación: Al preguntar ¿Conoce el significado de Responsabilidad Social Empresarial o Empresa Socialmente Responsable? Como se puede observar en la Figura 1, el 32% respondió que sí conocía el significado y el 68% respondió que no conocía su significado.

Figura 1: Significado de Responsabilidad Social Empresarial

*Esta Figura muestra que los dirigentes de las pequeñas empresas constructoras en su mayoría 68% no conocen el significado de Responsabilidad Social Empresarial.*

Al preguntar. ¿Con que aspectos asocia que una empresa aplique la Responsabilidad Social Empresarial? Como se puede observar en la Figura 2, el 45.3% menciono que retribuir a la sociedad por el consumo de sus producto, el 5.7% con actos de caridad.

Figura 2: Conceptos Asociados con la Responsabilidad Social

*Esta figura muestra la tendencia a asociar la Responsabilidad Social Empresarial, con la retribución a la sociedad por el consumo de sus productos y con la colaboración con la sociedad*

A la Pregunta Su empresa cuenta con una política o código de ética empresarial. El 86% de los encuestados contestos en forma afirmativa, de los cuales respondieron a la pregunta cómo se puede observar en la Tabla 2, la forma de divulgación de los valores y principios éticos, su empresa:

Tabla 2: Principios Éticos

	SI	No
Su empresa cuenta con una política o código de conducta empresarial	86%	14%
En el caso que en su organización exista un código de ética y/o declaración de valores, éste: Aborda a tres o más de las siguientes partes interesadas: empleados, proveedores, consumidores/ clientes, comunidad, gobierno y accionistas	82%	18%
Prohíbe expresamente la utilización de prácticas ilegales (corrupción, soborno, doble contabilidad) para obtener ventajas económicas	74%	26%

*Esta tabla muestra que la mayoría de las pequeñas empresas constructoras cuentan con un código de ética empresarial que prohíbe prácticas desleales.*

Se pregunto ¿Qué acciones está realizando como empresario para beneficiar a sus empleados? Como se puede observar en la Figura 3, el 25% de los encuestados respondió que la convivencia con sus empleados (realizando actividades deportivas una vez al mes), el 19% proporciona cursos a sus empleados y un 37% no tiene acciones implementadas en su empresa

Figura 3: Acciones Implementadas

*Esta figura muestra las acciones que han implementado los dirigentes de las pequeñas empresas constructoras en beneficio de sus empleados.*

A la pregunta ¿Que incentivos otorga a cuando el trabajador aporta ideas para mejorar su actividad o el área de trabajo? El 24% de los encuestados respondió que otorgan un bono extra, el 15% ascenso el 7% otorga un reconocimiento público, el 54 % no otorga ningún incentivo.

Figura 4: Incentivos Por Mejora del Trabajo

*La figura muestra los incentivos que se otorgan en las pequeñas empresas constructoras para motivar al personal, cuando realizan una propuesta de mejora, como bono extra., ascenso , reconocimiento público.*

El 74% de las pequeñas empresas miden los consumos de agua, recursos materiales y energía eléctrica de forma interna (indicadores internos) y con los recibos o facturas. El resto desconoce una forma estructural de medición. Otra pregunta fue la relacionada al tiempo de renovación y mantenimiento del equipo de transporte que tiene que ver con el cuidado al medio ambiente. El 9% de la muestra estudiada respondió que a los 5 años, el 56% más de 5 años y menos de 10 y el 35% más de 10 años. La mayoría de los dirigentes de las pequeñas empresas constructoras no conocen el termino de Responsabilidad Social Empresarial el 68% sin embargo se pudo constatar que a pesar de no tener conocimiento, si realizan algunas acciones que pueden considerarse de RSE. El desconocimiento de RSE se traduce en el hecho de que los empresarios simplemente apoyan a la sociedad de manera mínima con acciones que están más relacionadas con la filantropía.

## CONCLUSIONES

En este apartado se discuten las principales implicancias teóricas y empíricas derivadas de la presente investigación: El objetivo que se planteó al inicio de la presente investigación fue conocer de qué manera es llevada a cabo la Responsabilidad Social Empresarial en las pequeñas empresas constructoras ubicadas en Puebla México, misma que se logró como se puede observar en el apartado de resultados. Desde el punto de vista teórico los resultados de la investigación son consistentes con el Estado del arte, las acciones de RSE están encaminadas a fomentar la calidad laboral, el ámbito medio ambiental (Barroso, 2008; Botero 2009; López (2013). Los resultados muestran que poco menos de la mitad de las empresas implementa actividades de RSE enfocándose principalmente a acciones relacionadas a fomentar la calidad laboral, al ámbito medioambiental y a la mercadotecnia social.

Desde el punto de vista práctico es posible sugerir a las pequeñas empresas constructoras:

a) Capacitar al personal en términos de Responsabilidad Social Empresarial a todos los niveles desde el nivel Directivo hasta el nivel operativo; b) Deben Generar indicadores que midan las acciones de RSE; c) Generación de programas y actividades de voluntariado a los que las partes involucradas pudieran sumarse; d) Implementar la RSE como una estrategia de competitividad. Por último, futuros trabajos podrían retomar esta investigación para abordar elementos que quedan pendientes de analizar, como la RSE en el conglomerado de las micro, pequeñas y medianas empresas (mipymes) y en cada sector específico de

actividad, por entidades, así como añadir variables de control, como el género de los empresarios, la edad, etc.

## MIPYME Y PRÁCTICAS DE DESARROLLO SUSTENTABLE: DOS ESTUDIOS DE CASO DE EMPRESAS POBLANAS

María Antonieta Monserrat Vera Muñoz, Benemérita Universidad Autónoma de Puebla

Rafaela Martínez Méndez, Benemérita Universidad Autónoma de Puebla

José Gerardo Serafin Vera Muñoz, Benemérita Universidad Autónoma de Puebla

### RESUMEN

*La creciente exigencia por la preservación del medio ambiente y el cuidado de los recursos naturales influye en las actividades empresariales y se convierte en un reto para la actividad de las grandes empresas y de las MYPIME. En el presente trabajo se desarrolla un análisis de las diferentes prácticas de desarrollo sustentable a la luz de acciones recomendadas por de dependencias gubernamentales mexicanas; considerando como caso de estudio empresas poblanas una de giro industrial dedicada a la elaboración de productos para el cuidado de la piel y otra del sector servicios dentro del turismo ecológico. Las dos empresas tienen como parte de las actividades cotidianas de su vida empresarial acciones a favor del medio ambiente como la ecotecnia para contribuir al cuidado del medio ambiente. Los resultados muestran cómo las MIPYME pueden realizar prácticas sustentables para apoyar el cuidado de los recursos naturales y en general el medio ambiente independiente del tamaño de la empresa y del giro económico en el que se encuentren. Comprobando la pertinencia de las prácticas recomendadas por la dependencias gubernamentales mexicanas para el cuidado del medio ambiente. Y señalando también el cumplimiento de "Producción más Limpia" como parte del principio de sustentabilidad de las actividades humanas, en las cuales la economía, el bienestar y el ambiente forman un todo.*

**PALABRAS CLAVE:** Desarrollo Sustentable, Medio Ambiente, Ecotecnia, Prácticas Empresariales

### ABSTRACT

*The growing demand for environmental preservation and care of natural resources influences business activities and becomes a challenge for the activity of large companies and MYPIME. In this paper an analysis of different practices of sustainable development in the light of recommended actions Mexican government agencies develop, considering as a case study poblanas industrial businesses a rotation dedicated to the development of products for skin care and other service sector in ecotourism. The two companies have as part of the daily activities of your business life actions for the environment as ecotechnology to help care for the environment. The results show that MSMEs can make sustainable practices to support the care of natural resources and overall the environment independent of the size of the company and the economic downturn in which they are located. Noting the relevance of those recommended by the Mexican government agencies for environmental stewardship practices. And pointing to the fulfillment of "Cleaner Production" as part of the principle of sustainability of human activities, in which the economy, welfare and the environment to form a whole.*

## INTRODUCCIÓN

El cuidado del medio ambiente es una tarea de todos y las MIPYME no pueden permanecer al margen de esa tarea, es por algunas dependencias de gobierno en México, proponen una serie de prácticas empresariales que apoyan a la conservación del medio ambiente y a evitar el desarrollo del mismo. Las prácticas tienden al cuidado del agua, aire, flora, fauna, paisaje y actividades con la sociedad. Todo lo anterior para contribuir al desarrollo sustentable. La investigación se estructura de la siguiente forma: Revisión de la literatura, donde se integra el punto de vista de respecto a al desarrollo sustentable, la relación de las MIPYMES con el termino anterior y las practicas recomendadas por entidades del gobierno mexicano a las empresas, que apoyan el desarrollo sustentable y por ende al cuidado y conservación del medio ambiente. Posteriormente se presenta la metodología utilizada en la revisión de la literatura y para la investigación de campo se trabaja con dos empresas de giros distintos, pero que ambas realizan prácticas a favor del desarrollo sustentable, entre ellas la ecotecnía.

## REVISIÓN DE LA LITERATURA

Los últimos años se han caracterizado por el uso excesivo de los recursos naturales, propiciando la destrucción del medio ambiente, situación que es visible con la contaminación del agua, aire, suelo y el peligro de extinción o la desaparición de especies vegetales y animales (Vera, Vera y Méndez, 2014).

### Desarrollo Sustentable y Medio Ambiente

Fuertemente ligado al medio ambiente encontramos el desarrollo sustentable, el cual según La Comisión Mundial del medio Ambiente y del desarrollo, (1992), se puede definir como: El desarrollo que satisface las necesidades de la generación presente sin comprometer las capacidades de las generaciones futuras para satisfacer sus propias necesidades. Teniendo como referencia la Conferencia de Estocolmo en 1972, en la que se marca en el ámbito internacional un mayor interés por el cuidado y la preservación del ambiente para garantizar la calidad y la continuidad de la vida humana en el planeta, aparecen conceptos como: el de desarrollo sostenible, entendiéndose por éste el esfuerzo sostenido de las naciones del mundo por mejorar las condiciones de vida de la población y garantizar la continuidad de la humanidad, mediante el cuidado de los recursos naturales y la satisfacción de las necesidades esenciales actuales y futuras (Ablan y Méndez, 2004).

Cabe aclarar que en los países desarrollados se utiliza la expresión desarrollo sostenido, debido a que ellos han alcanzado ya un nivel que deben mantener, combinándolo con la conciencia ecológica; en los países en vías de desarrollo se habla de desarrollo sustentable para denotar un avance posible y con una conciencia ambiental a lo largo del tiempo. Al medio ambiente lo definen como: Conjunto de recursos naturales y bióticos, tales como el aire, el agua, el suelo, la fauna, la flora y la interacción entre tales elementos, así como los bienes que forman la herencia cultural y aspectos característicos del paisaje (Consejo de Europa, 1993: citado por Déniz, 2007). Como lo hacen diferentes países México propone actividades a las empresas ligadas al desarrollo sustentable en las que se consideran las extracción de recursos naturales, el impacto de las actividades empresariales sobre el medio ambiente y estable una vinculación con la historia política y social y los efectos de estos dos puntos sobre los recursos naturales; así como la percepción que la sociedad tiene del valor de la naturaleza. Debido a lo anterior podemos mencionar de forma concreta el gobierno mexicano plantea a las empresas prácticas de desarrollo sustentable por medio de recomendaciones que hacen dos dependencias como son: La Secretaria de Medio Ambiente y Recursos Naturales (SEMARNAT) y La Procuraduría Federal de Protección al Ambiente (PROFEPA).

### Prácticas Empresariales

Las empresas no pueden permanecer ajenas al daño ambiental y a apoyar al desarrollo sustentable y actualmente surge la empresa socialmente responsable. La responsabilidad social empresarial (RSE), se utiliza para referirse a la Responsabilidad Social (RS), la cual se debe entender como la existencia de un compromiso con carácter voluntario asumido por las empresas para su desarrollo sostenible (Porto y Castromán, 2006). Por lo que la responsabilidad social se puede entender como un conjunto de mecanismos para el desarrollo limpio que aplican las empresas para minimizar el impacto del desarrollo de su actividad al medioambiente (Lacruz, 2007). El libro verde la Unión Europea (UE, 2001; citado por Porto y Castromán, 2006) define a la RS:

*“[...] la integración voluntaria, por parte de las empresas, de las preocupaciones sociales y medioambientales en sus operaciones comerciales y las relaciones con sus interlocutores. Ser socialmente responsable no significa solamente cumplir plenamente las obligaciones jurídicas, sino también ir más allá de su cumplimiento invirtiendo más en el capital humano, el entorno y las relaciones con los interlocutores”.*

En México el Centro Mexicano para la Filantropía (CEMEFI), define a la empresa socialmente responsable:

*“[...] aquella que tiene el compromiso consciente y congruente de cumplir íntegramente con la finalidad de la empresa tanto en lo interno y lo externo, considerando las expectativas de todos sus participantes en lo económico, social o humano y ambiental, demostrando el respeto por los valores éticos, la gente, las comunidades, el medioambiente y para la construcción del bien común.*

Y entiende por Responsabilidad Social (RS):

*“[...] la conciencia del compromiso y la acción de mejora continua medida y consistente, que hace posible a la empresa ser más competitiva, cumpliendo con las expectativas de todos sus participantes en particular y de la sociedad en lo general, respetando la dignidad de la persona, las comunidades en las que opera y su entorno.* (Centro Mexicano para la Filantropía; citado por Porto y Castromán, 2006).

Retomando las prácticas empresariales propuestas por el gobierno, tenemos dos entidades con diferentes enfoques: La SEMARNAT, es la dependencia de gobierno que tiene como propósito fundamental "fomentar la protección, restauración y conservación de los ecosistemas y recursos naturales, y bienes y servicios ambientales, con el fin de propiciar su aprovechamiento y desarrollo sustentable" (Ley Orgánica de la Administración Pública Federal, Artículo 32 bis reformada en el DOF del 26 de diciembre de 2013). Para cumplir con este mandato, la SEMARNAT, trabaja en 5 aspectos prioritarios: La conservación y aprovechamiento sustentable de los ecosistemas y su biodiversidad, La prevención y control de la contaminación, La gestión integral de los recursos hídricos y El combate al cambio climático, Tabla 1.

Otras acciones importantes para cuidar el medio ambiente: agua, aire, suelo, flora, fauna, salud humana y paisaje y cultura. La participación de ciudadanos organizados y conscientes de temas como el calentamiento global, la disposición de agua, la deforestación, los patrones de producción y consumo, así como los principios y valores que sustentan a esta sociedad. Reflexionar en nuestros hábitos de consumo y actitudes hacia el cuidado y protección del ambiente en el desarrollo de actividades cotidianas como transportarnos, asearnos, viajar, cocinar o comprar productos, y los impactos de éstas en el ambiente.

En nuestra casa, trabajo, comunidad o escuela podemos iniciar actividades concretas para mejorar el entorno. Para lograrlo necesitamos observar nuestro alrededor e identificar alternativas menos dañinas al ambiente, cambiar conductas y tomar decisiones basadas en el mejoramiento de la calidad de vida.

Como parte de la SEMARNAT se encuentra el Consejo Nacional de Educación Ambiental para la Sustentabilidad cuyas funciones son: Emitir recomendaciones a la Secretaría de Medio Ambiente y Recursos Naturales sobre: La formulación, aplicación y evaluación de estrategias, políticas, programas, proyectos, estudios y acciones específicas en materia de educación ambiental para la sustentabilidad, Las disposiciones jurídicas y procedimientos en materia de educación ambiental para la sustentabilidad; Vincularse y, en su caso, coordinarse con otros órganos de consulta o espacios de participación ciudadana a fin de propiciar el intercambio de experiencias, Colaborar, por conducto del Cecadesu, con la Secretaría de Educación Pública, para el fortalecimiento de la educación ambiental para la sustentabilidad en el sistema educativo nacional, particularmente en los planes y programas de estudio, los materiales didácticos y la formación docente, y Promover la investigación en materia de educación ambiental para la

Tabla 1: Trabajos de la SEMARNAT

Conservación y Aprovechamiento Sustentable de los Ecosistemas y Su Biodiversidad	Conservación y Aprovechamiento Sustentable de los Ecosistemas y su Biodiversidad	Prevención y Control de la Contaminación	Gestión Integral de Recursos Hídricos	Combate al Cambio Climático
Conservar Y Aprovechar Sustentablemente Los Ecosistemas Es Fundamental Para Frenar La Erosión Del Capital Natural, Conservar El Patrimonio Nacional Y Generar Ingresos Y Empleos Para Los Mexicanos, Y Contribuir A La Sustentabilidad Ambiental Del Desarrollo Nacional.		Para Lograr La Salud De Las Personas Y Los Ecosistemas Es Necesario Prevenir, Reducir Y Controlar La Generación De Residuos Y Las Emisiones Contaminantes Que Afectan Los Suelos, El Agua Y El Aire.	El Agua, Es Uno De Los Recursos Naturales Más Valiosos Del Planeta; Sin Este Vital Líquido La Vida No Sería Posible; Por Ello, Asegurar El Abastecimiento A Los Mexicanos, Así Como Lograr El Manejo Adecuado Y La Preservación Del Agua En Cuencas Y Acuíferos Del País Es Indispensable Para Lograr El Bienestar Social, Impulsar El Desarrollo Económico Y Preservar Las Calidad Del Medio Ambiente. Por Ello, La Política Hídrica Nacional Se Ha Diseñado Para Lograr Que México Cuente Con Agua En Cantidad Y Calidad Suficiente, Reconozca Su Valor Estratégico, La Utilice De Manera Eficiente Y Proteja Los Cuerpos De Agua Para Garantizar El Desarrollo Sustentable.	El Cambio Climático Representa La Mayor Amenaza Para La Supervivencia De La Humanidad Y Para El Desarrollo De La Naciones Porque, Además De Poner En Riesgo A La Población Por Sus Efectos Adversos, Que Incluyen Principalmente La Variabilidad Y Los Extremos Del Clima, Incide Directamente En La Pérdida De La Biodiversidad Y La Capacidad De Los Ecosistemas De Ofrecer Bienes Y Servicios Ambientales.
Para Lograr lo Anterior, Se Desarrollan Diversos Programas E Instrumentos de Política Ambiental				
		Vigilar El Estricto Cumplimiento De La Legislación Ambiental Mediante La Realización De Acciones De Inspección, Vigilancia Y Auditoría Ambiental		

*En la Tabla se aprecia que para lograr los trabajos la SEMARNAT opera mediante la implementación de programas acompañados de instrumentos y políticas ambientales*

sustentabilidad. Las actividades de Fomento ambiental propuesta por la SEMARNAT las resumimos en la Tabla 2.

Tabla 2: Propuesta de Actividades Empresariales Para el Fomento Ambiental

Fomento Ambiental					
Fundamento	Conceptos	Actividades			
Leyes Federales y Estatales, Reglamentos del Sector, Diario Oficial, Normas Oficiales Mexicanas, Normas Mexicanas.	Turismo Sustentable	México natural	Especial de turismo sustentable	Mejores prácticas ambientales. Marinas y de campos de Golf	
	Producción y Consumo Sustentable Residuos				
	Energías Renovables	Sistema de Información Energética	Guía de Programas de Fomento de Energías Renovables	Uso eficiente de Energía	Desarrollo de proyectos comunitarios
	Playas Edificación Sustentable Manejo Sustentable de Tierras Calidad del aire				

En la Tabla se observan la fundamentación y los diferentes conceptos considerados para el fomento ambiental; únicamente se presentan las actividades de dos conceptos que son los que se relacionan con las empresas caso de estudio.

Tabla 3: Programas de PROFEPA

Programas	Programa de Liderazgo Ambiental Para la Competitividad	Programa Nacional de Auditoría Ambiental
Justificación	Liderazgo Ambiental para la Competitividad es un esfuerzo de cooperación entre la industria, instituciones de asistencia empresarial, gobiernos locales y el gobierno federal a través de la Secretaría de Medio Ambiente y Recursos Naturales y la Procuraduría Federal de Protección al Ambiente.	El Programa consiste en una serie ordenada de actividades necesarias para fomentar la realización de auditorías ambientales. El ingreso al programa es de carácter voluntario al cual pueden adherirse las organizaciones productivas que así lo deseen con la finalidad no solo de ayudarse a garantizar el cumplimiento efectivo de la legislación, sino mejorar la eficiencia de sus procesos de producción, su desempeño ambiental y su competitividad.
Población empresarial objetivo	Se incluye a empresas de más de 10 empleados y principalmente dedicadas a actividades de manufactura y/o transformación pertenecientes a cadenas de proveeduría de grandes compañías, para lograr beneficios económicos y ambientales que mejoren su competitividad.	Está orientado a las empresas en operación, que por su ubicación, dimensiones, características y alcances puedan causar efectos o impactos negativos al ambiente o rebasar los límites establecidos en las disposiciones aplicables en materia de protección, prevención y restauración al ambiente.
Acciones	Mediante la aplicación de una novedosa y sencilla metodología Liderazgo Ambiental para la Competitividad mejora el desempeño de las empresas desarrollando capacidades para generar importantes ahorros económicos en sus procesos de producción al reducir el consumo de agua, energía y materias primas, así como evitando emisiones, residuos y descargas de contaminantes.	El Programa consiste en una serie ordenada de actividades necesarias para fomentar la realización de auditorías ambientales. El ingreso al programa es de carácter voluntario al cual pueden adherirse las organizaciones productivas que así lo deseen con la finalidad no solo de ayudarse a garantizar el cumplimiento efectivo de la legislación, sino mejorar la eficiencia de sus procesos de producción, su desempeño ambiental y su competitividad.
Resultados esperados	Con el apoyo de Liderazgo Ambiental para la Competitividad las empresas pueden mejorar de manera continua sus productos y procesos de producción con sus propios recursos.	Contribuir a que la sociedad mexicana cuente con un medio ambiente mejor. Cada uno de nuestros socios desempeña una función muy importante, ya sea promoviendo, operando o participando en el programa a través de la auditoría ambiental.

La Tabla incluye de forma sintética los programas con los que trabaja la PROFEPA a favor del cuidado del medio ambiente, sin embargo el primero se enfoca a logros empresariales y el segundo a la vigilancia del apego a la normatividad ambiental y no tanto a promover de forma concreta actividades empresariales.

Adicionalmente la SEMARNAT, señala de forma específica los recursos debe cuidarse a beneficio del medioambiente, entre los que señala: La otra entidad de gobierno a la que nos referimos en párrafos anteriores es: La Procuraduría Federal de Protección al Ambiente, (PROFEPA), nace por la necesidad de atender y controlar el creciente deterioro ambiental en México, no tan sólo en sus ciudades, sino también en sus bosques, selvas, costas y desiertos, lo cual, sumado a una serie de eventos desafortunados como explosivos en el subsuelo, originó que el Ejecutivo Federal implementara sus políticas públicas afines al medio ambiente y tomara la decisión de crear un organismo que tuviera entre sus atribuciones, la de regular las actividades industriales riesgosas, la contaminación al suelo y al aire, y el cuidado de los recursos naturales. Una de las tareas principales de la PROFEPA es incrementar los niveles de observancia de la

normatividad ambiental a fin de contribuir al desarrollo sustentable. Entre sus atribuciones se encuentran vigilar el cumplimiento de las disposiciones legales; salvaguardar los intereses de la población en materia ambiental procurando el cumplimiento de la legislación ambiental, sancionar a las personas físicas y morales que violen dichos preceptos legales, etc. Para cumplir con sus tareas tiene dos programas eje, Tabla 3.

Algunas de las prácticas sustentables se apoyan con la ecotecnia.

*Ecotecnia:* Es un instrumento desarrollado para aprovechar eficientemente los recursos naturales y materiales y permitir la elaboración de productos y servicios, así como el aprovechamiento sostenible de los recursos naturales y materiales diversos para la vida diaria. La ecotecnia son tecnologías que garantizan una operación limpia económica y ecológica (SEMARNAT, 2013). Ventajas de la ecotecnia: Limitan el impacto humano sobre la biosfera, Mantienen el patrimonio biológico, Utilizan racionalmente los recursos naturales no renovables, Mejoran la salud de las personas, Hay reciclaje y manejo de desechos de forma adecuada y Ahorran agua y energía.

*ecotecnias conocidas en la actualidad:* Pintura natural, Impermeabilizante natural con baba de nopal, Composta (abonos orgánicos), Lombrí composta, Biodigestor, Estufa de aserrín, Bomba de mecate, Hidroponía, Cama biointensiva de hortalizas, Captación de agua de lluvia, Cisterna de ferrocemento, Letrina seca, Biofiltro tipo jardinera y Energías renovables. Consideramos la propuesta más concreta para el fomento de prácticas empresariales sustentables lo realiza SEMARNAT y es de donde tomamos elementos para aterrizarlos a los estudios de caso.

#### Estudios de Caso Caso 1: Orígenes

Vitamoril, es una empresa que está localizada en San Gabriel Chilac, distrito de Tehuacán Puebla (Figura 1) y tiene un local para la comercialización del producto en la Ciudad de Tehuacán, Puebla, la tienda que es uno de los puntos de venta se abre en la ciudad de Tehuacán en mayo de 2012. Los inicios de la empresa se remontan al año de 2006, a sugerencia del papá de uno de los empresarios, de profesión médico anestesiólogo, quien había investigado algunas propiedades de la semilla de moringa; propone a su hijo quien termina sus estudios de comunicación y es uno de los empresarios siembre la semilla ya a que a su hermano le consiguieron de Islas Canarias una variedad de semillas y entre ellas la de moringa (originaria de la India y África), el joven decide realizar la siembra en la azotea de la casa que habita con su familia. El joven abandona el proyecto por 2 años, mientras estudia una maestría en Diseño y retoma la empresa en 2008, al no encontrar el joven licenciado en comunicación empleo y pensar en autoemplearse, al retomar la empresa intentan la siembra de la semilla de moringa en un terreno propiedad de la mamá del joven localizado en Santiago Mahuatlan, Puebla pero las condiciones geográficas y la extensión del terreno no eran propicias para la siembra por lo que adquieren un terreno con recursos propios con una extensión mayor a una hectárea y media en San Gabriel Chilac Puebla.

Con la obtención de la cosecha de la semilla de moringa y con la integración a la empresa de un amigo con estudios de Ingeniero Agrónomo y con Maestría en Ciencias Ambientales; inician con su primer producto con apoyo de una tesis realizada en la Facultad de Ciencias Químicas; el producto es un “Complemento Alimenticio” con dos presentaciones en polvo y en capsulas.

A partir de ese momento se dedican a investigar los jóvenes empresarios Miguel Amador (Comunicólogo) y Alejandro Duran (Ingeniero) y empiezan a elaborar una serie de productos cosméticos como son: Cremas para la cara, manos y cuerpo, shampoo, jabones para baño, aceites para cuerpo y geles de ducha combinados con otros ingredientes como: semilla de uva, manzanilla, jalea real, nuez de macadamia, hueso de chabacano, lavanda, naranja y café. La empresa está legalmente constituida como una persona moral. Con

dos propósitos bien definidos: El primero de ello apoyar a productores de artesanía de palma, carrizo y bordados en tela localizados, en la zona, en lugares como Zapotitlán de las Salinas, San Pero Oztumba y Ajalpan, que se utilizan como empaque de los productos. Y a un grupo de la madres solteras de la Ciudad de Puebla que hacen pequeños muñecos de tela rellenos de hierbas y plantas aromáticas relajantes y el segundo la protección del medio ambiente con la práctica de la ecotecnia.

*Funcionamiento de la empresa:* Los familiares y amigos además de otros colaboradores se ocupan de diferentes actividades en la empresa; una persona para la administración, una para el laboratorio, 4 personas para el campo, una persona para la tienda, una más para planeación y otra para ventas.

Resumiendo; en la empresa de manera formal existen 3 niveles jerárquicos, el de dirección – gerencias, jefaturas y el de los asistentes. La empresa es administrada por un despacho externo. No se tiene financiamiento en la actualidad, el costo de operación de la empresa se soporta con los ingresos de las ventas y con aportaciones de los socios.

*Producción, productos y mercado:* El proceso de producción incluye la producción de campo bajo prácticas de agricultura orgánica, uso de residuos orgánicos para la producción, composta y lombricomposta evitando el uso de productos organicosintéticos y agroquímicos. En la huerta se utiliza la ecotecnia; como colecta de agua de lluvia, construcciones con botellas pet, secadores solares y manejo de aguas grises. El proceso se inicia con la siembra de la semilla en botes, después se prepara la tierra y se pasa la plata que creció en los botes campo. Ya la planta en el campo se le agrega jugos que se obtienen al producir la composta. El proceso de cultivo se mantiene en permanente investigación, experimentando con la preparación del suelo para la siembra en campo lográndose mejorar el cultivo en un año notándose mejora en el crecimiento de la planta y en follaje más abundante. También experimentan elaborando sus propios fumigadores e insecticidas con prácticas de ecotecnia. El tiempo de obtención del producto (semilla) es de un año a partir de la siembra.

El aceite de la semilla de moringa se mezcla con otros productos como son: semilla de uva, manzanilla, jalea real, nuez de macadamia, hueso de chabacano, lavanda, naranja y café. Para obtener una variedad de 27 productos para el cuidado de la piel actualmente, entre los que se encuentran; el complemento alimenticio, jabones, shampoo, gel de baño, cremas para cara y cuerpo y aceites relajantes y exfoliantes. Incluyendo también artesanías de la zona de tejido de palma, bordados y canastas de carrizo. Se han tenido avances en la empresa en lo referente al etiquetado, sellado, almacenaje de materias primas y control de inventarios Respecto al mercado, este se desarrolla con la asistencia a Expo-ferias Comerciales, tienda de la huerta (localizada en el centro de la ciudad de Tehuacán, Puebla), ventas a detalle en la trastienda de CINIA localizada en la ciudad de Puebla y en la tienda virtual [www.vitamoril.com](http://www.vitamoril.com).

La empresa atiende un mercado local, nacional e internacional. Los clientes más fuertes son del norte del país (Tamaulipas) y Guadalajara y algunos clientes en Estados Unidos. El personal de la empresa es capacitado en el manejo y propiedades de los productos antes de apoyar en las ventas en los diferentes espacios ya señalados. Se han hecho alianzas por parte de la empresa con comunidades de la zona en base a la confianza para la comercialización de las artesanías mencionadas, estableciendo trabajo por encargo.

*Vinculación Empresa – Universidad:* Se han establecido por parte de la empresa relaciones de apoyo en investigaciones en trabajos de tesis de licenciatura y maestría con ULAP, BUAP, UNAM, Universidad de Chapingo, Tecnológico de Monterrey (incubadoras de empresas). Así como permitir visitas de grupos de estudiantes a la huerta.

*Otros Datos:* No se tiene pertenencia a alguna Cámara o agrupación de productores. Lo que existía como agrupación era el Consejo Mexicano de la Moringa, donde se propiciaba un intercambio de experiencias en el manejo de la planta, pero actualmente ya no funciona.

## Caso 2: Orígenes

La idea surge en el año 2000 y el inicio de operaciones es en el año 2009. En el año 2000, el que era dueño del rancho tenía la idea de iniciar un proyecto ecoturístico, sin embargo, no la llevó a cabo. El señor Ciro compra la propiedad con la intención de llevar a la práctica la idea, pues comenta que siempre había tenido la inquietud de realizar un proyecto de esta naturaleza. El rancho que tiene una extensión de 150 hectáreas, lo compró con recursos propios. Hay que tener en cuenta que el señor Ciro ha sido un empresario muy exitoso desde muy joven. Y no tenían ningún proyecto, sin embargo, con la finalidad de buscar recursos para continuar con el proyecto tuvieron que elaborar un plan que presentaron a FIRCO con el cual obtuvieron 1.5 millones de pesos, el resto 6.5 millones de pesos fueron recursos propios. Posteriormente también obtuvieron un financiamiento del gobierno del estado por 1.5 millones de pesos con lo cual se construyeron las instalaciones actuales. Entre las principales están un restaurant para aproximadamente 60 personas, una alberca semiolímpica, un auditorio al aire libre para 150 personas, 5 cabañas perfectamente acondicionadas para 30 personas y un hostel para aproximadamente 50 personas, un área de estacionamiento para 40 automóviles, un criadero de caballos cuarto de milla, ganado vacuno (vacas de doble propósito) gallinas ponedoras, tirolesa, cuatrimotos, bicicletas de montaña y una pequeña huerta de cítricos. Un aspecto importante que señala el señor Ciro, son sus relaciones con algunos políticos, las que le sirvieron para gestionar el financiamiento del gobierno del estado.

*Funcionamiento de la empresa:* Una de las hijas del empresario ha participado en de diversos cursos de capacitación y la asistencia a congresos sobre turismo ecológico, quien es la directora general del rancho. Ella es licenciada en lenguas extranjeras por la Universidad Iberoamericana campus Puebla. Para la construcción del inmueble, se contrató a un arquitecto especialista en el uso del bambú. Esto, debido a que la región es rica en bambú y éste resulta ser un material muy útil para la construcción de civil y de muebles. Y teniendo en cuenta que se trata de un proyecto ecoturístico, el uso de este material abundante en la región resultó excelente. En total el personal de la empresa se integra por el dueño, su hija como directora general, un administrador, una cocinera, un mesero y un caballerango y 25 ayudantes haciendo un total de 30 personas.

## Producción, Productos y Mercado

Muchos de los materiales que se utilizaron para la construcción de la obra civil son de la región y abundan en el mismo rancho como el bambú, la arena y la piedra de río. Para los muebles se construyeron algunos de bambú otros de árboles viejos principalmente cedro, que también abundan en el rancho.

En las relaciones que mantienen empresario con distintas personas básicamente se intercambian algunos conocimientos y experiencias sobre proyectos ecoturísticos. El contacto es poco frecuente, sin embargo, el contacto se mantiene como parte de su actividad cotidiana. Respecto a la producción, el producto que se ofrece son servicios ecoturísticos. La idea empieza en el año 2000, en ese momento el señor Ciro que es propietario de otros ranchos, compra uno de los ranchos vecinos, cuyo dueño tenía la idea de hacer un proyecto ecoturístico con la finalidad de aprovechar los recursos naturales con que cuenta la propiedad de 150 hectáreas. Algunos de estos recursos naturales son: cuevas propias para practicar la espeleología, un río en el que es posible nadar y pescar, una huerta de cítricos, abundantes pastos para la cría de ganado vacuno y caballos finos, petroglifos, caídas de agua una amplia fauna silvestre como reptiles, armadillos y coyotes entre otros, así como una flora variada como las orquídeas silvestres. No obstante es hasta el año 2007, cuando el proyecto empieza a tomar forma en 2007. Para poder realizarlo se asiste a diferentes congresos, cursos de capacitación y ferias sobre turismo ecológico. En 2009 el proyecto inicia formalmente operaciones. Actualmente cuenta con una infraestructura que permite ofrecer al visitante diversos atractivos y comodidades. Como comida típica e internacional, paseos a caballo, paseos en bicicleta, paseos en cuatrimotos, caminatas, tirolesa, ordeña de vacas y recolección de huevos.

Al tratarse de un proyecto ecoturístico una de las condiciones fue utilizar y preservar los recursos naturales del lugar. Para ello se empezó a investigar con la finalidad de que se pudieran aprovechar los recursos naturales del lugar. Así se tiene que lo que son las cabañas, el restaurante, el auditorio y las oficinas administrativas están construidas con materiales como bambú, el cual es uno de los principales recursos del lugar y piedra de río. Los muebles de todo el lugar en su mayoría están elaborados con bambú, y maderas de árboles viejos, cedro, caoba y encino, principalmente. El excremento de los caballos cuarto de milla se vende como abono y se tienen en proyecto realizar otras actividades con la finalidad de hacer cada vez más sustentable el proyecto. Sobre todo se ha procurado emplear a personal del lugar, pues es gente acostumbrada al campo y a trabajar en él, tal ha sido el caso del personal de campo, de los vaqueros, del caballerango. Sin embargo, con el personal de nivel medio que en su mayoría ya cuentan con estudios superiores no obstante que son del lugar no es fácil que permanezcan por mucho tiempo en el rancho, pues uno de sus intereses principales es emigrar hacia la ciudad. El Mercado que se atiende básicamente a un mercado local, aunque en algunas ocasiones han llegado a tener a extranjeros como clientes, principalmente de EUA. Estos clientes son recomendados por gente del lugar que se ha ido a trabajar a aquel país. Y en muy raras ocasiones ha llegado a tener clientes de otros lugares. La empresa se ha dado a conocer por la participación en algunas ferias. Y como se dijo anteriormente por recomendaciones de gente de la región que se ha ido a trabajar a los EUA, actualmente se están preparando algunos paquetes turísticos, para darlos a conocer en las ferias y con los que han sido sus clientes. Y en la página: [www.elparaisodeayotoxco.com.mx/ubicacion.html](http://www.elparaisodeayotoxco.com.mx/ubicacion.html).

*Vinculación Empresa – Universidad:* Únicamente de forma esporádica se reciben visitas de grupos de universitarios.

*Otros Datos:* No se tiene pertenencia a alguna Cámara o agrupación de productores.

## METODOLOGÍA

Se da inicio con la revisión de literatura que sirva para enmarcar teóricamente el trabajo. El trabajo se desarrolla con investigación cualitativa, con la realización de registros descriptivos de los fenómenos estudiados bajo el método caso de estudio. El diseño incluye trabajo de campo, a través de una guía de entrevista, llevando a cabo entrevistas a profundidad y observación directa en la empresa. Lo anterior para identificar las diferencias y particularidades existentes en las prácticas de desarrollo sustentable en dos empresas MYPME, tomadas como caso de estudio de giros económicos completamente diferentes, identificando las coincidencias con las prácticas propuestas por dos entidades de gobierno. Las variables consideradas son prácticas de desarrollo sustentable y medio ambiente. Utilizando para la obtención de información entrevistas semiestructuradas y observación in situ. Las empresas tienen una caracterización general que se presenta en la Tabla 4, así como precisiones para la obtención de la información por medio de la investigación de campo: Las entrevistas se realizaron con los representantes de la empresa en el lugar donde tiene su domicilio y se realizó la observación in situ.

Tabla 4: Caracterización de las Empresas

Unidad De Análisis	Empresa A	Empresa B
Nombre de la empresa	Vitamoril	Rancho El paraíso de Ayotoxco
Giro económico	Elaboración de productos para el cuidado de la piel	Servicios de turismo ecológico
Antigüedad	Año 2009	Año 2008
Número de propietarios	5 socios	Un propietario
Localización	San Gabriel, Chilac, Puebla	Ayotoxco de Guerrero, Puebla
Diferenciación	Prácticas de desarrollo Sustentable	Prácticas de desarrollo Sustentable
Instrumento para la obtención de información	Cuestionario guía y observación in situ.	Cuestionario guía y observación in situ.
Forma de contacto con los representantes de la empresa	Feria RENDRUS	Directorio RENDRUS - Correo electrónico

*Esta tabla muestra la caracterización general de las empresas, resaltando en ambas como diferenciación las prácticas de desarrollo sustentable.*

### Operacionalización de Variables

La Operacionalización de variables se realiza en la Tabla 5.

Tabla 5: Operacionalización de Variables

Variable	Subvariable	Indicadores	Parámetros	Instrumento
Medio ambiente	Agua	Cuidado	Si - No	Cuestionario (Pregunta 10)
	Aire	Cuidado	Si - No	Cuestionario (Pregunta 6)
	Suelo	Cuidado	Si - No	Cuestionario (Pregunta 9)
	Flora	Cuidado	Si - No	Cuestionario (Pregunta 8)
	Salud humana	Cuidado	Si - No	Cuestionario (Pregunta 13)
	Paisaje y cultura	Cuidado	Si - No	
	Lombricomposta	Elaboración y uso	Si - No	Cuestionario (Pregunta 10)
Prácticas de desarrollo sustentable.	Ecotecnia	Aplicación	Si - No	Cuestionario (Pregunta 6)
	Reutilización del agua	Aplicación	Si - No	Cuestionario (Pregunta 9)
	Energías renovables	Uso	Si - No	Cuestionario (Pregunta 8)
	Apoyo a la comunidad	Realización de actividades en beneficio de la comunidad	Si - No	Cuestionario (Pregunta 13)

*Esta tabla muestra la población estudiada y el tamaño de la muestra del objeto de estudio*

## RESULTADOS

De acuerdo con las variables operacionalizadas se obtuvieron los resultados siguientes:

Tabla 6: Diversidad de Empresas Que Integran la Muestra

Variable	Subvariable	Indicadores	Parámetros	Empresa Vitamoril	Empresa Rancho El Paraíso De Ayotoxco
Medio ambiente	Agua	Cuidado	Si No	X	X
	Aire	Cuidado	Si No	X	X
	Suelo	Cuidado	Si No	X	X
	Flora	Cuidado	Si No	X	X
	Salud humana	Cuidado	Si No	X	X
	Paisaje y cultura	Cuidado	Si No	X	X
	Lombricomposta	Elaboración y uso	Si No	X	X
	Ecotecnia	Aplicación	Si No	X	X
	Reutilización del agua	Aplicación	Si No	X	X
	Energías renovables	Uso	Si No	X	X
Prácticas de desarrollo sustentable.	Apoyo a la comunidad	Realización de actividades en beneficio de la comunidad	Si No	X	X

*Esta tabla muestra las practicas sustentables por las MIPYE respecto a las dos variables operacionalizadas.*

Como puede observarse en la tabla 3 la presencia de las practicas sustentables por parte de las empresas es evidente, pero la empresa Vitamoril cuenta con mas actividades consideradas como practicas sustentables, que Rancho el Paraíso de Ayotoxco. En este mismo orden de ideas, respecto a la variable medio ambiente, con sus respectivas subvariables las practicas especificas realizadas por las empresas se presentan en la Tabla 7.

Tabla 7: Concentrado de Respuestas Respecto a la Variable Medioambiente

Variable	Subvariable	Prácticas de la Empresa Vitamoril	Prácticas de la Empresa Rancho El paraíso de Ayotoxco
Medio ambiente	Agua	Cuidado: evitando contaminación	Cuidado: evitando contaminación
	Aire	Cuidado: evitando contaminación	Cuidado: evitando contaminación
	Suelo	Cuidado: evitando contaminación	Cuidado: evitando contaminación
	Flora	Cuidado: evitando contaminación	Cuidado: evitando contaminación
	Salud humana	Cuidado: evitando contaminación	Cuidado: evitando contaminación
	Paisaje y cultura	Cuidado: evitando contaminación	Cuidado: evitando contaminación
	Lombricomposta	Elaboración de Lombricomposta	Utilización de abono orgánico (desechos de animales)
	Ecotecnia	Construcción de paredes con envases de pet llenos de tierra sustituyendo al tabique o block	Construcción de paredes con bambú
Prácticas de desarrollo sustentable.	Reutilización del agua	Utilización de agua grises	N/A
	Energías renovables	Utilización de hornos a base de celdas solares	N/A
	Apoyo a la comunidad	Compra de artesanía para empaque de productos a las comunidades	Empleo de personal de la zona

*La Tabla refleja el cuidado de las empresas por el medio ambiente y la practica de actividades a favor del mismo.*

La Tabla 7, permite exhibir el cuidado de ambas empresas por los elementos que integran el medio ambiente y de manera descriptiva las diferentes actividades que cada una de ellas realiza. De forma concreta

los resultados que encontramos son: la presencia de prácticas sustentables en las MIPYME, independiente del tamaño y giro. Las mencionadas prácticas además de favorecer a la conservación del medio ambiente y evitar su deterioro, traen el beneficio de bajos costos en el caso del uso de hornos que funcionan con energía solar, por ejemplo; o bien el uso de envases pet, o el bambú. Están presentes también las acciones que integran a la comunidad con las empresas. Además de ser empresas que de forma voluntaria han decidido cuidar el medio ambiente y sus prácticas se encuentran en la misma línea que las que recomienda la SEMARNAT, constituyendo un ejemplo para la comunidad, para el personal que labora en ellas y para el ámbito empresarial.

## CONCLUSIONES

Las prácticas empresariales sustentables no son algo aislado, nacen de diferentes entes privados y también de gobierno. México al igual que otros países realiza esfuerzos por concientizar y hacer participar a los ciudadanos y a las empresas en actividades a favor del medio ambiente. La SEMARNAT y la PROFEPA son dos entidades de gobierno que tienen bien definida su tarea de cuidar y preservar el medio ambiente. La validación del trabajo se efectuó mediante la determinación en primera instancia de la existencia de propuestas gubernamentales como prácticas de desarrollo sustentable que estén respaldadas por un marco normativo y legal y además se cuente con los mecanismos de vigilancia que permitan el apego a las mismas. Podemos decir que no es necesario ser una empresa considerada como peligrosa o contaminante para trabajar con procesos limpios y/o energías renovables. Finalmente concluimos que no importa el tamaño, el giro o la localización geográfica únicamente se necesita disposición para contribuir a la conservación del medio ambiente de forma responsable.

# **TURISMO: ALTERNATIVA DE INCLUSION LABORAL DE LOS JOVENES PROFESIONALES DE ADMINISTRACION TURISTICA EN LA GUAJIRA**

Olivia Isabel Rangel Luquez, Universidad de La Guajira  
 Marelis Mercedes Alvarado Mejía, Universidad de La Guajira  
 Wilmar Sierra Toncel, Universidad de La Guajira  
 Erick Johan Sierra Ortiz, Universidad Eafit  
 Ángela Nair Ortiz Rojas, Universidad de La Guajira

## **RESUMEN**

*El presente artículo es producto de la investigación "Turismo y emprendimiento como alternativa de inclusión laboral de los jóvenes universitarios de La Guajira", cuyo propósito es analizar el turismo como alternativa para la inclusión laboral de los profesionales del turismo en el departamento de La Guajira. Se fundamentó teóricamente en: Kuratko (2008), Vega (2009), Llamas (2009), Sierra y otros (2013), Martínez (2007), entre otros. El enfoque fue cuali-cuantitativo. Se aplicó una encuesta a cien (100) profesionales del turismo y una entrevista semiestructurada a los gerentes de operadores turísticos. La población estuvo constituida por estudiantes de administración turística y hotelera de la universidad de La Guajira y del programa de teoría del turismo de la Escuela Técnica. Dentro de los hallazgos encontrados se evidencia que el turismo representa una potencialidad para la explotación de diversas modalidades de turismo, sin embargo tiene una baja participación en el PIB, departamental y nacional. El talento humano tiene formación empírica. Existe preferencia del talento humano de baja formación por los operadores turísticos debido a razones de costos. El sector hotelero y restaurantero, son los que generan mayores oportunidades laborales para los futuros profesionales de administración hotelera y turística y técnicos con perfiles propios del sector.*

**PALABRAS CLAVE:** Turismo, Inclusión Laboral, Jóvenes Universitarios, Universidad

# **TOURISM: ALTERNATIVE WORKPLACE INCLUSION OF YOUNG PROFESSIONALS MANAGEMENT TOURISM IN GUAJIRA**

## **ABSTRACT**

*This article is the result of the investigation, "Tourism and entrepreneurship as an alternative labor inclusion of university students in La Guajira," whose purpose is to analyze tourism as an alternative to the labor inclusion of tourism professionals in the department of La Guajira. It was based on theoretically : Kuratko (2008) , Vega (2009) , Llamas ( 2009 ) , Sierra and others ( 2013 ) , Martinez (2007) , among others. The approach was qualitative and quantitative. A survey was applied to one hundred (100) tourism professionals and a semistructured interview managers of tour operators. The population consisted of students of tourism and hospitality management from the University of La Guajira and the theory of tourism program of the Technical School. Among the findings it is evident that tourism represents a potential for the exploitation of various forms of tourism, however has a low share of GDP, state and national. Human talent is empirical training. There is preferably low human talent training by tour operators due to cost reasons. The hotelier and restaurateur, sectors are generating greater employment opportunities for future professionals and technicians hotel and tourism sector profiles with own administration.*

## INTRODUCCIÓN

Los importantes cambios surgidos en los últimos años, han modificado el panorama del mercado turístico mundial enfrentándolo a nuevos retos y oportunidades. Ello ha provocado la necesidad de estudiar nuevos factores estratégicos que garanticen la competitividad de las empresas del sector, siendo sin duda indispensable el análisis del papel del capital humano turístico como elemento de competitividad en un nuevo contexto internacional. Teniendo en cuenta que la globalización ha venido determinando un escenario en torno a la competitividad, función del Estado, población y empresa, es por ello, que si el siglo XX se caracterizó por la competencia entre empresas, el siglo XXI se caracteriza, por la competencia entre sociedades que en sus territorios crean ventajas que pueden convertirse en nichos competitivos modernos en el contexto mundial, así como en nichos equitativos y participativos en el contexto nacional. En este sentido, la economía de los países industrializados, es el escenario de las actuales transformaciones mundiales en el marco de la cultura, lo que implica una serie de valores, formas de interpretación del mundo y vínculos con el otro, trayendo consigo el intento de erradicación de la diversidad problemática, que se evidencia en la disolución de tradiciones, prácticas y discursos locales.

Desde esta perspectiva, se puede inferir que el turismo hace parte de una de las manifestaciones para crear ventajas competitivas en la sociedad actual, esta práctica viajera ha estado presente en todas las etapas del desarrollo de la humanidad, siendo las condiciones de la sociedad del siglo XX (aumento del tiempo libre, disponibilidad del ingreso, mejoras tecnológicas en el transporte, entre otras) las que han permitido su evolución, hasta llegar a convertirse hoy en la industria más grande del mundo, que provee más del diez por ciento (10%) de los empleos globales y el once por ciento (11%) del producto bruto mundial. En donde, el número anual de viajes turísticos en todo el mundo se deberá duplicar a 1.6 millones para el año 2020, por lo cual, el número de personas que se mueven alrededor del mundo tiene un marcado y creciente aumento tanto en las personas como en la naturaleza, de acuerdo a la OIT.

En este sentido, la importancia del turismo en el ámbito mundial se comprueba a través de los datos estadísticos, los estudios y las investigaciones realizadas por los organismos gubernamentales, donde la actividad turística ha generado una alta competitividad entre los países turísticos, destacándose social y económicamente como uno de los sectores más significativos del mundo, incluyendo los viajes motivados por negocios, estudios, religión, salud, eventos deportivos, conferencias, aspectos culturales, exposiciones, visita a amigos, familiares y viajes de placer o de vacaciones. De acuerdo a lo anterior, el potencial del ecoturismo como producto turístico es evidente en un país como Colombia donde los atractivos naturales, la diversidad biológica, la riqueza cultural y étnica abundan.

En este orden de ideas, el turismo como una actividad de descanso, recreación, ocio, entre otros, ha venido equiparándose a las exigencias de la globalización en cuanto a las prácticas dirigidas a la preservación del medio ambiente, respeto a los paisajes, cultura, costumbres. De esta manera el turismo se ha venido orientando hacia la preservación, conservación de los recursos naturales, culturales y el deseo del hombre por conocer la forma en que viven otros, así como sus costumbres y manera de expresarse, a través del ecoturismo. Al respecto, la organización mundial del turismo establece que el ecoturismo junto al turismo de aventura y el turismo cultural, serán los que marquen la pauta en las demandas de estos servicios. Sin embargo, los fomentos y las prácticas turísticas inapropiadas degradan los hábitats y paisajes, agotan los recursos naturales, generan desperdicio y contaminación.

En coherencia con lo anterior el Foro Económico Mundial determina la competitividad del sector turístico a nivel global a través de la estimación de un Índice de Competitividad de Viajes y Turismo (ICVT). Este índice mide los factores y políticas que hacen atractivo desarrollar el sector de viajes y turismo en los

diferentes países. El ICVT contempla tres áreas fundamentales: el marco regulatorio; la infraestructura y el ambiente de negocios; y los recursos humanos, culturales y naturales.

En donde el área regulatoria comprende aspectos como derechos de propiedad, trámites para crear negocios, número de acuerdos de servicios aéreos bilaterales, transparencia de las organizaciones públicas, seguridad, cobertura de servicios públicos de salud, sanidad y políticas públicas orientadas a la promoción del turismo. La segunda área comprende infraestructura aérea, terrestre, de tecnologías de la información y turística, además de incluir la competitividad de los principales costos y precios asociados con el turismo. Por otro lado, de acuerdo con datos de la Organización Mundial del Turismo (OMT), la demanda por servicios turísticos es creciente a pesar de la desaceleración del mundo desarrollado. En el 2012 las llegadas de turistas internacionales crecieron 5,7%, sobrepasando unos 131 millones de visitantes, 7 millones más que este mismo periodo del año anterior. La OMT proyecta que las llegadas de turistas asciendan por primera vez a mil millones de personas en el mundo.

Así mismo, la OMT explica que la importancia del sector turismo en el PIB mundial es creciente; hoy representa el 30% de las exportaciones mundiales de servicios y el 6% de las exportaciones totales de bienes y servicios; para el caso, Colombia no es la excepción y según datos del Ministerio de Comercio, Industria y Turismo en su informe de diciembre de 2011, los ingresos en la cuenta de viajes y transporte de la Balanza de Pagos se incrementaron en 15,7% hasta el mes de septiembre, en comparación con el mismo periodo del año anterior. Por otro lado, de enero a diciembre de 2012 el PIB de servicios de hotelería y restaurante nacional creció 4,5% con respecto al mismo periodo de 2011, esto es, 0,6 puntos porcentuales más que el PIB total (3,9%). El sector de comercio, hoteles y restaurantes participó con el 26,9% del total de la población ocupada del país con un crecimiento de 2,5% frente al mismo mes de 2011 y se caracterizó por registrar un importante crecimiento en inversión extranjera directa, de US\$ 220 millones en 2010 pasó a US\$2.311 en 2011. Además se registró el ingreso de 2.429.075 viajeros no residentes, 3,0% más que el mismo periodo de 2011 (2.357.729).

Así mismo, la ocupación hotelera alcanzó al 53,5% lo que representó 2,7 puntos porcentuales más que el mismo periodo de 2011 (51,8%). Ahora bien, al analizar el contexto local se encuentra que la apuesta en la Agenda Interna de competitividad del departamento de La Guajira, esta deberá convertirse para 2020 en el principal destino eco-etnoturístico del Caribe, a partir de las potencialidades que se tienen en lo cultural y lo natural. La meta es que la participación del turismo en el PIB departamental alcance al 5%. En cuanto al perfil turístico del departamento de La Guajira en general, es el del Turismo Cultural: actualmente se produce o existe potencial para diversas tendencias como el agroturismo en el Corredor Agroindustrial (Corregimientos de Tigreras, Choles y Matitas), el ecoturismo en zonas como el Santuario de Flora y Fauna los Flamencos (Corregimiento de Camarones), Pozo García (Corregimiento de Tomarrazón) y el Delta del Río Ranchería o el turismo de playa que abarca nuestro corredor costero que comprende desde la margen oriental de la desembocadura del río Enea hasta la margen occidental de la desembocadura del río Ranchería. Sin embargo, todas estas tendencias tienen en la cultura un elemento aglutinante, los visitantes que llegan a Riohacha quieren conocer costumbres, modos de vida y manifestaciones artísticas de los distintos grupos humanos que la habitan; en respuesta a la naturaleza humana de conocer lo que le es diferente y atractivo.

Ahora bien, en cuanto a la problemática del empleo profesional en La Guajira, es importante revisar algunos datos estadísticos del mercado laboral de La Guajira, según la Gran Encuesta Integrada de Hogares GEHI, del DANE 2012, posee una población total de 875.000 habitantes de los cuales 526.000, se encuentran en edad de trabajar, una población desocupada de 38.000 personas que representa el 8,5% y una población subempleada de 151.000 personas, es decir, el 33,6% de la población. No obstante, la tasa de desocupación estar por debajo de la tasa nacional, no deja de ser preocupante debido al comportamiento de la pirámide poblacional del departamento que se presenta con una amplia concentración poblacional en la base en los

rangos edades entre 10 - 29 años, representan el 38,5% del total de la población y de la población desocupada el 30% presenta formación profesional es decir 11.400 jóvenes profesionales desempleados en las diferentes disciplina del saber, indicador que pone de manifiesto la dimensión problemática.

En este artículo se analiza la importancia del factor humano en los servicios turísticos, como elemento básico y diferenciador, capaz de aportar ventajas competitivas, destacando la importancia del valor de los intangibles de este sector. Asimismo, se analiza el papel de la educación y formación turísticas en el desarrollo de estrategias de competitividad en las actividades vinculadas al turismo. Para ello en la primera parte, se realizó una revisión literaria, en la cual se fundamentó la investigación, seguidamente se presentó el enfoque metodológico y los procedimientos que subyacen a la investigación, se describen los hallazgos más significativos encontrados en la investigación y finalmente se exponen las diferentes conclusiones a que se llegó luego de la misma.

## REVISIÓN LITERARIA

Para soportar esta investigación, se seleccionaron varias teorías y enfoques metodológicos, cada uno de ellos justificado desde diferentes concepciones de autores que apuntan a comprender el fenómeno del turismo desde diversas perspectivas, aterrizándolas en el contexto de oportunidades laborales de los jóvenes profesionales en turismo del departamento de La Guajira. Dado que los impactos específicos que las actividades propias del turismo producen en su entorno son el criterio que permite identificar las oportunidades laborales como un modelo de gestión particular. Teniendo en cuenta que estos impactos se derivan de sus principales actividades y funciones tradicionales: formación humana y profesional, la de investigación, con la creación de nuevos conocimientos y transferencia social de los mismos y la de extensión, dada la relación de la universidad con el resto de actores sociales.

Es importante entonces, hacer un acercamiento hacia las diferentes teorías de lo que es el turismo. Este comprende las actividades que realizan las personas durante sus viajes y estancias en lugares distintos al de su entorno habitual, por un periodo de tiempo consecutivo inferior a un año, con fines de ocio, por negocios y otros motivos. <http://www.uabc.mx/facultadcqing.tij/navciencia>, 2007. Por su parte, Damm (1998) refiere que el turismo es la actividad más importante del sector servicios de todo el mundo y para muchos países es de creciente importancia a nivel económico puesto que representa una fuente de ingresos de moneda extranjero, de ganancias y de trabajo.

Es por ello, que en estos tiempos, en que existe una indudable tendencia a la globalización y en que los cambios tanto culturales como tecnológicos son cada vez más rápidos, resulta imperioso el tener una capacidad de adaptación que esté acorde a la velocidad del cambio. Esto implica que para todos los sectores, incluyendo al sector turismo, estas nuevas tendencias tienen consecuencias relevantes tanto en materias como su investigación así como también en su gestión, operación y sin lugar a dudas en su enseñanza. En este sentido, en Colombia han surgido numerosos centros de educación que imparten carreras relacionadas al turismo. Estas van desde carreras muy operativas hasta carreras profesionales impartidas por algunas universidades. Todas ellas deberían dar a los futuros profesionales del sector las herramientas necesarias para afrontar los desafíos del turismo. En el caso del departamento de La Guajira, muy a pesar de ser un departamento con una variedad de atractivos turísticos se evidencia la falta de instituciones educativas que fortalezcan las competencias en turismo de su capital humano.

Al respecto, Damm (1998), señala que dentro de los factores más significativos para el fortalecimiento del potencial competitivo de las empresas de turismo están la idoneidad, la aptitud en el manejo de los negocios, la responsabilidad, el profesionalismo y el espíritu de servicio. Todos estos factores llegan a conformar un sistema, es decir, que es más que la suma de estos. La falta de uno de ellos le resta valor a los demás, disminuyendo la calidad del servicio. Por su parte, Aguiló y Alegre (2004), refieren de forma general que

existe un consenso de que el mercado turístico está cada vez mas segmentado en grupos de consumidores con intereses y necesidades diferenciadas, aumentando la demanda de formas más activas e individualizadas de turismo. Unido a esto, la tendencia al aumento del número de viajes realizados en el año junto con la minoración de tiempo de estancia, así como el deseo de nuevas experiencias.

Nos enfrentamos pues, a una demanda heterogénea, con segmentos de mercado cada vez más diversos y una mayor exigencia de atención personalizada y calidad del servicio recibido. También se han producido cambios en los estilos de vida y valores, de tal modo que podemos afirmar que los consumidores turistas son cada vez más experimentados, con niveles de renta suficientes para adquirir un producto turístico cada vez más asequible y dirigido a segmentos de demanda diferenciados, que y no es considerado únicamente como un bien de lujo. Asimismo también se ha producido un aumento de flexibilidad vacacional y tiempo de ocio disponible con un incremento del fraccionamiento de las vacaciones. En relación a los destinos turísticos, Sancho (1998), distingue, las ventajas comparativas que vienen dadas por las características del propio destino, como son los recursos naturales y que han posibilitado su nacimiento y expansión como enclave turístico, y otras ventajas competitivas que configuran el valor añadido del destino como son calidad de servicio, imagen, formación y educación para la actividad turística, el esfuerzo por introducir innovaciones, la mejora de los canales y medios de información, entre otras. Es por ello, que al intentar establecer que estrategias competitivas se deben llevar a cabo en el sector turístico, adquiere cada vez mayor importancia el análisis de activos intangibles.

Con referencia al sector turístico, Mochón (2004) justifica el valor atribuible a los activos intangibles, ya que los activos físicos, aunque no carecen de importancia, son fácilmente transmisibles en el mercado y originan pocas ventajas competitivas. El énfasis según este autor debe ponerse en los activos intangibles y en especial en el capital humano. En este sentido, se puede afirmar que incluso la tecnología, que es indudablemente un elemento indispensable para el funcionamiento de las organizaciones turísticas, se constituye en una verdadera ventaja competitiva si es utilizada por un capital humano bien formado, capaz de obtener una explotación plenamente eficaz de este recurso y capaz de adaptarse a las nuevas exigencias del sector. Desde esta perspectiva, se podría definir el capital humano turístico como la cantidad de conocimientos técnicos y cualificaciones que poseen los trabajadores del sector, procedente de las inversiones en educación formal y en formación en el trabajo.

Múltiples son los argumentos que sostienen la relevancia del factor humano en el sector turístico, entre otros: Camisón (1996) afirma que en una empresa de servicios como es la empresa turística, el principal recurso productivo son las personas que lo producen. Por tanto, la ventaja competitiva esta relacionada positivamente sobre todo con las capacidades de los recursos humanos. En tanto, Uriel y Monfort (2001) sostienen que cualquier empresa moderna ha interiorizado la importancia que llegan a representar los recursos humanos en el pleno desarrollo de la actividad empresarial. Esta realidad se hace singularmente patente entre las empresas turísticas, donde el protagonismo de los recursos humanos resulta fundamental en el ensamblaje del servicio turístico. En efecto, el elemento humano es considerado un factor de suma importancia para las empresas del sector servicios, ya que a diferencia del sector manufacturero, los servicios están indisolublemente vinculados a los trabajadores que lo prestan y por tanto, se constituyen como un eslabón indispensable en la cadena de valor y en la percepción por parte del cliente del nivel de calidad obtenido con relación a sus expectativas. Es por ello, que la inversión en formación y valoración de la educación permite ofrecer un servicio de mayor calidad, y esto debe concluir a la obtención a medio/largo plazo de mayores niveles de ingresos y beneficios en el sector.

De ahí la necesidad de considerar la educación del capital humano turístico no como un coste sino como una inversión cuyos rendimientos obtenidos en el medio o largo plazo superen claramente el gasto realizado en su formación. Jafari (1990) destaca la importancia de la existencia de una educación especializada para el sector turístico. La necesidad de mejorar la formación en el sector se configura como un elemento

fundamental en la actividad turística que requiere una cooperación entre todos los implicados y es una responsabilidad compartida entre los individuos, los poderes públicos y las empresas. Así mismo, refiere Grant (1991) que es importante determinar no solo que recurso no se posee, sino también el modo de mejorar el que tenemos para diseñar estrategias de futuro y en ello juega sin duda un papel muy relevante la educación y formación del capital humano turístico.

En el mismo sentido, señala Casado (1997) que la educación y formación turística deben considerarse como uno de los más importantes elementos estratégicos de la planificación turística, indicando que las iniciativas gubernamentales deben estar dirigidas a crear el conocimiento científico y tecnológico necesario para incrementar el nivel de eficiencia y productividad en este sector. Es importante entonces, analizar de qué forma el fortalecimiento de las competencias de estos profesionales ayuda a la competitividad del sector turístico. Al respecto Albert y otros (1998) utilizan los ficheros enlazables de la encuesta de población activa para estudiar las influencias que tienen las características personales y socioeconómicas en la probabilidad de realizar con éxito una transición desde el sistema educativo hasta el empleo. Definen inserción profesional como la obtención de un punto de trabajo tras la salida del sistema educativo. Estudian a través de regresiones logísticas la decisión de abandonar el sistema educativo y ocuparse. Observan que una de las variables más importantes a la hora de decidir la permanencia en el sistema educativo es el sexo (ser mujer incrementa esta probabilidad). Además encuentran un factor de éxito para conseguir un empleo en el hecho de compatibilizar estudios y paro mientras se está en el sistema educativo, en la medida en que, para la mayoría de los jóvenes, el paro es una etapa necesariamente intermedia entre los estudios y la ocupación.

Para Serrano (1995), el proceso de inserción laboral tiene como marco normativo el conjunto de prescripciones sociales que organizan la transición joven/adulto. Esto hace que este proceso de inserción no pueda ser reducido a sus componentes estrictamente laborales, sino que, en dicho proceso interviene gran número de prácticas de poder que definen lo que significa tal proceso social. En tanto, para Verniéres (1998), es el proceso por el cual los individuos inactivos acceden a una posición estable en el sistema de empleo. Y para Díaz y Tucno (2008), hace referencia al hecho de conseguir un empleo en un momento determinado, es decir, un contrato laboral. La inserción laboral incluye tanto la incorporación de la persona a un puesto de trabajo como el mantenimiento del mismo.

## **METODOLOGÍA**

La investigación es de carácter descriptivo, documental con diseño no experimental y de campo, para la obtención y desarrollo de la investigación, se pretende obtener información primaria proveniente de base de datos del observatorio del egresado de ministerio de educación, además de información secundaria que apoyaría al material investigativo. El enfoque a utilizar en esta investigación es cuali-cuantitativo ya que se lograra estudiar las opiniones de la población objeto de estudio donde se tendrá respuesta de inquietudes sobre la realización del proyecto de investigación basada en el turismo jóvenes universitarios de La Guajira. Para la realización de todo el proceso de investigación de este proyecto, se tendrá en cuenta como población objeto de estudio a todos los jóvenes universitarios desocupados del Departamento de La Guajira de ambos sexos, principalmente a aquellos que estén cursando Administración turística y Hotelera o aquellos que se estén enfatizando en esta área. Muestra: Para la obtención de la muestra se utilizará las técnicas estadísticas descriptiva para poblaciones finitas. Se utilizará una confiabilidad del 95% y un error muestreo del 5% En cuanto al desarrollo de los objetivos de programas y políticas de inclusión laboral del joven profesional, se utilizará la revisión documental y la entrevista semiestructurada a las entidades encargadas, resultados de las encuestas integradas de hogares y del observatorio de egresados

## **RESULTADOS**

Del desarrollo de la investigación se obtuvo los siguientes resultados:

Teniendo en cuenta las expectativas de los estudiantes de turismo, es importante considerar la situación real en la que se encuentra el mercado laboral turístico. Según el Observatorio del mercado laboral de La Guajira la participación porcentual promedio por ramas de actividad económica, en el departamento, se caracteriza por la alta participación de la minería (58%), principalmente de la explotación del carbón mineral, el gas y la sal; seguido de otros servicios (sociales, comunales y personales) con el 7,2% y la administración pública el 5,3%; los de menor participación son servicio de automotores, (0,1%), servicio de correo y telecomunicaciones (0,9%) e industria (1,4%).

De acuerdo a la revisión bibliográfica el departamento de La Guajira ofrece innumerables atractivos turísticos desde el punto de vista natural, cultural y científico. Dentro de sus principales atractivos se resaltan el cabo de la Vela, las playas entre Dibulla y Bahía Honda, los cerros piramidales de la Teta y Pilón de Azúcar y ruinas históricas en el corregimiento de Puerto López, el santuario de fauna y flora Los Flamencos, los parques nacionales naturales Macuira y Sierra Nevada de Santa Marta, el área comercial de Maicao, las minas de carbón de El Cerrejón y las salinas de Manaure. (Observatorio del mercado laboral de La Guajira) En referencia al diagnóstico realizado a los profesionales con competencias en turismo se encontró que un pequeño porcentaje correspondiente a un 48% se desempeña en actividades relacionadas con el turismo, sin embargo, solamente el 20% de ese 48% cuenta con formación profesional en turismo, es decir, que existe la necesidad de inclusión laboral de profesionales en turismo, lo que evidencia que el licenciado en turismo hace parte económicamente activa en el departamento, mientras, un 40% de ellos lo hacen en actividades ajenas al turismo, tales como: comercio, finanzas, telecomunicaciones, ventas entre otros. Mientras que el restante 12 % no se encuentra vinculado a ninguna actividad laboral. Según los encuestados, uno de los factores más relevantes que impiden laborar en turismo es la escasa demanda de empleo.

## CONCLUSIONES

El objetivo principal del presente trabajo fue analizar el turismo como alternativa de inclusión laboral de los profesionales del turismo en el departamento de La Guajira. Ahora bien, dentro de los hallazgos encontrados hasta el momento, se pudo concluir que el sector turístico como sector de servicios con características propias, es sin lugar a dudas el capital humano el principal factor donde se encuentra una de las fuentes de competitividad del turismo, por lo tanto, es fundamental la educación como uno de los factores clave en la obtención de ventajas competitivas sostenibles para el sector. De este modo se observa la importancia estratégica de este recurso, como capacidad distintiva, dando lugar a plantear la necesidad de diseñar políticas de educación y formación de calidad en turismo. Como manifiesta Grant (1991) que es importante determinar no solo que recurso no se posee, sino también el modo de mejorar el que tenemos para diseñar estrategias de futuro y en ello juega sin duda un papel muy relevante la educación y formación del capital humano turístico. Es necesaria entonces, una reestructuración en la importancia del sector turístico como alternativa y la necesidad de adecuar la formación turística existente en el departamento de La Guajira a las necesidades del sector y de lograr un mayor acercamiento del ámbito académico universitario a las instituciones públicas turísticas y a las empresas del sector para establecer sinergias y mejorar el capital humano y por ende la competitividad del turismo.

# LA IMPORTANCIA DEL FACTOR HUMANO EN EL CAMBIO ORGANIZACIONAL

María del Carmen Arias Valencia, Universidad Michoacana de San Nicolás de Hidalgo

Marcela Patricia del Toro Valencia, Universidad Michoacana de San Nicolás de Hidalgo

## RESÚMEN

*Una meta primordial de la administración organizacional es preparar a las organizaciones para hacer frente a los retos y desafíos que la sociedad demanda, y especialmente a sus cambios, en los que pueden contenerse las previsiones de un futuro. En este orden de ideas, la arquitectura organizacional: “anteproyecto avanzado en el despliegue de nuevas funcionalidades, de la adquisición de nuevas competencias o de la eliminación de las existentes y de la reconfiguración de las relaciones con los clientes” (Mora y Aguilar, 2009, p. 435) se presenta como una estrategia funcional, que facilitará y posibilitará, el cambio organizacional, ese largo y complejo proceso de transición entre un estadio y otro, que lleva implícito el descubrir lo que verdaderamente se tiene que trabajar y, sobre todo, cómo es que se va a emprender la transformación que ello significa. En el presente trabajo se presenta una reflexión crítica sobre la necesidad del cambio en la organización, partiendo de dos premisas: una de ellas, es que todo cambio traerá consecuencias, que bien plateadas, pueden ser positivas y, la otra, es el factor humano, con su dimensión emocional, la piedra angular del cambio organizacional. Además, se plantean hipótesis de trabajo y se argumenta su elaboración.*

**PALABRAS CLAVES:** Administración Organizacional, Cambio Organizacional, Factor Humano

## THE IMPORTANCE OF HUMAN FACTOR IN ORGANIZATIONAL CHANGE

### ABSTRACT

*A primary goal of the organizational management is prepare organizations for cope with the challenges that society demand, and especially their changes, which may contain forecasts of a future goal. In this vein, organizational architecture: “progress in the deployment of new functionalities, the acquisition of new skills or the elimination of existing and reconfiguring customer relations blueprint” (Mora y Aguilar, 2009, p.435)) is presented as a functional strategy that will facilitate and enable, through a long and complex process of transition from one stage to another, **organizational change**. A critical reflection on the need for change in the organization is presented in this paper, based on two premises : one, is that any change will bring consequences, good silver, can be positive and the other is the human factor, with its emotional dimension, the cornerstone of organizational change. In addition, working hypotheses are presented and argued its development.*

**KEYWORDS:** Organizational Management, Organizational Change, Human Factor

## INTRODUCCIÓN

El mundo de la administración organizacional es un territorio desde el cual se mira al futuro, pues ahí están los nuevos retos y las necesidades que deberán hacer frente y cumplir las organizaciones. Para ello deben estar preparadas. En cierta forma, esto se logra mediante una mirada aguda y siempre atenta del presente, de sus oportunidades, sus riesgos y especialmente de sus cambios, donde pueden contenerse las previsiones

de un futuro en que, esa es la meta, las organizaciones puedan posicionarse, o seguir, *a la alza*. “Lo importante ahora no son los sistemas o las estructuras, lo importante ahora es adivinar el futuro y proyectarlo desde un trabajo que no se justifica por el éxito logrado sino por la capacidad de lograr un éxito nuevo” (p.467). Este presente, por otra parte, está delineado por la emergencia de una nueva sociedad: la sociedad del conocimiento; frente a ella, y como consecuencia, tienen grandes oportunidades las llamadas “organizaciones inteligentes”, que funcionan como núcleos orgánicos (Sobre esas líneas se recuerda lo que Mora y Aguilar refieren, cuando señalan el paso del “modelo mecánico al modelo biológico”, según el cual la organización funciona en el marco un “humanismo empresarial”. P. 466.) cuya mejor ventaja es, precisamente, el conocimiento y el aprendizaje. Ahora bien, el significado de estos dos conceptos tampoco responde ya a la formulación tradicional relacionada con un orden autoritario y vertical; hoy, el aprendizaje y el conocimiento deben ser, por decirlo así, horizontales y *generativos*, con miras al ejercicio de una creatividad sostenida, elemento fundamental para que las organizaciones respondan exitosamente a las condiciones de su entorno y puedan prever estrategias igualmente exitosas para prevenir las necesidades que traerá el futuro. Pero cómo. Para responder a esta interrogante, la arquitectura organizacional se presenta como una especie de “anteproyecto avanzado en el despliegue de nuevas funcionalidades, de la adquisición de nuevas competencias o de la eliminación de las existentes y de la reconfiguración de las relaciones con los clientes” (p. 435), como una estrategia funcional; ahí se habla de lo que se debe trabajar “inmediatamente”.

La cuestión, es descubrir lo que verdaderamente se tiene que trabajar y, sobre todo, cómo es que se va a emprender la transformación que ello significa. Sobre esto es que trata el cambio organizacional, que es “un largo proceso que implica facilitar una etapa tremendamente compleja como es la transición” (p.447) entre un estadio y otro, atendiendo al ejercicio de cuestiones fundamentales como la comprensión del momento en que se encuentra la empresa, la exploración sobre el orden de prioridades de lo que se debe desarrollar con inmediatez para preparar el futuro, y la comunicación hacia todos los componentes de la organización, a fin de facilitar y posibilitar el buen término del citado proceso. Resulta de suma importancia el *cómo* se pueden lograr los cambios. Consideramos que en ese proceso, la piedra angular es la persona, o bien, el conjunto de personas, sin las cuales toda transformación organizacional es imposible. En ese sentido, las organizaciones inteligentes son, además, organizaciones humanas, y es en función de tal característica que deben planearse los cambios positivos para el mañana.

### Necesidad del Cambio

En vista de las transformaciones aceleradas que se gestan en el entorno presente, los teóricos organizacionales han comenzado a plantear que “la gran batalla del futuro se libraría no para conseguir participación de mercado, sino para conseguir el liderazgo intelectual” (p. 435) entre las empresas; sin embargo, esto es algo que la mayoría de las mismas han obviado, dada la tendencia pragmática de considerar a este tipo de organización como un ente estrictamente ‘material’, con un fin especificado en la acumulación de valores financieros. Mas la empresa no es esto ya, y por ello, la postura tradicional se ha vuelto ineficiente. Lo que se requiere ahora, es que las empresas desarrollen “una rápida capacidad de respuesta y que centren todos sus esfuerzos hacia una alta capacidad de aprendizaje y de adaptación” (p. 436), lo que derive más tarde en la creación de ideas revolucionarias y creativas. En teoría, esto anterior es viable; sin embargo, su ejecución en los hechos es asunto más complejo. Porque un cambio organizacional requiere abandonar una estructura de pensamiento y entrar a otra, más dinámica y flexible; esto es, que las personas deben cambiar sus formas de pensar y de actuar. Ello conlleva un gran reto, pues el cambio de mentalidad es uno de los procesos más arduos en las sociedades y siempre ha respondido a procesos históricos de gran envergadura. Lograr esto al interior de las organizaciones, supone, pues, un gran esfuerzo que sin embargo es inevitable si aquéllas desean sostenerse y provocar esa transformación que aludimos en términos positivos.

### El proceso para cambiar

El cambio organizacional supone, como su nombre apunta, un “rediseño total o parcial de la estructura” de una organización, pero no desde una perspectiva meramente administrativa e incluso científica; dado lo que implica –todo cambio conlleva pérdidas, reacomodos, nuevas condiciones, etcétera, por lo que también genera incertidumbre, e incluso, desconcierto- puede resultar un proceso difícil para las personas y por ello, la directriz de la empresa debe hacer lo necesario para facilitararlo; es decir, “apoyar a las personas para que primero visualicen, luego internalicen y posteriormente se involucren voluntariamente en el logro del objetivo resultante de la situación emergente” (p.439).

En relación con la lectura propuesta, pensamos que hay dos factores esenciales para llevar a cabo un cambio organizacional con éxito; el primero es la disposición de las personas, la cual se logra con una comunicación constante entre todos los miembros del equipo. Dado que el cambio -como se explica- no puede ser un proceso unidireccional al cual se alineen las personas, para que ello ocurra éste habrá de tener sentido y de ahí la importancia de comunicar las razones y los objetivos del mismo; dicho de otra manera, el cambio es un proceso conjunto y por ello requiere de la cohesión de las partes. El otro factor, es en cierto modo complicado y está relacionado con saber qué es lo que se debe cambiar, para qué debe hacerse el cambio, cuáles son los objetivos que se persiguen y, algo esencial: la visualización a mediano y largo plazo de lo que dichas transformaciones podrían traer.

Sin falta de claridad y precisión en estos asuntos, es posible que las organizaciones sólo demoren la solución de una situación desfavorable, o bien que, buscando una mejora, recaigan en viejas prácticas o incluso produzcan situaciones contraproducentes. Por ejemplo, se mencionan en el documento citado casos como el de una empresa cuyo éxito le induce a “contratar demasiados integrantes nuevos que no comparten ese estilo laboral ni los valores de los fundadores” (p.482), o bien puede ocurrir que crezca tanto, que prácticamente absorba su propio mercado, o también, el caso de una empresa en periodo de gran crecimiento, el cual la lleva a contratar más y más personal, de suerte que éste resulte difícil de administrar para que su trabajo redunde en mejores y más diversos productos. Cualquiera que sea el caso, la planeación con vista al futuro implica, no sostener la situación actual por temor al cambio, sino la conciencia de que todo cambio traerá consecuencias, que bien planeadas pueden ser favorables; cuando éstas dejen de funcionar, habrá entonces que continuar con la revaloración de factores, a fin de que la empresa vaya adecuando su acción, conforme se planteen las necesidades de cada presente y las expectativas posibles que el mañana traiga consigo.

Relacionado con el factor humano, se ha señalado que el momento más difícil del cambio organizacional es la transición al cambio, ese momento crítico “difícil de mensurar y más aún de facilitar” (p.439) dado que se trata de un proceso psicológico de adaptación a las nuevas condiciones, que pueden en ocasiones no ser tan ventajosas para el interés individual –pérdida de jerarquías, espacios de poder, nuevas tareas, etcétera- si bien lo son para el interés general. Esta contraposición de intereses, sumada a un estadio de incertidumbre sobre lo que vendrá, puede resultar negativamente y hacer fracasar el proceso. Por ello, es que se hace énfasis en el cambio conjunto, donde cada miembro de la organización es capaz de entender, visualizar y sumarse al proceso con plena conciencia y reconocimiento de su necesidad y ventajas futuras. Lograrlo, dependerá del cumplimiento de una serie de pasos, tendientes al reconocimiento de la resistencia al cambio y de la aceptación de las diversas reacciones en torno al mismo; así como de la comprensión de que “las personas no son artefactos” sino que requieren acompañamiento; también se recomienda acotar al máximo posible el periodo de transición, a fin de minimizar el impacto emocional que genera. Ahora bien, reconocer este impacto emocional plantea una perspectiva integral frente a ese “drama de la transformación” donde el papel de los directivos se vuelve fundamental, dado que a ellos compete “dirigir la organización al futuro” en los mejores términos posibles. El reconocimiento, entonces, también se extiende a las pérdidas inevitables en todo proceso de esta índole.

En ese sentido, los directivos deben tener claro cuáles son las competencias esenciales de las compañías; es decir, sus habilidades actuales -o dicho de otra forma, “aptitudes y tecnologías que permiten que la compañía proporcione algún beneficio a sus clientes” (p. 437)-. Además, los directivos deben tener una gran capacidad de liderazgo, aunque la tarea de renovarse en una organización compete a todos quienes la componen. Y por ello, el proceso ha de hacerse en los términos más amplios posibles.

Esto anterior, no sólo con respecto a la planeación administrativa del cambio, a la atención de factores como las funcionalidades subyacentes a productos y/o servicios de la empresa, que implican igualmente una consideración amplia hacia el futuro, para dar así con “un nuevo abanico de oportunidades potenciales” (p.438) y con el reconocimiento de las competencias esenciales de la misma, para ver cuáles de éstas pueden ser sujetas de transformación. El cambio, además, ha de ser emocional, en el sentido de que no se le puede asumir como una actividad mecánica, burocrática meramente, sino como un proceso complejo cuya efectividad descansa en las personas que integran la organización, por lo que la forma en que se les motiva y suma a la acción llega a ser el factor determinante.

Entre los mecanismos que se proponen para llevar a cabo una transición exitosa, se encuentran la formación de equipos que dirijan ese proceso, y especialmente de la atención de sus etapas y la acción correspondiente para paliar sus efectos nocivos. Se habla de una etapa de duelo, que tiene efectos psicológicos como la angustia y las “dificultades para entender sistémicamente el cambio”, pero que puede ser contrarrestada con la definición de las razones del cambio y sus objetivos últimos, en el marco de una organización incluyente; de una etapa neutral, cuando los objetivos parecen ambiguos y donde es necesario ejercer una comunicación eficiente entre los miembros del equipo; y, la zona de inicio (de la nueva etapa), cuando es importante dar a conocer los logros alcanzados y donde el directivo tiene un papel esencial, como ejemplo de nuevas y mejores prácticas productivas. Como se observa, se trata pues, de planear, coordinar, sumar, comunicar y articular el proceso desde distintos ángulos.

### Los Riesgos Latentes

De acuerdo con los datos incluidos en el título de referencia, los resultados del cambio organizacional suelen no ser satisfactorios (La encuesta citada, de la Consultora Arthur Andersen, señala que sólo un rango del 13 por ciento de las empresas consideraba haber tenido, a costos altos, un cambio muy o moderadamente exitoso, mientras que un 77 por ciento se mostraba inseguro sobre si los resultados eran benéficos. P. 442.) en buena parte de los casos, debido, en principio, a un mal manejo del periodo de transición que deriva incluso en situaciones menos favorables que al comienzo del proceso, en altos costos, pérdida de credibilidad y confianza, pérdida de legitimidad por parte de las directivas y, en concreto, en un enrarecimiento del clima organizacional. Las razones son varias, pero destacan dos: el aspecto emocional que antes mencionábamos, si bien a menudo las organizaciones no suelen prestar “la debida atención a los llamados “aspectos humanos” que toda situación de cambio supone” (p.448); así como la planeación del proceso, la cuestión técnica necesaria para desarrollarlo. En ese sentido, para poner en marcha esta forma de arquitectura, las empresas han de plantearse su actuar conforme a los postulados del pensamiento sistémico, el cual apuesta por un mayor discernimiento en la acción, a partir de la consideración de que “Lo estable, lo circular, lo determinado, es sustituido por la visión de un universo en transformación permanente donde se conjugan el orden y el desorden..., lo previsible y lo imprevisible, lo programable y las bifurcaciones aleatorias” (Mora Fausto y Aguilar García, 2009, p. 93.)

Una vez que hemos dado con qué, en concreto, es necesario transformar, la segunda fase es ponerlo en marcha. Se habla, entonces, de la necesidad de contar con “facilitadores” del proceso, ya sean los directivos o bien, en el mejor de los casos, un grupo interdisciplinario encargado de conformar las llamadas “comunidades de compromiso, comunidades de conocimiento y comunidades de integración o trabajo” (p.448); es de hacer notar que estos facilitadores han de tener una acción temporal

en la empresa, ya que su labor tiene más relación con ‘enseñar a hacer’, que a hacerse cargo del proceso. Si toda acción transformadora dependiera de éstos -y el cambio en las empresas es un proceso que no debe terminar, si las consideramos como organismos vivos- su permanencia podría degenerar en dependencia y de esta suerte, el cambio no sería integral, sino paliativo de ciertas situaciones que, en realidad, no estarían mejorando. Por otra parte, para que esta labor directriz funcione, es necesario contar con competencias específicas, como decíamos: capacidad de liderazgo, una visión estratégica del negocio, una capacidad de generar desarrollo entre los miembros de la empresa y actitud para el trabajo en equipo; así como la conciencia de que ese rol -de facilitador- no recaerá en las mismas personas, por las razones que señalábamos un párrafo anterior.

### La Organización Inteligente

Como escribíamos en un comienzo, la situación actual, de profundos cambios en todos los ámbitos y saberes humanos, empuja con mayor fuerza la necesidad de cambio e innovación en las empresas; tales transformaciones no sólo deben atender a sus necesidades inmediatas de mejores resultados financieros y organizacionales, también, deben atender a la necesidad de aquéllas de cambiar para adaptarse a ese entorno en movimiento, dejando atrás los paradigmas ya entrenados, para adentrarse en nuevos descubrimientos que les permitan permanecer, no obstante a las variaciones de su contexto. Sobre esas líneas, es que hablábamos de las organizaciones inteligentes, que no son ya organizaciones rígidas y burocráticas, sino conjuntos humanos cuyas mejores herramientas son su inteligencia y su libertad para alcanzar una plena competitividad; su existencia se basa en el nuevo paradigma del pensamiento sistémico y son, en suma, “organizaciones capaces de llegar a saber más, de aprender cosas nuevas y enseñarlas a otros”, son capaces así, de “aprender de nuevo y enseñar de nuevo” (p. 456).

Las empresas de la posmodernidad tendrán, pues, que hacer, quizá como nunca antes, uso del conocimiento y aun este conocimiento no será el mismo, pues ya no es tanto un conjunto de saberes estáticos, como un crecimiento interior, un “enriquecimiento de nuestro ser práctico, una potenciación de nuestra capacidad operativa” y un punto de arranque para la asunción de una actitud de creatividad y dinamismo constantes. Esto, pues “el paso hacia la sociedad del conocimiento consiste... en darnos cuenta de que la energía de los talentos humanos es incomparablemente superior a la fuerza de la materia” y sus transformaciones (p. 454), y en que, por tanto, quienes integran las organizaciones son en realidad “fuentes de descubrimiento y generación de recursos”. Así entonces, entre más recursos se generen, más fuerte será la empresa. De esta forma, conformar una organización inteligente dependerá de cuánto conocimiento puede generarse -pues siempre será necesario “saber más”- y, la forma en cómo se va a utilizar ese mismo. El tipo de conocimiento al que aludimos es práctico, debe surgir, para nuestro interés, en la empresa entendida como una comunidad de aprendizaje donde el saber es compartido.

En términos de nuestro texto de referencia, se trata de hacer válidas seis propuestas específicas, tendientes a entender el trabajo como un proceso de aprendizaje y enseñanza; y, a la organización como una comunidad de investigación y aprendizaje compartido, pero no dictado según un ‘nivel general deseado’ sino en atención de las particularidades de cada miembro del equipo. Así mismo, se trata de ejercer el profesionalismo como un oficio, esto es, como un trabajo continuo y en permanente enriquecimiento; adquirir lo que se describe como “una ineludible dimensión ética” (p. 462), que no es otra cosa que el fundamento para ejercer con transparencia y en estricto apego a la verdad las funciones de la organización inteligente; y, cultivar una profunda cultura corporativa, mediante el cultivo de hábitos intelectuales y prácticos entre todos los componentes de la organización. Por último, es necesario comprender que “investigación y gestión se identifican”, toda vez que se trata de procesos paralelos y concomitantes.

Emprender un cambio organizacional en función de lo antes explicado, con base en la aplicación del pensamiento sistémico, representará, en efecto, un proceso complejo, pues de fondo supone abandonar la vida organizacional rígida, para volcarse en una nueva relación dinámica, interactiva y, sobre todo,

horizontal entre las partes (sin perder por ello, el valor de las jerarquías necesarias). Como se decía antes, supone construir un nuevo tipo de empresa, humanística y competitiva a un tiempo, capaz de comprender y adecuarse activamente a su momento, y de asumir los riesgos necesarios para mantenerse siempre en el futuro deseado.

# UNA REVISIÓN A LA APLICACIÓN DE LAS REDES NEURONALES ARTIFICIALES EN LOS MERCADOS FINANCIEROS LATINOAMERICANOS

Pilar Tatiana Parada Mayorga, Universidad Industrial de Santander

Juan Benjamín Duarte Duarte, Universidad Industrial de Santander

## RESUMEN

*El principal propósito de este trabajo es presentar el estado del arte acerca de la aplicación de las redes neuronales artificiales para el pronóstico de series de tiempo asociadas a índices bursátiles y acciones de los principales países de América Latina: Brasil, México, Colombia, Argentina, Chile y Perú. Se hace una revisión de artículos de investigación de cada país de donde se extraen los principales componentes de las RNAs diseñadas que son: la arquitectura utilizada, la función de activación de las capas ocultas y las capas de salida, el algoritmo de entrenamiento, los métodos de transformación de los datos, la división de la serie en el conjunto de entrenamiento y de prueba y las medidas de desempeño. La consolidación de la información arroja que el índice BOVESPA es el que cuenta con mayores aplicaciones, el tipo de red utilizada en todas las investigaciones es feedforwardnet, la topología de las redes diseñadas cuenta con una o máximo dos capas ocultas, el algoritmo de aprendizaje más utilizado es BackPropagation y el desempeño de las redes neuronales en el pronóstico de las series supera en algunos casos a los modelos autorregresivos. Se concluye que la aplicación de RNAs en estos países está en auge, lo que abre el espacio para la aplicación de RNAs innovadoras en la región.*

**PALABRAS CLAVE:** Redes Neuronales, Pronóstico, Latinamerica, Indices Bursátiles
